INDEX OF CONTENTS.

JULY TO DECEMBER, 1909.

(FOR SPECIAL HEADINGS SEE UNDER BOOKS; CERTIFICATES; LAW NOTES; NURSERY NOTES; OBITUARY; PLANT PORTRAITS; PLANTS, NEW; SCIENTIFIC COMMITTEE; SOCIETIES; AND ILLUSTRATIONS.)

A

ABBEY, George (*The Balance of Nature*), 164
 Aberdeen nurserymen receive Government order for trees, 312
 Aberdeen, proposed new park for, 169
 Absorption of ammonia by plants, 328
Acanthus Perringii, 194
Actinidia chinensis, flowering of, 78, 79; in the United States, 228
 Afforestation, 399; in Italy, 282
 Africa, British East, forests of, 340
 Africa, South-west, a botanical journey in, 369, 401, 414
Aganisia lepidota flowering in Mr. Tracey's nursery, 370
 Agricultural education, 233
 Agriculture, retirement of U.S.A. Secretary of, 314
Ailanthus glandulosa as a town tree, 164
 Aldenham House, Elstree, 429
 Allwood's patent plant support, 382
 Almond, fruiting of the, 438
 Alpine garden, the, 18, 54, 91, 212, 246, 290, 370
 Alpine garden at Pont de Nant, 4
 Alps, Maritime, some flowers from, 78
 Althorp Park, Northampton, 123
Amaryllis Belladonna, culture of, 225
 America, exhibitions in, 58
 American Association of Nurserymen, 362
 American blight, remedy for, 175
 American Hawthorns, described by Linnaeus, 412; new, 289, 308
 Ammonium salts, direct absorption of, by plants, 328
 Ampezzo Dolomites, botanising on the, 225
Anchusa italica Dropmore variety, 8
Anemone sulphurea, 91
Angreum caudatum, 115
Anthonomus rubi, a pest of Strawberries and Raspberries, 249
Antirrhinum sempervirens, 166, 186
 Ants and plants, 96
 Aphids and galls on Lombardy Poplars, 157
 Aphids destroyed by extract from Tomato leaves, 380
Aphyllanthes Mospeliensis, 54
 Apiary, the, 21, 55, 113, 263, 295, 311, 377
 Apple culture at Swanmore Park, 19
 Apple tree, a large, 130, 157
 Apple trees, transplanting, 323
 Apples: Golden Noble, 421; Hambleton Deux ans, 157, 320, 346, 438; Rev. W. Wilks, 251; St. Everard, 276; at the Woburn Experimental Fruit Farm, 432; Thomas Andrew Knight on the deterioration of, 266; new, competition for, 249, 265; some good old, 294
 Applications for employment unanswered, 118
 Aquilegias, Mrs. Scott-Elliott's strain of, 23
 Arbour day, plea for a people's, 118
 Arseniate of iron as an insecticide, 380
 Arsenical insecticides, 436
 Artichoke, the Jerusalem, 374, 403
 Asparagus fly, the, 380
 Aubergine, culture of, 19
 Australian Myrtle, the, 388

B

BAKER, Mr. H. Clinton (*Illustrations of Conifers*), 68

Bangor, new park at, 418
 Bankruptcy statistics, 186
 Banks, industrial, 399
 Banks, Sir Joseph, 248
 Barnes, Philip, burial place of, 234
 Barr, Peter, the late, 232, 234, 252, 399
 Bateson, Prof. W., appointed Director of the John Innes Horticultural Institution, 360
 Battersea Park, 420, 437; *Chrysanthemums* at, 338
Beaucarnia recurvata flowering at Bushey House, 4
 Beccari, Dr. Odoardo (*Asiatic Palms*), 87; (*The Doum Palm*), 292
 Bedding Violas, 127
 Beech coccus, to destroy, 66, 256
 Bees, the management of, 21, 55, 113, 263, 295, 311, 377; raising queen, 440
 Begonia rust, cure for, 157
 Belgium: formation of a Department of Horticulture in, 345
 Belgrove gardens, arrangement of flowering plants in the, 170
 Benevolent Institution, Gardeners' Royal (Festival Dinner), 6
 Bergeret, Gaston (*Flore des Basses-Pyrénées*), 394
 Berlin Botanic Garden, 145
 Berlin International Exhibition, 59
Beschorneria yuccoides, 312; at Cambridge Botanic Garden, 8
 Biologists, Economic, Association of, 7
 Birds caught in fruit nets, a plea for, 8
 Black scab disease of Potatoes, 154, 314; and carbolic acid, 361
 Blackman, F. F. (*Vitality of Seeds*), 80
 Blackwell, Mr. G., presentation to, 329

BOOKS, NOTICES OF:—An Essay on the Making of Gardens (*Sir George Sitwell*), 275; *Asiatic Palms* (*Dr. Odoardo Beccari*), 87; *Book of Nature Study* (*J. Bretland Farmer, Sc.D., F.R.S.*), 258, 322; *Botanical Magazine*, 41, 114, 184, 232, 361, 419; *British Fern Gazette* (*Chas. T. Druery*), 153, 281; *Catalogue and Field Book of British Basidiomycetes up to end of 1905* (*M. C. Cooke*), 281; *Darlington's South Devon and Cornwall*, 37; *Dutch Bulbs and Gardens* (*Una Silberrad and Sophie Lyall*), 292; *Essai de Géographie Botanique des Districts Littoraux et Alluviaux de la Belgique* (*Jean Massart*), 194; *Field and Woodland Plants* (*W. S. Furneaux*), 373; *Flora of Cornwall* (*P. H. Davey*), 194; *Flore des Basses-Pyrénées* (*Gaston Bergeret*), 394; *French Gardening* (*Thomas Smith*), 306; *Fruit Culture in Japan* (*T. Ikeda*), 394; *Illustrations of Conifers* (*H. Clinton Baker*), 68; *In a Yorkshire Garden* (*Reginald Farrer*), 373; *Journal of the R.H.S. Gardens Club*, 379; *Les Aspects de la Végétation en Belgique* (*Chas. Bommer and Jean Massart*), 194; *Le Palme d'Inde ou Hyphène* (*Dr. O. Beccari*), 292; *Les Végétaux, leur rôle dans la Vie quotidienne* (*J. Bois and G. Godecaux*), 233; *Kew Bulletin*, 418; *Manual Pratique de la culture du Caféier et du Cacaoyer au Congo Belge* (*Belgian Ministère des Colonies*), 259; *Manual Pratique de la Es-*

sences Caoutchoutifères indigènes et introduites au Congo Belge (*Belgian Ministère des Colonies*), 259; *National Rose Society's Catalogue of Varieties*, 380; *Practical School Gardening* (*Percy Elford*), 135; *Sir Joseph Banks, the Father of Australia* (*J. H. Maiden*), 248; *Spring Flowers at Belvoir Castle* (*W. H. Divers*), 292; *Studies in Fossil Botany* (*Dukinfield H. Scott*), 354; *Successful Jam Making and Fruit Bottling* (*Lucy H. Yates*), 275; *Text Book for Lectures on Agriculture* (*James McCutchen*), 394; *The Balance of Nature and Modern Conditions of Cultivation* (*George Abbey*), 164; *The British Year Book of Agriculture*, 275; *The Cultivation and Preparation of Para Rubber* (*W. H. Johnson*), 292; *The Curious and Profitable Gardener* (*John Cowell*), 353; *The Flowers of Madeira* (*Ellen and Florence du Cane*), 450; *The Gardener's Companion* (*Selina Randolph*), 413; *The Whole Art of Husbandry, or the Way of Managing and Improving Land* (*John Mortimer*), 257; *Trees* (*H. Marshall Ward*), 68; *Trees and Shrubs of the British Isles* (*C. S. Cooper and W. Percival Westell*), 400; *Warley Garden in Spring and Summer* (*Ellen Willmott, F.M.H.*), 436; *Winning a Living on Four Acres* (*Fred. A. Morton*), 147; *Publications received*, 7, 59, 116, 133, 154, 201, 250, 329, 362, 400
 Book, an interesting old garden, 353
 Bordeaux mixture, history and use of, 163
 Borlars, fruit tree, the making and planting of, 193, 252, 266
 Botanical exhibits at the Royal Society's Conversazione, 41
 Botanical journey in South-West Africa, 369, 401, 414
 Botanic Society, Royal, 217
 Botanising round Misurina, 337
 Botanists, honorary degrees for, 7
 Botany, pharmacy's debt to, 249
 Botany, systematic, Dr. Prain on, 264
 Bowkeria Gerardiana, 109
 Bowwood, Wiltshire, 298
 Bramble, the Parsley-leaved, 8
 Bristol garden suburb, 169
 British Columbia, *Cornus Nuttallii* in, 390
 British East Africa, the forests of, 314, 340
 Brittany, importation of Potatoes from, 329
 Britten, Mr. James, retirement of, 598
 Brussels International Exhibition, 1910, 7, 58, 115, 153, 217, 380; and the Board of Trade, 22
 Budapest International Exhibition, 96
 Buenos Ayres International Exhibition (1910), 419
 Bulb culture in Scotland, 218
 Bulb garden, the, 276
Bulbophyllum saurocephalum, 242
 Bulbs, dispute over sale of, 97; Japanese, unfavourable season for, 314; merits of deep and shallow planting of, 277
 Bunyard, George, portrait presentation by R.H.S. Fruit Committee, 7, 23
Buphthalmum salicifolium, 234
 Purpee, W. Atlee, & Co., new seed farm, 314
 Bushmanland, a botanical journey in, 369, 401

C

CABBAGES, 214
Calandrinia chromantha (*Talinum patens*) at Belgrove, 157, 172
Calanthe Dominyi, a fine specimen of, 328
 Calcium cyanamide destroys Charlock, 77
Caenodula Tragus, 293, 315
 California, removal of large Palms in, 149; Feijoa Sellowiana in, 369
 Calla, a hybrid, 162
 Cambridge Botanic Gardens, notes from, 88
 Camellias, 175
Campanula carpatica in a London garden, 412
 Campbell, J. W., appointment of, 281
 Canada, lecture on, 385
 Candle Tree (*Parmentiera cecifera*), 431
 Carbolic acid and black scab disease, 362
 Carbon bisulphide for destroying rats, 133
 Carnation trials at Wisley, 134
 Carnations at Porter's Park, 19; manure for, 32; slow blooming of in 1909, 42
 Carrot fly, the, 60, 80, 98
 Carruthers, Mr. J. B., appointment of, 281
 Castle Ashby, 49
 Castle Kennedy, 227
 Castlewella, flowers from, 59
Catalpa bignonioides as a town tree, 230
 Caterpillars, a plague of, 97
 Cattle Show, the Smithfield, 405
 Cattleyas: Eldorado, 112; *Fabia*, 322; *Gaskelliana* Delight, 258; *Iris King Edward VII*, 258
 Caw, Mr. C. A., presentation to, 264
 Celery disease, 352
 Census of Strawberries, 283
Cercospora circumscissis, cure for, 203
 Cereal-breeding station, need for a national, 59
CERTIFICATE OF FRUITS AND VEGETABLES:—Apple: St. Everard, 237; Beans: Cholet, 136; Everyday, 136; Excelsior, 136; The Belfast, 136; White Emperor, 237; Melon: *Barnet Hill Favourite*, 100; Strawberries: *Atkins's Continuity*, 237; *Laxton's Perpetual*, 206
CERTIFICATED PLANTS:—*Anemopsis macrophylla*, 136; *Angreum stylosum*, 206; *Anthers*: *Bianca*, 300; *Lustre*, 267; *Astilbe rivularis gigantea*, 135; *Begonia* *The Gem*, 331; *Bulbophyllum hirtum*, 364; *Caena Roi Humbert*, 136; *Carnations*: *Elizabeth Schiffer*, 99; *Fairy Furnace*, 99; *Jupiter*, 99; *King of Spain*, 99; *Lieut. Shackleton*, 26; *Mary Vildon*, 406; *May Day*, 301; *O. P. Bassett*, 236; *Cattleyas*: *Basil*, 237; *Three supra*, 364; *Hardyana* *The Baron*, 268; *iridescens splendens*, 206; *Mrs. Pitt supra*, 237; *Mossie Wageneri Sanders*, 27; *Rhoda conspicua*, 237; *Warszewiczii* var. *W. Waters Butler*, 100; *Chrysanthemums*: *Altamham Yellow*, 301; *Empress*, 284; *George Hemming*, 318; *Franz Joliffe*, 318; *J. H. Groszold* *Walslams*, 318; *J. B. Lowe*, 303; *Leslie Wells*, 205; *Lingwood's Pride*, 331; *Mary Farnsworth*, 267; *Mensa*, 363; *Mrs. Colles*, 318; *Mrs. R. Laxford*, 301, 318; *Mrs.*

- W. Buckingham, 363; Mrs. Thornton, 301; Miss Lihan Ballivant, 363; Phosphoreuses, 318; Tom Edwards, 254; White Queen, 254, 267; *Cirrhopetalum*: Fascinator, 268; longissimum, 364; pulchrum, 136; *Columnnea magnifica*, 301; *Cypripediums*: *Albaster magnificum*, 439; *Beacon magnificum*, 302; *Boltonii*, 364; *Cynthia*, 268; *Elatior* var. *Rex*, 303; *Faire Maude*, 268; *Leon*, 405; Mrs. F. Sander, 439; **Dahlias**, Edward Mawley, 205; *Gold Crest*, 236; H. H. Thomas, 192, 205; *Indomitabile*, 192, 205; *Iolanthe*, 192, 205; *Jupiter*, 205; *Little Beeswing*, 205; *Little Donald*, 236; *Prima Donna*, 205; *Quimbo*, 236; *Red Admiral*, 192, 205; *The Lancer*, 236; *Delphiniums*: *Nulli Secundus*, 61; *White Queen*, 26; *Dendrobium*s: *acuminatum*, 136; *muricatum*, 174; *Phalenopsis album*, Sander's variety, 439; *Sandera*, 100; *taurinum* *Colmanii*, 268; *Disa polygonoides*, 237; **Eremurus** *Sir Michael*, 61; *Eria ornata*, 100; *Galga Hartlandii*, 99; *Gentiana ornata*, 173; *Gladioli*: *Lord Alverstone*, 135; *Miss Ada Reeve*, 135; *Gloxinia* (*Veitch's Strain*), 99; **Helium** *Riverslea Beauty*, 205; **Lelio-Cattleyas**: *Barbarossa* *Westonbirt* variety, 364; *Baroness Schröder* var. *Mme. Henriette*, 332; *Black Prince*, 136; *calistoglossa superba*, 81; *Coruna* *Westonbirt* variety, 332; *Firminii*, 439; *Golden Oriole* *Westonbirt* variety, 174; *Invincible*, 136; *Jason*, 136; *King Manoel*, 364; *Martinetti* "The Prince," 27; *Nelthorpe Beauclerk*, 364; *Pizarro Holford's* variety, 237; *Listrostachys forcipata*, 174; **Megachinium** *Arnoldianum*, 62; *Miltoniada Harwoodii*, 27; *Monomeria barbata*, 405; *Montbretias*: *George Henley*, 173; *Pageant*, 173; **Nephelaphyllum** *pulchrum*, 62; *Nephrolepis exaltata* var. *Marshallii*, 331; *N. magnifica*, 26; *N. splendens*, 363; *Nymphaea* *Countess of Warwick*, 99; *N. Mooreana*, 61; **Odontiada** *Keighleyensis* *Fowler's* variety, 439; *Odontoglossum*: *ardentissimum* *Starlight*, 62; *Goodsonii*, 136; *Grariana*, 174; *Oncidium* *hybridum* 439, *pumilum* 62; **Pelargonium** *His Majesty*, 363; *Pentstemon* *Middleton Gem*, 236; *Phaius pauciflorus*, 100; *Polystichum aculeatum pulcherrimum plumosa*, 136; *Potentilla atrosanguinea* *Gibson's Scarlet*, 205; *Piimula* *Littoniana*, 26; **Rhus** *sinica*, 206; *Roses*: *Ariel*, 26; *Claudius*, 222, 267; *Countess of Shaftesbury*, 30; *Duchess of Wellington*, 26; *Flower of Fairfield*, 236; *Grace Molyneux*, 26; *Juliet*, 61; *Lady Pirrie*, 30; Mrs. Edward J. Holland, 222; *Miss Cynthia Forde*, 222; *Walter Speed*, 26; **Sophro-Cattleya** *Blackii*, 174; *Spathoglottis plicata alba*, 61; *Spirea* *Veitchii*, 61; *S. venusta magnifica*, 99; *Streptocarpus* strain, 267; *Sweet Peas*: *Chas. Foster*, 136; *Clara Curtis*, 136; *Colleen*, 26; *Dazzler*, 136; *Doris Usher*, 26; *Eldon Beauty*, 136; *Edna Unwin*, 61; *Masterpiece*, 26; Mrs. Henry Bell Improved, 26; Mrs. Townsend, 26; Mrs. W. J. Unwin, 136; *S. Lee*, 81; *Sunproof* *Crimson*, 136; **Tunica** *saxifraga alba plena*, 99; **Vanda** *oreolea* *Dreadnought*, 136; *Vitis* *Wilsonae*, 236; **Zygo-Colax** *Charlesworthii*, 364; var. *rubida*, 439
- Ceylon Botanic Gardens, 115, 431; *Dendrocalamus giganteus* flowering in, 134
- Chalwin, Mr. H. J., 185
- Charlock, destroyed by calcium cyanamide, 77
- Cheal, J. & Sons, vegetable exhibition, 204
- Chemical analysis of the Wonderberry, 419
- Chenopodium amaranticolor* as an edible vegetable, 380, 403
- Cherry leaf scorch, 185
- Chestnut, Spanish, history of, 176
- China, E. H. Wilson's journeys in, 161, 178
- Chinese *Cypripediums*, two, 419; *Primulas*, new, 344
- Chlorophyll, nature of, 380; protection, in leaves, 400
- Chlorosis in vines, 42
- Chrysanthemum* conference, 233
- Chrysanthemum* fly, 185
- Chrysanthemums* at Battersea Park, 338; new decorative varieties of, 394; the propagation of, 383
- Chrysophlyctis endobiotica* (warty disease of Potato), 79
- Cineraria* and *Chrysanthemum* fly, 185
- Cinerarias*, a new disease of (*Coleosporium senicionis*), 153
- Cladrastis tinctoria*, 7
- Clay soils, treatment of, 336
- Clethras*, the, 228
- Clianthus Dampieri*, propagation of, 220
- Clibrans, Messrs., staff outing, 42
- Cockroaches in rooms, to exterminate, 78
- Codiums* (*Crotons*), varieties and culture of, 52
- Coleogyne asperata*, 34
- Colchicum speciosum*, 278
- Cold storage of fruit, 380
- Colonial exhibition at Westminster, 345, 384
- Colonial notes, 134
- Colour, effect of salts upon, 97
- Conference of Mutual Improvement Societies, 269
- Congo, flora of the, 185, 265
- Cooke, M. C. (*Catalogue and Field Book of British Basidiomycetes*), 281
- Cooper, C. S., and W. Percival Westell (*Trees and Shrubs of the British Isles*), 400
- Coprosma acerosa*, 341
- Cordylina* (*Dracena*) *australis*, 129
- Corsewall Gardens*, 227; *Cornus Nuttallii* in British Columbia, 390
- Cosmos*, a new race of early flowering, 234; for furnishing cut blooms, 266
- Cotoneaster rugosa* *Henryi*, 339
- Cowell, John (*The Curious and Profitable Gardener*), 355
- Crataegus tanacetifolia* at Glasnevin, 68
- Crataegus*, American species of, described by Limaens, 412; new American species of, 289, 308
- Crocuses*, autumn-flowering, 432
- Crops, official estimate of the, 78
- Crystal Palace Company, the, 298
- Cucumber, Nelson's Prolific, 60
- Cucumber and Melon canker, 186
- Cucurbitaceous* fruits, influence of the removal of style in, 67

LIST OF ILLUSTRATIONS.

A

ACACIA giraffe in Great Namaqualand, 401
 Acanthus Perringii in flower, 194
 Actinidia chinensis, floral parts of, 77
 Africa, South-west, map of Prof. Pearson's travels in, 369; native plants in, 401, 402
 Allolobophora intermedia (Earth-worm), 357
 Allwood's patent plant support, 382
 Aloe dichotoma and species of Euphorbia in Namaqualand, 401
 Althorp Park, views in the gardens at, 124, 125
 Angraecum Kotschyi, 221
 Annuals, a garden of, at Madresfield Court, 411
 Antirrhinum sempervirens, 165
 Apples: Rev. W. Wilks, 251; St. Everard, 276
 Apple tree, a large, 130
 Artichokes, forms of the Jerusalem, 371
 Azaleas in the International Exhibition of 1866, 117

B

BAMBOOS, giant, in Jamaica, 436
 Banks, Sir Joseph, portrait of, 248
 Barr, Peter, the late, portrait of, 216, 217
 Bateson, Prof. W., portrait of, 360
 Beaucarnia recurvata, a flowering plant of, 4
 Begonias shown by Messrs. Blackmore & Langdon at Shrewsbury, 140
 Berberis Gaenepanii, foliage and fruits of, 226
 Beschneria yuccoides, 309, 313; flowering in Cambridge Botanic Gardens, 8
 Bothy at Bowood, 298
 Bowkeria Gerardiana, a flowering shoot of, 109
 Bowood, views in the gardens at, 295, 298, 299
 Bulbophyllum saurocephalum, 242
 Bunyard, George, portrait of, 28

C

CALLA, a hybrid, 162
 Campanula carpatica flowering in a London garden, 412
 Carnations: Elizabeth Schiffler, 98; Fiery Furnace, 99; Her Majesty, 10; May Day, 322
 Castle Ashby Gardens, views in, 49, 50, 51
 Cattleya Iris King Edward VII., 258
 Centaurea biflora, 147
 Cevlon Botanical Gardens, view in, 450
 China, a view in the Tali Range, showing habitat of Rhododendron bullatum, 379
 Chrysanthemum Mary Farnsworth, 347
 Chrysophlyctis endobiotica in Potato tubers, 79
 Clip for attaching grease bands, 326

Cologyne asperata (Lowii), 34; C. cristata, a group of, 15
 Columnea magnifica, 301
 Commiphora saxicola in the Damaraland littoral desert, 402
 Coprosma acerosa, fruiting shoots of, 341
 Cordyline (Dracena) australis flowering out-of-doors at Torquay, 129
 Cotoneaster rugosa Henryi, 359
 Craven Nursery, views in the, 35, 36, 37
 Cyananthus incanus, 422
 Cyamiding apparatus, a simple, 388
 Cymipedium acaule, 209; C. calceolus, 210; C. californicum, 211; C. macranthum, 212; C. parviflorum, 227; C. Thunbergii, 228; tibeticum, 420; C. ventricosum, 229

D

DAFNE rupestris in the Craven Nursery, 37
 Dendrobium acuminatum, a flower-spike of, 150
 Disa grandiflora, a group of plants of, 154

E

ELMWOOD, Kent, views in the garden at, 196, 197, 199
 Eriogonum macranthum, a fine variety of, 53
 Exhibit by Messrs. Webb & Sons at the Leamington Show, 110

F

FASCICLATE inflorescence of Lilium dalmaticum, 259
 Forbes, Mr. John, portrait of the late, 192
 Fossil plants, foliage, seed cupules and seeds of, 355
 Friar Park, the Matterhorn at, 277
 Fruit-room at Dover House Gardens, 306, 307
 Furcraea Bodinghausii flowering in a Devonshire garden, 340

G

STRAWBERRY CULTURE FOR MARKET.

THE business of Strawberry-growing in this country has reached such dimensions of recent years that it may now be considered an important rural industry. Looking at the official returns of the Strawberry crop for the first time, it seems well-nigh incredible that such enormous quantities of fruit can be consumed by the British public, for, compared with most other European peoples, we are not considered a nation of fruit-eaters. But the progress of the Strawberry as a market commodity affords a striking illustration of the doctrine that supply creates demand; for there can be no doubt that, in the case of so seductive an article of diet as the Strawberry, when displayed to good advantage in the fruiterer's window, the public yields willingly enough to the temptation to buy it. Extensive production has also reduced the price of Strawberries to a figure that places the fruit practically within the reach of every household, and "God's best berry" can no longer be regarded as an expensive luxury.

Even the forced Strawberry is a comparatively cheap extravagance in these days, and it is to be feared that the British grower suffers a good deal in the matter of price from the importations that reach this country every spring from across the Channel. It is a natural sentiment to hold that those who want their Strawberries out of season—that is to say, at any time before the early days of June—ought to pay for them, but Strawberries must be cheap when sixpenny fruit-salads containing three or four Strawberries may be bought before the middle of May. Even in April, this year, Strawberries—

doubtless from abroad—were being hawked in the streets, and shortly afterwards the very finest fruit could be purchased retail in the shops at anything from 2s. 6d. to 4s. per lb. Time was, and not so very long ago either, when the grower of Strawberries under glass expected a piece of gold for every pound of fruit produced in April, and thought himself badly treated if he could not clear the last of his crop, which came in just before the outdoor berries, at 3s. to 4s. per pound wholesale.

Whether the foreigner finds it a very paying business at present prices to send forced Strawberries to England is open to doubt. For the last two years, at any rate, there has been a reduction in the quantity shipped. Most of the foreign fruit comes from the Brest district, and the boats that bring it to Plymouth are chartered by the growers themselves, who recoup themselves as far as possible by also carrying cargo of a general nature. In 1906 the Great Western Railway Co. handled 1,416 tons of foreign Strawberries, brought by French steamers to Plymouth, but in the following year the total had fallen to 1,125 tons, while last season it was still further reduced to about 1,000 tons.

The first of the British outdoor Strawberries come from the West of England, a fairly steady production of between 400 and 500 tons per annum being maintained. This, at least, is the quantity handled each season by the G.W.R., which has supplied these figures to the writer for some years past. Last year this company conveyed 2,520 tons of Strawberries in all, including the 1,000 tons from the Continent and the early consignments mentioned above from the West. These latter come chiefly from the Saltash and Tavistock districts.

Hampshire, however, produces the bulk of the market consignments, and usually manages to despatch the first of its outdoor crop a few days before the Kentish berries are ready. In the Southampton district, where the fruit is mainly produced, the crop was not so good last year as in 1907, which, in spite of a generally cold and backward season, supplied a record in the matter of Strawberries. In that year no fewer than 4,705 tons of fruit were carried by the London and South-Western Railway Co., which has practically a monopoly of this traffic in the district mentioned. The amount of labour involved in dealing with such a quantity may be imagined when it is stated that over two million baskets were needed to hold the crop. Previous to the 1907 season the record year was 1904, when the Hampshire crop amounted to 4,250 tons.

From the foregoing figures it may readily be judged that occupation is afforded each year for a very large number of workers in the Strawberry fields. It is estimated that in the Southampton district there are over 150 growers. Labour is required in the Strawberry fields during a great part of the year, what with planting, hoeing, cleaning and trimming, manuring and littering the plants, but the busiest periods are in June and July, when hundreds of men, women, and children are employed in picking, packing, and despatching the fruit for a period of a month to six weeks according to the length of the season. Two years ago, when there was such a prodigious crop, the season lasted for nearly

seven weeks, owing to the fact that cool and showery weather, broken only by intermittent periods of sunshine, kept the crop from maturing quickly, and enabled the berries to swell to their largest size before they began to ripen. In that year many of the pickers must have made quite a considerable sum of money, for a good worker can earn from 6s. to 12s. a day, while even higher sums than this have been made by industrious and adept gatherers working together. Children are employed largely in the business, and many of them can earn as much as 2s. 6d. to 3s. 6d. each by a hard day's work. The price paid by the growers is about 1½d. a gallon basket of between 5 lbs. and 6 lbs., and so long as the fruit fetches 1s. a gallon (wholesale) picking for dessert continues. When the price falls below that figure the fruit is picked into larger receptacles for jam, and big and small berries are put in together.

The British Strawberry grower still has a good deal to learn in the matter of grading and marketing his fruit in an attractive way. The Southampton grower always uses the handle basket, which is a great improvement upon the peck measure still so popular in Kent and elsewhere. The latter is much too large for so soft and perishable a fruit as the Strawberry, since the peck holds nearly a dozen pounds, while the handle basket contains no more than half the quantity. Perhaps the larger package is still used by some because the railway companies carry such baskets at a lower rate, since the "pecks" can be packed flat one on top of the other, while the "handle gallons" must be stood on shelves in single layers, or suspended. By an ingenious method of movable shelves, fitted one above the other in special fruit vans and sometimes even in old passenger carriages, the South-Western Railway Co. has devised a most satisfactory method of dealing with the handle basket. Naturally this description of package involves more labour and expense to the Company, for, while it occupies practically the same amount of room as a peck basket, it only weighs half as much. This means, of course, that each ton of fruit in handle baskets requires as much handling as two tons packed in "pecks."

Among the Hampshire growers the light "chip" basket has come very much into favour in recent years. Being cheaper than the old wicker pattern, it can be "non-returnable," which is an advantage that anyone who has grown produce for market will readily appreciate. The getting back of "empties" from market is one of the greatest troubles that the grower has to put up with, and it usually pays him much better to pack his fruit in a cheap, non-returnable basket than in one that he cannot afford to lose. Wickerwork Strawberry baskets are made at Winchester Prison and also abroad, whilst those of the chip pattern come chiefly from Glasgow.

As for this year's Strawberry crop, it seems likely that when the returns are made up at the end of the season the figures will be scarcely smaller than a year ago. May frosts did more damage than usual, and the plants suffered badly from want of moisture during the time that the earlier fruit was forming. Subsequent rains, however, have made amends, and, owing to the later blossoms having set well, this has compensated for the loss of the early bloom by frost. E. S.

NEW OR NOTEWORTHY PLANTS.

PÆONIA VEITCHII, n. sp.

THIS new species of *Pæonia* is a welcome addition to gardens. It is a native of the uplands around Fatién-lu, a district in the far west of China, close to the Tibetan frontier, and is frequently found by the margins of thickets at an elevation of from 8,000 to 11,000 feet. It was introduced by Messrs. James Veitch & Sons through their collector, Mr. Wilson. The plant is so charming and so unlike every other kind, that I think it worthy of bearing the name I have ventured to give it. It does not, of course, compare with the old garden doubles or even with the great singles, but it has attractive features found in no other *Pæony*. *P. Veitchii* has been referred to *P. anomala*, one of the sections

shows equally marked differences. In its habit of producing from one to four flowers to a stem, it is distinct from all other species except *P. albiflora* and *P. Emodi*, neither of which it resembles. The flowers of the genus *Pæonia* are almost always solitary, and I know of one further exception only, that of a specimen, perhaps abnormal, of either *P. peregrina* or an ally, which I saw in the Herbarium of the Jardin des Plantes, Paris, some years ago. I have not referred to flower characters because in *Pæonia* they are not strong; other characters are stronger, and in this genus there is evidence, I believe, that evolution may affect other organs of a plant and leave the flowers unmodified. Quite distinct species of *Pæonia* may have flowers that are difficult to distinguish in technical terms, and, moreover, the same species may show remarkable variation in a flower character. Two or three species, for instance, may have

give a formal and detailed description. A few words, however, are necessary with reference to the garden value of the plant. It is free-flowering, of very neat and graceful habit, and forms a dense mass of conspicuously light-green, many-pointed foliage. It might, I think, be useful in hybridising for the purpose of reducing the stiffness of the big *Pæonies*. Last year an assistant made a few crosses, but nothing happened, yet still I think crosses may be possible. The flowers are very bright in colour, and unless required for a very large arrangement, there is no species so suitable for cutting from. They last well in water. *P. Veitchii* is quite easy to grow in an ordinary border. All *Pæonies* like rich soil, and they must be well established before they do their best. I have found that they like a little shade, and even planted among the roots of trees they do well. *R. Irwin Lynch, Botanic Garden, Cambridge.*

FIG. 1.—PÆONIA VEITCHII, LYNCH N.SP.: COLOUR OF FLOWERS, PURPLISH-CRIMSON.

in which the leaves are narrowly divided or pinnatisect, but if compared with that of either of the allied kinds, it is found to differ remarkably in bearing several flowers to a stem, in having a light green, brightly-glistening leaf surface both above and below, very distinct elevations of the leaf between the veins, and a different proportion between certain parts of the plant. While the stem of *P. anomala*—to take this species for comparison—may be 2 feet high and bear 9 or 10 leaves, with the lowest petiole only one-eighth as long as the stem, *P. Veitchii*, with a stem 2 feet high, has only six or seven leaves, and the petiole of the lowest leaf is one-third or one-fourth, or at least one-sixth as long as the stem that bears it. Again, with regard to the leaf, while *P. anomala* may have 22 distinct leaf segments, each $\frac{1}{4}$ inch across, *P. Veitchii* has 15 segments only, and they are $\frac{1}{2}$ inch across. Comparison with every other species of the genus

either glabrous or hairy carpels—usually in other plants a difference of some moment—and yet they may not vary in any other particular. *P. Veitchii*, however, is quite distinct in the flower, though there are few strong characters for description. In bud, and even when open, the flower, having a slender stalk, is often nodding, and may expand to be quite flat. The flowers are $3\frac{1}{2}$ inches in diameter and of a slight, yet distinct, purplish-crimson. The accompanying illustration from a photograph taken by my son shows several of the features I have pointed out; it should be explained that the lower leaf belongs to the tall stem and the two lower flowers are on separate stalks, and are put in to show the fully-open and partly-open flower. In the above account I have referred, I think, to all the chief features of contrast with other *Pæonies* of the subgenus *Pæon*, which includes all the herbaceous kinds, and it is, therefore, perhaps unnecessary to

THE ROCK GARDEN.

SAXIFRAGA AIZOON ROSEA.

THIS daintily-coloured variety was warmly welcomed by lovers of choice Alpine plants, for up to the time of its appearance all the *Saxifragas* of the aizoon section produced whitish flowers. But pretty and dainty as it is, there is plenty of room for improvement, especially in the direction of colour, whilst there is also need for greater floriferousness in the plant. It bears very few blossoms on each flower-stalk, the stem being bare of flowers for some inches. This sparse-flowering character is masked when the plants are grouped and in a clump its full beauty and worth are best realised. The plant grows freely, and it is not a difficult matter to raise a stock of it. Those who delight in raising seedlings of these plants will probably produce plants of greater merit than that under notice, and, if so, it will be welcomed by all interested in hardy plants. *S. a. balcana*, with copiously-spotted flowers, is also a good plant, and, like *S. aizoon rosea*, almost as much at home in the border as in the rock-garden.

THE ROSARY.

CULTURAL NOTES FOR JULY.

ALL classes of Roses have made excellent growth during the past few weeks, and there is every promise of a good season. The rains have cleansed the shoots of aphid and other insect pests, and the plants have developed fine, strong shoots. Standard Briars are now in a suitable condition for budding. Remove all but three or four of the strongest shoots if this has not already been done. The best buds for the purpose are those at the base of the shoot, but in the case of rare varieties it is sometimes desirable to use almost all the buds on the scion. In this case extra care must be taken with the work. When budding standard Briars, insert the bud in the axil of the shoot as near to the main stem as is possible, for this will enable the plant to form a compact head the following season. Any suckers arising from the roots or from the stems should be removed as soon as the budding is completed. The next to be operated upon are the seedling dwarf Briars. Take away a few inches of the soil around the base of the stem, so that the buds can be inserted just above the roots. This has the advantage of preventing the formation of suckers, whilst the plant in due time will be practically on its own roots. In the case of the *Manetti* and *De la Grifferie* stocks, and especially those growing in heavy soils, it is advisable to defer the budding until August.

Time will be well spent in examining some good Rose nursery or attending the Rose shows with a view to inspecting and selecting the best kinds. If strong-established pot plants of the newer varieties are secured they will furnish plenty of

scions for budding this year, by which means a good stock of novelties can be easily secured at a comparatively small cost. I noticed at the recent Temple Show that Minnehaha, Hiawatha, Delight, and Dorothy Perkins were specially fine amongst Rambler Roses, whilst very beautiful were the larger-flowering Mrs. Joseph Lowe, Mrs. A. Ward, Lady Roberts, Mrs. Cornwallis West, and Margaret Molyneux. The newly-budded plants on the Briar stock should be carefully examined for the last time with a view to securing the shoots and stopping those which are making extra vigorous growth. Towards the end of the month when the Rambler varieties, including Aimée Vibert, Feilenberg, Dorothy Perkins,

should be within 1 foot of the glass. Shoots which have flowered this season should be selected for the cuttings, preferably with healthy foliage. Make the cuttings about 4 to 6 inches long. Cut off the two bottom leaves and shorten the top to a bud, making a sloping cut. Dip the shoot in some insecticide and then cleanse it with clean water. Procure some very small pots, either thimbles or thumbs, and fill them with a mixture of three parts turfy loam, and equal parts of sand and crushed charcoal, passed through a sieve having a $\frac{3}{8}$ -inch mesh. Insert one cutting in each pot, and then water the soil. Place the pots in the frame and afford no ventilation, but shade the glass until the cuttings are rooted.

plant Roses lifted from the ground, but Roses in pots can be planted at all times. An important matter to observe when planting Roses is to afford them plenty of rich, loamy soil mixed with a quantity of manure. The atmosphere of towns being charged with deleterious substances, it is necessary to keep the foliage constantly syringed with clear water. One cause of failure with town and suburban growers is over-pruning; it must be borne in mind that plenty of healthy foliage is necessary for satisfactory root development; weak liquid manure is one of the finest stimulants to produce this satisfactory growth. The following, amongst hybrid perpetual varieties, do fairly well in town gardens: General Jacqueminot, Duke of Connaught, Margaret Dickson, John Hopper, Mrs. John Laing, and Magna Charta; amongst the more vigorous climbers may be included Gloire de Dijon, Mme. Verard, Belle Lyonnaise (all of the Tea section), Aimée Vibert (Noisette), most varieties of the Crimson Rambler section, Queen of the Belgians, Dundee Rambler, and Fair Rosamond. The three varieties named last are of the hardiest type, although only second-rate in quality. Of the Rugosa type, alba and Mme. George Bruant are two of the best. It may be advisable to include some of Lord Penzance's Sweet Briars.

Remove all buds and weakly growths from planted-out Roses under glass. *J. D. Godwin.*

FIG. 2.—IRIS "REMBRANDT," REPRESENTING A STRAIN OF EARLY-FLOWERING BULBOUS IRISES.

IRIS "REMBRANDT."

On June 10 we received a consignment of Iris flowers from Mr. C. G. Van Tubergen, junr., Nurseryman, Haarlem, with the information that they represented a new strain of bulbous Irises which he proposed to designate "Dutch" Irises. These have been raised from crossings of early-flowering Xiphiums, such as *filifolia*, *tingitana*, *lusitanica* and others. Mr. Van Tubergen claims that his varieties, whilst resembling *Iris hispanica*, flower at the least a fortnight earlier than ordinary varieties of the Spanish Iris. The flowers opened at Haarlem on June 1 to 3, but it is said to be usually June 20 before *I. hispanica* blooms in Holland. The flowers sent by Mr. Van Tubergen are of large size, and have unusually thick segments. The plants are described as being of robust habit. The variety which Mr. Worthington Smith has sketched in fig. 2 is called Rembrandt. In this flower the outer segments of the perianth are rich, shiny purple with an orange-coloured blotch above; the three, inner, erect segments are also purple but of less deep a shade. This is but one of many varieties received from Mr. Van Tubergen. It is sufficient to say that whilst the flowers show differences in size, they vary in colour, from white, or nearly white, to the rich purple seen in Rembrandt. As we have said, the point claimed for them is that they bloom earlier than the present race of Spanish Irises. We do not think they have yet been cultivated in Britain.

ORCHID NOTES AND GLEANINGS.

SCHOMBURGKIA TIBICINIS (BATEM).

THIS remarkable species is now flowering at the Botanic Gardens, Liverpool. The plant is a fine, vigorous specimen, with 20 pseudo-bulbs, the largest being 15 inches in length, cylindrical in form and furrowed, tapering towards the apex from a base 2 inches in diameter. Towards the top of the growth are four alternate, coriaceous leaves, the largest 7 inches in length by 4 inches in breadth. The flower-spike, which is developed from the apex of the pseudo-bulb, is 5 feet 6 inches in length, and carries 17 large flowers. The oblong sepals and petals are of a rosy-red colour, shading to brown towards the tips on the inner surface; they are very fleshy and undulated on the margins. The broad, spreading lip

and others that produce their flowers in clusters, have finished their blooming, cut out the old flowering wood close down to the new growths. Tie these latter loosely to the arches or trellis-work and sprinkle the ground with some fertiliser, afterwards affording a copious supply of water. At the end of July, if side shoots are taken off with a portion of the old wood attached they will root freely in sandy soil under hand-lights. Keep them close and carefully shaded.

The following is a simple plan for increasing Roses by means of cuttings: Make up a hot-bed, and when the heat is about 70° to 75° place a box frame on the top. The bed should not be less than 3 feet deep at the back, and 2 feet 6 inches in the front. The surface of the manure

which will be in about a fortnight. After the first week the foliage should be sprayed lightly with clear water two or three times daily according to the weather. In southern districts the rooted cuttings can be afterwards planted out and hardened off during August and September, but in colder parts it is advisable to pot them into 4 or 5-inch pots and winter them in a cold frame. All Roses of a robust and vigorous habit do well on their own roots, but weaker-growing kinds are best grafted on a stronger stock. This system of propagation is quite distinct from that previously described for cuttings rooted in the spring, a system largely adopted by the traders.

ROSES FOR TOWN PLANTING.—It is too late to

is the most beautiful part of the flower; it is marked with numerous lines of rosy-red on a yellow ground, shading to deep red at the edge of the side lobes; the small front lobe is marked by a distinct bar of yellow. The flowers are scentless, and each remains fresh for about ten days. This fine species rarely flowers in this country. It has a very annoying habit of developing a spike which grows to about 1 inch in length, and then remains stationary, forming into a hard, horny point. The plant now flowering was placed under stove conditions while making its growth last summer. When fully matured it was removed to a rather cool intermediate house, where it was gradually dried and rested, until in March the flower-spike began to show signs of active elongation; it was then removed to the Cattleya house, where the inflorescence quickly developed. The rooting medium is a mixture of peat and Sphagnum-moss in equal parts. It is a native of Honduras, and is figured in *Gardeners' Chronicle*, May 23, 1891, fig. 126, and in the *Botanical Magazine*, tab. 4476. W. Hackett,

BEUCARNEA RECURVATA.

THIS Liliaceous species (see fig. 3) has flowered recently in the gardens of E. H. Cuthbertson, Esq., Bushey House. The plant and flower-spike measured 13 feet, the flowering spike itself being 6 feet in height. The base is very swollen and resembles a huge piece of cork, measuring at the top of the tub 4 feet 7 inches in circumference. The plant stood for many years in the centre of a span-roof show-house. As the flower-spike developed it had to be removed to the winter garden to give it the necessary height. The plant is believed to be from 50 to 60 years old and it grows very slowly. The individual flowers are small and of a dull whitish colour. The swelling seed-pods are three-lobed. In the succulent house, Royal Gardens, Kew, there is another large plant which has not yet flowered, although it is a good age. As far as I can trace, there are no records of *Beucarnea recurvata* having previously flowered in this country. Seed of this species is sometimes imported from Mexico, from which country it was introduced about 60 years ago. C. G. Blake, *The Gardens, Bushey House*.

FOREIGN CORRESPONDENCE.

THE ALPINE GARDEN AT PONT DE NANT.

THE following notes on the Alpine garden at Pont de Nant, sur Les Plans, in Canton de Vaud, Switzerland, are based upon the details of a visit made to the garden at the end of May by my friend Mr. George Flemwell, and sent by him to me in the hope that they might be of interest to readers of the *Gardeners' Chronicle*, and perhaps lead some who may be going to the Alps this year to turn their steps towards this interesting and picturesque spot.

This Alpine garden is called Thomasia, after an early botanist of Bex, belonging to a family which made and sold collections of dried plants and minerals throughout the Swiss Alps and in different parts of Italy. Some of the Thomas family were among the earliest visitors to Zermatt, about the middle of the eighteenth century, in search of rare plants. Thomas made various discoveries, and several plants were named after him.

The garden is on limestone formation, at an elevation of about 5,800 feet above the sea, at the foot of the precipitous sides of the Grand Muveran. Started originally by a society in Bex, it was afterwards taken over by the Canton de Vaud, and affiliated to the University of Lausanne. There is a resident gardener throughout the summer months. It is strictly scientific, thus differing slightly from the gardens at Bourg

St. Pierre, on the Great St. Bernard road, and the Rochers de Naye.

Looking west, one has the Dent de Morcles and Glacier des Martinets; north, the Gorge of the Avançon and distant Alps of Savoy; east, the Col des Essets leading to the Diablerets; and south, the giant cliffs of the Grand Muveran.

The rockeries are simply and naturally laid out, and new ones are being constructed. There is a flat, grassy portion, in which the more robust-growing plants are grouped. A stream flows through it, and there is a pond for water plants.

Naturally at this early date the rockeries are not flower-full. Moreover, the garden gets no sun until 10 o'clock each morning; and the heaped-up remains of big avalanches lie on either side of it.

The following are among the chief plants at present in flower and doing remarkably well:—Primulas: *P. rosea*, the most brilliant of them all, perhaps, with the exception of the rich magenta of *P. spectabilis*; *P. Fachini* (minima ×

allied to *pulsatilla*, sulphur yellow and velvety, whose name was not legible. Among the Saxifragas are *apiculata* (sancta × *Bursleriana*), *Pseudo-sancta*, *Albertii*, *Elizabethæ*, all yellow; *Ferdinando Coburgi*; a bright yellow Saxifrage, probably named after the new Czar of Bulgaria, who is an enthusiastic botanist, especially devoted to Alpines; he has recently founded an Alpine garden in the mountains of Bulgaria.

Outside the Thomasia garden, on the plateau of short, lawn-like grass, *Gentiana verna* is brilliant. *Soldanella* plentiful, and *Erica carnea* in full beauty among the boulders. Marsh Marigolds and the true Oxlip (*Primula elatior*) adorn the sides of the streamlets, and in the shade are masses of both the white and purple *Dentaria*. H. Stuart Thompson, June.

The Week's Work.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Figs.—Should the earliest planted-out trees be clean and otherwise healthy, they may be allowed to produce a second crop of fruits. But the Figs will need to be severely thinned, or the prospects of a good, early supply of fruits next year will be greatly prejudiced. At least two-thirds of the fruits should be removed, for the second crop is usually very numerous, and, as a rule, very few of the fruits drop. Examine the trees and cut away any weak shoots, whilst any that are growing too freely must be punched at the second or third leaf. If red spider is present on the foliage, syringe the trees two or three times with a mixture of soft-soap and sulphur. If the old top-dressing is exhausted of its manurial properties, replace it, using either well-rotted cow or horse manure. In addition, the roots should be given stimulants, such as liquid manure, or a dusting of some fertiliser. Syringe the trees vigorously in the morning, and again in the afternoon when closing the house; in addition, damp all the bare surfaces in the house three or four times each day. Later trees, which are maturing their fruits, must be afforded a dry atmosphere, but do not let the roots suffer from want of water. If the fruits are to be forwarded by rail, they should be gathered before they are too ripe, as they are easily damaged. Young Fig trees intended for fruiting in pots should be placed into larger receptacles before they become pot-bound, using pots about two sizes larger than those in which they are growing. A suitable rooting medium is good fibrous loam, with a fair sprinkling of old brick rubble, using an 8-inch pot full of crushed bones and a little soot to each barrow load of soil. Ram the soil fairly firmly, and keep the trees actively growing till the roots permeate the new soil. Stop the shoots at the third or fourth leaf. Later on they should be gradually hardened, and eventually placed out-of-doors, so that the wood becomes thoroughly ripened before the end of autumn.

PLANTS UNDER GLASS.

By A. C. EARLETT, Gardener to Mrs. Ford, Pencarrow, Cornwall.

Clerodendron fallax.—The foliage of this species being so attractive, the plants must not be allowed to suffer from any check likely to cause injury to the leaves. Therefore, until the plants are in their flowering pots they should not be allowed to become root-bound in the least degree. At the same time care must be taken not to get drawn and soft foliage, but, by keeping the plants near the glass, encourage them to make sturdy, short-jointed growths. Plenty of atmospheric moisture is necessary during the season of growth, but as the plants commence to flower they should be placed in a drier and cooler house, or the partially-opened flowers will damp off. Seeds may be sown now to produce plants for flowering next spring.

Campanula pyramidalis.—These plants require liberal applications of liquid and chemical manures. The Chimney *Campanula* continues to flower over a considerable period, therefore feeding should not be discontinued when the flowering commences. Seeds of both the tall and dwarf

FIG. 3.—BEUCARNEA RECURVATA FLOWERING IN BUSHEY HOUSE GARDENS.

spectabilis), with large, pure flowers, paler than *spectabilis*; *P. denticulata*, in profusion, *P. cashmeriana*; *P. calycina*, from Lombardy; *P. viscosa* was not noticed, and is probably over, but the following all resemble it remarkably in flower: *pedemontana*, *marginata* (Maritime Alps), *spectabilis Wulfeniana* (Eastern Alps), *serratifolia*, the last two resembling each other very closely.

Gregoria vitaliana, with its hundreds of clear, canary-yellow blossoms, is possibly the showiest thing at present in bloom, but the deeper yellow *Erysimum Kotschyianum* rivals it. There were also *Draba olympica* and its variety *diversifolia* from Armenia, and the variety *bruniefolia* from Persia; *Lupine Blagayana*, a most lovely, creamy-white plant from Bosnia; *Soldanella Wettsteinii*, having a paler, longer flower and more bell-like than the common *Soldanella*; but the gem of the *Soldanellas* is *S. austriaca*, with its delicate, shell-pink flowers.

The Anemones are all over except one species

varieties should be sown now. If the seed-pans or boxes are placed in heat they should be transferred to a cool house or frame as soon as the seeds have germinated.

Lilium speciosum (lanceifolium). *L. auratum*, &c.—Plants for later flowering should be given a top-dressing of broken loam, dried cow-dung, and leaf-mould. As the stem-roots which will feed chiefly upon this have not the penetrating power of the basal roots, the top-dressing should not be pressed very firm.

Bovardia.—Many growers plant their *Bovardias* out-of-doors during the present month. Where this method of culture is practised, a warm border has been already prepared by deeply digging the ground and incorporating with the first spit such materials as manure from a spent hot-bed and leaf-soil. This ensures that the plants will lift in autumn with a good ball of soil attached to the roots. If possible, the plants should be put out during dull weather. If, however, the sun is very hot, the plants had better be shaded for a few days by placing branches of some broad-leaved tree amongst them. Towards the close of dry days the plants should be syringed to encourage growth and prevent red spider from infesting the foliage. If it is intended to grow the plants in pots, they will soon be fit for their flowering pots. The potting should be firmly done, and, after the plants have been potted a few days, the frames should be freely ventilated whenever possible. Except in the case of *B. Humboldtii corymbiflora*, the pinching of the shoots, to induce a bushy habit, should be continued for fully another month.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Cherries.—The fruits of early varieties, including Belle d'Orleans, Bigarreau de Schrecken, Knight's Early Black and Black Tartarian, having been gathered, the nets should be removed, so that any necessary stopping or training of the shoots may be done. If the trees are infested with red spider, black fly, or other insect pests, spray them with an insecticide, and then give the foliage a good washing with clear water. Later varieties of Cherries should be well cleansed before the fruits commence to ripen, and then the nets should be placed in position.

Thinning Apples.—I learn that in some parts the fruits have dropped freely, and that caterpillars have damaged the foliage. Young, healthy trees here are bearing an abundant crop, and many fruits will need to be removed, and this needs to be done without delay. It is wiser to be satisfied with a moderate crop of good fruits rather than to allow the trees to be overlaid. Not only does overcropping result in small fruits, but the trees are exhausted, and feel the effect for two or three years after. Especially is this the case with young trees of such varieties as Lord Grosvenor, Stirling Castle, and Lane's Prince Albert, for these trees usually crop very freely. Special attention should be given to varieties required for exhibition purposes: these should be still more severely thinned. Amongst the best of the culinary varieties for the exhibition table are Emperor Alexander, Peasgood's Nonesuch, Bismarck, Gascoyne's Scarlet Seedling, Gloria Mundi, Mère de Ménage, Bramley's Seedling, Hambling's Seedling, Warner's King, Golden Noble, Lane's Prince Albert, Newton Wonder, Norfolk Beauty, and The Queen. If extra fine fruits are required, water the roots whenever the ground is dry and afford manurial stimulants. Dessert varieties need not be thinned so freely as culinary sorts, but it is well to go over the trees and remove a number of fruits where they are numerous, for the same danger of overcropping applies to dessert as to the culinary varieties. Large size in dessert Apples is not commended in many quarters; nevertheless one that no tree carries more fruits than will allow it to plump up its fruit-buds for the following season. A good selection for dessert Apples for exhibition purposes may be had from among the following:—James Grieve, Worcester Pearmain, American Mother, Christmas Pearmain, King of the Pippins, Cox's Orange Pippin, King of Tompkins County, Wealthy, Ribston Pippin, Lord Hindlip, Charles Ross, Rival, Egremont Russet, King Harry and Washington.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Leptotes bicolor.—A few well-flowered plants of this pretty species form delightful objects when suspended over the other occupants of the Cattleya house. At the present time the plants are making fresh roots, and re-potting may be done if necessary. *Leptotes bicolor* is sometimes severely checked by root disturbance, but if the work is carefully done no harm will accrue. Shallow pans are the most suitable receptacles, and these should be three parts full of drainage. Pot the plants quite firmly in the same kind of compost as advised in a former issue for Cattleyas, affording copious waterings each time the compost becomes dry. When the terete or sub-cylindrical leaves are completely developed the amount should be gradually lessened.

Lælia purpurata.—Plants of *Lælia purpurata* that have recently passed their flowering stage should be placed, until growth recommences, in the coolest part of the house, where they can obtain plenty of fresh air. Sufficient water only should be given them to keep the roots alive and the pseudo-bulbs from shrivelling, for plants which commence to grow at this season fail to produce flower-sheaths. They should be kept dormant for as long a period as possible. If any plants of this species have started to grow they should be repotted, since the young shoots, as soon as they are a few inches long, send out a number of large roots that will readily enter and appreciate new rooting material and quickly become re-established. If repotting is delayed, some of these roots are sure to be injured during the operation. The same remarks are also applicable to plants of *L. grandis* and its variety *tenebrosa* after they have finished flowering. Many *Lælio-Cattleyas*, including *L.-C. Canhamiana*, *L.-C. eximia*, *L.-C. Martinetti*, *L.-C. Arnoldiana*, *L.-C. hippolyta*, and *L.-C. Phebe*, also several *Brasso-Cattleya*, and *Brasso-Lælia* hybrids, whose flowering has recently finished, should be placed in a similar position to enjoy as long a period of rest as possible. Repotting may be done as advised for *Lælia purpurata*.

Lælia monophylla.—This is interesting as the only species of *Lælia* known in Jamaica. Its flowers, which are large for the size of the plant, are of a bright orange-scarlet. Owing to the beautiful colouring of its blooms the plant should form a good subject for hybridising purposes. The collectors state that this *Lælia* is found on mountains at elevations varying from 3,500 to 5,000 feet; consequently it is comparatively a cool-growing species. At Burford it thrives well in a cool intermediate temperature, planted in small, well-drained pots, filled with the new Cattleya compost. The plant needs to be kept well up to the roof glass, where it may obtain plenty of light, although it needs shading from direct sunshine; the roots should be kept fairly moist at all times. *Lælia monophylla* flowers in the late summer or autumn. The plants are sending up their slender flower-spikes.

THE KITCHEN GARDEN.

By E. BRACKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

The recent rains.—Although June has appeared to be a very wet month, our rainfall for the past half-year has been not more than 3 inches. The vegetable crops generally are very late, but they are looking remarkably well. Early Peas are especially backward, being fully three weeks late. Still I have never seen more promising crops of this vegetable.

Carrots.—Make frequent small sowings during the next three months, both on an early border in the open and in frames or pits, selecting the short or stump-rooted varieties. As in the case of most vegetables this year, the main crops of Carrots are badly infested with aphids. They should therefore be syringed with a suitable insecticide, such as quassia extract or a strong mixture of soft soap and water.

Broad Beans.—Late sowings of the Broad Windsor type will require attention, for encouragement must be given them in order to obtain a good crop of Beans. Syringe the shoots frequently with soap and water to keep down black aphid. Apply a good mulching of manure

and see that the roots are well supplied with water at all times. Pinch out the points of the growths immediately a fair set is assured, and keep the growths upright by stretching a row of stout cord on either side of the plants.

Savoys.—As a rule these are planted much too early, with the result that the heads become perfected at a time when other vegetables are plentiful, and thus they are of little value. These early plants are unable to withstand severe weather. Savoys should be grown more strictly for winter use, as they are unquestionably one of the most hardy and delicious vegetables at that season. Plant Savoys at intervals, on any vacant plots and in any position which can be spared, during the present month, and even up to the middle of August. The varieties of a medium size are much to be preferred to the larger ones.

Cardoons should be kept well supplied with moisture at the roots; it will be necessary in exposed positions to secure each plant to a stake. Apply a good mulching of half-decayed horse-droppings about the roots.

Celriac.—This crop will need abundance of water, and manure should be liberally afforded. Keep the foliage well dusted with soot, and the surface soil stirred frequently. All side shoots should be removed.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardslee, Sussex.

Seedlings.—Wallflowers are ready for transplanting into rows made 12 inches apart, allowing not less than 9 inches between the plants in the rows. The recent showery weather has been very suitable for transplanting seedlings. If the sun is very powerful after they have been transplanted, afford a moderate amount of shade during the daytime, but the covering material must be removed before night-time so that the plant may receive the full benefit of the dews. *Campanula media* (Canterbury Bell) should be treated similarly; also Pansies, *Myosotis* and *Delphiniums*.

Violets.—Stir the soil freely between these plants, and give them an occasional syringing with soot-water, which is an excellent specific for checking or arresting attacks of red spider.

Carnations.—Have ready for layering purposes some soil with which is incorporated a considerable quantity of road-grit, and turn it over several times before it is used. Late varieties should have their first flower-buds removed, so that they will give the best result in their proper season. See to the staking of those that require it, as the blooms are disfigured when splashed with soil. Two of the best garden varieties for general purposes are Ruby Castle and Much the Miller.

Sweet Peas.—If late plants are required there is still time to sow the seed, but it should be seen to at once. In a genial autumn, plants from these late sowings will furnish a good crop of flowers, which are very useful at that time for decorative purposes in dwelling-rooms. Plants that are flowering should have their blossoms gathered directly they are ready; it is best to cut them in the evening before they are fully expanded and to place them in a cool room.

Climbing plants grow rapidly at this time of the year, and unless they are attended to in good time they soon become entangled, and it is then difficult to train them properly. Species and varieties of *Vitis* will need attention, also Clematis, for high winds soon snap off their young shoots.

Aquatic plants.—See that the more rampant growers do not crowd out the smaller ones. If the plants are divided up at this time the portions detached can be used for planting in other parts, as aquatics do very well if planted in July.

Plants for terrace walls.—In favoured spots the following plants will succeed well on walls: *Freemontia*, *Crinodendron*, *Abutilon*, *Carpenteria*, *Cassia* and *Berberidopsis*. These are much more hardy than many persons imagine. Roses are especially suited for dwarf walls, but it must be remembered that in summer-time the backs get very hot, and it is necessary to regularly syringe the foliage. Plants with their roots at the foot of walls often suffer from drought, and this is often seen in the case of *Alcea grandiflora*, the leaves becoming brown instead of presenting a healthy green appearance.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

APPOINTMENTS FOR JULY.

SATURDAY, JULY 3—
Sutton Rose Sh. Soc. Franç. d'Hort. de Londres meet.

TUESDAY, JULY 6—
Roy. Hort. Soc. Summer Exh. at Holland Park, Kensington (2 days). Southend-on-Sea Fl. Sh. (2 days).

WEDNESDAY, JULY 7—
Bath Rose Sh. (2 days). Hanley Hort. Sh. and Fête (2 days). Croydon Fl. Sh. Hereford Rose Sh. Hemel Hempstead Rose and Sweet Pea Show. Jubilee Dinner of K.H.S. Fruit and Floral Committees.

SATURDAY, JULY 10—Purley Rose and Hort. Sh.

MONDAY, JULY 12—
United Hort. Ben. and Prov. Soc. Com. meet.

TUESDAY, JULY 13—
Saltare Rose and Hort. Soc. Sh. in conjunction with Nat. Sweet Pea Soc. Wolverhampton Floral Fête (3 days).

WEDNESDAY, JULY 14—
Beckenham Hort. Soc. Sh. Luton Rose Sh. in conjunction with Nat. Rose Soc. Hort. Ex. in conjunction with Agr. Sh. at Louth (3 days). Elstree and Boreham Wood Fl. Sh.

THURSDAY, JULY 15—
Woodbridge Fl. Sh. Great Yarmouth Fl. Sh.

TUESDAY, JULY 20—
Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. P. H. Batten, on "Mendelism and Barley"). Roy. Scottish Arboricultural Soc. Annual Exh. at Stirling (4 days). British Gard. Assoc. Ex. Council meet.

WEDNESDAY, JULY 21—
Nat. Carnation and Picotee Soc. Sh. at Hort. Hall, Westminster. Truro Fl. Sh. Liverpool Hort. Assoc. Sh.

THURSDAY, JULY 22—
Roy. Ulster Agric. Soc. Sh. and Hort. Exh. (2 days).

FRIDAY, JULY 23—
Nat. Sweet Pea Soc. Exh. at Hort. Hall, Westminster. Southampton Roy. Hort. Soc. Carnation Exh.

WEDNESDAY, JULY 28—
Midland Carnation and Picotee Soc. Exh. at Birmingham Bot. Gardens (2 days). Newcastle Fl. Sh. (3 days). Haywards Heath Fl. Sh.

SALES FOR THE ENSUING WEEK.

TUESDAY—
Unreserved sale of a portion of the "Chillingham" collection of Orchids, by Protheroe & Morris, at 67 & 68, Cheapside, E.C., at 1 o'clock.

WEDNESDAY—
400 Lots of Choice Selected Orchids, by Protheroe & Morris, at 67 & 68, Cheapside, E.C., at 1 o'clock.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—62.4°.

ACTUAL TEMPERATURES:—
LONDON.—Wednesday, June 30 (6 P.M.): Max. 61°; Min. 51°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden. London—Thursday, July 7 (10 A.M.): Bar. 30.2; Temp. 68°; Weather—Cloudy.
PROVINCES.—Wednesday, June 30 (6 P.M.): Max. 60° Bury St. Edmunds; Min. 51° Scotland N.E.

Garden Cities and Town-Planning.

From small beginnings a few years ago, the movements to institute garden cities and to control town development have developed greatly and extended far. The awakening from the curious lethargy which led to the acceptance of overcrowding and of mean and sordid houses as the necessary accompaniments of urban life, began in the closing years of last century, and it may be predicted with confidence that these evils will be mitigated, if not banished, during the next two or three generations. If this prove the case, if more space can be provided for the town dweller, and if new towns and suburbs can be set in pleasant gardens or amid leafy avenues, none will have more reason to rejoice than the horticulturist. For to him these changes will appeal with double force. As a good citizen he will welcome these ameliorations of city life; as a craftsman he will profit by them.

To people—if any there be who yet require to be convinced of the great importance and of the great necessity of this movement toward a wiser planning of our towns, we

commend the perusal of *Garden Cities and Town Planning*, the organ of the Garden City Association. From the pages of this periodical it will be learned that this problem of town planning is not of importance only from the aesthetic point of view. It is not only a question of providing prettier surroundings, but one of environment for the adequate physical development for the poorer citizens of this Empire. That congested towns of the 19th century type do not provide a proper environment, comparative statistics prove. Thus, at Bourneville, near Birmingham, the death-rate, per 1,000, averages 7.5, and the infant mortality, per 1,000 births, amounts to 78.8. At Birmingham the death-rate is 17.9 and the infant mortality 170. Letchworth, a garden city more recently established than Bourneville, has a death-rate between three and four times less than that of Birmingham, and an infant mortality of 38.5 per 1,000 as compared with Birmingham's 170. Making every allowance for difference of size, there can be no doubt that the wastage of life is less in the new type of city than in the old. Nor is this the whole of the matter. The children of the new cities are superior to those of the old cities in physical development. A Birmingham slum boy, 11 years of age, has an average height of 4 feet 2 inches; the Liverpool boy, 11 years of age, from the poorest schools, 4 feet 3¼ inches; the 11-year-old, Port Sunlight boy is 4 feet 9 inches, and so also is the Bourneville boy of like age. The garden city boys are, moreover, far sturdier than those from the poor quarters of towns: thus the weight of the boy of Bourneville is 4 stone 13 lbs.; of Port Sunlight, 5 stone; of Liverpool (poorest schools), 4 stone 3 lbs.; and of Birmingham slums, 3 stone 11 lbs.

It is on such facts as these that the appeal for wiser counsels in town planning must rest. When the facts are known, town planning will come to be—as for many years it has been already in other countries—among the most important duties of municipalities. Already Parliament has begun to legislate in this direction: already the most progressive of our new universities has founded a Professorship of Town Planning; already garden cities in this country, in France, and in America are springing into existence. We have every confidence that horticulturists will exert their influence to forward the desirable end of healthier and worthier homes for the people of this fair country.

The Benevolent Institution.

The aims and work of this Charity could not be better presented to the public than in the excellent speech of Mr. Harry James Veitch, made at the recent Festival dinner, of which a brief report was given in our last issue. The knowledge that 239 pensioners, either gardeners or the widows of gardeners, are permanently assisted at a period of their lives when they have not the physical powers to help themselves, and, further, that others are afforded temporary measures of relief from the Victorian Era and Good Samaritan Funds, is sufficient to commend the Institution to all who have charity. But this is only half the story. There remain many who, though in urgent need of help, must wait because the amount of support which the Institution receives is not proportionate to the suffering

which it would alleviate. After the election last year there remained between 50 and 60 candidates, whose claims, though recognised by the committee, failed for lack of funds to gain for them the full pension. As Mr. Veitch pointed out, the remuneration which gardeners obtain for their skilled services is not high; in many cases, indeed, it is miserably inadequate. Nevertheless, the gardener is subjected to the same trials as beset those in other walks of life. Illness may overtake him or his family; his tenure of office is anything but secure, and thus it is that but few are enabled to make sufficient provision for times of trouble or old age. The Institution does not insist that a person shall reach old age before he or she is eligible for benefit. The youngest pensioner on the fund is not past the prime of life—41 years—but he is totally incapacitated from work by paralysis. Others are blind, but the majority of those who receive assistance are those who, having given their days and strength to horticulture, are now too aged and infirm to work. Thus, as was stated in our report last week, six of the beneficiaries are more than 90 years of age, whilst 55 are between 80 and 90 years, and 127 have passed three score years and ten. Mr. Veitch appealed earnestly for help, and the response was the sum of £2,099. It is a matter for congratulation that the Charity has such noble-minded patrons as the members of the Rothschild family, six of whom have presided at these annual festivals. There are others whose large-heartedness is equally commendable, but we fear there are still many who love their gardens but are not sufficiently mindful of the interests of those who have made them beautiful. Col. Lockwood's claim that British horticulture is unrivalled goes to prove that those for whom we plead are worthy of assistance. Inasmuch as it is not possible for all gardeners to make adequate provision for old age, it behoves them to remember that by becoming annual subscribers to the Benevolent Institution they can practically ensure for themselves the relief which that Institution affords. If this were borne constantly in mind, the increased subscriptions which would ensue would enlarge greatly the powers of the Institution to succour the distressed.

OUR SUPPLEMENTARY ILLUSTRATION gives a view of a group of Orchids staged by Messrs. ARMSTRONG & BROWN. Orchidhurst, Tambridge Wells, at the Royal Horticultural Society's meeting on April 6 last, when the Society's Gold Medal was awarded to the exhibitors. *Dendrobium nobile virginale* was especially well represented in 200 good specimens. It is a noteworthy fact that all the plants of this variety were raised from one seed-capsule borne on a plant of the white *Dendrobium nobile*, fertilised with pollen of the same variety. Every plant raised reproduced the true albino form of the parent. Messrs. ARMSTRONG & BROWN were extremely fortunate to secure such a large stock of this desirable variety. It is easy to grow, has a free-flowering habit, and is one of the most useful plants for decorative purposes, the flowers being valuable in a cut state. *Dendrobiums* can be raised easily from seeds by anyone possessing an ordinary warm plant house, and although a very large number of beautiful hybrids have been raised already, there are still many promising combinations not yet effected which would give interesting results. *Dendrobium nobile*

virginale is the first instance in which an albino has been produced in sufficient quantity to render it available for gardens generally, and, seeing that there are a number of albinos of other species which have appeared, and in some cases disappeared, it would be desirable to adopt the seeding mode of propagation in all cases until a sufficient stock is obtained. *Dendrobium luteiflorum candidum*, *D. Phalenopsis hololeuca*, *D. Bensonie album*, *D. crystallinum album*, and the white forms of *D. superbum* would be good subjects, and probably seedlings would be more satisfactory in gardens than the original importations.

HOLLAND HOUSE SHOW.—The summer show of the Royal Horticultural Society will be held in the grounds of Holland Park, Kensington, on Tuesday and Wednesday, July 6 and 7. It is to be hoped the weather will improve so that visitors may enjoy to the full the pleasure to be derived from an inspection of the show and the charming gardens attached to the picturesque mansion.

R.H.S. ORCHID COMMITTEE.—On Friday, the 25th ult., the members were invited by Messrs. CHARLESWORTH & Co. to visit their new establishment at Haywards Heath. The party was conveyed by motorcars from the Horticultural Hall, Vincent Square, Westminster. Mr. J. GURNEY FOWLER (chairman of the Committee), Mr. R. BROOMAN WHITE, and Mr. R. G. THWAITES brought their own cars. The nurseries were reached soon after one o'clock, and after partaking of luncheon the visitors were conducted through the glasshouses, all of which are connected by a spacious corridor. Many interesting plants were in flower, including a number of the so-called botanical Orchids. We have recently published a description of this nursery.

FLOWERS IN SEASON.—Mr. ANTHONY WATERER, Knap Hill Nursery, Woking, Surrey, sends flowering shoots of *Cladrastis tinctoria*, syn. *Virgilea lutea*. Mr. WATERER states that they were cut from a tree growing in his nursery, about 35 to 40 feet high and having about the same spread of branches.

SIR JOSEPH HOOKER AT THE DARWIN COMMEMORATION.—Horticulturists all the world over will be glad to hear that Sir JOSEPH HOOKER, despite his 92 years, was able to attend the DARWIN celebrations. To see him, hale and hearty, receiving the congratulations of all the men of distinction, and to witness the vivacity with which he conversed with them, was one of the most gratifying sights of the celebration.

FLOWER SHOW FIXTURES.—A useful list of dates of exhibitions, principally in Scotland, is sent us by Messrs. AUSTIN & McASLAN, 89, Mitchell Street, Glasgow. From the numerous engagements in the list it would appear that flower shows in the North are as popular as ever.

BRITISH GARDENERS' ASSOCIATION (LONDON BRANCH).—By permission of the Hon. VICARY GIBBS, members of this branch will visit the Aldenham House gardens on Saturday afternoon, July 10.

SWANLEY HORTICULTURAL COLLEGE.—The annual prize-giving will take place on Thursday, July 15. The Hon. Sir JOHN COCKBURN, K.C.M.G., will occupy the chair, and the prizes will be distributed by the Viscountess FALMOUTH.

MR. A. J. HARTLESS has been appointed assistant lecturer in horticulture at the Reading University College, under Mr. F. G. DREW. Mr. HARTLESS will have the care of the recently established fruit station at Shinfield, situated about three miles from Reading.

NATIONAL SWEET PEA SOCIETY.—We are requested to remind readers that the annual exhibition will be held at the Royal Horticultural Hall, Vincent Square, Westminster, on Friday, July 23. There will also be an exhibition at Saltaire, under the Society's auspices, on Tuesday, July 13. Mr. CHAS. H. CURTIS, Adelaide Road, Brentford, is the hon. secretary of the Society, and Mr. E. WRIGHT, The Glen, Saltaire, hon. secretary of the Saltaire branch. We are requested to announce that the outing arranged for July 9, for the purpose of inspecting several stocks of Sweet Peas in Essex, has been postponed to a later date, probably July 17. The recent heavy rains, with sunless days, have caused the plants to be very backward.

THE NATIONAL VEGETABLE SOCIETY.—At a recent meeting of the Committee, the announcement was made that his Grace the Duke of PORTLAND had consented to become president. That is a fact which cannot fail to have great weight in the country. The list of vice-presidents includes some 30 gentlemen, members of the horticultural trade, market-gardeners, and others, all of whom hold honorary office. The Committee consists of some 24 members, including eminent gardeners, market-gardeners, amateurs, and representatives of the horticultural Press; but includes no one engaged in the seed trade. Mr. G. WYTHES, V.M.H., of Hopefield House, Windmill Road, Brentford, W., is treasurer, whilst Mr. E. G. FINCH, of 20, Tavistock Street, Covent Garden, London, is the hon. secretary. No exhibitions are at present in contemplation, but should the society receive wide support, it is hoped that some competitions may be instituted next year. The Committee have arranged to conduct two separate trials, one at Twickenham on light soil and one at Romford on stiff soil. In each case the products tested will be early spring Cabbages and autumn-sown Onions, and the object is not to interfere in the least with seedsmen's lists of names, but rather to test varieties and methods of culture for commercial, ordinary garden and allotment purposes. Each trial will be conducted with absolute secrecy, the names of the varieties being known only to the superintendents of the trials, Mr. OWEN THOMAS and Mr. G. WYTHES.

THE BRUSSELS EXHIBITION, 1910.—As a consequence of the departmental enquiry conducted by the Board of Trade, a Royal Commission has been established, having for its object the adequate representation of Great Britain at international exhibitions. The following gentlemen have been appointed by the Commission to further the interests of agriculture and horticulture at the forthcoming international exhibition, which is to be held in Brussels from May until October, 1910:—Mr. CHARLES ADEANE, Mr. E. A. BOWLES, Mr. EDWARD BROWN, Mr. W. A. BILNEY, Mr. T. BEVAN (National Chrysanthemum Society), Mr. RICHARDSON CARR, Sir GILBERT GREENALL, Bart., Mr. A. J. GILES, Dr. OTTO HEHNER, Mr. A. W. LAST, Mr. R. LEONARD, Mr. T. H. MIDDLETON, Sir DANIEL MORRIS, K.C.M.G., Mr. H. B. MAY, Mr. H. A. NEWTON, Mr. A. B. J. NORRIS, Lieut.-Colonel PRAIN (Royal Gardens, Kew), Mr. C. HARMAN PAYNE (National Chrysanthemum Society), Mr. A. G. L. ROGERS, Mr. ARTHUR SUTTON, Mr. HARRY VEITCH, and Mr. J. W. WHEELER-BENNETT.

PRESENTATION TO A GARDENER.—At Culham Court, Henley-on-Thames, on June 4, Mr. W. TURNHAM was presented with a silver teapot by the employes in the gardens on the occasion of his relinquishing the position of head gardener, which he had held for the past nine years.

PRESENTATION TO MR. GEORGE BUNYARD, V.M.H.—That their esteemed chairman, Mr. G. BUNYARD, may possess some tangible memento of his office during the jubilee year, the members of the Fruit and Vegetable Committee of the Royal Horticultural Society have unanimously invited him to accept from them a large, handsomely-framed photographic portrait. This portrait shows Mr. BUNYARD wearing the robes of the Master of the Fruiteers' Company, a position he filled a few years since. The ceremony of presentation will take place at the Royal Horticultural Hall, on Wednesday evening next, the 7th inst., at 8 p.m.

HONORARY DEGREES FOR BOTANISTS.—Not the least brilliant of the ceremonies in connection with the recent DARWIN celebrations at Cambridge was the conferment, on Thursday, June 24, of the degree of Doctor of Science on 21 of the most distinguished delegates. Among those so honoured were the following botanists:—Professors GOEBEL (Munich), CHODAT (Geneva), VÖCHTING (Tubingen), DE VRIES (Amsterdam), ZEILLER (Paris) and FRANCIS DARWIN (Cambridge). To Mr. DARWIN fell the unique honour of being the only Englishman who received this mark of distinction.

THE ASSOCIATION OF ECONOMIC BIOLOGISTS.—The Association of Economic Biologists, which was founded in 1904, will meet this year on July 13-15, at Oxford. Among the long list of communications which will be made, mention may be made of the following, which have a particular interest for horticulturists:—"Injurious Fungi," by Professor W. SOMERVILLE; "Predaceous Insects and their Prey," by Professor POULTON; and "The Application of Recent Discoveries in Heredity to Economic Problems," by Mr. A. D. DARBISHIRE. Particulars of the meeting may be obtained from Mr. W. E. COLLINGE, Uffington, Berkhamsted.

NURSERY EMPLOYEES AT DINNER.—On Tuesday evening last the members of the staff of Messrs. STUART LOW & Co., Bush Hill Nursery, near Enfield, were entertained at dinner in the Assembly Rooms of the village, Mr. STUART LOW presiding. After the usual loyal toast, speeches were made by Mr. W. WATSON, of Kew, an employe of Messrs. HUGH LOW & Co. when a boy, and by Mr. HARRY A. BARNARD, the travelling representative of the firm, both being reminiscent in character and entertaining. The different speeches were interspersed with vocal music and recitations by several members of the staff and others. Mr. G. MAYES, who had been with the firm of Messrs. HUGH LOW & Co. for 50 years, was the recipient of a presentation on this occasion.

PUBLICATIONS RECEIVED.—*Beautiful Flowers and How to Grow Them*, edited by Horace J. and Walter P. Wright. Part XVI (London: T. C. & E. C. Jack.) Price 1s. net.—*Darlington's South Devon and South Cornwall*. (N. Wales: Darlington & Co., publishers, Llangollen.) Price 2s. 6d.—*The Foundations of the Origin of Species*. Two essays written in 1842 and 1844 by Charles Darwin. Edited by his son, Francis Darwin. (Cambridge: University Press.—*French Market-Gardening*, by John Weathers. (London: John Murray, Albemarle Street, W.) Price 3s. 6d. net.—*The Botanical Magazine*. (April.) (Published at Tokyo, also by Wm. Wesley & Son, 28, Essex Street, Strand, London.)—*New York Agricultural Experiment Station* Technical Bulletin No. 9. A Mycosphaerella Wilt of Melons, by J. G. Grossenbacher; Bulletin No. 314: A Comparison of Tillage and Sod Mulch in an Apple Orchard, by U. P. Hedrick; Bulletin No. 315: The Grape Districts of New York and Table of Varieties, by M. J. Dorssey. (Geneva, New York: published by the Station.)

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

ANTHUSA ITALICA VAR. OPAL (see p. 417).—The varieties Opal and Dropmore should be planted at some distance from each other. My first plant of Opal was planted not far from the Dropmore variety, with the result that the latter with its richer colour quite destroyed the value of Opal. *E. H. Jenkins.*

A PLEA FOR BIRDS CAUGHT IN THE FRUIT NETS.—Will you allow me to suggest to the "bird-lovers" among your readers that during the summer season they should make a point of periodically visiting their fruit-nets and so insure against such of our little songsters as may have been caught there, dying a slow death by hunger and thirst? The dead body of a bird entangled amongst the meshes of a Strawberry net is no

convenience or necessity, and where little artificial watering was possible. In these circumstances the growth of flower was meagre. On the rocky the rhizomes, closely pressing the surface of a stone, appeared by their growth and flowering to be perfectly happy. I have never favoured peat for this free-growing plant. Rich soils of loam and leaf-mould, with abundant supplies of moisture in spring and summer, appear most satisfactory. *E. H. Jenkins.*

LARGE MELONS.—These fruits are not grown so large as was the custom a few years ago; therefore, unusual weights in these fruits are not often recorded. It may interest Mr. Bloxham to know that, some years ago, when under the late Mr. Pettigrew, at Cardiff Castle, we grew a variety of Melon under the name of Great Blake Hall, and the fruits of this variety weighed over 14 lbs. Mr. Pettigrew was a noted grower of Melons; but I have no recollection of any other variety reaching the weight given. *T. H. Slade.*

leaved Bramble. It is now finding its chief competitor in the American Loganberry, and not in any forms of British origin. *D.*

MUTISIA CLEMATIS.—It would be interesting to know if this handsome climber succeeds in the South of England, or in Ireland; I only know one garden on the Sussex coast where it exists, and it can hardly be a common plant, as four years ago, on applying to several of our leading nurserymen, I was unable to obtain a specimen. Mr. Robinson, in his *English Flower Garden*, speaks of it as of easy growth. Perhaps some readers will give us their experiences with it. *Wm. Kemp, Lyminster House Gardens, Arundel.*

BESCHORNERIA YUCCOIDES.

I SEND herewith a photograph (see fig. 4) of this interesting Mexican plant, flowering out-of-doors in the Cambridge Botanic Garden. It was planted permanently in a sheltered position between two plant houses about seven years ago, and it has been carefully protected during the winter months. During the early part of last summer it developed a flower-spike to a height of nearly 6 feet, the bright green pendent flowers, with the rosy-red bracts and reddish scape, being much admired. The flowers were followed by a quantity of the Fig-shaped fruits, which ripened late in the autumn. The seeds appeared to be fertile, but they have failed to germinate. The plant has produced several young shoots from its base. *E. J. Allard, Botanic Garden, Cambridge.*

SOCIETIES.

ROYAL HORTICULTURAL
Scientific Committee.

JUNE 22.—*Present:* Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the Chair); Sir J. T. D. Llewelyn, Prof. A. H. Church, Messrs. S. Pickering, W. Fawcett, W. Cuthbertson, J. Fraser, J. W. Odell, W. Hales, R. Hooper Pearson, J. T. Bennett-Poë, J. Douglas, A. W. Sutton, C. T. Drury, G. S. Saunders, H. J. Veitch, E. M. Holmes, F. J. Chittenden (hon. sec.) and Prof. Hugo de Vries (visitor).

Jessamine shoot with adventitious roots.—Mr. G. S. SAUNDERS showed shoots of white Jessamine from a wall, having large numbers of adventitious roots springing from all round the nodes on the stem, and occasionally from internodes. It was suggested that possibly the roots had become dry, and this had induced the plant to attempt to make roots at other parts of the stem. Mr. PICKERING mentioned that the peculiarity of producing abundant adventitious roots appeared to be innate in certain varieties of Apples, especially in Northern Spy, the variety so largely used for stocks in New Zealand and other places. Mr. CHITTENDEN remarked that the same character was to be seen in the variety "Oslin," a variety long ago known as the "Burrknot," on account of the frequent formation of burrs upon the branches.

Exotic Solanum.—Mr. A. W. SUTTON exhibited a flowering plant of a Solanum, the seed of which had been sent him by a correspondent at Monte Video, collected in Uruguay, and called by him "a wild Tomato." The plant was referred to the secretary for further examination.

Malformations in Trifolium.—Mr. J. FRASER showed examples of Trifolium hybridum var. elegans (Lavi) with typical forms for comparison, collected at Coulsdon, Surrey, in which the pedicels were elongated and the pistil elongated and stipitate. He also showed T. fragiferum, collected at Mitcham, with axial proliferation of the inflorescence, and T. dubium, in which the pedicels of the original inflorescence were many times branched and bore many capitula, the sepals showed partial phyllody, the stamens pistiloid, the pistils, which were stipitate, showed phyllody; in many flowers axial proliferation was to be seen, and in some cases the capitulum became an elongated raceme.

Flowers of Streptocarpus malformed.—Mr. J. W. ODELL showed flowers of Streptocarpus malformed in a manner similar to those exhibited by him last year (see *Journal R.H.S.*, Vol. XXXIV., p. cxii.). This is now the third year

FIG. 4.—BESCHORNERIA YUCCOIDES FLOWERING IN CAMBRIDGE BOTANIC GARDEN.

uncommon sight, and though we have to protect our fruit from their ravages, we surely ought not to leave the little culprits to expiate their crimes by such a lingering and painful death. *Missel Thrush.*

OURISIA COCCINEA (see p. 417).—It is insufficiently recognised that it is necessary for this plant to make a fair proportion of new growth each spring. This growth is really a superficial extension of the rhizomes, and these rhizomes produce the best flowers when they have made free growth early in the season. That this is so may be seen in small nursery-grown plants in pots, for the chief flowering is obtained from the new rhizomes that overhang the side of the pot. To what extent this Ourisia will succeed in full sunshine will depend very much on the amount of root-moisture available. I have grown the plants by hundreds in fully exposed sun-baked beds, where they were planted as a matter either of

THE PARSLEY-LEAVED BRAMBLE.—In his lecture on Dr. Masters's *Teratology* Mr. de Vries, as I gathered, referred to the Parsley-leaved Bramble as but a deviation in form from the common British Bramble. It would be interesting if that be so to learn something as to its origin, as it has been so widely held that it is of American origin. The plant has, however, always shown itself to be a hardier variety than any other American varieties, and a far better grower and fruiter. Indeed, it seems to thrive well almost anywhere. But if it be a sport from the British Bramble, it seems inexplicable that it should ripen its fruits earlier, that they should be much finer, and generally more freely produced than is the case with wild forms. No doubt, being subjected to garden cultivation has done something to conduce to these improvements, but even true British Brambles, selected and cultivated, do not seem to have attained to that popularity which has characterised this cut-

in which the plants have borne similarly modified flowers.

Large flower in Apple.—Mr. S. PICKERING, F.R.S., enquired whether anyone had noticed flowers of Apples with very numerous petals. He had seen this season in the case of Bramley's Seedling a single flower (the only one on the shoot) which exhibited no sign of synanthly, which bore 25 petals, the stamens and other organs being well developed.

Helianthemum sporty.—Messrs. BARR & SONS sent an interesting sport of *Helianthemum Golden Ball*, a yellow variety, bearing branches producing double scarlet flowers in the upper part of the plant.

Nomenclature of multigeneric hybrids.—The SECRETARY read the report of the sub-committee upon the nomenclature of multigeneric hybrids, the committee approving the recommendations contained therein. After being read to the Orchard Committee, it will be presented to the Council for its approval.

Certificate of Appreciation.—A Certificate of Appreciation was recommended to be awarded to Mrs. SCOTT-ELLIOTT, of Teviot Lodge, Hawick, N.B., for work in connection with the hybridising of Aquilegias.

ROYAL AGRICULTURAL.

We append the official list of the awards made by the Royal Horticultural Society at the horticultural show held at Gloucester under the auspices of the Royal Agricultural Society:—

LAWRENCE GOLD MEDAL to Col. Holford, C.I.E., C.V.O.

GOLD MEDAL to Col. Holford, James Cypher & Sons (2), and Blackmore & Langdon.

SILVER-GILT FLORA MEDAL to Mr. Holmes, Chesterfield; Stuart Low & Co.

SILVER-GILT BANKSIAN MEDAL to C. W. Breadmore, Winchester; Dobbie & Co.; King's Acre Nurseries Co., Hereford; J. S. Sharp, Almond-bury; W. Vause, Leamington; W. Cutbush & Son, Highgate.

SILVER CUP to Sir John Dorrington (gr. Mr. Saverar); J. G. Blacker, Esq. (gr. Mr. Curtis); the Hon. Vicary Gibbs (gr. Mr. Beckott); Sir R. Baker, Bart. (gr. Mr. Usher); Messrs. Heath, Cheltenham.

SILVER FLORA MEDAL to C. F. Waters, Balcombe; John Jeffries & Sons, Cirencester; Bakers, Wolverhampton; Hugh Andrews, Esq. (gr. Mr. Tooley); Mamrice Prichard; E. J. Hicks, Twyford; Dicksons, Chester; R. H. Bath, Wisbech.

SILVER KNIGHTIAN MEDAL to Laxton Bros., Sutton & Sons.

SILVER BANKSIAN MEDAL to Alex. Dickson & Sons; Gunn & Sons; W. J. Godfrey, Exmouth; W. & J. Brown, Peterborough; J. H. White & Co., Worcester; Miss H. Hemus; Mr. H. N. Ellison, West Bromwich; A. A. Walters & Sons, Bath; Toogood & Sons, Southampton; Bell & Sheldon, Guernsey; A. F. Dutton, Iver; Harkness & Sons, Bedale; Geo. Mount & Sons, Canterbury; T. W. Darlington, Carnforth.

IRISH SEED AND NURSERY TRADES ASSOCIATION.

JUNE 21.—The following resolution, we are informed, was adopted at a meeting of the Irish Seed and Nursery Trades Association held in Dublin on the 21st ult.:—"That this Association views with the utmost apprehension and alarm the possibility of nurseries being included in the taxation of undeveloped land. Lying, as so many nurseries do, in suburban districts, it is feared that the proposed tax on undeveloped land will have a most disastrous effect upon an industry already weakened by keen competition, both home and foreign. It is most earnestly hoped that the Chancellor of the Exchequer will make a concession in this instance and allow nurseries to be classed as an 'industry.' The capital invested in greenhouses, sheds and other buildings, and the large amount of labour employed in this differentiation, and as the area occupied by nurseries is small compared with that of the cultivated land as a whole, this concession would preserve a deserving industry, without seriously interfering with the yield of the tax."

HORTICULTURAL CLUB.

VEGETABLE CULTURE AND COOKING.

JUNE 23.—The usual monthly dinner of this club took place on the above date at the Hotel Windsor, under the chairmanship of Sir John D. Llewellyn, Bart. Mr. Alexander Dean, V.M.H., delivered an interesting address on the culture and cooking of vegetables. He regretted that vegetables were in these days so greatly subordinated to flowers at all the great shows, despite their greater practical importance as food for mankind. He found some sort of parallel between this habit and the predominance which sport and games have assumed of late years as compared with more practical employment of spare time, the prosaic but essential being largely ignored in favour of the aesthetic and ornamental or that which contributed to excitement and in some degree to ostentation. The cooking of vegetables was not to be ignored in the practical aspect of life, since the proper preparation of vegetables for consumption was a matter of considerable importance. He mentioned several examples where the ordinary treatment of vegetables, such as Parsnips and Potatoes, tended far more to spoil them than to bring out their full flavour. Mr. Dean considered it to be an important step in the right direction that the National Vegetable Society was now being formed to endeavour to place the culture of vegetables as it were on an official level with that of flowers. It was a matter of great congratulation that the Duke of Portland had accepted the presidency of the new Society, whilst, as a result of his present address, Sir John Llewellyn had consented to be one of the vice-presidents. Mr. Dean mentioned the valuable results which had, here and there, been obtained by intelligent working men from their small allotments.

WINDSOR AND ETON ROSE.

JUNE 25.—The 18th annual show was held, by permission of his Majesty the King, in the beautiful "Slopes" on the north side of Windsor Castle. Although the weather was not summer-like, it was fine during the greater part of the day, and the attendance was satisfactory.

The King's Challenge Cup, offered for 48 distinct blooms, was keenly contested by eight competitors. Messrs. FRANK CANT & CO., Colchester, secured the trophy with a stand of beautiful blooms, the varieties including Marquis Litta, Bessie Brown, Mrs. Theodore Roosevelt, Lohengrin, Marechal Niel, Mildred Grant, Mme. Jules Gravereaux, Rosamaine Gravereaux, and Helene Guillot. Messrs. BEN. R. CANT & SONS, Colchester, were placed 2nd; Messrs. ALEX. DICKSON & SON, 3rd; and Messrs. D. PRIOR & SON, 4th.

In a class for 18 Tea or Noisette Roses, Mr. GEORGE PRINCE, Longworth, showed much finer flowers than his rivals, and was worthily awarded the 1st prize. A selection of his best flowers include Cleopatra, The Bride, Marechal Niel, Maman Cochet, Mme. Jules Gravereaux, Catherine Mernet, Mrs. E. Mawley, Golden Gate, and E. V. Hermanos. 2nd, Mr. HENRY DREW, Longworth. 3rd, Messrs. BEN. R. CANT & SONS.

In the class for 12 distinct varieties of Roses, three blooms of each kind, Messrs. BEN. R. CANT & SONS won the 1st prize, having excellent examples of Mildred Grant, Richmond, Dean Hole, Bessie Brown, and J. B. Clark. Mr. CHARLES TURNER, Slough, followed closely; whilst Messrs. D. PRIOR & SON were placed 3rd. This last-named firm showed the best 12 blooms of a Hybrid Perpetual or Hybrid Tea Rose, having superb blooms of Dean Hole variety. 2nd, Messrs. A. BIDE & SONS, Farnham, with Queen of Spain. 3rd, Mr. CHARLES TURNER, with Mrs. J. Laing.

In the class for 12 blooms of any Tea or Noisette variety, Mr. GEORGE PRINCE showed best, having beautiful flowers of Souvenir de S. A. Prince. 2nd, Mr. HENRY DREW, with Mme. Jules Gravereaux.

In the class for 12 blooms of a crimson and 12 blooms of a white variety, Messrs. S. BIDE & SONS won the premier prize easily with J. B. Clarke and Kaiserin A. Victoria. 2nd, Mr. HENRY DREW.

For six vases of distinct varieties, five blooms of each kind, Messrs. ALEX. DICKSON & SONS

were placed 1st, their best examples being Nita Weldon, Mildred Grant, and Lady Helen Vincent. 2nd, Mr. CHARLES TURNER.

AMATEUR CLASSES.

A trophy known as the "Windsor Cup" was offered for 24 blooms, distinct. It was won by E. J. HOLLAND, Esq., with a splendid exhibit, including Mildred Grant, Florence Pemberton, William Shean, Mrs. David McKee, Mrs. W. J. Grant, Bessie Brown, and Mme. Melanie Souper. 2nd, CONWAY JONES, Esq. 3rd, Rev. T. G. HENSLOW, whose exhibit contained the best Rose in the show in a superb bloom of Marechal Niel.

In the class for 12 distinct Tea or Noisette Roses, J. B. FORTESCUE, Esq., won the 1st prize with splendid examples of Mrs. E. Mawley, Medea, Mme. Jules Gravereaux, and Comtesse de Nadailac. 2nd, CONWAY JONES, Esq. 3rd, Rev. T. G. HENSLOW.

In the smaller class for six distinct varieties, the 1st prize was awarded to E. J. HOLLAND, Esq., who showed excellent blooms of William Shean, Mrs. W. J. Grant, Mildred Grant, and Bessie Brown. 2nd, G. A. HAMMOND, Esq.

G. A. HAMMOND, Esq., won the 1st prize for three distinct varieties, five blooms of each kind, to be shown in three vases. 2nd, CONWAY JONES, Esq.

Mr. JONES showed the best 12 bunches of decorative Roses, having the varieties Claire Jacquier, Papillon, Aglaja, W. A. Richardson, Isabella Sprunt, and Gustave Regis in good form. 2nd, J. CURNOCK SAWDAY, Esq. 3rd, MARCUS DIMSDALE, Esq.

The best 18 blooms were shown by J. B. FORTESCUE, Esq.; and the best 12 blooms by Dr. LAMPLOUGH in the respective classes.

A special class for 12 blooms, distinct, was provided for growers of fewer than 1,000 plants. LEWIS J. PAWLE, Esq., Harrow, was well to the fore with Mildred Grant, Bessie Brown, Mme. Jules Gravereaux, Mrs. W. J. Grant, and William Shean. 2nd, A. C. TWINCEN, Esq. 3rd, Dr. LAMPLOUGH.

The "Alet Challenge Cup," offered for 24 blooms, was won by J. B. FORTESCUE, Esq. Mrs. Theodore Roosevelt, J. B. Clark, Mrs. Harold Brocklebank, William Shean, and Bessie Brown were some of the best varieties in this stand. 2nd, COLIN ROMAINE, Esq.

Other prominent winners in the amateur classes were Rev. J. B. SHACKLE, ERNEST J. MOCATA, Esq., E. F. BROWN, Esq., and Miss LANGWORTHY.

There was keen competition in the class for a decorated dinner table, no fewer than 16 exhibitors competing. Mrs. MALBY obtained the premier award.

NON-COMPETITIVE EXHIBITS.

Exhibits from nursery firms were not so numerous as usual. Messrs. THOMAS WARE, LTD., Feltham, showed herbaceous flowers in variety. Mr. H. W. CAISTER, Slough, exhibited Sweet Peas and Nectarines. Messrs. G. & A. CLARK, LTD., Dover, showed herbaceous flowers and Sweet Peas. Messrs. TITT & SONS, Windsor, displayed floral devices and herbaceous flowers. Mr. CHARLES TURNER, Slough, staged herbaceous flowers and Carnations. Messrs. GEORGE JACKMAN & SON, Woking, had a beautiful stand of Roses and herbaceous flowers. Messrs. JAMES VEITCH & SONS had an extensive arrangement of herbaceous flowers, Roses, Lilies, and Paeonies.

RICHMOND HORTICULTURAL.

JUNE 30.—The 35th annual flower show was held on this date in the Old Deer Park. The weather in the morning was cold and dull, but in the afternoon the sun shone at intervals. The exhibits were much fewer than usual, and especially was this noticed in the classes for Roses and Sweet Peas. The show generally was inferior to many that have preceded it.

GROUPS OF PLANTS.

There were two competitors in the class for a group of plants occupying a space of 100 square feet. The better of the two was shown by Lady WALTER, The Terrace House, Richmond (gr. Mr. H. Binfoot). It was a remarkably bright display, the chief features being Campanulas,

Begonia 'Gloire de Lorraine', Hippeastrums, Odontoglossums, Hydrangeas, Gloxinias, with tall plants of Humea elegans, Codiaums, and Palms. The groundwork was composed of Ferns and Gypsophila. 2nd, Mr. WM. VAUSE, Leamington Spa, for a rather heavier arrangement in which Orchids were a feature.

There was a similar class in which the space was restricted to 60 square feet. There were three exhibits, the 1st prize being awarded to C. M. BARTLETT, Esq., Uplands, East Sheen (gr. Mr. H. Hicks). Caladiums, Dracaenas, Codiaums, with Schizanthus, Clerodendron fallax, Gloxinias and Gypsophila were the principal subjects comprising the group. 2nd, Mr. W. VAUSE, Leamington Spa. 3rd, Mrs. FITZWYGRAM, Hampton Hill (gr. Mr. W. Redwood).

Prizes were offered by J. H. Masters, Esq., Petersham, for a basket of plants arranged for effect. Five baskets were shown, the 1st prize being awarded to L. WARDE, Esq., Petersham (gr. Mr. A. Allum), for an effective exhibit of Caladiums, Gloxinias, Fuchsias, Clerodendron

LETT, Esq., Uplands, East Sheen, who had fine specimens of the variety R. Box and the red-coloured Cardinal. 2nd, Mrs. VAUGHAN ARBUCKLE. There were three competitors.

There was rather better competition in the class for Fuchsias, the 1st prize being won by Mrs. FITZWYGRAM, who had the largest plants. Her best specimen was the variety named after Mrs. Marshall; General Gordon and Mrs. Rundle were also fine. 2nd, Mrs. COWPER COLES, Heddingham House, Twickenham (gr. Mr. W. H. Keary).

Highly-coloured Coleus, shown by L. WARDE, Esq., Petersham House (gr. Mr. Allum), were awarded the 1st prize in the class for these plants. Considering the sunless season, the foliage was remarkably bright.

J. H. BRIERLEY, Esq., Kew Road, Richmond, excelled in the class for Ferns, having crested varieties of hardy kinds.

Some good plants of Gloxinias were staged. In the class for six of these plants, C. M. BARTLETT, Esq., Uplands, East Sheen (gr. Mr. H.

arrangement of Pink Carnations, Gypsophila, Ferns, Asparagus and Grasses.

ROSES.

The only exhibitors in the class for 48 blooms, shown in triplets, were Messrs. FRANK CANT & Co., Colchester. There were four competitors last year, so that the single entry was disappointing. Messrs. CANT's blooms showed evidences of the sunless summer and repeated rains. Their best examples were Caroline Testout, Liberty, Antoine Rivoire, Dean Hole, Mrs. John Laing, Gustave Piganeau, Oscar Cordell, Frau Karl Druschki, and Mme. Melaine Soupert.

Poor blooms were also shown in the class for 12 blooms, the best of four collections being staged by A. CHANCELLOR, Esq., J.P., Richmond.

The best 12 blooms of a Hybrid Perpetual or Hybrid Tea variety were shown by Messrs. W. & J. BROWN, Peterborough and Stamford, who staged a dozen good blooms of the variety Mildred Grant; the 2nd prize was awarded for poor examples of Liberty. There were four exhibitors in this class.

In the class for 12 Tea Roses, the well-known Marechal Niel variety, shown by Messrs. W. & J. BROWN, secured the 1st prize with no competition.

In the amateurs' class for 24 blooms, W. C. ROMAINE, Esq., Windsor (gr. Mr. J. Guttridge), was awarded the 1st prize. Several of the blooms were choice specimens, notably Mildred Grant and Bessie Brown.

Mr. ROMAINE was also placed 1st for 12 blooms in competition with three other exhibitors, Mr. W. J. TURNER, Teddington, winning the 2nd prize.

In the class for 12 Roses, the competition being restricted to persons residing in the district and to those not employing a permanent gardener, some excellent blooms were shown by W. J. PALMER, Esq., 12, Netherton Road, St. Margarets, who secured the 1st prize. Caroline Testout in this exhibit was one of the best blooms exhibited in the show. Dean Hole and Mrs. W. J. Grant were also noteworthy. 2nd, G. J. FAVEL, Esq., High Street, Hampton Hill.

Messrs. W. & J. BROWN, Peterborough, showed the best bunches of garden Roses, and they also excelled in the class for 12 H.T. Roses, the prizes being given by Lady Rugge-Price.

Mr. WM. HAYWARD, Fife Road, Kingston, showed the best basket of Roses; Miss COLE, Feltham, the best basket of cut flowers and foliage; and Mrs. MARTIN, 13, North Road, Richmond, won the 1st prize for a bouquet of Roses.

FRUIT AND VEGETABLES.

The most important class for fruits was one for a collection of six dishes of distinct kinds. There was only one exhibit, this being shown by the Earl of DYSART, Ham House, Petersham (gr. Mr. T. F. Conway). His examples were Peregrine Peach, Early Rivers Nectarine, fine fruits of Leader Strawberry, Black Hamburg and Foster's Seedling Grapes, and a Melon. The collection was awarded the 1st prize.

The best white Grapes were shown by W. G. RAPHAEL, Esq., Castle Hill, Enfield Green (gr. Mr. H. H. Brown), the variety being Buckland Sweetwater. The berries were large but rather green; the best black Grapes were exhibited by Sir W. GREENWELL, Bart., Morden Park, Caterham (gr. Mr. W. Lintott), the variety being Black Hamburg.

Highly-coloured fruits of Early Rivers Nectarine, shown by W. G. RAPHAEL, Esq., and very small fruits of Crimson Gaiende Peaches, shown by Messrs. W. & E. WELLS, Hattonhurst, Hounslow (gr. Mr. G. Thompson), won the 1st prizes respectively in the classes for these fruits.

The best Melon was shown by F. H. COOK, Esq., Barnett Hill, Guildford (gr. Mr. A. Kitchelson), who exhibited a seedling with yellow skin.

VEGETABLES were shown well, especially by cottagers. The Earl of DYSART won the 1st prizes in the classes for collections in which the prizes were given by Messrs. Jas. Veitch & Sons, Ltd., and Messrs. Webb & Sons, Stourbridge, having no competitor in either case. The same exhibitor beat Mr. R. KEENE, 8, Manor Grove, Richmond, in Messrs. Carter & Co.'s class for nine distinct varieties of vegetables.

The Society offered prizes for a collection of 12 kinds of vegetables, and this was closely contested by the Earl of DYSART and the Earl of

FIG. 5.—CARNATION HER MAJESTY: COLOUR YELLOW WITH DEEP-PURPLE EDGE.

This variety received an Award of Merit at the last meeting of the R.H.S. (See ante, p. 419.)

fallax, Statice and other flowering plants, with a Cocos Palm in the centre. 2nd, HENRY LITTLE, Esq., Twickenham (gr. Mr. G. Watts), for a bright group containing many flowering plants of common subjects.

Orchids were shown by three exhibitors in a class for six plants. A collection of showy Cattleyas and Lælio-Cattleyas displayed by H. LITTLE, Esq., Baronshalt, Twickenham (gr. Mr. A. Howard), received the 1st prize. The 2nd prize group was exhibited by Mr. W. VAUSE, Leamington.

In the class for six tuberous-rooted Begonias there were three competitors. The 1st prize was awarded to S. EDWARDSON, Esq., Sidcup (gr. Mr. T. Rabbitt), for large examples. 2nd, G. ATKINS, Esq., East Sheen (gr. Mr. W. J. Hill). This exhibitor showed best in Messrs. Sutton & Sons' class for Begonias, and he also excelled in the class for Streptocarpuses.

Caladiums were best shown by C. M. BART-

Hicks), won the 1st prize with freely-flowered specimens. 2nd, C. R. W. BENNETT, Esq., Sunbury (gr. Mr. W. Chant).

The best Palms were shown by Mr. W. VAUSE, who also showed the best collection of six fine foliage plants, but was only awarded the 2nd prize. The best single specimen plant was a finely-coloured Codium shown by Mrs. VAUGHAN ARBUCKLE, Stawell House, Richmond (gr. Mr. H. Lawrence).

Exhibits of hardy flowers provided a pleasing display. In the class for 24 bunches, the premier position was taken by L. WARDE, Esq., Petersham (gr. Mr. A. Allum), and he was followed by the Earl of DYSART with a good collection.

Floral decorations formed an attractive portion of the show. Mrs. ALEX. ROBINSON, Carshalton, arranged the best exhibit of three vases or stands of flowers and foliage suitable for a dinner-table decoration. It was a light

MARKETS.

COVENT GARDEN, June 30.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Ed.]

DEVON, Powderham Castle, near Exeter (gr. Mr. T. H. Bolton). There was not much to choose between the two exhibits, but the 1st prize went to the local exhibitor, the Earl of DEVON receiving the 2nd award.

A dish of Duke of York Tomatos shown by Mrs. COWPER COLES, Twickenham (gr. Mr. W. H. Keary), was adjudged the best of nine exhibits, and Messrs. W. & E. WELLS had the finest Cucumbers, the variety being Telegraph.

A Cucumber weighing 9 lbs. 8 ozs., and measuring 37 1/2 inches in length and 1 1/2 inches in girth, was shown by G. R. KENDLE, Esq., Wilton, near Salisbury (gr. Mr. J. C. Scammell). The variety was Duke of Edinburgh.

NON-COMPETITIVE EXHIBITS.

Messrs. JAS. VEITCH & SONS, LTD., King's Road, Chelsea, staged a pleasing exhibit of Roses in pots, with Lilium auratum and L. lancifolium album effectively interspersed. The group had an undulating border composed of Eurya latifolia variegata. The Roses were a representative collection, and included several fine plants of the variety Dorothy Perkins. (Gold Medal.)

Mr. WILLIAM THOMPSON, Sheen Nurseries, Richmond, staged a group of foliage and flowering plants, amongst which Hydrangeas, Roses and Pelargoniums were a feature, with Acer Negundo variegata, Palms, Eurya latifolia, and other ornamental-leaved plants. (Gold Medal.)

Mr. L. R. RUSSELL, Richmond, staged a magnificent group of miscellaneous plants, the exhibit extending in the whole length of one of the largest tents. The display was formed of a number of semi-circular groups, each bay being separated by Roses, Nertera depressa, Saxifraga sarmentosa, &c.

Messrs. JOHN PEED & SON, West Norwood, London, S.E., showed hardy flowers in variety, also Carnations, tuberous-rooted Begonias, Gloxinias, and Roses.

Mr. W. H. PAGE, Tangle Nurseries, Hampton, showed a magnificent group of Carnations and Liliums, interspersed with Ferns. The same exhibitor showed climbing Roses, Ivy-leaved Pelargonium Countess Grey, and pink-flowered Astilbes. (Gold Medal.)

Messrs. T. S. WARE, LTD., Feltham, filled the greater part of one large tent with a showy display of flowers, including garden plants, Carnations, tuberous-rooted Begonias, Roses, &c., the whole presented in excellent condition. (Gold Medal.)

Mr. J. BRUCKHAUS, Orleans, and St. Mark's Nurseries, Twickenham, showed a semi-circular group of Aspidistras and Ferns, interspersed with Metrosideros floribunda, the Bottle-brush tree. (Silver-gilt Medal.)

Mr. H. E. FORDHAM, Twickenham, showed Gloxinias set in a groundwork of Adiantum Ferns. (Silver Medal.)

Messrs. W. & J. BROWN, Stamford and Peterborough, showed bunches of Roses, also Sweet Peas in variety. (Silver Medal.)

Messrs. J. PIPER & SON, Bishop's Road, Bayswater, exhibited Box trees clipped in the form of birds, &c. (Silver Medal.)

Mr. WILLIAM POUPART, Fernleigh Orchards, Twickenham, showed bottled fruits in variety.

NEW INVENTIONS.

A PORCELAIN PLANT LABEL.

A PLANT label that has a more or less permanent character is a great boon to the gardener. The wooden labels that are so largely used are unsatisfactory, because after a short time the writing on them becomes illegible. Paper labels are convenient, but they are soon destroyed by the weather. Perhaps the most simple, and yet the most durable, are those made of lead, with the names stamped in them, but these have to be very closely approached in order to read them. A very neat form of label has just been sent us by Messrs. Kirkland & Co., Albion Pottery, Etruria, Stoke-on-Trent. It is made of vitreous earthenware and the name is stamped on a white ground before being covered by the glazing. The labels are totally unaffected by the weather, and unless broken they will last indefinitely. One end is pierced for the purpose of attaching the tally by a piece of string or wire.

Cut Flowers, &c.: Average Wholesale Prices.

Table with columns for flower types (Asters, Carnations, etc.), quantities, and prices in s.d. and s.s.d.

Cut Foliage, &c.: Average Wholesale Prices.

Table with columns for foliage types (Adiantum, Agrostis, etc.), quantities, and prices in s.d. and s.s.d.

Plants in Pots, &c.: Average Wholesale Prices.

Table with columns for plant types (Ampelopsis, Arabis, etc.), quantities, and prices in s.d. and s.s.d.

Plants in Pots, &c.: Average Wholesale Prices (Contd.).

Table with columns for plant types (Lobelia, Magnolias, etc.), quantities, and prices in s.d. and s.s.d.

Fruit: Average Wholesale Prices.

Table with columns for fruit types (Apples, Apricots, Bananas, etc.), quantities, and prices in s.d. and s.s.d.

Vegetables: Average Wholesale Prices.

Table with columns for vegetable types (Artichokes, Asparagus, Beans, etc.), quantities, and prices in s.d. and s.s.d.

REMARKS.—English Cherries are arriving in an unsound condition, the fruits having been spoiled by the rains. Strawberries are much cheaper, but well-coloured berries are scarce. Gooseberries are about the same trade as last week. Apples are selling slowly owing to the large quantities of Strawberries. Consignments of oranges are smaller, but Lemons are more plentiful. English Peaches and Nectarines are inclined to be drier. English Tomatoes are plentiful and cheap, but badly coloured. Trade generally is moderate. E. H. K., Covent Garden, 11, Monday, June 30, 1909.

Table with columns for potato varieties (Lincolns, Up-to-Date, etc.) and prices in s.d. and s.s.d.

REMARKS.—There is little demand for old Potatoes, and the stock is nearly exhausted. The trade in new tubers is fair, and prices are a little higher. E. H. K., Covent Garden and St. Pancras, June 30, 1909.

COVENT GARDEN FLOWER MARKET.

Bad weather and the abundance of Strawberries from the more-favoured districts have been detrimental to the plant and flower trade. This morning there were large quantities of cut flowers and plants unsold at closing time. In the plant trade there are many growers who hold stock over rather than reduce prices. And it is the same with cut flowers to some extent; but late in the morning there are many who try to clear at greatly reduced prices, and it is this which causes trouble on both sides. The grower hears from a local man that he has paid a certain price, but does not make an allowance for the waste or what has to be cleared at very low prices, if it is sold at all.

POT PLANTS.

Some growers have discontinued sending consignments, but I have lately seen bedding plants so plentiful at the end of June. Zonal Pelargoniums in all colours are good in 3-inch and 5-inch pots. Good white varieties may be few, but all other colours are over-plentiful; King of Denmark is the most prominent. The variety Mrs. Brown Potter, in 5-inch pots, is well flowered. All the ivy-leaved varieties are good, but do not sell well. Marguerites are remarkably good; the yellow variety is better than I have seen it for some years past, but unfortunately it comes in too late for the best trade. The white variety is present all the year through, and at the present time, though so late in the season, the plants are of excellent quality. Fuchsias are good, and Saxifraga pyramidalis is procurable in good plants. The Crassulas now include good examples of *C. coccinea*, and the dwarf hybrid varieties are well flowered. Liliums are not quite so plentiful and prices may advance. *Rhodanthus* is scarce. *Spiræas* are good, and it must be disappointing to growers of the new pink varieties to have so many left unsold. *Verticillaria* are still very good, and prices are hardly equal to the quality of the plants. We do not often get late *Mignonette* so good as it is at present. The supplies of foliage plants are more than equal to the demand.

CUT FLOWERS.

Roses are over-plentiful except the best red sorts on long stems, which were difficult to procure even at advanced prices. An abundance of Carnations is seen. At closing time there were heaps of Sweet Peas left on the stands. I may again refer to the fact that it is only the definite colours that are in general demand. The variety *Stirling Stent*, which gained an award of merit last week, should prove useful for market; and *Blanche Steven*, the pure white variety, should also be worth attention. *Pyrethrums* are not quite so plentiful. *Paeonies* are good in all colours, but very few of the single varieties are seen. Spanish Irises from English growers are remarkably good, the weather having been particularly favourable for them. *Gladiolus Brechtleyensis* is now coming in, and the hybrids of *Colvillei* are over-plentiful. *Statice* in white, yellow, and blue has been making good prices. Liliums sell for prices below the average. *A. H. Covent Garden, June 30, 1909.*

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending June 30.

The fourth cold week in succession.—All the days of the past week were more or less cold, and on the coldest day the temperature in the thermometer screen at no time rose higher than 54°, which is 15° below the average maximum for the time of year. The nights were also all cold, but much less unseasonably cold than the days. The ground temperatures still remain low, and are at the present time 2° colder at 2 feet deep, and 3° colder at 1 foot deep than is reasonable. Rain has fallen on each of the last nine days and to the aggregate depth of 1½ inches. Of that amount four gallons have already come through the bare soil gauge, but less than half that quantity through that on which short grass is growing. The sun shone on an average for four hours a day, which is 2½ hours a day short of the average daily duration for the end of June. The winds have been as a rule light. The mean amount of moisture in the air at 3 o'clock in the afternoon exceeded a reasonable quantity for that hour by as much as 14 per cent.—*E. M., Berkhamstead, June 30, 1909.*

Obituary.

WILLIAM WHIBBERLEY.—The death occurred on the 18th ult., at The Hollies, Little Budworth, Cheshire, of Mr. William Whibberley, late gardener to Sir Philip Egerton, Bart., of Oulton Park, Cheshire. Mr. Whibberley commenced his gardening career with Sir Joseph Paxton at Sydenham. Later he acted as foreman at Nunington Castle and Apley Park, his first charge being with the Earl of Wicklow, at Shelton Abbey, Co. Wicklow. He was also gardener at Mitchelstown Castle. In 1855 Mr. Whibberley returned to England to take charge of the gardens at Oulton Park, where he remained until retiring last year, an allowance being made to him in recognition of long and faithful services. Deceased leaves a widow and one son. The funeral took place at Little Budworth Parish Church.

MRS. WADDS.—Hannah, wife of Bailey Wadds, on June 24, at 151, Uttometer New Road, Derby, aged 75 years.

* * * The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as supplementary illustrations in this Journal.

CARNATIONS: *W. E. B.* You cannot expect to obtain strong, healthy stock from diseased plants. Spray the healthy ones before layering the shoots with potassium sulphide solution at a strength of 1 oz. in three gallons of water.

CATERPILLARS INFESTING TOMATOES: *Worried.* So far as we can ascertain, the caterpillars are those of the moth *Heliothis armiger*. Paris green, although effective, cannot, unfortunately, be used owing to the danger of placing poison on fruits used for food. Hydrocyanic acid gas would no doubt destroy the insects, but it is questionable whether or not it would have an injurious effect upon the plants. The safest, if not the most effective, course is to check them by hand picking, and if the plants will admit of the treatment, shake them over a sheet of paper or an inverted umbrella.

EMPLOYMENT AT KEW GARDENS: *G. O.* Particulars may be obtained from the Curator of the gardens. No examination is entailed, and no women gardeners are now employed at Kew. Your chances of obtaining an official appointment after completing your two years' course will depend upon whether any vacancies occur during the time you are about to leave, and on your fitness for filling the post.

EMPLOYMENT IN PUBLIC PARKS: *F. B.* Write for particulars to the superintendent of the park you wish to enter. A list of the principal parks is given in the *Gardening Year Book and Garden Oracle*, published by Messrs. W. H. and L. Collingridge, City Press, Aldersgate Street, London, E.C.

FIG LEAVES: *T. S.* No disease is present to account for the trouble. The cause must be looked for in some other direction.

FOXGLOVE FLOWER: *H. M.* The flower has become regular, a condition termed *peloria*. *Peloric* flowers are common in other plants of the Foxglove family.

GRUBS ON APPLE: *Libertia.* There are no "grubs" on the twigs you send; but the bark is practically covered with the eggs of the *Bryobia* mite. Spray the trees during the winter with the Woburn wash.

INFESTED CABBAGES, &c.: *W. B. Bruce.* The dry weather of May is accountable, in a large measure, for the ravages of the "Turnip fly" (*Maltica nemorum*), which you refer to as being so destructive to Cabbages, &c. The recent rains will no doubt enable the plants to outgrow the attack. If, as you say, arsenate of lead has so far failed, we would recommend another application of this insecticide. It must be borne in mind, however, that such measures will not destroy the larvae or prevent them from feeding, as they do, between the cuticle of the leaves. Every care should be taken to encourage early development of the plants. Copious waterings should be afforded during periods of drought.

INJURED ROSES: *John Sergeant.* The grubs causing the damage are the "Cochybonddu" of the Welsh (*Phyllopertha horticola*), often used as a bait by fishermen. The only satisfactory method of dealing with the pest, seeing that the Roses are in full bloom, is to shake the plants over an inverted umbrella and destroy the beetles that are thus collected.

NAMES OF PLANTS: *J. S. H.* *Muscari comosum monstrosum*. In this form the flowers are all barren and their structure abnormal. It is popularly known as the Feather Hyacinth.—*J. L.* 1, *Aristolochia Siphoc*; 2, *Mackaya bella*.—*J. H.* 1, *Campanula glomerata*; 2, *Gum coccineum*.—*Idris.* *Styrinchium hermudium* (syn. *S. anceps*), blue-eyed Grass.—*T. W.* Alder, *Alnus glutinosa*.—*E. G. H.* 1, *Tsuga Bruuniana*; 2, *Cupressus Lawsoniana pendula*; 3, *C. L. lutea*.—*T. Menden.* The specimen is *Prunus Padus*, the Bird Cherry. It can be

propagated by means of seeds, which ripen freely.—*A. I.* *Ilex dipyrena*.—*Constant Reader.* 1, *Sedum rupestre elegans*; 2, *S. spatulifolium*; 3, *Eschscholtzia californica*; 4, *Erigeron philadelphicus*; 5, *Helianthemum vulgare* var.; 6, *Polygonum Bistorta*.—*E. N.* 1, *Kalmia latifolia*; 2, *Dieltamnus albus* var. *purpureus*; 3, *Clematis integrifolia*; 4, *Geranium dissectum*; 5, *Helianthemum vulgare* var.; 6, *Hieracium villosum*.—*T. T.* 1, *Acæna inermis*; 2, *Astragalus danicus*; 3, *Paronychia capitata*; 4, *Helichrysum orientale*; 5, *Tradescantia virginica*; 6, *Linaria reticulata*.—*Fruces.* 1, *Vicia sepium*; 2, *Polygonum Bistorta*; 3, *Geranium pyrenaicum*; 4, *Lathyrus pratensis*.—*B.* 1, *Mertensia echioides*; 2 and 3, forms of *Pentstemon humilis*.—*Cornwall.* *Lycchnis Flos-uculi*.—*Oliver Hayles.* *Achillea sibirica*.—*Libertia.* 1, *Abies cincea*; 2, *Cryptomeria japonica*; 3, *Aster Fremontii*; 4, *Iris versicolor* var. *virginica*; 5, *Veronica Teuerium*; 6, *Saxifraga Wallacei*; 8, *Pyrus Aria*; 9, *Pyrus floribunda*.—*G. H. Greenham.* 1, *Amalanchier canadensis*; 2, *Nandina domestica*; 3, *Serophularia aquatica variegata*; 4, probably *Esculus indica*; 5, *Kniphofia Tuckii*; 6, *Polypodium aureum*; 7, *Phuopsis stylosa*.—*R. H.* 1, *Adiantum hispidulum*; 2, *Adiantum formosum*; 3, *Asplenium trichomanes*; 4, *Selaginella umbrosa*; 5, *Nephrolepis exaltata*; 6, *Pteris aquilina*, common *Bracken* which often comes up in the peat in which *Oreohids* are potted.—*O. T.* Both *Cattleya Mossie*.—*F. W. J.* 1, *Davallia dissecta*; 2, *Stenotaphrum americanum variegatum*; 3, *Selaginella ucinata* (*cesia*); 4, *Pellionia pulchra*; 5, *Helxine Soleirolii*.—*E. B.* *Periploca græca*.—*M. A. M.* *Muscari comosum* variety *monstrosum*.—*F. B.* *Vanda Bensonii* variety *Jack*. (*Enothera fruticosa*; 2, *Dielytra eximia*; 3, *Centranthus ruber*; 4, *Sedum spectabile*; 5, *Hemerocallis Middendorffii*; 6, *Stachys lanata*.—*C. B., Hants.* The slender yellow flowers are *Oncidium flexuosum*; the others *Oncidium Wentworthianum* and *Centranthus ruber*.—*Hortus.* *Cattleya Gaskelliana*.—*A. H.* *Ophrys apifera*, *Corydalis lutea*. Send when in flower.

PEACH LEAVES: *W. Y. N., C. H., and Gardner.* The foliage is affected with the "shot-hole" fungus—*Cercospora circumscissa*. Put 8 lbs. of good quicklime into a barrel, add one gallon of water, and when the lime begins to slake add 3 lbs. powdered sulphur. Stir well until the lime is thoroughly slaked, then add water to make 50 gallons of the mixture. This should be kept stirred during its application to the trees. The specific is most efficacious just when the leaves have first expanded, but its use should be continued at intervals.

PEACH TREES UNHEALTHY: *E. H. & Co.* The shoots are affected with "blister," caused by a fungus—*Exoascus deformans*. Cut off and burn the badly-affected parts and spray the trees with a dilute ammoniacal solution of copper carbonate at intervals. See also reply to *Wals* in the issue for June 5, p. 372.

SCHEDULE: Enquirer. Rule 5 states that all specimens exhibited must be the bona-fide property of the exhibitor, or of his employer, and have been in his possession at least three months. If the committee desired certain classes to be exempted from the operation of this rule, it may be assumed they would have declared this in the schedule. They do not appear to have done so, and, therefore, the rule should be enforced.

VINE LEAVES WITH WARTS: *H. C. R.* The irregularities on the leaves are not due to disease due to fungus or insects, but are the result of outgrowths of cellular tissue. The presence of too much moisture in the atmosphere is generally the cause of the trouble. Keep the viney drier and admit plenty of fresh air.

WILLOW: *H. R. W., Stuttgart.* We cannot find anything to account for the remarkable growth. It is one of those teratological variations the cause of which remains unknown.

THE DISTRIBUTION OF PLANTS.

THE systematic study of the branch of botany now generally known under the name of ecology, is of quite recent growth. Prof. Warming's Danish work, called *Plantsamfund* ("Plant Societies"), published in 1895, and well known to most English botanists in the German translation which appeared the following year under the title of *Ökologische Pflanzengeographie* (Ecological plant-geography), was the first general text-book dealing with this attractive subject. *Ecological* plant-geography differs from plant-geography as it used to be understood (now often called *Floristic* plant-geography), in that the former deals, not with the distribution of plants on the earth by species, genera and families, but with the distribution and composition of those natural units of vegetation, or plant-communities—forests, prairies, marshes and the like—into which plants naturally group themselves, and with the causes which lead to this composition and distribution. The study of the detailed facts of distribution is a branch of plant-

geography, while the study of the actual effect of external conditions on the plants, which leads to the success of one type of vegetation in one place and another in another, belongs to one of the most recondite regions of plant-physiology.

Professor Warming's new work* follows the lines of his earlier book already alluded to, though it is considerably increased in size owing to the great additions to our store of information which have accrued during the last 14 years. The introduction deals with the scope of the subject; with the "growth-forms" which are the characteristic features of different kinds of vegetation (such, for example, as the coniferous tree, the deciduous tree, the bush form, the grass-types, rosette-plants, different forms of submerged plants, &c.), and the adaptations which they show to the different conditions under which they live; and, finally, with the conception of a plant-community.

The first section considers the "ecological factors" (light, heat, atmospheric humidity, nature and water-content of soil, &c.) and their effect upon plants and plant-communities. The next section deals with the "communal life of organisms," and shows how, owing to the interdependence of plants living together in one habitat, whether by way of competition or because one set of plants furnishes something that another set needs, e.g. by enrichment of the soil, by shelter, and the like, plants come to exist in more or less definite communities. The third section deals concisely with the numerous adaptations of structure found among plants living under different conditions of life. Then follow 13 sections devoted to a systematic review of the various plant-communities of the world grouped into 13 classes, and, finally, there is a section on the "struggle between plant-communities."

Every part of the book contains much valuable information. Prof. Warming is not only one of the pioneers of the subject and a most assiduous worker at its detailed development, but he is also a master of skilful and penetrating discussion of the problems in which the subject abounds. In fact, as the author plainly tells us, in the preface and elsewhere, the whole subject is still in its infancy, and this, indeed, is not to be wondered at when we consider that it involves parts of plant-physiology as yet unexplored. A perusal of the section dealing with ecological factors and their action is sufficient to show how little we know that is fundamental about the effect of external influences on plants. The author concludes, as indeed is inevitable, that water is by far the most important factor in determining the actual distribution and character of plant-communities. He also concludes that the physical characters of the soil are more important than the chemical in determining vegetation. This is an old quarrel between two rival schools of plant-geographers, reaching far back into the last century, and the only way to assign the correct relative importance to the two classes of factors is by direct experiment. It may be sus-

pected that Prof. Warming's view is influenced by his knowledge of the vegetation of his native land, where the soil is mostly glacial debris, in which there are no marked chemical distinctions as between one region and another.

The classification of all known plant-communities into 13 classes is necessarily provisional, as the author contents all ecological classification must needs be at present. It is doubtful if some of the classes, such, for instance, as *Chersophytes*, or plants of waste places, have any value at all.

The final section, on the struggle between plant-communities, is able and concise, though we cannot agree with the author's views on the origin of species. He assumes that "plants possess a peculiar, inherent force or faculty by the exercise of which they *directly adapt themselves* to new conditions, that is to say, they change in such a manner as to become fitted for *existence in accordance* with their new surroundings" (author's italics). To assume so much appears to be to renounce the attempt at real scientific explanation altogether.

We confess to some curiosity as to whether the present book was written in English by Prof. Warming and revised by Professors Groom and Balfour, or whether it was actually translated from a Danish text. The preface is obscure on the point. The English is very good, but we can scarcely congratulate those who prepared the book for publication in English on all the new technical terms. "Fell-field" and "fell-heath" may be good etymological equivalents of the Danish originals, but we do not think it either likely that they will, or desirable that they should, find a permanent place in English terminology. "High moor" and "low moor" are also likely to be misleading. There seems no adequate reason for writing "oecology" rather than "ecology."

The book is not quite free from small mistakes, most of which are due to defective proof-reading, and there are a few doubtful statements. But there can be no doubt of its general usefulness. T.

ORCHID NOTES AND GLEANINGS.

MOORE, LIMITED.

THIS establishment has taken a prominent place in Orchid horticulture during the past three years. It is under the management of the well-known experts in Orchids, Mr. W. H. Hatcher and Mr. W. Mansell. The nursery is situated on high ground at Rawdon, some seven miles from Leeds, near to Apperley Bridge Station on the Midland Railway. The Orchid houses are built on the hill-side, and, consequently, are arranged in terrace form, and longitudinally the different sections of each range exhibit the same arrangement. The older houses have been thoroughly renovated, and new ranges added, including a large span-roofed range connecting the ends of the other houses. The houses, on the occasion of a recent visit, presented a very attractive appearance, with many showy Orchids in bloom, including a fine strain of *Lælio-Cattleya Aphrodite*, with some exceptionally good white-petalled forms; *L.C. Bletchleyensis*, one of them a very large and finely coloured flower; *L.C. Fascinator*, *Cattleya Dusseldorferi Undine*, one of the best white *Cattleyas*; the true *C. Harrisonia violacea*, of which there are several finely-coloured examples; good *C.*

* *Oecology of Plants*, an introduction to the Study of Plant-communities. By Eug. Warming, Professor of Botany in the University of Copenhagen, assisted by Martin Vahl, prepared for publication in English by Percy Groom and Isaac Baxby Balfour. (Oxford, at the Clarendon Press, 1909.) Pp. xi. and 422. Price 8s. 6d.

Mossæ and *C. Mendelii*; some hybrid *Odontoglossums*, including *O. Rolfeæ* and good forms of *O. crispum*-*Harryanum*; *O. maculatum*; several hybrid *Phaius*; *Oncidium varicosum* *Rogersii*, *O. sarcodes*, and other Brazilian *Oncidiums*, with the handsome and fragrant *O. Lanceanum*, a large importation of which has recently arrived.

In the internal arrangement of the greater part of the houses the usual plan of having close, moisture-holding stages fitted with an open wooden stage has been adopted. In some of the new houses the whole of the staging is of open woodwork, it having been found that *Dendrobiums* and some other genera, if plentifully supplied with water, make finer pseudo-bulbs under this system of culture. For, when the resting time approaches, and water is withheld, the air passing freely between the staging facilitates the ripening of the growths. Mr. Hatcher holds that open staging for many Orchids is as good as any system during the growing season, and pre-

with *O. Papilio* and *O. Kramerii* with their butterfly-like flowers, which have the advantage of being produced for years from the same flower-spikes. Other batches noted in the range were *Cypripedium bellatulum*, *C. niveum* and fine varieties of *C. Charlesworthii*. The rare *Dendrobium Lyonii*, which produces from stout, quadrangular pseudo-bulbs upright spikes of rose-pink flowers, resembles a better form of the Bornean *D. Treacherianum*.

Another house was filled with seedling *Lælio-Cattleyas*, crosses between *Sophranitis grandiflora* and other genera, and hybrid *Cypripedium*, the records of which show that *C. insigne* *Harefield* Hall has been used largely. They are approaching flowering size, some being noticed already in bud.

The next house, like some of the other houses, contained subjects which appeal strongly to the botanist and lover of species of Orchids, there being in it an interesting selection of *Bulbophyllums*, *Cirrhopetalums* and *Megaceliniums*. One probably new and rather large growing species from Southern Nigeria had a bracteate head to the inflorescence from which appeared in succession curious flowers with blackish, brush-like labellums. A batch of Burmese species of the deciduous section, including *Bulbophyllum hirtum*, and *B. comosum*, though

D. Dearei, the importation bringing with it a few of another species, probably *D. revolutum*. *D. Wardianum*, and other Burmese *Dendrobiums*; a small lot of the highland Indian form of *D. Jamesianum*, known as *D. Domesiæ*, which is very dwarf in growth and bears larger flowers than the type; a lot of the true *D. infundibulum*, some of them in flower; and *D. cœlogyne* were also noticed.

In the next house was a collection of *Cymbidiums*, also two fine specimens of the rare and handsome *Cœlogyne asperata* (*Lowii*), the one with five, and the other with two flower-spikes; *C. pandurata*, *Zygopetalum Burkii*, *Z. rostratum* and other warm-house species.

The *Odontoglossum* houses contained a very fine lot of plants, principally *O. crispum*. These are grown as cool as possible, and with more ventilation than is the custom with some growers.

In one house hybrid Orchids are being raised, and some promising crosses are in course of development, but it is interesting to observe that the importation of Orchids is considered of equal importance to the growing of hybrids.

The grounds are some three and a half acres in extent. The fine trees on the hill-side have beneath them some pretty paths and rocky nooks, with heavy masses of the natural rock of the district.

FIG. 6.—INFLORESCENCE OF *PRIMULA LITTONIANA*, AS SHOWN AT THE HOLLAND PARK EXHIBITION.
(See pp. 15 and 26.)

ferable where large batches of *Dendrobiums*, such as the firm import, have to be rested.

Provision is made for storing rain-water in the tanks, and liberal use is made of this in summer. At that season the artificial heat from the boilers is reduced to the lowest possible limit, and quite cut off from the cool and cool-intermediate houses—the result being that the plants throughout are in very vigorous condition. For potting material *Osmunda* fibre is said to be far better and more economical than the Orchid peat now procurable.

The new lean-to range on the highest level has on the one side a fine lot of *Phalenopsis*, the largest batch consisting of *P. Rimestadtiana*, of which some were in bloom. On the other side of the same house was a batch of *Oncidium Lanceanum*, and small lots of *O. luridum guttatum* and others of the section, together

FIG. 7.—*PRIMULA LITTONIANA* AS IT GROWS IN THE LICHANG VALLEY, YUNNAN, CHINA.
(See pp. 15 and 26.)

not in flower, gave off that hay-like fragrance peculiar to the section, and noticeable in the flowers, pseudo-bulbs, leaves and roots, especially when dry. A batch of *Catasetums* with large pseudo-bulbs, and another of *Mormodes* and *Cynoches* were also interesting.

The next house contained hybrids, but only *Cattleya Dusseldorfei* *Undine* was in flower; a good batch of *Brasso-Cattleyas*, however, was in sheath.

A large span-roofed house contained a collection of *Vandas*, *Aërides*, *Saccolabiums* and *Angraecums*, a few being in bloom. *Vanda coerulea* of the best type was present in considerable numbers. In the next intermediate house, among many rare species, were noted *Sarcochilus unguiculatus*, several *Gongoras*, including the rare *G. odoratissima* with a fine spike of claret-red flowers; *Bulbophyllum lenniscatoides*, whose curious, fringed flowers are borne on a drooping head; *Physosiphon Loddigesii*, with pretty racemes of orange-coloured flowers; *Epidendrum umbellatum*, and several other *Epidendrums*, *Stelis*, *Octomerias*, and a great number of pretty *Masdevallias*.

The *Dendrobium* houses had one side nearly filled with hybrid and white *D. nobile*, and on the other stages was a large batch of the fine white

THE ROCK GARDEN.

EUPHORBIA MYRSINITES.

This prostrate-growing plant, with markedly glaucous foliage, is one of the most distinct species of the genus. By reason of its habit of growth it is better suited to the rock-garden or rudely-constructed rock-wall than to the border. The species appears more or less indifferent as to soil and succeeds in strong loam or quite sandy material. In text-books the usual references to "seeds, division, and cuttings" are given, without qualification, as the methods of propagation. As a matter of fact, it is not easy to increase this species by division. Seeds are useful enough when available, but they are often a long time before they germinate. The only really serviceable type of cutting is that which may be torn from the base of the plant in spring or early summer with a heel attached, and when about 3 inches in length. Such cuttings as these may be inserted without more ado, and they usually form roots in a month or less. Cuttings which are made of the stem portions and cut to a joint, may remain for months without rooting; indeed, I have kept them for nearly a year before discarding them. *E. H. J.*

NEW OR NOTEWORTHY PLANTS.

*PRIMULA LITTONIANA (G. FORREST).

THIS new species of *Primula* was found by Mr. George Forrest in "open mountain meadows on the range forming the eastern boundary of the Lichiang Valley" in the Yunnan, at an altitude of 10-11,000 feet, and was named by him to commemorate the late Consul Litton, who did so much to extend our knowledge of the outlying parts of the Chinese Empire. From seed collected by Mr. Forrest the plant has now been introduced to cultivation by Bees Ltd.

scribed as blood-red; the corolla is purple, the tube darker than the limb, passing into pale lilac. Before opening, the somewhat conical spike, red through the conspicuous bracts and calyces, tops the scape. As the purple flowers, each slightly drooping, begin to open from the base of the spike, the scape lengthens, and at mid anthesis there is produced a wonderful contrast between the lilac-purple corollas of the opened flowers and the bright-red cap of unopened ones. At the same time, as the expanded flowers do not overlap completely, streaks of red from the calyces and bracts are seen between them. The plant is thoroughly hardy. It has gone through two seasons in the open in the Royal Botanic

George Forrest in "moist, open situations on mountain meadows on the eastern flank of the Lichiang range, Yunnan, at an altitude of 10-11,000 feet." A First-class Certificate was awarded to it recently by the Royal Horticultural Society, and a number of specimens were exhibited at the Temple Show. The species belongs to the *Cankrienia* section of the genus *Primula*, which includes the familiar garden plants, *P. japonica*, *P. Cockburniana*, *P. Poissonii*, and others. Like them, this new plant has a series of whorled flowers in tiers upon a scape which may ascend to as much as 2½ feet. The flowers are orange-coloured, not the deep orange of *P. Cockburniana*, although in bud they rival in intensity the colour of the opened flowers of that species. The foliage is large, and each leaf is marked by a red midrib, especially towards the base. The nearest allies of *P. Bulleyana* appear to be *P. prolifera*, Wall., and *P. imperialis*, Jungh.; indeed, as Mr. Watson, of Kew, said to me at the Temple Show, *P. Bulleyana* may be looked upon as the Chinese form of the type which appears in the Himalayas as *P. prolifera* and in Java as *P. imperialis*. The plant is perennial, hardy, and it produces abundant seeds. Alike on its own account as a decorative plant, and as the prospective parent of garden races this *Primula* is a valuable addition to garden plants. The illustration in fig. 10 shows the plant as it is growing in the rock-garden in the Royal Botanic Garden, Edinburgh, where this year (as also last year) plants raised from seed, presented by Mr. Bulley through Mr. Forrest, have flowered freely. The plants shown are still in process of elongating their flower-scapes. Fig. 11 is from a photograph taken by Mr. Forrest of the plant as it grows on the Lichiang range. I. B. B.

FIG. 8.—PRIMULA LITTONIANA FLOWERING IN THE ROYAL BOTANIC GARDEN, EDINBURGH.
(See also Figs. 6 and 7.)

The illustrations (Figs. 6, 7 and 8) will show sufficiently that *Primula Littoniana* is a striking plant; what they cannot show is the feature of colour which makes this the most extraordinary of all known *Primulas*, and one of the most interesting of recent additions to hardy garden plants. From a tuft of greyish-green hairy leaves rises a scape, 1 to 2 feet long, coated with white meal and ending in a dense spike, like that of a *Kniphofia*, which may be at best as much as 5 inches long. The bracts and calyces have a bright red colour, almost scarlet in some lights, but perhaps better de-

Garden, Edinburgh, where the plants figured were raised from seed presented by Mr. Bulley through Mr. Forrest. *P. Littoniana* belongs to the *capitata* section of the genus of which the type is *P. capitata*, and in which is also included the Chinese *P. muscarioides*, another new species raised by Bees Ltd., from seed collected by Mr. Forrest. I. B. B.

*PRIMULA BULLEYANA (G. FORREST).

THIS handsome new *Primula*, introduced to cultivation by Bees Ltd., was found by Mr.

* Described in *Notes from the Royal Botanic Garden, Edinburgh*, for April, 1908; named in honour of A. K. Bulley, Esq., Ness, Cheshire.

NOTES ON IRISES.

IRIS CLARKEI.

AN interesting point with regard to this *Iris* has lately been cleared up. As described by Baker in his *Handbook of the Iridaceae*, this species possessed both beard and crest, and it was therefore classed in the group of *pseudevansia*. Owing to this fact, I thought I was justified in giving in the *Gardeners' Chronicle* for January 2 and 16, 1909, a description of what appeared to be a new *Iris* under the name of *I. himalaica*. However, after seeing the material in the Herbarium at Kew, and suspecting that the only evidence for the crest and beard was Sir Joseph Hooker's sketch at Kew, I recently sent more flowers, with the suggestion that they should be compared with the sketch. The keeper of the Herbarium, Dr. Stapf, now tells me that he has no doubt that the flowers are identical with the subject of the sketch. As it happened, Sir Joseph Hooker himself was at Kew, and, on seeing a flower, remembered collecting the plant for the first time on Tenglo 60 years ago!

The name of *I. himalaica* cannot therefore stand, and *I. Clarkei* must be removed from the *pseudevansia* group and placed among the *Apogon* section near *I. sibirica* and *I. Delavayi*.

The plant is interesting from the fact that it appears to be in a state of mutation similar to that of the famous plants of *Oenothera* found by Prof. de Vries. I have already noticed wide differences in the standards and in the foliage. In imported plants the leaves have a curiously polished upper surface, but in seedling plants there is sometimes apparently bud variation, and plants occur with leaves that are distinctly glaucous on both sides, while some of the shoots on the same plants have leaves with the characteristic polished upper surface. In colour, too, there is considerable variation—to a much greater degree than I have found in growing seedlings of other species of *Iris*. W. R. Dykes, *Charterhouse, Godalming*.

* Described in *Notes from the Royal Botanic Garden, Edinburgh*, April, 1908.

LILACS.

OF flowering shrubs and trees in gardens, perhaps none is more appreciated than the Lilac (*Syringa vulgaris*). In recent years many improved varieties have been introduced to cultivation. Most of these have larger inflorescences, and the individual flowers are of greater size and better form. There has been considerable development in colour, and in point of freedom of flowering there appears nothing further to attain. Indeed, varieties are now so numerous that one is led to hope that the Lilac will not suffer by the multiplication of names and by the cataloguing of so many varieties that some will lack distinctness. The variety Charles X. is a form of *Syringa vulgaris*, in which the panicles are thicker, more freely produced, and the blooms richer in the shade of purple. It was formerly considered a very fine variety. Charles X., however, is now surpassed by such varieties as Souvenir de Louis Spath, in which the colour is again intensified, the panicles are larger, and almost as freely produced as in the older varieties. For garden decoration it is difficult to imagine a more beautiful Lilac. A shapely bush, furnished with, say, 300 densely-coloured blossoms, is a most effective object, and the flowers last in good condition for a considerable time. I have for a long time entertained a great admiration for Lilacs, and have now in the garden upwards of 60 varieties. All these possess good qualities, but some naturally are more desirable than others.

Although the cultivation of Lilacs is a simple matter, the shrubs are seen but seldom in a satisfactory condition. Often they are cramped in between evergreen shrubs, where they are forced to grow tall and ungainly, or they are planted under forest trees, which eventually overhang them, and not only are the Lilacs robbed of the necessary amount of light, but the roots are unable to get the moisture and plant food necessary for them. Lilacs should be given a situation where they will be fully exposed to air and sunshine. Abundance of space is necessary for them in order that the growths may become properly ripened each season, which is necessary to their flowering perfectly. Lilacs are best when largest, but it must be remembered that weakly shoots can only produce weakly inflorescences. In regard to soil, Lilacs are not over fastidious. It should be of a heavy, rather than light, nature, as in such soil the flowers develop a richer tint. Deep trenching should be practised before planting, and an abundance of farmyard manure may be added at the same time. Established plants should be given a liberal top-dressing of bonemeal, and this should be lightly forked in for the benefit of the surface roots. This top-dressing may be followed with a mulch of half-decayed stable manure, which will hinder evaporation of moisture from the soil in April and May at a time when the flowers are developing. Copious supplies of liquid manure early in May are distinctly beneficial. Too often the suckers which spring from the various stocks upon which the choicer varieties are grafted, are allowed to rob the plants of much of their energy. All such suckers should be removed directly they are detected. When first planted Lilacs should have the previous year's shoots pruned to within an eye or so of the base, with the view of getting a dwarf specimen of good shape. In the future the cutting of the panicles of bloom will be nearly all the pruning the bushes require. If any weakly shoots are detected the least promising may be removed, as this will allow more space for the stronger shoots.

DOUBLE-FLOWERED VARIETIES.—Amongst those with white flowers the best double variety is Miss Ellen Willmott. The pure white flowers are large and the panicles exceedingly fine. Mme. Lemoine produces longer panicles, but they lack the size observable in Miss Ellen Willmott

FIG. 9.—PRIMULA BULLEYANA: FLOWER SPIKE SLIGHTLY LARGER THAN NATURAL SIZE.

(See p. 15.)

and the flowers are less pure white. Mme. Abel Chatenay is later in flowering than any other white variety. It is a magnificent flower, and should be planted with a view to extending the season of bloom. Mme. Casimir Perrier has thick panicles of rather dull white flowers. They are not so attractive as those of the varieties already mentioned. Jeanne d'Arc, Taglioni, Ranquise, and Mme. de Miller are new varieties. Mme. de Miller is a dwarf-growing sort, but all are worth cultivation in a large collection.

Of coloured varieties the following are desirable: Maurice de Vilmorin has a thick panicle. The buds are attractive by their rich red colour, but when expanded they are blue with a white centre. Dr. Troyanowsky has enormous panicles of rosy-pink buds, which open into azure-blue flowers. Comte de Kerchove has rich red buds and rosy-pink flowers. It is very free in blooming and a remarkably showy variety. Mme. Bassompierre has close, thick panicles of coloured flowers. President Loubet is a very fine variety,

lilac-coloured flowers with pink margins. President Grey has flowers of Cobalt blue with rosy edgings.

SINGLE-FLOWERED VARIETIES.—Marie Legraye has creamy-white, fragrant flowers and is very free in blooming. Alba grandiflora has small flowers, but Alba magna is distinctly the best of the single-flowered white varieties.

Of coloured varieties, Negro is attractive. It has extra large blooms, deeper and clearer coloured than Louis Spathe, and it retains its purple-blue shade for a longer time. It is a variety of great excellence. Othello has deep claret-coloured flowers with red border, but when opening they are a pale red. Each bloom is distinct, but they are so placed as not to overlap each other. Uncle Tom has flowers of deep violet-purple. Dr. Mirabel has tall, erect panicles of claret-coloured buds, opening into

TOWN PLANTING.

THE LONDON PLANE.—This is generally regarded as the variety *acerifolia* of *Platanus orientalis*, the Oriental Plane. It stands first in the category of select town trees, as it grows vigorously, and is well adapted for withstanding smoke and other impurities in the atmosphere. Repeated experiments have clearly proved that in London this tree flourishes better than any other, and a visit to the parks, public squares or the Thames Embankment will substantiate the statement. There is a fine old tree at Cheapside, and an equally beautiful specimen, which has hardly room for perfect development, in the Court of Stationers' Hall, Ludgate Hill. Other notable specimens exist in Staple Court, High Holborn, and in Dean's Court, St. Paul's. There being a diversity of opinion as to which

FIG. 10.—PRIMULA BULLEYANA FLOWERING IN THE EDINBURGH ROYAL BOTANIC GARDENS. (See p. 15.)

FIG. 11.—PRIMULA BULLEYANA GROWING ON THE LICHANG RANGE, YUNNAN. (See p. 15.)

with carmine buds and deep purple-red flowers. Waldeck Rousseau has extra large flowers of rosy-lilac colour, becoming white towards the centre. It is a very charming flower. Countess Horace de Choiseul has creamy-white flowers shaded with rose. Marc Micheli has pink buds opening into blue flowers. Belle de Nancy has rose-pink buds and lilac-coloured flowers changing to blue. Souvenir de L. Thibaut has rose-coloured buds, but the flowers are a purplish shade of blue. Condorcet has the largest panicles of any variety. The flowers are a lovely shade of blue. Alphonse Lavallée has blue flowers shaded with violet. Emile Lemoine has large flowers of lilac colour. La Tour d'Auvergne has double flowers of large size and a shade of violet-purple. Mme. Jules Finger has satiny-rose flowers and is very fragrant. Leon Simon has coral-coloured buds changing to blue. Michael Buchner has pale

purple-lilac coloured flowers. Duchesse d'Orleans has pale blue and pink flowers, produced on very long panicles constituting a variety of a very elegant sort. Philemon has a broad, rather short panicle of dark red flowers. Ville de Troyes has claret-red flowers producing upright panicles. Mme. F. Morel has huge panicles with extra large blossoms of purple colour. Mme. Briot is bright red. Gloire de la Rene has red buds changing to violet. Professor Stockhart has flowers of a lilac shade of blue. Gloire de la Rochelle has rosy-lilac flowers changing to a light shade of blue. Mme. Krentzeri has large spikes of red flowers of rather small size. Hyacinthiflora is a very pretty variety with pale blue flowers produced in long, rather thin, panicles. Pasteur has erect trusses of large flowers of waxy red colour changing to Mulberry red. *E. Molyneux*,

variety of Plane it is, it may be stated that, on a careful examination of a large number of specimens, the variety *P. o. acerifolia* was found not only more commonly distributed, but likewise better suited for town planting than the typical *P. orientalis*. This valuable variety is readily distinguished from the American Plane (*P. occidentalis*), with which it is not infrequently confounded, by the many fruit "balls" which are attached to each peduncle, the fruits of *P. occidentalis* being for the greater part produced singly. But not only because it succeeds so well as a town tree is the Oriental Plane much sought after; the large size to which it grows, coupled with the handsome, finely-cut leaves and easy habit of growth, render it one of the most ornamental of trees. Another good quality is that it succeeds extremely well in soils of the very opposite qualities. In mid-

winter the beautifully-marbled stem of grey and yellow caused by the shedding of the bark in great irregular patches, renders the Plane one of the most picturesque of our woodland trees. In Portman and Manchester Squares specimens have attained to a size rarely exceeded by the tree when growing under more favourable atmospheric conditions. Other examples of equally rapid growth and development are the beautiful trees in Bedford, Russell and Gordon Squares, also in Lincoln's Inn Fields, many being fully 70 feet in height, with a branch spread of 80 feet and a stem girth of from 5 to 7 feet at 3 feet from the ground level. No doubt in all these cases the healthy condition and giant proportions to which they have attained are mainly due to the care with which the trees were planted and to good management in timely pruning and providing ample room for the development of root and branch. But in many other of the London squares, where the atmosphere is by no means pure, the Plane tree may be seen in all its glory of leaf and branch. It is, however, not only in the squares and gardens of the great metropolis that the Plane thrives in a satisfactory manner, but even where the tree is hemmed in by buildings. There are many examples at Cheapside, in the Tower of London, at Ludgate Hill, and in not a few of the old and disused churchyards, where the heated, dusty, and otherwise impure atmosphere is almost stifling. The main points to be attended to in producing healthy, well-developed specimens of the Plane are providing a suitable medium in which to plant the tree, careful pruning in the matter of ungainly branches and leading shoots, and allowing a clear space for the spread of the branches. Amongst Plane trees growing in very confined positions, the following may be mentioned:—

THE WOOD STREET PLANE TREE.—This famous tree, which stands at the left-hand entrance to Wood Street from Cheapside, marks the site of St. Peter in Chepe, a church which was destroyed by the Great Fire (1666). The terms of the leases of the houses at the west-end corner are said to forbid the erection of another storey or the removal of the tree. This tree is in a healthy condition, as is evidenced by the growths which have been made since it was pollarded about three years ago. It is gratifying to know that this pruning was, unlike much of such work in London, carried out in a practical and sensible fashion, and has interfered but little with the original appearance of the tree. The smooth, well-rounded stem rises for 30 feet without a branch, the diameter being about a yard through at breast high. As late as 1845 rooks built their nests in this tree.

THE PLANE IN STATIONER'S COURT.—This is a magnificent specimen, though growing in a very cramped and confined position, the branches on all sides nearly touching the surrounding buildings. The tree is in excellent health. It has a large, well-formed stem, but unfortunately, owing to "snag-pruning," the outline has been rendered somewhat unsightly. This Plane tree, which grows in the Court of Stationers' Hall, Ludgate Hill, is much prized by the residents around.

THE DEAN'S COURT PLANE TREES.—Though growing in a very confined and dusty position, these two Plane trees have attained to a height of fully 60 feet, and are healthy and well-developed.

IN STAR YARD, by the Law Courts, there is a large and well-developed Plane tree, which is growing in so cramped a position that it has hardly room for perfect development of either root or branch. In Amen Court there is also a large Plane tree growing contiguous to lofty buildings. Taking everything into consideration, I doubt whether any other forest tree is of equal value with the Plane for town planting. *A. D. Webster.*

MUSHROOM CULTURE.

FEW vegetables are more esteemed than Mushrooms, and provided there are reasonable means for cultivating them and a good supply of material, they may be had in perfection throughout the year. It is not necessary to expend large sums of money on so-called up-to-date Mushroom houses. Excellent results are obtainable from beds cultivated in the most rudely constructed buildings, and even in the open air. The ideal place for growing Mushrooms is either in caves or cellars where the temperature throughout the year is more or less uniform. In such places the atmospheric conditions, too, are just what the fungus delights in, and, where such places are available, very little difficulty will be experienced in keeping up a regular supply. The following remarks refer more especially to Mushroom production in ordinary sheds. My best results have been obtained in a large, lean-to, open shed built on the north side of a high wall, with the front of the building boarded up in the ordinary way and the inside thatched. The beds are made 5 feet wide on either side, with a pathway 3 feet wide down the centre of the shed. No artificial flooring is used,

temperature falls to about 75°. The spawn should be broken into pieces about the size of a chicken's egg. These should be dipped in warm water, and placed 3 inches deep in the manure in rows made 9 inches apart. In about a week's time the beds should be soiled, using, if obtainable, the top spit from an old pasture. Rub the loam through a coarse-meshed sieve, place it on the bed to a depth of about 2 inches, then moisten and beat it well with the back of a spade. Mushrooms may be expected in about six or seven weeks. During the summer months the whole of the interior of the shed should be thoroughly syringed two or three times a day, and at no time must the house be allowed to become dry. Always use tepid water, and occasionally give the beds a soaking with warm water. When the crop shows signs of exhaustion farmyard liquid manure must be given. In gathering the Mushrooms take great care to twist the stems out cleanly; do not cut them. Although we have an excellent Mushroom house at Elstree, we get far better results from this open shed. In fig. 12 is shown a portion of the crop of one of the beds in this structure. *Edwin Beckett.*

THE ALPINE GARDEN.

SAXIFRAGA AIZOON LUTEA.

THERE are two yellow or yellowish-flowered varieties of Saxifraga Aizoon, viz., *S. A. lutea* and *S. A. flavescens*. Both are very desirable plants for the rock-garden. In their growth and flowering the two plants might well be referred to as "major" and "minor," respectively, and the terms might not inaptly be extended to the blossoms. In both instances the yellow colour is somewhat transient, for after a few days the blossoms develop a creamy tone. In the early stages of flowering the pale canary or primrose-coloured flowers are very pleasing, and one cannot but long for a greater fixity of tone in these charming varieties. There is not the least difficulty attending their cultivation, for in quite light and ordinary soils, as well as in those of a more loamy character, the plants grow freely. *S. A. lutea* has the longer leaves, and the rosettes are of a more open character than those of the other variety. All the varieties of *S. Aizoon* flower in June. Their freedom of growth soon enables them to form a fine colony or group. Not only on level ground, but also in chink and crevice—provided a good bank of soil is at hand—both these Saxifragas grow well.

PRIMULA SIKKIMENSIS.

THE Sikkim Cowslip is one of the most desirable of the hardy species of this extensive genus of flowering plants. It is, however, not a commonplace subject, even at the leading exhibitions. Many years before *Primula rosea* was known to cultivation this lovely yellow-flowered species was well known, and while the former is grown in thousands, *P. sikkimensis* is rarely seen in cultivation. How much the sparse habit of growth, and tall, somewhat thin and lank stem has been the cause of its unpopularity is difficult to say. It might have been otherwise had some hardy plant nurserymen made a speciality of it and displayed it not in isolation, but in groups of a hundred plants or more, so that the soft and beautiful colour and general effect could be realised. There is a great charm about the plant, and much beauty in its drooping flowers. The very erect carriage of leaf and inflorescence would almost suggest the necessity of grouping to show this fine plant to perfection, for just as it is desirable to group freely such plants as the Michaelmas Daisy, so is it needful with this *Primula*. The plant seeds freely and, although it is a perennial, much the best results are obtained from young plants raised from seeds. *E. H. Jenkins.*

FIG. 12.—MUSHROOMS CROPPING IN AN OPEN SHED

but ordinary deal boards, to the depth of 18 inches, are used to keep the manure in position. No artificial heat is employed, but during severe weather a good depth of fresh manure is placed on the path, and this is turned over every morning. One of the most important items in the culture of Mushrooms is the collecting and preparation of the manure. This should be used, as far as possible, when fresh, for it is a mistake to allow it to remain too long in a manure pit. It is not advisable to take away the whole of the litter. If the shortest of the straw is retained, it will be found that the spawn will grow more freely and the beds will continue to bear for a longer period. The manure should be placed about 3 feet deep, and turned regularly every morning for ten days or so, taking care to put that which has heated most on the outside. After this it will only require turning about every third morning. In about 18 or 20 days the material should be ready for forming the beds. In carrying out this work, the manure must be made very firm by means of long-handled rammers. After this operation, it frequently happens that the heat increases, in which case the spawn should not be inserted until the

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

SALLOW AND ITS USES.—The Sallow (*Salix caprea*) is such a useful tree that one might expect to see it more frequently planted in those marshy, and usually good-for-nothing, situations that it loves so well. No plant is more easily established, for it is simply necessary to cut branches of medium size into short lengths and stick them in anywhere. Nine out of ten so planted will usually grow, and in course of time make good trees. The growth of all Willows is rapid, and the timber they produce may be utilised for various purposes in from 12 to 15 years after planting. If good-sized trees are desired, it will be necessary, when the cuttings have well established themselves, to remove all except the lowest four or five shoots in order that the whole strength of the tree may be thrown into those remaining. Sallow thrives best where its roots can come in constant contact with water, but it will grow in comparatively dry situations. It is useful for forming a sort of ready-made hedge, as it can be planted in 6-foot or 7-foot lengths, and if these are put in a few inches apart the gaps caused by those that die will not be noticed. The shorter the lengths planted, however, the more bushy will be the hedge. The wood of Sallow in stout lengths is much used for piles when these are required to shore up newly-moved ground or for being built upon. In the latter case, if driven in some time beforehand, the lengths will begin to grow and strike roots into the soil, holding all firmly together in a compact mass and forming a stable basis for light buildings on shaly ground. The tree also roots readily in newly-moved soil, and can be allowed to do so as long as required, when growth may be stopped by cutting down the posts or piles to the ground level. For ordinary fencing Sallow is very suitable, as it is light and tough and splits easily. But perhaps the best use to which this tree is put is the making of truck-baskets (or "trugs"), of the pattern so extensively manufactured in Sussex and so useful in the garden. The wood is easily bent to shape and lasts for a number of years. The smaller growths are employed for Hay-rake handles and also for the rakes themselves, while the twigs make a very passable substitute for osier, and can be utilised for many of the rougher kinds of basket work. Next to the cricket-bat Willow, the Sallow is probably the most useful member of this extensive family. *East Sussex.*

EREMURUS ROBUSTUS FAILING.—My attention has been drawn, in several gardens I have visited, to the complete failure of plants of *Eremurus robustus*, and as I have been unable to ascertain the cause I shall be glad if any reader can help to solve the problem. It is an important matter, as these noble plants are increasing in general favour and their probable loss in gardens is not to be viewed with equanimity. I do not suggest that *E. robustus* is liable to fail in every garden—my observations lead me to think the contrary, but although now much cheaper than before, and the pecuniary loss may not be great, the disappointment to many gardeners is considerable. So far as I have seen, there has been nothing to account for the death of the plants. I have, for example, in my study the photograph of a fine plant which lived for several years in a garden not far from my own. This flowered well and continuously, always producing a fine inflorescence. The plant, however, failed to reappear after a winter of no more than ordinary severity, and certainly not in itself sufficient to account for its death. A more recent instance has come under my notice. In a garden where I have in former years seen some of the finest spikes of *Eremurus robustus* I was informed of the loss of several plants, and one or two were pointed out which appeared to be dwindling away without flowering this season. The group in flower was composed of plants which had been a shorter time in the garden, and it is earnestly to be hoped that they will be more fortunate than their predecessors. In neither of these gardens could it be said that climatic conditions were unfavourable; in fact, they are much

more suitable than in many places where the species still succeeds. They are well protected from cold winds, whilst the soil is a good loam. I am inclined to attribute the trouble to fungal disease. So far as I can learn, the other species of *Eremurus* do not show the same losses as *E. robustus*. *S. Arnott.*

APPLE CULTURE AT SWANMORE PARK, BISHOP'S WALTHAM.—The market cultivation of Apples has for some years past been practised under the management of Mr. E. Molyneux at Swanmore Park, Bishop's Waltham. Some twenty years since six acres of land were planted with about 2,000 Apple trees. The site is an exposed one, and the trees frequently suffer damage from west and south-west winds. As a protection, tall hedges of *Thuja gigantea* (syn. *T. Lobbii*) form an effectual as well as a pleasing and novel screen. These Conifers have been allowed to grow about 20 feet high. They are kept closely clipped at the top and sides, their width not exceeding 20 inches. On the north side is a dense Quick hedge also 20 feet in height. For a few years the Apple trees did remarkably well, but suddenly it was found that the growths were unsatisfactory, and the fruit far from what it should be. Fortunately, Mr. Molyneux was able to determine the cause, and now practically every tree is heavily laden with fruit and healthy foliage. The trees, indeed, are so heavily cropped that it will be necessary in the great majority of cases to thin the fruits liberally. Mr. Molyneux attributes his success mainly to two causes. Each winter the ground is forked over and a fair quantity of good farmyard manure is worked into the soil, and, secondly, winter spraying is practised. Not a particle of Lichen or American blight could I discover on the trees. In addition, many of them have been lifted, and the roots brought to the surface. Worthless varieties have been headed down and regrafted. Nearly every known variety has been tested, but those which do best are, in their order, as follow:—Dessert varieties: Worcester Pearmain, Lady Sudeley, Cox's Orange Pippin, Ben's Red, and Beauty of Bath; Kitchen varieties: Lord Grosvenor, Warner's King, Blenheim Pippin, Bramley's Seedling and Norfolk Beauty. The last-named variety is cultivated extensively. The great majority of these trees are grown in bush form, the remainder being standards. *E. Beckett.*

AUBERGINE.—The culture of this vegetable is simple. The seeds require to be sown in March and the plants potted on as required, using good loamy soil as a rooting medium. Fruits of a good size should be ready for use in August. Important points to observe in the culture of Aubergines are to keep the plants in a moist, warm house, not to shade them, and to train them to a single stem. The number of fruits on each plant must be determined by the size of the pots in which they are grown. I have cut fruits weighing 1 lb. from plants grown in 10-inch pots, allowing four fruits per plant. Inferior fruits were on sale last season at 3d. and 4d. each, but good fruits of the New York Purple variety realised 6d. each. *Sidney Lawrence.*

THE RAINFALL, 1909.—Mr. E. Beckett states in his weekly "Calendar" for July 3 that the rainfall at Aldenham in the first six months of the present year was not more than 8 inches. The rainfall in these gardens for the same period was 14.03 inches. *J. S. Higgins, Rüg Gardens, Corwen, North Wales.*

CARNATIONS AT PORTER'S PARK.—For some years these famous gardens have been noted for Carnation culture, and especially the culture of *Souvenir de la Malmaison* varieties to flower in winter. The owner, C. F. Raphael, Esq., has devoted many glasshouses to Carnations, and the management is effectively carried out by the gardener, Mr. A. G. Grubb. On many occasions excellent groups have been exhibited from Porter's Park very early in the season. A large contribution was to have been made to the Holland Park Show on July 6, and on the 3rd inst. I visited Porter's Park specially to see those plants. But I found Mr. Grubb almost in tears, for, owing to the dull weather,

the blooms had not fully developed, therefore the idea of exhibiting them at Holland Park was abandoned, and, instead, they will be shown at the Vincent Square Hall a fortnight later. The plants are remarkable for their vigour and fine flowers. I noticed 200 plants of Princess of Wales in 8-inch pots, with eight and nine flowers to a plant. "The Colonel," a fine new red variety, with flowers nearly 6 inches in diameter, was at its best. King Arthur, Lady Rose and King Oscar were also especially fine. The collection included 700 plants in 8-inch pots, and 1,000 plants in 6-inch pots. Tree Carnations for winter-flowering are grown in equal numbers. *E. Beckett.*

"DUTCH" IRISES.—The hybrid xiphium Irises raised by Mr. C. G. Van Tubergen, jun., a good example of which was shown in the illustration of *Iris Rembrandt* on p. 3, are indeed a great acquisition. Six varieties have been growing here for the last two seasons and have proved remarkably vigorous. There can be no doubt as to their superiority in point of size and colouring, and it is equally true that they flower at least a fortnight earlier than the ordinary Spanish Irises. Last year the first flower opened on June 1, this year they were even earlier, and I had some in flower on May 28. I find, too, that they multiply very rapidly, and the 18 bulbs that Mr. Van Tubergen very kindly gave me in 1907 have now increased to considerably over one hundred. *W. R. Dykes, Charterhouse, Godalming.*

NOTES FROM A "FRENCH" GARDEN.

THE wet weather during the past fortnight has checked the growth of Melons: therefore, it has been necessary to use the greatest caution in ventilating the frames and in watering the plants. The slightest excess of water at such a period causes great injury. The earliest batch has now the fruits of full size. The young shoots require to be thinned out, and the leaves round the fruits must be removed to admit light to the fruits. The fruits must be turned to allow the parts lying on the ground to ripen properly.

The Cauliflowers planted behind the first batch of Cos Lettuces under the cloches are now ready. The dry weather in May and subsequent change have forced them into flower too early to form nice heads. Those grown early in the open have done much better.

All the old manure beds have now been dug over, and two beds have been made into one large one. The ground was levelled, trodden, and then raked. We have planted Celery plants at 18 inches apart each way on the flat. Some beds have also been planted with Endive "La Rouennaise," at 10 inches apart each way. In three weeks' time we shall plant Cauliflowers, one row between every three rows of Endive. Endive does not do well at this time of the year when grown alone, as the soil is too rich in manure; but by planting Cauliflowers among the plants, this difficulty is overcome. At the same time, the Cauliflowers must not be planted too soon, or they would overtake the Endive.

The varieties "La Ruffec" and "La Meaux" are unsuitable for planting on old manure beds, the crown of the young leaves decaying when the plants are three parts grown.

We are now planting in the open ground a batch of Endive "La Ruffec," at 12 inches apart each way; the crop will be ready for the market early in September.

We shall sow next week a batch of Lettuce "Palatine." This variety does well in heavy soils during the summer months. The seeds will be sown broadcast, and the seedlings will be pricked off four weeks after the sowing.

The prices of vegetables grown under the French system have been well maintained during the spring, but they show a tendency to fall, which goes to prove that this method of cultivation has spread over the country. *P. Aquilias.*

The Week's Work.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Late vines.—The final thinning of late Grapes must now be carried out, if it has not already been done. This is an operation, which requires careful and experienced hands. Any damage caused by dirty scissors or by rubbing of the berries will be evident when the Grapes are ripe. It is necessary to thin the berries in the interior of the bunches severely, but the shoulders require different treatment, it being desirable to have them well furnished with berries. If there is at present a good spread of foliage over all the trellis, the lateral growths should be kept pinched out. In cases where the foliage is meagre, growth must be encouraged, it being essential that late Grapes should have a good covering of foliage, as they are required to keep in good condition for a long period after they are ripe. If the borders have not already been mulched, this work should be done at once, following the operation by applying a liberal watering. Should mealy bug be present on the vines, the pest must be constantly sought after, for if allowed to enter the bunches it causes infinite damage. The month of June was notable for low temperatures and lack of sunshine, so that it was necessary to use more artificial heat than usual to maintain the temperatures required in the fruit houses. Extra care will be needed to prevent scorching of the foliage, because owing to the absence of sunshine, the leaves are unusually soft and tender. Air must be admitted early in the morning on fine days, increasing the amount as the sun gains power. During changeable weather the ventilators will need constant attention in order that the temperatures may be maintained as equable as possible.

Ripe Grapes.—Ripe Grapes now hanging on the vines should be shaded a little from the sun's rays. Black Grapes quickly lose their colour when exposed to sunshine. A double thickness of fish netting, or a little limewash syringed over the glass will answer the purpose. Keep a little warmth in the water pipes to dispel damp during dull or wet weather.

Tomatos.—Seeds should now be sown for raising plants to fruit in winter. These plants must be grown sturdily from the commencement. Sow the seeds thinly in pans and place them in a gentle heat. When the seeds have germinated let the pans be removed to a position near to the glass in a light, well-ventilated structure. As soon as the seedlings have made the second leaf pot them into 3-inch pots, using a fairly light compost, and again place them on a shelf near to the glass. Keep the front ventilators closed for a day or two till the roots are again active, after which a free circulation of air will be necessary. When they have become well rooted into these pots they will need another shift into pots 6 inches in diameter, using a compost slightly rougher than before. Turfy loam, a little manure from a spent Mushroom bed and a sprinkling of finely-crushed mortar rubble will be suitable. The soil must be rammed firmly in the pots, or the plants will make long-jointed growths. Plants fruiting in pots need copious supplies of water and, if the pots afford room for another surface dressing, this should be applied.

Melons.—The plants are growing rapidly, and it is necessary to pay timely attention to the stopping and regulating of the shoots, but do not remove too much leafage at one time, as this is often the cause of the main stem splitting and thus allowing canker to enter. Plants on which the fruits are swelling must not be allowed to become dry at the roots. They will need plenty of feeding, and for this purpose liquid manure made from cow dung is best. This may be alternated with some chemical fertiliser. Gradually withhold water from the roots, and keep the atmosphere dry as the fruits approach maturity. Plants in frames will need close attention when they are in flower to ensure the fruits setting. Each flower must be pollinated in the middle of the day. During the flowering stage the atmosphere of the frame must be kept dry, and the air allowed to circulate, but cold draughts must be avoided. The middle of the present month will be late enough for sowing seeds for the last batch of plants, unless fruits are required later than October.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Cattleya.—The strongest plants of *C. Gaskelliana* and the autumn-flowering varieties of *C. labiata* have made considerable progress with their new growths; in some cases the pseudo-bulbs and flower-sheaths are already formed. At this stage the plants should be elevated well up to the roof glass, for if kept low down upon the stage they keep wet for too long a time after watering, and this has a tendency to cause decay in the new pseudo-bulbs. Each time the compost becomes properly dry afford the plants a good watering until it is seen the growths are mature and the flowers are commencing to push up through the sheaths, when the supply should be gradually diminished. Among the plants of *C. gigas* which have finished blooming, and those that failed to flower this season, there may be some which require re-potting. The best time for this operation is about a week or a fortnight after the flowers have faded. Directions as to the kind of compost to be used were given in the Calendar printed in the issue for May 8. After the plants have been repotted it is an advantage to place them in a house which is somewhat drier and more freely ventilated than the *Cattleya* house. Plants of *C. gigas* should not be too copiously watered after flowering, or they will start away into growth instead of resting. All that is needed is to afford sufficient water to encourage the new roots to obtain a firm hold of the compost: even after they have become re-established they will need very little water until growth recommences. Plants of *C. Dowiana* and *C. D. aurea* may also be repotted as they pass out of flower. The same kind of treatment as advised for *C. gigas* will suit them, but they should be suspended in the lightest part of the *Cattleya* house during the ripening process.

Lalia anceps.—In the *Cattleya* or Mexican division, plants of *L. anceps* and its numerous varieties, also several of its hybrids, as *L. Leliouxii*, *L. Crawshayi*, *L. Edissa*, *L. Nemesis*, *Lelio-Cattleya Liptonii*, and *L.-C. Wrigleyi* are now growing and rooting freely, whilst some of the *L. anceps* are developing flower-spikes with the growths. Now is the time to afford these plants copious root waterings. Remove the roof shadings early in the afternoon, damping well between the pots and under the stages, and spraying the plants overhead with clear water. Maintain a warm (with sun-heat if possible), moist atmosphere throughout the evening, and last thing at night open the bottom ventilators; if the weather permits, the top ventilators may also be partly opened. Early in the morning close the top ventilators and give the house a good damping down.

Lalia pumila.—Such cool-growing plants as *L. pumila*, *L. praestans*, and *L. Dayana* are developing new growths. If a light position can be found for them in the cool house they may remain there until the flowers show, but at that stage they should be removed to the intermediate house. These plants may be afforded fresh rooting material when they begin to make roots. They are best cultivated in shallow pans that can be suspended close to the roof glass. From the present time afford the plants plenty of water at the root until the new growths are made up. The thin bulbous *L. harpophylla* should be kept in a light position in the cool house till the growths are nearly completed, when it should be removed to a warmer house, such as the *Cattleya* house, there to remain until the flowers are past.

Dendrobium requiring cool treatment.—In the *Odontoglossum* house the blue-flowered *Dendrobium Victoria Regina* thrives admirably when fastened on moss-covered rafts, allowing the pseudo-bulbs to hang in a semi-pendulous position. The plant should be suspended to within a foot of the roof glass at the warmer end of the house; it should be taken down several times each week, so that the moss can be sprayed with water sufficient only to keep the plant alive. When grown in this manner the plant is very floriferous. *D. infundibulum* and its variety *Jamesianum* also thrive best when suspended in a cool house. The former has flowers with a golden-yellow throat; in the other the throat is coloured cinnabar-red. Small plants may be grown in shallow pans suspended to the roof rafters, while larger ones may be grown in pots elevated well up to the roof-glass. Both varieties

root and grow well in equal parts of *Osmunda* fibre and *Sphagnum*-moss chopped up moderately small and well mixed together. Pot each plant quite firmly, and during the operation add plenty of small crocks to the compost so that water will pass away freely. Being an evergreen, the plant should never be allowed to become quite dry, even whilst growth is dormant.

Small Zygotepalums.—*Zygotepalum* (*Pro-meneae*) *citrinum*, syn. *xanthinum*, is developing its pretty flowers of citron-yellow colour. It is a dwarf-growing species, and, if suspended alongside the well-known *Odontoglossum Rossii* and others that require cool conditions when making their new growths, it will thrive admirably. A little extra warmth should be allowed when the flowers commence to open. Similar treatment should be afforded the allied species, *Z. stapelioides*, *Z. Rollisonii*, and *Z. micropterum*.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

Campanula persicifolia.—This species and its white variety *alba* is very useful for conservatory decoration from early spring until summer. Cuttings should be made of the side growths obtainable from pot plants, which have been forced, or from plants growing in the hardy flower borders. They should be inserted singly in small pots, and placed in a cool frame shaded from bright sunshine. The atmosphere should be kept close until the cuttings have formed roots, when they should be grown in as cool conditions as possible. When the small pots have become filled with roots transfer the plants to 5-inch or 6-inch pots, using a soil consisting of loam, leaf-mould, and a little decomposed manure. The plants will winter well in a cold frame, and at the turn of the year batches may be forced easily if placed in gentle heat.

Streptosolen Jamesonii.—As the roof-plants cease to flower they should be pruned hard back, for this species flowers best upon the growth made during the previous summer provided it has become thoroughly ripened. In order to ensure this ripening, the shoots should not be allowed to grow too thickly together, and they must be exposed to the sunshine. If large specimen pot plants are required they should be treated in a similar manner at the commencement, but after they have made a little fresh growth they should have some of the old soil removed and be re-potted. A batch of cuttings should be rooted each year so as to keep a succession of young and strong plants to take the place of the older ones.

Climbing plants.—These plants, whether growing in the stove or greenhouse, will require frequent attention. Their growths must be kept well thinned out, and the early-flowering kinds will require either a severe pruning or a shortening of the shoots. The old light-flowered *Heliotrope* makes a good cool-house pillar plant, and it may be safely pruned at any time of the year. This severe treatment is necessary, as otherwise the growths become long and straggling. *Habrothamnus* or *Cestrum* species should be pruned hard as they pass out of flower. The flowers of *Cestrum aurantiacum* are useful for evening decorations, at which time the flowers, which smell somewhat unpleasantly by day, emit a strong perfume, as of Tangerine Oranges. The growths of *Lapageria rosea* should be trained to hang downwards, that they may the better display the flowers.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODGE, Bart., Leonardlee, Sussex.

Trimming evergreen hedges.—The present is the proper time to clip hedges of Box, Yew, and similar evergreens. In the case of dwarf plants of Box used as edgings to garden paths, it is a good plan to stretch a garden line down the centre of the row. This will be a guide in cutting, but the work should be done by a careful man who has a "straight eye." Box edgings, unless they are regularly attended to, soon become untidy. The plants are often injured by weed killers sprinkled along the paths. Whenever these corrosive substances are used, planks should be placed so as to protect the foliage. Hedges of Yew are best trimmed with a small

fang-hook, with which the work can be done much quicker than when shears are employed, although the final trimming may have to be done with hand-shears. In the case of small evergreen hedges around flower-beds and Rose gardens, it is generally sufficient to trim the sides only unless the shoots at the top are growing very irregularly. The common Laurel (*Cerasus Laurocerasus*) needs to be cut with great care. Shears should not be used, as these cut many of the leaves in halves. The pruning can be done with a sharp pair of scateurs, but a knife is best. Hedges of Rhododendrons should also be pruned back wherever necessary.

Mombertia.—These are valuable for furnishing a display of flowers in late summer. In order to obtain the best results the bulbs should be planted fairly widely apart and be given a mulching of manure with an occasional dusting of soot. If they are afforded moisture whenever the ground is dry, sometimes using soot-water, the plants will develop to a height of 4 or 5 feet, and produce correspondingly strong flower-spikes.

Dahlia.—Attend to the staking and tying of the shoots, which are soon broken by the wind. If the weather turns dry and hot, afford a mulching of manure from either a spent hot-bed or Mushroom house. If blooms are required for exhibition purposes the shoots should be thinned and the flowers disbudded.

Roses.—The climbing and rambling varieties are developing strong shoots. These must be carefully secured or they will be liable to injury from high winds. All classes of Roses are looking extremely well. After the first crop of blooms is past the plants should be given another top-dressing of manure, and this should be lightly forked into the soil. The variety Mme. Alfred Carriere is a charming variety for training to a pole or pergola. The colour is a light salmon, suffused with white. The plant has a good constitution, flowering freely and early. A good companion variety is Reine Olga de Wurtemberg. Of the newer varieties of climbing Roses, Hiawatha is doing splendidly now that the plants are established. For a west or east wall nothing is more suitable than the elegant variety named William Allen Richardson.

Bedding plants.—The flower garden will now be planted with its summer occupants, and no pains should be spared to keep it attractive. All dead flowers must be removed at the earliest opportunity, any staking neatly done, weeds kept down, and the edges and borders made tidy. Where carpet bedding is employed the plants must be kept distinct by frequent pinching of the shoots. See that the lawns, paths and drives are maintained in a state of tidiness.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Strawberries.—The present Strawberry season, which promised so well early in the season, has so far proved very disappointing. Fine weather is needed to ripen the fruits. As I write the fruits have not been dry for many days, slugs have increased to an alarming extent, and are ruining the fruits even before they colour. The fruits generally are deficient in flavour. Some people favour the cultivation of only one or two varieties, such as Royal Sovereign, but in a season like the present those who cultivate a number of varieties for succession may at the least hope that later varieties will have better weather in which to mature their fruit. The late varieties look exceedingly well, and, as the weather is cool as well as damp, they are backward, many being only in bloom. Laxton's Latest, Givon's Late Prolific, Latest of All, and Elton Pine are four reliable varieties for late fruiting, and if the weather takes a favourable turn, may redeem the season from failure.

Strawberry runners.—The plants reserved for the production of Strawberry runners for forcing or for planting on south borders will now be showing runners in abundance. These should be layered into small pots in good time, and before they root into the ground. The question of soil for these pots is not very important, but if preference can be given, a good loam mixed with some manure from a spent Mushroom bed is the best procurable. If

dry weather sets in it will be necessary to water the layers every afternoon. Do not allow many runners from each plant, but cut off those which are not laid into pots.

Grafts.—Examining any fresh grafts, and if the scions are growing freely loosen the ties in cases where more space is necessary. Keep the long shoots tied to stakes or wires to prevent them getting damaged by storms. Clear off all shoots and suckers below the union as soon as they are noticed. If a dry period sets in, apply a mulch and give frequent waterings.

General work.—Continue to stop and thin the shoots on all fruit trees, as recommended in previous Calendars; especially all side and lateral growths not required for extending the tree. Burn the prunings. When the stopping and tying is completed, give the trees a thorough washing with water applied by the garden engine. See that nets are placed over all fruit about to enter on the ripening stage. Complete the thinning of Apples and Pears, as these fruits are swelling very rapidly.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Celery.—The earliest plants should now be sufficiently advanced for blanching. The most economical and simple method of effecting this is to use strips of brown paper. First of all carefully remove all secondary shoots which spring from the base of the plant, also any leaves that are damaged or split. Examine the foliage with scrupulous care for the Celery maggot, and, if any be found, destroy them whilst still young by pressing them with the thumb and finger. Give the plants a thorough drenching of water at the roots, and in the middle of the day, when the leaves are driest, proceed to place the paper round each plant. The hands should be cut about 5 inches in width, and they should be fastened securely, but not too tightly, round the bottom of the plant. A very small quantity of fine soil should be placed round the base, adding a little fresh soot. In eight or ten days a further band should be added to the plant, the process being continued until a sufficient depth of blanching is secured. Although this method is not new, it is surprising that it is not universally adopted. In the case of early Celery, especially, it has many advantages over that of banking the plants up with soil. The blanching is more perfectly done, the stems are not liable to be injured with worms or slugs, the method is economic, and the plants can be fed and watered much in the same way as if blanching was not in operation. Successional plants should be kept perfectly clean, well watered, and the surface soil should be moved frequently with the Dutch hoe. Lose no time in completing the planting of the latest sowings. Though single rows are to be preferred, two or even three rows may be grown in each trench, but in such cases a little extra space should be allowed between the plants.

Spring-sown Onions.—It is now necessary to feed the plants liberally, either with liquid manure or some patent manure specially suitable for vegetable crops. In the event of dry weather liberal waterings will be indispensable.

Chicory.—This should receive careful attention at this season of the year. Early sowings need thinning out that the plants may be left at 8 to 12 inches apart. The surface soil should be frequently stirred between the plants. If from any means the crop has failed, another sowing should be made at once on deeply-tilled, rich soil having a south aspect.

Parsley.—Apply a dusting of fresh soot to the Parsley once each week, and thoroughly hoe the soil between the plants.

Spinach.—This vegetable is highly esteemed throughout the whole year, but at no time is it more difficult to procure in good condition than the period from the commencement of August to the middle of September. The seed should be sown thinly on rich ground situated in a fairly shady part of the garden.

Radishes.—Sow small quantities of seed every 10 days in a shady part of the garden, and afford the plants frequent waterings.

Dwarf or French Beans.—These being sometimes preferred to Scarlet Runners, the new form

of Runner French Bean is valuable in keeping up a supply of pods for the table. Where this type is not cultivated it will be necessary to make frequent small sowings, but after this date the seeds must be placed in a warm, sheltered part of the garden, or where protection can be given them in the event of early frosts. These Beans require from 10 to 12 weeks from the date of sowing before their pods are ready for use. Plants raised early in cold frames are now yielding good crops. They require to be kept well supplied with moisture, both at the roots and overhead; diluted manure water should also be afforded liberally. The plants are benefited if the pods are harvested directly they are of a suitable size.

THE APIARY.

By CHLORIS.

Importance of a prolific queen.—Many colonies do not produce a satisfactory amount of honey, and the beekeeper is often at a loss to understand the cause. The hive should be examined, and if it be found there is little brood compared with other stocks, it is a sign that the queen needs to be replaced. To secure the greatest possible success, it is needful to have at hand some spare queens, those in their second season being best. Each colony should contain a second-year queen, and then two or three surplus queens will be all that are required in case of accidents. Queens are very expensive to purchase; therefore it will be wise to rear some.

Raising of queens.—To produce the best queens, two hives are required, and these should contain bees that produce a large quantity of honey. Each hive should be headed by a two-summer-old queen. Both the stocks selected should be fed to stimulate breeding; one should be provided with worker comb only and the other with drone comb placed in the centre of the brood chamber. Whilst the drones are hatching, place in the other hive a frame containing a sheet of comb foundation, the bottom cells being of a size to produce worker bees. The bees will soon form cells and the queen will lay eggs in these. In two or three days after this, the old queen may be removed and used elsewhere, or destroyed if not required. The best queens are always raised from eggs laid at the edge of the comb; therefore cut back the comb close to the cells containing eggs and enlarge the cavity with a conical piece of wood. In eight to ten days there will be a number of queen cells ready to be utilised by the beekeeper in forming nuclei. Two combs containing honey and pollen, with the adhering bees, and another containing brood, should be placed in a nucleus hive. Cut out a hole in the centre of the brood comb about 2 inches in diameter, and in it fix one of the queen cells. (The fixing may be done with pins, but care must be taken not to shake the cell or the queen may be injured.) Proceed in this manner with as many of the queen cells as are required. Place the nuclei hives not less than 6 feet apart. The queen cell will be sealed over on the ninth day after the egg is laid, and in another six days the queen will be hatched; in five days more she will leave the hive to be fertilised. Two days after the queen has hatched it will be best to supply a frame containing eggs, so that the nuclei have young brood in the hive, or they may desert the hive when the queen leaves to meet the drones.

Introducing queens.—This is not an easy operation. If honey is plentiful, the following plan may be successful:—During the afternoon remove the old queen and also the queen to be introduced, and keep the latter in a warm place. Just before dark take out the young queen and place her at the entrance of the hive where she will reign, and, being hungry, she will be at once fed by the bees and proceed with her egg-laying. A pipe-cover cage is needed generally. Place the queen on a stiff piece of paper or cardboard, and over it place the cage, then put the cage and cardboard on the comb, slipping the cardboard away gently. Press the cage firmly into the comb, where there is brood and honey. Feed the bees with syrup and release the queen in 24 hours. After releasing her, carefully note the behaviour of the bees, and if they attack her she must be recaged for another 24 hours. If the bees take no notice of her, then the comb may be replaced in the hive, for she is probably accepted.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, JULY 12—

United Hort. Ben. and Prov. Soc. Com. meet.

TUESDAY, JULY 13—

Saltaire Rose and Hort. Soc. Sh. in conjunction with Nat. Sweet Pea Soc. Wolverhampton Floral Fête (3 days).

WEDNESDAY, JULY 14—

Beckeham Hort. Soc. Sh. Luton Rose Sb. in conjunction with Nat. Rose Soc. Hort. Ex. in conjunction with Agr. Sh. at Louth (3 days). Elstree and Boreham Wood Fl. Sh.

THURSDAY, JULY 15—

Woodbridge Fl. Sh. Great Yarmouth Fl. Sh.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—63°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, July 7 (6 P.M.): Max. 66°; Min. 62°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, July 8 (10 A.M.): Bar. 29.8; Temp. 65°; Weather—Cloudy.

PROVINCES.—Wednesday, July 7 (6 P.M.): Max. 61° Bury St. Edmunds; Min. 54° Yorkshire.

SALES FOR THE ENSUING WEEK.

TUESDAY—

The Freehold Nursery, Carterhatch Road, Enfield Highway, with 8 Greenhouses, Piping, Boilers, Pits, &c., area 2½ acres; at the Mart, Tokenhouse Yard, E.C., by Protheroe & Morris, at 2.

The famous exhortation, **International Exhibitions.** "Wake up, England!" addressed on a memorable occasion by H.R.H. the Prince of Wales to the people of this country is producing its desired effect in various directions. Among these we would mention particularly the efforts which the Board of Trade is making to encourage British manufacturers, traders, and others to take a larger share in important international exhibitions.

In a circular recently issued in connection with the international exhibition to be held next year at Brussels, the welcome announcement is made that exhibitors are no longer to be dependent on a voluntary committee. They are not to be left, as heretofore, to install their goods as best they can whilst engaged in an operation the cost of which they cannot ascertain.

The systematic assistance which the French and Germans have long enjoyed from their respective Governments is to be extended to British exhibitors. To this end the British section has been put under the charge of a special department of the Board of Trade.

We learn that a prominent position in the exhibition has been allotted already to the exhibitors from this country, and that owing to the arrangements made by the British Commissioner-General, Mr. U. F. Wintour, intending exhibitors will be able to know beforehand the total cost of their enterprise. The British section, moreover, is to be treated, with respect to decoration, in a uniform manner; show-cases are to be provided in various sizes and at low rates; so

that those who choose to use them will not be put to any considerable expense on this hand.

A special catalogue will be published in English and French, and a certain amount of space in it will be allotted free for the description of each exhibit.

Transport charges are to be reduced; both railway and shipping companies having agreed to a reduction of 50 per cent. on returned, unsold exhibits, whilst the Belgian State railways will return exhibits to their termini free of charge.

It is to be hoped that this new departure from the old *laissez-aller* methods will meet with a considerable response from the great firms of this country. That in consequence the imperfect representation of their interests at recent important exhibitions will not continue to characterise those held under the new conditions.

It is evident that the international exhibition is a form of advertisement from which no country can afford to stand aloof. It is true also that inadequate representation is but little better than no representation. In the past British exhibitors have suffered a disadvantage; now that this is removed, it would be well for this country to demonstrate to the world that she is still in the forefront of the nations. We published in our last issue a list of the members of the committee appointed to further the interests of agriculture and horticulture at Brussels. At their invitation a number of horticulturists met at the Royal Horticultural Hall on Wednesday evening last to hear an address on the subject by the Earl of Lytton, Chairman of the Royal Commission.

Fixation of Atmospheric Nitrogen.

It is ten years since Sir Wm. Crookes, in his presidential address to the British Association at Bristol, said "the fixation of atmospheric nitrogen is one of the greatest discoveries awaiting the ingenuity of chemists." Short as the intervening time has been, it has sufficed for the invention and working on a commercial scale of no fewer than three processes to fulfil this object. One of these—the Birkeland-Eyde process—has recently been described in these columns (see *Gardeners' Chronicle*, June 12, p. 380, vol. xlv.). It will be appropriate to refer briefly to the other methods.

The possibility of bringing about the combination of nitrogen and oxygen by the use of electricity was originally demonstrated by Cavendish in 1785, and since his day many workers have studied the question in its scientific and also in its commercial aspects. One class of investigators assumes that, in order to use the electrical energy to the best advantage, it should be distributed over a large number of small sparks or arcs. Birkeland and Eyde, who obtained the first practical success in this direction, cause the electric discharge to burn in a strong magnetic field, and thus spread it out in the shape of a flat, more or less, circular disc. The Badische Anilin and Soda Company, so well known in this country on account of the wonderful enterprise shown by them in successfully introducing the manufacture of synthetical indigo, have adopted, after some years of patient investigation, a somewhat different process. In this, an arc,

several yards long, is produced inside an iron tube of comparatively small diameter, into which air is introduced with a tangential or rotatory motion. A column of arc flame (which is quite stable) is obtained, burning quietly in the axis of the tube. The air passing through the tube in contact with the arc becomes partially converted into nitric oxide, and is then cooled rapidly so as to prevent this being decomposed again. It contains about 2 per cent. of nitric oxide, or nearly twice as much as is given by the Birkeland-Eyde process.

The hot gases are caused to give up a portion of their heat to the air which is entering the furnace, whilst, of the heat given by the arc, only 17 per cent. is lost by radiation, the rest being employed in producing hot water, heating the boilers, and evaporating the calcium nitrate solutions which are produced at a later stage of the process.

The next step is to bring the nitrogen-containing gases into a marketable state. They are passed through an absorption tower, down which water is trickling, and a solution of nitric acid is obtained. This can be run down the tower several times to make a stronger acid. The acid is neutralised with ordinary limestone and calcium nitrate is produced. It is placed on the market under the name of Norwegian saltpetre or air saltpetre, and is quite as valuable a nitrogenous manure as nitrate of soda.

It will be seen that the apparatus is both simple and durable, and the manufacture runs smoothly without interruptions; but cheap water-power is required before the process can be carried out profitably. This is at present being furnished by the waterfalls of Norway where several factories are in course of construction. It is to be regretted that suitable water-power is hard to find in this country. The Badische and the Birkeland-Eyde companies have combined forces and propose to work their processes side by side at Notodden and on the Rjukan and elsewhere.

The third process, with which the names of Frank and Caro are associated, is based on the reaction of nitrogen with calcium carbide, which latter can be so easily obtained by heating lime and charcoal in an electric furnace. The preliminary production of carbide is, however, unnecessary, and satisfactory results are obtained by passing nitrogen over a mixture of lime and carbon heated in the electric furnace. The product is sold as nitrolime or kalkstickstoff; chemically it consists of calcium cyanamide mixed with lime and calcium impurities. The chief point is, however, that it contains 20 per cent. of fixed nitrogen. In the soil, nitrolime gives rise to ammonia, and should be applied some days before the seed is sown. It is not so easy to use and control as saltpetre, and some authorities advocate its conversion into ammonium sulphate before application to the soil.

Air saltpetre has the additional advantage that it also supplies lime to the plant; moreover, the nitrogen contained in it, being in the form of nitrates and nitrites, has a higher value than that in ammonium sulphate or nitrolime.

Whatever be the merits of the respective processes, the world's demand for combined nitrogen is growing so enormously that there is room and to spare for them and others to develop.

OUR SUPPLEMENTARY ILLUSTRATION.—In this country, where *Hymenocallis littoralis* needs to be cultivated in a glasshouse, there are no such magnificent specimens as that depicted in our Supplementary Illustration. Such plants as this can only be obtained in climates that permit of the species succeeding in the open garden, as is the case in New South Wales. Mr. H. W. BRADLEY, of Sydney, who kindly sent us the photograph, supplies the following information:—"I enclose a photograph of a group of *Hymenocallis littoralis* growing in my garden at North Sydney. This was originally one bulb planted 10 or 12 years ago, and practically nothing has been done to it since. The group now measures about 8 feet across each way. At the time the photograph was taken there were from 350 to 400 spikes of bloom all open together, though unfortunately there had been heavy rain the night before, which had broken some of the flowers. The plants are left to take care of themselves from April until Christmas time. At Christmas watering recommences, and the plants are afterwards thoroughly soaked once a fortnight. By the middle of February they commence to open their flowers, and the last blooms fade at about the middle of March. *Crinum Powellii* album, growing close to the *Hymenocallis*, was planted a few years ago as a single bulb, but it is now represented by not fewer than 25 bulbs, most of which bear two flower-spikes in the spring, and flower again in autumn. This species is grown in much the same manner as the *Hymenocallis*, except that the watering commences earlier. In this climate, where these and similar bulbs grow admirably out-of-doors, I cannot think of any better plan than growing them by themselves in small beds set out in the lawn, having nothing else near them to interfere with their general appearance." We may add that *Hymenocallis littoralis* is sometimes known in gardens as *H. adnata* and *Paneratium littorale*. It has pure white flowers. This species and *Crinum Powellii* both belong to the Amaryllidaceæ.

VISIT OF THE R.H.S. COMMITTEE TO EAST BURNHAM PARK.—The number of visitors who accepted Mr. and Mrs. HARRY VEITCH's invitation to visit East Burnham Park on the 1st inst. was fewer than on previous occasions, owing no doubt to the threatening weather on the morning of that day. The weather became finer as the day wore on, and by noon there was bright sunshine. Most of the visitors journeyed by train to Slough Station, and proceeded to East Burnham Park by brake. The gardens looked extremely beautiful, notwithstanding the exceedingly wet season. After luncheon a game of cricket was played, the respective captains being Mr. ICETON and Mr. GEORGE WOODWARD. Mr. WOODWARD's side batted first, but wickets fell rapidly, four of the batsmen being dismissed quickly without scoring, and all were out for 19 runs. The bowlers responsible for this were Messrs. J. G. VEITCH and A. A. McBEAN. The opposing side rapidly secured runs, and soon compiled the total of 78 for six wickets. Mr. F. SANDERS, junr., made the highest score. Whilst the cricket was proceeding others of the party played bowls. Tea was provided, and later the party returned home.

POSTPONEMENT OF SHOW.—Owing to the late season, the annual exhibition of Carnations arranged to take place under the auspices of the Midland Carnation and Picotee Society on July 23 and 29 has been postponed until Thursday and Friday, August 5 and 6.

THE RICHMOND SHOW.—Owing to a printer's error, the award of a Gold Medal to Mr. L. R. RUSSELL at the Richmond Show last week was not mentioned in our report published on p. 11.

JUBILEE OF THE R.H.S. FRUIT AND FLORAL COMMITTEES.—The jubilee of the establishment of the Royal Horticultural Society's Fruit and Floral Committees was celebrated on Wednesday evening last by a dinner at the Hotel Windsor, Westminster. Sir TREVOR LAWRENCE, Bart., President of the Society, presided, and he was supported on his right by Mr. GEORGE BUNYARD, V.M.H., Chairman of the senior Committee, namely, the Fruit and Vegetable Committee, and on the left by Mr. WILLIAM MARSHALL, V.M.H., Chairman of the Floral Committee. There were nearly 70 members present. The President, upon proposing the toast of "The Committees," related a few reminiscences of 1858, the year in which the Fruit Committee was established. At that time, Sir TREVOR LAWRENCE was serving the country in India, and, notwithstanding the unsettled condition of India at that time, he contrived to put his gardening knowledge to a good purpose, introducing English vegetables and Strawberries. He not only succeeded in cultivating many of them successfully, but distributed seeds to other cultivators in various districts. The Floral Committee, said Sir TREVOR, was established in 1859, and Mr. MARSHALL not only remembered that event, but in 1868 he became a member of that body, and has remained a member ever since, having been chairman for the past 24 years. Proceeding to speak of the work the Committees were called upon to do, the President paid a very high tribute to the services they rendered the Society. He spoke of the wonderful development that had taken place in horticulture, and made special reference to the magnificent Strawberries exhibited this week at the Holland Park Show by Lord LLANGATTOCK, stating they were the finest exhibit of the kind he had ever seen. Mr. BUNYARD, responding to the toast, said that he had been a member of the Fruit Committee since 1880. He spoke of the progress that had been made in the past 50 years in improving the varieties of Strawberries, Peaches, and other fruits. He also referred to the presentation that had been made him by the members of his Committee earlier in the evening. Mr. WILLIAM MARSHALL commenced his speech by declaring that the present year was the most remarkable he had experienced. Two months ago he had celebrated his golden wedding, and now all present were celebrating the jubilee of the Committee over which he had presided for nearly a quarter of a century. He interested the company with various reminiscences connected with the Committee, and stated that in the past 24 years he had never had any serious unpleasantness with a single member. On the contrary, he had made many friends and acquaintances, whom he would never have met but for the love of horticulture which actuated them all. The President, with his usual modesty, in replying to a vote of thanks, moved by Mr. WILLIAM POUPART, declared that it was not due in any degree to himself that the Royal Horticultural had prospered, but it was rather due to the attraction horticulture itself possessed for most people. Happily, those who know anything worth knowing of the recent history of the Society know that the influence of Sir TREVOR LAWRENCE has been one of the greatest factors in determining the policy of the Society, and it is the pursuance of that very policy that has placed the Society in the satisfactory position it now enjoys.

MR. GEORGE BUNYARD'S PORTRAIT.—Some 30 members of the R.H.S. Fruit and Vegetable Committee met at 6 p.m. on Wednesday evening last in the lecture room at the R.H.S. Hall in Vineet Square, for the purpose of presenting the Chairman, Mr. GEORGE BUNYARD, with a portrait of himself, to mark the jubilee of the Committee. Mr. A. DEAN, who suggested the presentation and, with the aid of Messrs. W. BATES and W. POUPART, carried out the arrangements, spoke of the unanimity amongst the members in so readily assisting in the movement. He invited Mr. A. H. PEARSON to make the presenta-

tion. Mr. BUNYARD, in accepting the portrait, expressed his deep pleasure on receiving such an acceptable token of a very interesting event. The portrait, which is three-quarter length, depicts Mr. BUNYARD in the robes of the office of Master of the Fruiterers' Company, and is reproduced on p. 23. On the base of the frame was the inscription: "Presented to GEORGE BUNYARD, Esq., V.M.H., Chairman of the Royal Horticultural Society's Fruit and Vegetable Committee, by his fellow members, as a memento of its jubilee, and as a mark of their high esteem."

FLOWERS IN SEASON.—Mrs. SCOTT-ELLIOT sends from her garden, Teviot Lodge, Hawick, Roxburghshire, a box of choice *Aquilegias* belonging to a strain raised by herself. The strain is remarkable for its brightly-coloured, well-formed flowers, in which the spur shows considerable development. It will be remembered that the Scientific Committee of the Royal Horticultural Society recently granted a Certificate of Appreciation to Mrs. SCOTT-ELLIOT for her work in connection with the hybridisation of *Aquilegias*. —Messrs. JAMES VEITCH & SONS send from their Coombe Wood Nursery some sprays of flowering shrubs. The numerous varieties of *Philadelphus* are all handsome, and especially one labelled *P. rosace*, the blooms being like small Roses. *Styrax japonica* is well known as a floriferous species. The double-flowered variety of *Pyrus coronaria* bears handsome pink blooms like large Apple blossoms. *Ceanothus thyrsiflorus* is a suitable subject for planting against brick walls. *Rhododendron Govenianum* is one of the latest to flower. *Viburnum nudum* is a plant seldom seen in gardens. Its foliage is extremely pleasing, while the inflorescences are fragrant. —Mr. C. H. HERBERT, Hazlewood Road, Acocks Green, Birmingham, sends blooms of a perpetual-flowering Pink named Progress. The flower-stems are long and bear moderately-sized, deep mauve-coloured blooms of good shape. —Lady JULIA WOMBWELL sends us an inflorescence of Sweet Pea bearing as many as 10 flowers and buds. The first few flowers on the stem are normal, but afterwards there is proliferation and slight branching, accompanied by small leaves. Had the inflorescence remained upon the plant, it would have been interesting to watch its future development.

THE WOLVERHAMPTON FLORAL FETE.—The Wolverhampton Flower Show this year marks the coming-of-age of this important institution. The prizes have been largely augmented for this event, and the secretary informs us that there is every prospect of the exhibition being even better than usual. It will be held on the 15th, 14th and 15th inst., in the beautiful West Park.

VISIT OF GERMAN GARDENERS TO BRITAIN.—At the present time a company of 100 Members of the German Society of Garden Art are touring in Britain. Visits have been made to the Royal Gardens, Frogmore, Gunnersbury House gardens and other places. On Wednesday last the party was entertained at luncheon at the Holland Park Exhibition by the Council of the Royal Horticultural Society, Sir ALBERT K. ROLLIT in the chair. The visitors expressed the highest appreciation of the general good quality observed at the exhibition.

EXHIBITION AT ZEIST, HOLLAND.—A great horticultural exhibition will be opened at Zeist, near Utrecht, on August 25 next, and will continue until September 16. The permanent exhibition will include coniferous and other trees, shrubs, fruit trees, Roses, and perennial flowering plants; garden architecture, decorative plants, bedding plants, hothouse plants, and garden implements. There will be special shows of hothouse plants and Orchids on August 25 to 28; cut Roses, September 1, 2, 3; florists' arrangements, September 7, 8, 9; cut flowers, September 10, 11; vegetables and fruit, September 14, 15, 16. Full particulars may be obtained from Mr. W. H. J. BLANCKENHAGEN, Zeist.

ROYAL HORTICULTURAL SOCIETY.

Summer Exhibition at Holland Park.

JULY 6, 7.—The show which opened on Tuesday last in the grounds attached to Holland House, Kensington, will rank as the finest summer exhibition held by the Society. Nothing was needed but fine weather to make it a conspicuous success, but, unfortunately, heavy rains fell on the afternoon of the opening day, and Wednesday was anything but summer-like. To a great extent, therefore, the show—so far as the attendance of visitors was concerned—was robbed of much of its success, although the receipts on Wednesday exceeded those on the same day last year. In all departments of horticulture a magnificent display was provided, rivalling, in the opinion of many, the famous exhibitions held in the Temple Gardens. The Society is to be congratulated on its achievement, and the thanks of all concerned are due to those responsible for the arrangements, and especially to the superintendent, Mr. S. T. Wright, the secretaries, the Rev. W. Wilks and Mr. A. J. Gaskell, and the members of the office staff, including Mr. Frank Reader and Mr. W. H. Plowman, to whose courtesy and assistance we, in common with others, are greatly indebted.

Floral Committee.

Present: W. Marshall, Esq. (Chairman), and Messrs. Henry B. May, C. T. Drury, T. W. Turner, Herbert J. Cuthbush, W. J. James, W. P. Thomson, N. F. Barnes, F. Page Roberts, C. R. Fielder, W. Bain, Jas. Hudson, R. Hooper Pearson, Jno. Green, H. J. Jones, Chas. Dixon, W. Cuthbertson, W. J. Bean, W. G. Baker, Jas. Walker, G. Reuthe, R. C. Notcutt, J. F. McLeod, and Charles Blick.

GROUPS OF PLANTS.

It would be difficult to point to any exhibit more imposing or elegant than the magnificent display of exotic plants shown by Messrs. JAMES VEITCH & SONS, LTD., King's Road, Chelsea, in the largest marquee. It had as companion groups on either side Messrs. W. PAUL & SONS' group of Roses and Messrs. H. B. MAY & SONS' Ferns, a worthy trio, diverse in composition as could well be, but each serving to throw its companions into greater prominence. The space occupied by Messrs. VEITCH'S group was 500 square feet. It was arranged with skill, each plant being disposed so as to show its full beauty, there being no crowding. We noticed *Anthurium crystallinum*, *Medinilla magnifica*, *Davallia fijiensis elegans*, *Alocasia macrorrhiza variegata*, *Begonia Bowringiana*, *Anthurium Andreanum*, *Platyceium alceiense* (at the back), *Aralia elegantissima*, *Cannas* in groups, a choice specimen of *Nepenthes Hookeriana*, N. Sir W. Thistlethorpe, *Cyanophyllum magnificum*, *Heliconia illustris*, and, as a corner plant, *Dracena Doucettii* var. de Grootii.

Mr. L. R. RUSSELL, Richmond, was also the exhibitor of a fine collection of stately-leaved plants, such as are used for the embellishment of plant stoves. Such elegant species as *Maranta insignis*, *M. regalis*, *Cyanophyllum magnificum*, the pretty *Alpinia Sanderiana*, with silvery striations; *Anthurium crystallinum*, *Cissus discolor*, an elegant twiner, and its companion *Dioscorea bulbiferum*; *Nidularium Meyendorffii*, *Alocasias* in assortment, many elegant *Codiaeums*, *Phyllanthus roosei pictus*, and others of equal beauty contributed to a group of much excellence. In another tent Mr. RUSSELL showed varieties of *Bertolonias*, especially fine being those labelled Mme. A. Bleu (green and silver) and *Souvenir de Gand* (the veining and spotting of cerise colour).

Messrs. WM. BULL & SONS, King's Road, Chelsea, showed ornamental foliage plants, including *Dracena Victoria*, D. Prince Manonk Bey, with handsome red leaves, *Macharium firmum*, with pinnate leaves like an *Acacia* but tinged with red; *Anthurium crystallinum*, also numerous *Caladiums*, *Crotons*, *Eugenia myriophylla*, and many others of like nature.

FERNS.

Messrs. H. B. MAY & SONS, The Nurseries, Upper Edmonton, showed a magnificent group of

exotic Ferns. The exhibit covered an area of 400 square feet. There were 150 species and varieties. On stands were presented *Gymnogramme schizophylla superba*, a most elegant Fern; *Goniophlebium sub-auriculatum*, *Davallia fijiensis robusta* and *Asplenium Nidus*, with exceptionally large fronds. *Polypodium Knightiae* and *Davallia solida superba* were shown as large specimen plants, both representing fine culture. Of the more popular *Nephrolepis*, N. *Whitmannii* and N. *Amerpohlii* were shown in elegant specimens. Messrs. MAY also showed a representative collection of hardy Ferns, in all 200 species and varieties. Many were crested forms of *Nephrolepis*, *Athyrium*, *Polystichum*, *Scolopendrium* and *Lastraea*, representing the choicer kinds in commerce. Beneath a large glass shade was an elegant plant of *Todea superba*, one of the most handsome of the filmy Ferns. *Polystichum angulare cruciatum* has much-reduced leaves, with wedge-shaped pinnæ. *Polypodium ornatum* is an elegant species, and equally beautiful are *Polystichum angulare stipitatum*, *Athyrium filix-foemina plumosum superbum*, A. *Goringianum tricolor*, and *Scolopendrium vulgare ramo-marginata gracile*.

Mr. H. HEMSLEY, Crawley, staged varieties of hardy Ferns such as are suited for planting in the rock-garden.

Mr. AMOS PERRY, Enfield Chase, also contributed a display of Ferns of this type.

Mr. H. N. ELLISON, West Bromwich, had many pot plants of Ferns such as are suitable for dwelling-rooms and the conservatory.

ROSES.

Messrs. WM. PAUL & SON, Waltham Cross, Herts., put up an exhibit of Roses as a bank of flowers, with tall plants arising therefrom. The choicer blooms were arranged along the front, such sterling varieties as Betty, Lady Faire, Lyon Rose, Juliet, and Mme. Abel Chateau being shown in magnificent specimens. There were baskets of Roses in great assortment, and then Pillar Roses, with several standard plants, none being more elegant than Helene, with dense clusters of semi-double blooms, and Fairy, with single white blooms. Rubin is a fine red Pillar Rose. The group was one of the most attractive features in the largest tent.

Messrs. PAUL & SON, Old Nurseries, Chesham, exhibited a group of Roses as a ground exhibit. The base was formed with vases of large blooms with pillar varieties at intervals. Specially fine were Ulrich Brunner (red), Lady Ashtown (pink), La Tosca (blush), Richmond (red), Marquise Litta (rose-red), Killarney, Mrs. T. Roosevelt (excellent), *Souvenir de Maria Zayas*, and Countess of Caledon. The pillar varieties included large, freely-flowered plants of the soft yellow Goldfinch and Ariel, a large, delicate pink, single-flowered variety.

THE KING'S ACRE NURSERY CO., Hereford, contributed a fine exhibit of Roses of all types, some being large-bloomed varieties, such as Liberty, Mrs. W. J. Grant, Lady Ashtown, Caroline Testout, Lady Roberts, Richmond, and others of equal worth, with the elegant Rambler kinds of which we may instance Aglaia, its soft yellow blooms being produced in large bunches and showing prominently against the handsome foliage.

Of all the numerous exhibits of Roses, none was finer in quality than that shown by Messrs. ALEX. DICKSON & SONS, LTD., Royal Irish Nurseries, Newtownards, co. Down. Each bloom was of perfect development, and shown not singly, but in large epergnes of one variety. Exquisite were Mrs. Arthur Munt (deep cream), Nita Weldon (faint pink on a cream ground), Mary Countess of Ilchester, Walter Speed (faint yellow), John Cuff (carmine), Lady Helen Vincent (shell-pink), Geo. C. Waud (reddish and orange), &c.

Messrs. FRANK CANT & CO., Colchester, showed 100 varieties of Roses, all the blooms being of high quality.

Another choice group of Roses was shown by Messrs. B. R. CANT & SONS, Colchester, and, as

in the last-named display, of exceedingly fine quality.

Mr. GEO. PRINCE, Oxford, showed a choice exhibit of Roses, having vases and epergnes filled with a selection of well-known kinds. Especially beautiful was Lyon Rose, with its sheen of orange suffused on rose.

Mr. CHAS. TURNER, Slough, showed banks of some varieties, with others singly in boxes, and smaller bunches in vases. Very handsome were the varieties Viscountess Folkestone, Caroline Testout, and Ulrich Brunner. Adjoining the Roses the same exhibitor staged pot plants of Carnations in variety, including the *Souvenir de la Malmaison* and perpetual-flowering varieties.

Messrs. GEO. JACKMAN & SON, Woking Nurseries, Surrey, had excellent blooms of well-known varieties attractively staged.

Mr. CHAS. TURNER, Slough, and Messrs. R. H. BATH, LTD., Wisbech, showed a fine group of Roses and many excellent Carnations.

Other exhibitors of Roses were Messrs. S. BIDE & SONS, Farnham, Surrey; Mr. W. R. CHAPLIN, Joyning's Nursery, Waltham Cross; Lt.-Col. C. HESSELTINE, Walthampton, Lynton, Hants.; and Messrs. R. HARKNESS & Co., Hitchin.

CARNATIONS.

In one corner of the largest tent Messrs. WM. CUTHBUSH & SON, Highgate, London, N., staged a most effective exhibit of Roses and Carnations with banks of coloured *Astilbes* (*Spiræas*), and batches of the large red-leaved *Coleus Cordelia*, with *Dracenas* furnishing foils at intervals. The Carnations were shown in banks, with tall vases arising from them and displaying sheaves of long-stemmed varieties in scarlet, pink, blush, white, and other tones. In the corner, a bank of Rose Mrs. F. W. Flight, an elegant single-flowered variety, served as an effective background with other clumps of Roses, including *Crimson Rambler* and *Dorothy Perkins*. The Carnations included the variety *Lady Coventry*; there were also many well-grown examples of *Prince of Wales*, the best all-round variety of the *Souvenir de la Malmaison* type. As a floral display, nothing could be finer than this charming exhibit.

Mr. W. H. PAGE, Langley Nursery, Hampton, presented a wealth of beautiful Carnations and Lilliums, arranged in big masses, every bloom a choice specimen of some meritorious variety. There were great bouquets of *Enchantress*, *Britannia*, Mrs. T. W. Lawson, *White Lawson*, &c., intermixed with pink-flowered *Astilbes* and *Rambler Roses*, with here and there a large stand of *Lilium longiflorum*, *L. speciosum*, and *L. s. album*. The whole display presented a bank of flowers in many hues.

Messrs. STUART LOW & CO., Bush Hill Park, Enfield, showed a superb group of Carnations as a portion of their exhibit in the largest tent. No pains had been spared to make it a telling exhibit, and in this the exhibitors were highly successful. Almost all the best kinds in commerce were seen in magnificent specimens, there being many of the *Souvenir de la Malmaison* type, in addition to the pick of the perpetual-flowering kinds. The other subjects in the exhibit were *Roses*, blue-flowered *Hydrangeas*, *Gerbera Jamesonii*, *Ericas*, *Ampelopsis Lowii*, and a golden-leaved *Bougainvillea*.

Messrs. BELL & SHELDON, Guernsey, showed a bright group of perpetual-flowering Carnations, having large blooms, well coloured, of all the chief varieties.

E. J. JOHNSTONE, Esq., Burr's Wood, Groombridge (gr. Mr. A. T. Pashett), put up a very large exhibit of Carnations and Sweet Peas.

Groups of Carnations were also exhibited by Mr. C. LANGE, Hampton, and THE AMERICAN CARNATION NURSERY, Sawbridgeworth.

BEGONIAS.

Messrs. BLACKMORE & LANGDON, Twetten Hill Nursery, Bath, showed tuberous-rooted Begonias, one portion of the exhibit being composed of varieties having frilled petals, of which type this

exhibitor has some exquisite kinds, at present all unnamed. One, of a salmon tint, was especially pleasing. Amongst the ordinary kinds the varieties Mrs. P. Clowes (salmon), Mrs. Lockwood (cream, with faintest suffusion of pink), Duchess of Cornwall (the finest of the crimson kinds), Millicent (a fine tall-habited salmon variety), Rt. Hon. J. Chamberlain (deep crimson), Mrs. T. D. Harris (rose), and Mrs. W. L. Ainslie (one of the best yellow varieties), may be instanced as especially choice.

Another excellent group of tuberous-rooted Begonias was shown by Messrs. T. S. WARE, LTD., Feltham, Middlesex. The numerous flowers were of many tints, making a bright bank of colouring. In the centre of the group were many plants of the pale-blush coloured Mrs. A. P. Brandt, an exceptionally free-blooming variety with large flowers. Excellent also were Duchess of Connaught (salmon), Thomas Rooney (white), Lord Hopetoun (crimson), Patrick Ainslie (bright red), Countess of Dart-

were exceedingly handsome, with flowers in shades of red, coral, and scarlet. Fürst O. von Wernigerode (coral pink), Trudchen Bonstedt (pale salmon-pink), Mary (bright red), Gartenmeister Bonstedt (a big-flowered variety, a shade of orange-scarlet), and Clio (reddish-pink, one of the best habited varieties) are a selection. Amongst the Cannas we noticed Frau Constant Soupert (a very large cherry-crimson flower), Elizabeth Tutenberg (striped red on orange), Carl Hausmann (orange on a yellow ground), Rosea gigantea (carmine), Fürst Wiäd (crimson), Frau Daisy Hultsch (rose-pink), Frau Dr. Bloch (new, reddish and golden), and Garten Inspector Junge (fawn and orange). In all there were 165 Cannas.

MESSRS. JAS. VEITCH & SONS, LTD., King's Road, Chelsea, exhibited an assortment of choice flowering plants. A large batch of Carnations of Souvenir de la Malmaison and tree varieties, with an assortment of greenhouse-flowering plants formed the chief features. We noticed

Although disposed in an out-of-the-way corner, no exhibit was more interesting than the group of three varieties of Primulas staged by Messrs. BEES LTD., Liverpool. They were P. Malacoides, P. Bulleyana, and P. Littoniana. It was interesting to notice the wide divergence in the habit of inflorescence and colour of the flowers in the different species. P. Malacoides has a lax panicle of blush flowers; P. Bulleyana a spike bearing its orange flowers in whorls; whilst P. Littoniana (see fig. 7) has a dense spike, resembling that of some of our British Orchids.

Rarely are Fuchsias shown better than those displayed on this occasion by J. FRIEDLAND, Esq., Reading (gr. Mr. F. Bright). So exceedingly well were they shown, the Floral Committee conferred a Cultural Commendation. The specimens were about 10 feet in height, and covered from base to summit with innumerable flowers, the basal shoots sweeping the ground with their burden of blossoms. The varieties were Elegance, White Knight's Gem, Amy Lye, Mrs. Bright, and Mrs. Julius Friedlander.

MESSRS. JAS. CARTER & CO., High Holborn, London, showed Sweet Peas, Begonias, and Gloxinias, arranging a semi-circular group of each subject on a table. The plants of Begonias and Gloxinias were good specimens, the flowers being large and of many colours. The Sweet Peas were all noted varieties.

Mr. LALLEY, Guernsey, showed varieties of Gladioli, mostly hybrids raised in his nursery. Very beautiful were Ardens (scarlet), Insignis (salmon-pink), Red Admiral (the lower petals blotched with white), and Queen Alexandra (rose).

MESSRS. STORRIE & STORRIE, Glencarse, Perthshire, showed hybrid Streptocarpus, Primula obconica, Iceland Poppies of a choice strain, and Hydrangea hortensis with excellent inflorescences. The Streptocarpaceae were a great advance on the older kinds, in size of blossom and colours.

Mr. W. ICETON, nurseryman, Putney, showed three columnar groups of Lily of the Valley arranged in a setting of Adiantum Ferns. The spikes of flowers were of the largest size, with correspondingly broad foliage.

MESSRS. JOHN PEED & SON, West Norwood, London, showed a circular exhibit of Caladiums. The plants were large and with finely-coloured foliage, but the heavy canvas of the tent did not permit of their full beauty being seen. Sir William Broadbent (with maculated foliage and reddish veining), Mme. J. R. Box (reddish and green), Mrs. Cresswell (brilliant red, margined with green), W. E. Gladstone (almost wholly red), John Peed (one of the largest-leaved), C. E. Dahle (green, silver, and red), and Rio de Janeiro (reddish, with green markings) are all handsome in their several colours.

SWEET PEAS.

MESSRS. SUTTON & SONS, Reading, staged large masses of the best varieties in a pergola, the sides being prettily decorated with the flowers. The exhibit was delightfully arranged and most effective.

MESSRS. E. W. KING & CO., Coggeshall, decorated numerous arches with Sweet Peas of such beautiful kinds as Helen Lewis, Elsie Herbert, Evelyn Henus, Mrs. Wm. King, Anglican Blue, and Anglican Pink.

MESSRS. J. & F. KING & SONS, Coggeshall, Essex, exhibited fine blooms of Apple Blossom Spencer, Olive Bolton, Primrose Spencer, Harold, Clara Curtis, and other choice kinds.

MESSRS. WEBB & SONS, Stourbridge, displayed a brilliant lot of Sweet Peas in a collection of Melons and other fruits.

MESSRS. G. & A. CLARK, LTD., Dover, staged an excellent lot of these flowers, the extensive exhibit containing most of the leading sorts.

MESSRS. CARTER, PAGE & CO., London Wall, staged a group of Sweet Peas containing about 60 varieties.

MESSRS. KELWAY & SONS, Langport, and Mr. T. CROSS, Bury St. Edmunds, each brought good displays of these flowers.

MISS HEMUS, Upton-on-Severn, showed Sweet Peas. A few of the best were in great assortment and of fine quality.

Mr. H. J. JONES, Lewisham, also showed Sweet Peas very finely. The new white variety Beatrice Stevens was conspicuous.

Sir RANDOLPH BAKER, Bart., Blandford (gr Mr. A. E. Usher), had a charming display of these flowers in tall vases and Bamboo stands.

WILLIAM MARSHALL, ESQ., V.M.H.

(Chairman for 24 years past of the R.H.S. Floral Committee, which has just celebrated its jubilee.)

month (lemon suffused with rose), Mrs. J. F. Brown (orange-red), Wm. Marshall (crimson), and Mary Pope (white).

Mr. A. LL. GWILLIM, Cambria Nursery, New Eltham, Kent, exhibited tuberous-rooted Begonias in variety. Very choice were the varieties Sultan (orange-red), Mrs. J. C. Gwillim (deep salmon), Dragon (deep red), Marguerite Gwillim (yellow), Eltham Grenadier (a tall scarlet-flowered variety), Sea-Shell (an exquisite flower with crimped petals edged with soft pink), Avalanche (white), Rhoda Pope (Camellia shaped, soft rose suffusion with pink edges), Mrs. H. Harris (light salmon shade), and a magenta-coloured seedling.

MISCELLANEOUS GREENHOUSE PLANTS

MESSRS. H. CANNELL & SONS, Swanley, displayed a collection of Cannas and varieties of Fuchsias of the splendens type. The Fuchsias

as especially good Lobelia tenuior, a charming subject for greenhouse decoration and for hanging baskets; Kalanchoe flammea, with bright red corymbs; a dwarf small-flowered Begonia, the colour being a fine shade of red; Pelargonium Snow Queen, with pure white bunches of flowers and silver variegated leaves; and an assortment of Gloxinias in tones of crimson, white, lavender, purple, red, and other shades, all exhibiting the highest skill in culture. The Fuchsias were shown as standard plants, all prolific in flowering.

MESSRS. H. B. MAY & SONS, The Nurseries, Edmonton, showed varieties of Zonal Pelargoniums and Abutilons.

MESSRS. W. & J. BROWN, Stamford and Peterborough, staged greenhouse plants: Heliotropes, Zonal Pelargoniums, Trachelium coruleum, and Salvia being prominent. Roses were also shown by this firm, and exceedingly fine were two large banks of Liliun Szovitsinum.

Mr. C. W. BREADMORE, Winchester, showed a superb and extensive exhibit of all the choicer varieties.

Other exhibitors of these flowers included Messrs. S. BIDE & SONS, Farnham; Messrs. C. STARK & SONS, Great Ryburgh, Norfolk; Mr. W. R. CHAPLIN, Waltham Cross; Mr. ROBERT SYDENHAM, Tenby Street, Birmingham; Mr. S. MORTIMER, Farnham; and Mr. W. J. UNWIN, Histon, Cambridge.

HARDY PLANTS.

Never before have there been finer displays of herbaceous plants at the Holland Park shows than on the present occasion. An entirely new feature was introduced in the group staged by Messrs. WALLACE & CO., Colchester. The arrangement was novel, quite apart from the merit of the exhibit as a whole. It was an ideal representation of a formally-arranged herbaceous border with a terrace and a paved stone path. In front was a low wall of stonework planted with rock plants, together with a border of Ferns. A water-garden was included on the extreme left. The arrangement was so realistic in its execution as to appear like some border from an established garden transferred to the exhibition tent. The border itself was filled with Lilies, Eremurus (chiefly E. Bungii and E. Shelford), masses of Lychnis and Peonies, together with Cyclanthos, Larkspurs, and other showy flowering subjects. The stone-paved way in front of the border contained a few Alpine plants between the joints of the stones, while on the rock wall in front numerous Sedums, Sempervivums, Dianthi, Pentstemons, and a great variety of suitable species were planted.

Mr. AMOS PERRY, Hardy Plant Farm, Enfield, furnished the entire side of one of the tents with showy border flowers and a water-garden arrangement. At either end of the group were seen large semi-circular groups of Larkspurs in variety, the central portion being occupied by an exceedingly well-arranged water and rock-garden. This portion of the exhibit was arranged with Ferns, Iris Kempferi, Rushes, Bamboos, and other suitable subjects.

Messrs. WM. ARTINDALE & SONS, Sheffield, also displayed an extensive water-garden exhibit, well furnished with suitable plants, together with an extensive collection of Violas and Pansies.

Messrs. R. H. BATH, LTD., Wisbech, had a capital display of Peonies and Larkspurs, the former in many superb varieties.

Messrs. WM. BULL & SONS, Chelsea, displayed a comprehensive assortment of English Irises.

Herbaceous and bulbous plants were extensively displayed by Messrs. GEO. BONYARD & CO., Maidstone. There were numerous Poppies, Peonies, Larkspurs, Lilies and Lychnises in this group.

Herbaceous plants, together with a well-planned rock-garden, was formed by Messrs. J. CHEAL & SONS, Crawley.

Messrs. G. & A. CLARK, LTD., Dover, made an extensive exhibit of hardy flowers, including Gillia coronopifolia. They also showed Marguerite Perfection, an assortment of Sweet Peas, Aquatics, and other plants.

Mr. HOWARD H. CRANE, Highgate, exhibited a choice collection of Violas and Violettas, the whole forming a fresh and pleasing group.

Messrs. WM. CUTBUSH & SONS, Highgate, arranged an extensive group of herbaceous plants, the more showy flowers, such as Peonies, Poppies in variety, Larkspurs, and Iris Kempferi, creating an excellent display.

Messrs. GUNN & SONS, Olton, near Birmingham, showed perennial Phloxes, the flowers, in bright and varied colours, being admirably arrayed.

The Misses HOPKINS, Shepperton-on-Thames, arranged a well-executed rock-garden tastefully planted with a variety of low-growing plants.

Messrs. GEO. JACKMAN & SONS, Woking, exhibited fine Peonies, Iris laevigata in variety, Water Lilies and other seasonable hardy cut flowers.

Messrs. KELWAY & SONS, Langport, showed Peonies, Delphiniums, Gaillardias and other showy flowers, the whole making a rich display.

Messrs. LADHAM & SONS, Shirley, near Southampton, showed herbaceous flowers in assortment, Gaillardias being especially fine. They also exhibited many good varieties of perpetual-flowering Pinks.

Messrs. GEORGE MALLET & CO., Cheddar, had

a comprehensive group, in which Alpine, bulbous and herbaceous plants were prominent.

Excellent hardy flowers were shown by Mr. R. C. NOTCUTT, Woodbridge, Suffolk; this group also contained many showy flowering shrubs.

Mr. MAURICE PRITCHARD, Christchurch, Hants., arranged a water-garden, and tastefully planted the surroundings with Bamboos, Rushes, Iris laevigata and other moisture-loving subjects. He also showed Campanulas, Larkspurs, Gaillardias, Achilleas and other seasonable flowers.

Mr. H. C. PULHAM, Elsenham, formed a small rockery exhibit.

The exhibit from Mr. G. REUTHE, Keston, Kent, was of more than ordinary interest, and his collection contained many plants of the choicest description.

Messrs. W. SEAGRAVE & CO., Sheffield, had an excellent lot of tufted Pansies.

Messrs. T. S. WARE, LTD., Feltham, displayed a pretty group of hardy plants, with many boxes of dwarf Alpines in variety. Dianthus alpinus was especially fine.

Other exhibitors of hardy plants were Messrs. WHITELEGG & PAGE, Chislehurst; Messrs. GIBSON & CO., Bedale; Messrs. H. & W. EVANS, Cardiff; Mr. A. J. HARWOOD, Colchester; and THE GUILDFORD HARDY PLANT NURSERY.

AWARDS.

FIRST-CLASS CERTIFICATE.

Primula Littoniana.—A new species discovered in China by Mr. George Forrest and introduced to Britain by Messrs. Bees Ltd. The species is illustrated in figs. 6, 7, and 8. It will be seen from Professor Isaac Bayley Balfour's description on p. 15 that *Primula Littoniana* is likely to rank amongst the most interesting species in cultivation.

AWARDS OF MERIT.

Carnation Lieut. Shackleton.—A very pretty border Carnation, yellow ground, with salmon-pink colouring. From Mr. CHAS. BLICK.

Delphinium White Queen.—This is a very dainty variety, with well-formed, double flowers. The blooms are a shade of pale lemon but little removed from white. Shown by Messrs. WALLACE & CO.

Nephrolepis magnifica.—Another new variety of *N. exaltata*, somewhat like the form known as *Amerpohlii* but more elegant, exhibiting finer-cut fronds. Shown by Messrs. STUART LOW & CO.

Rose Ariel.—As shown, this appears to be a good pillar Rose, or it may perhaps have the habit of a Rambler. The flowers are single, 4 inches across, rose-crimson in colour, with yellow centre. Shown by Messrs. PAUL & SON, Cheshunt.

Rose Duchess of Wellington.—This new Hybrid Tea variety is quite distinct in tint, being of rich apricot shade. The buds possess unusual length and are very pretty. One of the most remarkable amongst new Roses. Shown by Messrs. ALEX. DICKSON & SONS.

Rose Grace Molyneux.—A Hybrid Tea variety with shell-white petals, excepting those in centre of the flower, these being salmon-pink. The blooms are large and the petals very fine. A delightful Rose. Shown by Messrs. ALEX. DICKSON & SONS.

Rose Walter Speed.—A Hybrid Tea Rose with large, full flowers with good centre. The petals are white, with lemon shade, and in the centre a suspicion of salmon tint. Shown by Messrs. ALEX. DICKSON & SONS.

Sweet Pea Doris Usher.—A pink variety with very large flowers, three, and often four, on a spike. The standard, although waved, is partially erect. Shown by A. E. USHER, Esq.

S. P. Colleen.—A very attractive flower with standard of bright rose colour, the other portions being white, or nearly white. Shown by Mr. W. DEAL, Kelvedon.

S. P. Mrs. Henry Bell Improved.—A magnificent variety with three or four flowers on a spike. Colour pink, with cream tint. Shown by Messrs. DOBBIE & CO.

S. P. Masterpiece.—A beautiful mauve-coloured flower, which was illustrated in these pages last week. Shown by Messrs. DOBBIE & CO.

S. P. Mrs. Townsend.—A very delicately-tinted flower, white, with heliotrope towards the margins. It is an improvement on the variety Phenomenal. Shown by Messrs. JARMAN & CO.

Orchid Committee.

Present: Harry J. Veitch, Esq. (in the Chair), and Messrs. Jas. O'Brien (hon. secretary), de B. Crawshaw, Sir Jeremiah Colman, H. J. Chapman, H. G. Alexander, R. G. Thwaites, H. A. Tracy, A. Dye, W. Boxall, H. Little, Walter Cobb, F. Sander, Gurney Wilson, J. Cypher, W. H. Hatcher, G. F. Moore, W. P. Bound, W. H. White, F. M. Ogilvie, H. Ballantine, and A. A. McBean.

In extent and in quality the show of Orchids was finer than any previously staged, the proportion of good and rare things being great, although the really remarkable novelties were few. Out of the 17 entered to go before the Committee, only three secured awards.

Messrs. CHARLESWORTH & CO., Haywards Heath, staged an extensive group of uniformly good things. These were well arranged on the central staging, commencing at the entrance of the tent. Their new bigeneric hybrid *Miltoniada Harwoodii* attracted much attention, and although still not well developed, secured the new Certificate of Appreciation (see Awards). The body of the group was made up of selections of fine *Laelio-Cattleyas*, *Odontoglossums*, *Cattleyas*, &c., all being so arranged that they grouped the classes together. In the centre was a very fine selection of white *Cattleyas*, most of the known varieties of the season being represented. Some of the best things noted were the charming *Cattleya Warszewiczii* var. Mrs. E. Ashworth, of a uniform blush-white tint with pure rose freckling on the lip; *Laelio-Cattleya Fantasia* (L.-C. Dominiana × C. Mendelii), with purple-feathered petals and finely-coloured lip; a selection of scarlet *Odontodias*, O. Charlesworthii being the finest in colour; a grand plant of a remarkable new snow-white *Laelia purpurata* with a slight rose line on each side of the lip; a selection of *Disas* and *Satyrums*, including several of the showier hybrids and the singular orange-coloured *Disa polygonoides*; the pretty and profuse-flowering *D. sagittalis*, some of the plants having six or eight spikes; several of the yellow *Satyrum ochroleucum*; and another curious greenish *Satyrum*; a batch of showy varieties of *Laelio-Cattleya Canhamiana*; L.-C. Aphrodite, with the true *Odontoglossum Williamsianum*, and some handsome hybrid *Odontoglossums*; *Oncidium Harrisoniae* and other pretty species; two very fine specimens of the rare *Cymbidium tigrinum*; *Coleogyne pandurata*; a fine example of *Aerides Houletianum* with three spikes; a batch of very fine blue *Vanda cœrulea*, and *Cattleya Eldorado* alba.

Sir JEREMIAH COLMAN, Bart., Gatton Park, Reigate (gr. Mr. Collier), continued the display with a very pretty and interesting group, a feature in which were two arrangements of rare and curious species and hybrids. In the first were *Coleogyne Schilleriana*, *Promenaea stapelioides*, *Masdevallia troglodytes*, and other pretty *Masdevallias*; *Bulbophyllum biflorum*, B. Godseffianum, *Brassia maculata*, B. Keliiana, the rare and showy *Dendrobium McCarthiae*, and *Nephelaphyllum* species with very pretty leaves and whitish flowers. In the other lot were *Cirrhopetalum pulchrum*, with an umbel of very pretty blooms; *Enlophia maculata*, *Masdevallia macrura*, *Barkeria spectabilis*, *Dendrobium nudum*, *Physisiphon Loddigesii*, various pretty *Epidendrums*, and a specimen of the pretty *Brasso-Cattleya Mary* with three white flowers uniformly spotted with purple. In the body of the group were good *Laelio-Cattleya Canhamiana*, L.-C. Aphrodite, a selection of *Cypripediums*, including *C. callosum* *Sanderæ*, *Dendrobiums*, and *Odontoglossums* arranged with scarlet *Masdevallias*. A section of the group having good *Odontoglossum crispum* (the showy *O. crispum* *Princess Margherita* with prettily-spotted flowers), arranged with *Oncidium macranthum*, the bright purplish-rose *Dendrobium Statterianum* and hybrid *Cattleyas* and *Laelio-Cattleyas*, was a pretty feature.

Messrs. SANDER & SONS, St. Albans and Bruges, staged a very fine and beautifully-arranged group of good things, the elevated parts being capped by a fine lot of *Phalenopsis Rimestadiana*, including one plant of the new variety alba, which has not the blush tint seen on most of the type. One of these lobes had good varieties of *Miltonia vexillaria*, a plant of *M. v. chelsiensis* being specially handsome; also white *Cattleyas*, the new pure white *C. Mossii*

Wagneri Sanderæ being the perfection of white Cattleyas (see Awards). In a depression in the group were scarlet Masdevallias with Anguloa Clowesii, A. Ruckeri and patches of Cypripedium Godefroyæ leucochilum. Among the Lælio-Cattleyas the grand L.-C. Martinetii "The Prince," which secured a First-class Certificate, was pronounced to be the best Lælio-Cattleya in the show. Cattleya Mendelii Princess Mary and C. M. celeste were two pretty new varieties, and C. Mendelii Mrs. F. Sander, a superb white variety. C. Mossiæ Empress of India was a richly-coloured flower, with the greater part of the lip of a bright orange tint. Among the many pretty hybrid Odontoglossums raised at Bruges were O. Landolphus decorum (Andersonianum × Rolfeæ), a very distinct, cream-coloured flower with the bright reddish-brown markings arranged as in O. Andersonianum, the lip being unspotted; O. alnum, O. delectabile, O. Vulcan, O. Lambeanum brugense, a nice lot of O. ardentissimum, O. nigrum and others, including good O. Rolfeæ and O. crispo-Harryanum. In one section of the group the finely-coloured and showy forms of Cattleya Warszewiczii Sanderiana, with white Cattleyas, including a fine specimen of C. Mossiæ Reineckiana excelsa, were effective. Another section had a fine selection of Lælio-Cattleya Martinetii, with flowers of various tints, with Phalenopsis, including four of the pretty pink-tinted P. Sanderiana, and in front showy plants of Odontonia Laiessee, Cypripedium Frau Ida Brandt, a curious orange and red Mormodes from Peru, a selection of Cypripedium bellatum and other dwarf Cypripediums, Oncidium candidum, and Zygopetalum rostratum.

F. MENTRETH OGILVIE, Esq., The Shrubbery, Oxford (gr. Mr. Balmforth), who always stages his plants in the pink of perfection, showed a very pretty representative group, one of the most remarkable plants in which was Odontoglossum Pescatorei luteum, a yellow O. Pescatorei which seems to be removed from the reproach of being a pale form of O. excellens. The flowers were pale yellow, of true O. Pescatorei form, with a purplish tinge at the backs of the sepals. Mr. OGILVIE'S group also had a very beautiful selection of varieties of Miltonia vexillaria, some very dark Lælia tenebrosa; Odontioda Bradshawæ, a pale variety, but the best-flowered plant which has yet appeared; Miltonia Bleuana grandiflora, a very large and handsome flower; Cypripedium Maudie, C. callosum Sanderæ and C. Lawrenceanum, all arranged in a batch. Odontoglossum Harryanum of very fine quality was also shown in this group.

Messrs. MOORE, LTD., Rawdon, Leeds (Hatcher and Mansell), staged a very pretty group, in which the artistic arrangements of the plants accentuated the excellent quality of the varieties shown. At the back was a grand plant of Cœlogyne asperata, a species which Messrs. MOORE seem to have been the first to grow successfully, for they have other plants of it in bloom. Messrs. MOORE are noted for their interesting collection of Bulbophyllums, Cirrhopetalums and other curious Orchids, and their group contained several of these, the most noteworthy being Bulbophyllum leopardinum, a gem of a plant with pretty crimson-spotted flowers. The carmine-crimson Broughtonia sanguinea which Messrs. MOORE have so far unsuccessfully attempted to hybridise; the feather-lipped Bulbophyllum barbigerum, B. Godseffianum, B. saurocephalum and other Bulbophyllums; Galeandra lacustre; Angrecum modestum; the singular Oncidium abortivum, which produces pretty yellow flowers on the inflorescence, but a larger number of filamentose abortive blooms; the rare Catsetum trifidum; a selection of good hybrid Odontoglossums; the rare Costa Rica Epidendrum Brassavolæ; a bright scarlet batch of Cochloda Noezliana and a good selection of hybrid Orchids were also in the group.

Mr. Ed. V. Low, Orchid Nursery, Vale Bridge, Haywards Heath, staged an interesting group, in which among the best plants were a good form of the pure white Cattleya Mossiæ Wagneri; the rare and beautiful Lælia tenebrosa Walton Grange variety, with sepals and petals greenish yellow, the lip being claret-purple with white tip, and offering a good example of a distinct variety, holding its own after the type has been repeatedly imported; Cypripedium Mary Beatrice; Odontioda Goodsonia, light variety; Cattleya Mossiæ alba

Vale Bridge variety, and other showy Orchids were also in the group.

J. RUTHERFORD, Esq., Beardwood, Blackburn (gr. Mr. Lupton), staged an interesting group of Odontoglossums, Lælias, including L. tenebrosa Walton Grange variety, and other Orchids.

Messrs. STUART LOW & Co., Bush Hill Park, Enfield, had a very effective and interesting group, the showy part of which was composed of varieties of Lælio-Cattleya Canhamiana and other showy Cattleyas and Lælio-Cattleyas. The varieties of Odontoglossums and Miltonias in this group were specially good and well grown. Cattleya Mossiæ alba, C. Mendelii varieties, including one with snow-white petals; Lælio-Cattleya Canhamiana alba; good forms of Lælio-Cattleya Canhamiana and L.-C. Aphrodite, a grand form of Cypripedium macrochilum, Cœlogyne Dayana, with a fine show of drooping spikes, and some showy Masdevallias. Mr. STUART LOW being specially interested in rare and pretty Orchids, he included a selection of rare species and varieties, including the neat little Sigmatostalix Eliæ, Pleurothallis pulchella, with upright spikes of pretty silver-white flowers with purple lines. The true yellow and dark purple Dendrobium clavatum, the rare Bulbophyllum Reinwardtii, with ruby-crimson motile labellum, the dark purple Masdevallia calura, Cochloda sanguinea, with pretty white and rose flowers, exhibiting the usual peculiarity of flowering from the apex backwards; Bulbophyllum umbellatum; the pretty rose and white Chysis Sedenii; and the true Oncidium amictum.

Colonel G. L. HOLFORD, C.I.E., C.V.O., West-birt (gr. Mr. H. G. Alexander), showed Odontoglossum crispum Sappho, a grand variety, which Mr. Alexander has grown up to its best. The flowers were large, pure white, with some purple-brown blotches on the sepals and petals.

Miss M. WATERS ANSON, Dovedale, Lewin Road, Streatham, showed a very fine collection of paintings of Orchids, most faithfully and artistically rendered and comprising over 40 subjects.

Mr. G. BORNEMANN, Blankenburg, Harz, Germany, showed a very interesting set of hybrid Disas, varying in tint from scarlet to purple. The flowers were damaged in transit, and as Mr. BORNEMANN gave no particulars of his hybridisation, the results cannot be estimated beyond the broad statement that good progress seems to have been made in this pretty genus of Cape terrestrial Orchids, which Messrs. Jas. Veitch & Sons have already so successfully worked.

AWARDS.

FIRST-CLASS CERTIFICATE.

Lælio-Cattleya Martinetii "The Prince" (*L. tenebrosa* × *C. Mossiæ aurantiaca*), from Messrs. SANDER & SONS. One of the most beautiful Lælio-Cattleyas, with large flowers, the sepals and petals bronzy-orange, the large lip vinous-purple, darkest on the veining.

AWARD OF MERIT.

Cattleya Mossiæ Wagneri Sanderæ, from Messrs. SANDER & SONS, St. Albans. A very chaste, pure white flower, which differs from the type in the broader crimped petals, and finely-developed lip.

CERTIFICATE OF APPRECIATION.

Miltoniodes Harwoodii (*Miltonia vexillaria* × *Cochlioda Noezliana*).—A very remarkable and, when developed, a showy new bigeneric hybrid, raised by Messrs. CHARLESWORTH & Co. The tiny plant bore a single flower about 2 inches in length, the sepals and broader petals being bright cerise-rose; the Miltonia-like lip cream-white, freckled with rose, in shape nearest to that of *M. cuneata*.

CULTURAL COMMENDATION.

To Mr. G. E. Day (gr. to H. S. GOODSON, Esq., Putney) for a grand specimen of the white Cattleya Mossiæ Wagneri with 17 flowers.

Fruit and Vegetable Committee.

Present: G. Bunyard, Esq. (in the Chair), and Messrs. P. C. M. Veitch, G. Kelf, A. R. Allan, Fred. G. Treseder, J. Willard, O. Thomas, G. Woodward, W. Bates, W. Poupard, W. Pope, W. Fyfe, C. O. Walter, H. Parr, J. Davis, J. Cheal, A. H. Pearson, H. Hooper, T. Coomber, W. H. Davis, J. Gibson, A. Dean, and G. Wythes.

Messrs. STUART LOW & Co., Bush Hill Park, sent a basket of fruits of Blackberry Phenomenal, and Mrs. SELIGMAN, Etchingam, showed three handsome fruits of Melon Eminence, which is of excellent flavour. The exhibitors were asked to send seeds to Wisley for trial.

Mr. W. PALMER, Andover, sent a dish of Peach King Edward. The fruits were of medium size.

Mr. F. PAUL, Botley, Hants., showed Tomato Miss Paul. It was considered by the Committee to resemble the Hipper's 1st and Sunrise.

A fine collection of some 50 Cherry trees in pots, from four years to six years old, and heavily fruited, was sent by Messrs. G. BUNYARD & Co., Maidstone. It was the most representative collection of such trees yet seen at any show. All carried fine crops, the fruits being large and richly coloured. The trees also were in a fine condition of health. Of black varieties were Black Tartarian, Black Eagle, Bohemian Black, Guigne d'Annonay, Géante d'Hedelfingen, Windsor, Knight's Early Black and Waterloo. White varieties included Governor Wood, Ludwig's Bigarreau, Elton Heart, Florengé, Frogmore Bigarreau and Monstrueuse de Mezel. In front of these trees was a collection of Strawberries, including fine fruits of Royal Sovereign, Monarch, The Bedford, Laxton's Progress, Fillbasket, Waterloo, Bedford Champion, Reward, Reliance and Givon's Late Prolific.

S. HELLBUT, Esq., Maidenhead (gr. Mr. G. Camp), showed eight very large Cherry trees in pots ranging from 8 to 9 feet in height, and all heavily fruited. Specially good were Bohemian Black, Early Rivers, Noir de Guben, Emperor Francis, Alton, and Monstrueuse de Mezel. All were remarkably good. The group included two well-fruited trees of Brown Turkey Figs. In baskets were gathered Cherries of Bigarreau de Schrecken, Noir de Guben, Emperor Francis, Bohemian Black, Early Rivers, and Monstrueuse de Mezel.

LORD LLANGATTOCK, The Hendre, Monmouth (gr. Mr. T. Coomber), staged 20 very handsome Queen Pines and a collection of exceptionally fine, bright Strawberries. These were shown in flat boxes, and included The Laxton (a superb sample), Royal Sovereign, Fillbasket, Reward, Bedford Champion, Leader, Cropper, The Alake, Gunton Park, Sir C. Napier, Sir J. Paxton and Trafalgar.

THE HORTICULTURAL COLLEGE, Swanley, Kent, had a striking collection of fruit, including 30 very fine fruits of their College Melon. The exhibit also contained Early Favourite Melon, 12 medium-sized bunches of Black Hamburgh Grapes, good Dymond Noblesse and Alexander Peaches, Royal Sovereign Strawberries; Comet, Carter's Sunrise and Duke of Clarence Tomatos; and Laing's Prolific Cucumber.

Messrs. LAXTON BROS., Bedford, had one of the largest collections of picked Strawberries we have yet seen. There were 40 large flat baskets, each containing in one layer 100 fruits, and some others in punnets. Of named varieties there were The Laxton, Bedford Champion, Sir J. Paxton, Laxton's Profit, Reward, Mentmore, Leader, Fillbasket, The Cropper, Connoisseur, Pineapple and Progress. The baskets of fruits were interspersed with small Palms, Ferns and Asparagus Sprengeri.

Messrs. WEBB & SONS, Wordsley, showed fine fruits of Melons Masterpiece, Centennial, Pride of Stourbridge and Favourite. They also showed choice vegetables, including Webb's Peerless, Early Frame, Kinver Monarch and Early Mammoth Cauliflowers; New Colonist Potatoes; Emperor, Jubilee and Yellow Sovereign Tomatos; a new Marrowfat Pea named Paragon, also Stourbridge Glory Pea; with excellent Carrots, Turnips, Crimson Globe Beet and new "Everbearing" Cucumbers.

Mr. W. POUPART, Fernleigh Orchards, Twickenham, showed a collection of bottled fruits presented in perfect form, and with all the latest-known appliances. The fruits included various white and coloured Plums, Cherries, Gooseberries, Currants and Raspberries.

Mrs. MILLER, Moylen, Bucks., exhibited bottles of Chutney and orange jelly.

VEGETABLES.

The only amateur's collection of vegetables stages was one of superb quality and excellence, as well as of a thoroughly representative nature. It was set up by

the Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. Ed. Beckett). The collection included some 90 dishes, and had a background 4 feet in height, on which was secured, by means of small projecting shelves, many remarkably fine samples. The table space was 3 feet wide and 36 feet long. On the background were staged White Queen, Magnum Bonum and First Crop Cauliflowers; Lettuces Giant, Paris White, Sutton's Ideal, Heartwell, Marvel and others; very fine Earliest and Flower of Spring Cabbages; white and red Celeries, Seakale, Beet, Early Milan Turnips, Moore's Cream Marrows, Carrots and Crimson Globe Beet. On the table were arranged Potatos Duke of York, May Queen, Eightyfold, King Edward VII., Guardian, Crimson Beauty and Midlothian Early; Winter Beauty, Perfection, Golden Perfection and Golden Nugget Tomatos; several Cucumbers, including Matchless, Peerless, Satisfaction and A1. Peas were excellent, the varieties being Duke of Albany, Superlative, Centenary and Early Giant. Beans included Green Leviathan, Long

petitor in the class for three dishes of Cherries and three dishes of Strawberries. The Cherries were excellent, and included Emperor Francis, Governor Wood and Early Prolific; whilst the Strawberries were Kentish Favourite, Leader, Bedford Champion, and Waterloo.

Lord ENFIELD, Wyotham Park, Barnet (gr. Mr. H. Markham), showed very fine Dymond Peaches in the class for these fruits. In all cases the 1st prizes were awarded.

GROUPS OF PLANTS IN THE OPEN.

Messrs. J. CHEAL & SONS, Crawley, Sussex, arranged a parallelogram of turf, enclosed on three of the sides with a chain fixed to posts 3 yards apart, and trailing plants fixed to the chain and the posts. Next a line of miniature Roses and a flower-border, 4 feet wide at each end, filled with flowering plants—the soil being covered with flakes of Woodmoss. Behind the enclosed space was a pergola planted with Roses and Ampelopsis, backed by tall Roses with various trees, coniferous and other. At the two

green-leaved; all in a fine, healthy condition. An edging of *Hedera arbor* "Sheen Silver" was placed along the front and ends of the group. A feature of the group was an oblong tank about 20 feet in length and 3 yards wide containing *Nymphaeas*.

Messrs. JAMES VEITCH & SONS, LTD., showed an extensive collection of Sweet Peas growing in 9-inch pots and flowering abundantly. The plants were supported by Birch spray, and surmounted the pots by an average height of 4 feet. We noted the varieties St. George, Lady Grizel Hamilton, A. J. Cook, King Edward VII. (of a rich crimson colour), Mrs. Collier, White Spencer, Prince of Wales, and Miss Willmott Improved. Interspersed with the Peas were plants in bloom of *Erenurus Warei* and others. Messrs. VEITCH also showed an extensive group of hardy shrubs, climbing and creeping plants, *Hydrangeas* in blue and white-flowered varieties and species, *Bambusas*, *Rambler Roses*, &c.

Messrs. W. FROMOW & SONS, Sutton Court Nursery, Chiswick, W., arranged a large group of mixed species of trees and shrubs, and among them the Japanese Maples were the most conspicuous.

Mr. CLARENCE ELLIOTT, Six Hills Nursery, Stevenage, showed a neat rockery laid out on a bench and planted with suitable species.

Messrs. J. PIPER & SON, Bishops Road, Bayswater, showed neat examples of clipped *Buxus* and one tall Yew.

Mr. G. REUTHE, the Fox Hill Hardy Plant Nursery, Keston, Kent, showed rare and interesting Alpine plants in pots and pans. He likewise showed a quantity of early-flowering *Gladiolus*, *Iris Kämpferi* in variety, *Peonias*, &c.

Mr. AMOS PERRY, Hardy Plant Farm, Enfield, showed a small collection of hardy species and varieties of Ferns.

Messrs. BARR & SONS, 11, 12, 13, King Street, Covent Garden, exhibited Japanese pigmy trees.

Messrs. JOHN FORBES, LTD., Hawick, Roxburghshire, showed a large number of varieties of shrubby *Phloxes*, capitally-bloomed *Pansies* and *Violas*, and a few spikes of *Antirrhinums*.

Messrs. W. CUTBUSH & SON, Nurseries, Highgate and Barnet, exhibited an extensive and varied collection of objects of the topiary art, a few being formed of Yew, but chiefly of Box.

Messrs. WHITELEGG & PAGE, Chislehurst, arranged a small rockery at the end of one of the big tents.

Awards made by the Council.

GOLD MEDALS.

The Rt. Hon. Lord Llangattock (gr. Mr. Coomber), the Hon. Vicary Gibbs (gr. Mr. E. Beckett), F. Monteith Ogilvie, Esq., G. Bunvard & Co., J. Carter & Co., Charlesworth & Co., Cutbush & Son, H. B. May & Sons, W. Paul & Son, Amos Perry, M. Pritchard, Sander & Sons, Sutton & Sons, J. Veitch & Sons, and R. Wallace & Co.

SILVER CUPS.

Sir Jeremiah Colman (gr. Mr. J. Collier), Sir Randolph Baker (gr. Mr. A. E. Usher), J. Friedlander, Esq. (gr. Mr. F. Bright), S. Heibut, Esq., W. Artindale & Son, Barr & Sons, Blackmore & Langdon, G. & A. Clark, W. Fromow & Sons, Hobbies, Ltd., E. W. King & Co., H. B. May & Sons, G. Paul & Son, G. Reuthe, L. R. Russell, R. C. Notcutt, S. Low & Co., J. Veitch & Sons, T. S. Ware, E. Webb & Sons, Lt.-Col. C. Heselstine, E. J. Johnstone (gr. Mr. A. J. Pashett), and W. H. Page Hampton.

SILVER-GILT FLORA MEDALS.

G. Jackman & Son, W. Bull & Son, C. Turner, J. Cheal & Sons, Bell & Sheldon, W. J. Unwin, C. W. Breadmore, H. Cannell & Sons, J. Carter & Co., F. Lilley, F. Cant & Co., G. Lange, J. W. Moore, Ltd., B. Ladham & Sons, Alex. Dickson & Son, Ltd., A. F. Dutton, C. F. Waters, G. Bunyard & Co., Ltd., A. Gwillim, W. J. Godfrey, R. Harkness & Co., W. Seagrave & Co., W. Icton, H. H. Crane, J. Piper & Son, Whitelegg & Page, Misses K. & E. Hopkins, Miss A. W. Anson, G. W. Riley, and Wm. Wood & Son, Ltd.

SILVER-GILT BANKSIAN MEDAL.

Lamp Pump Syndicate.

SILVER FLORA MEDALS.

C. & W. Buswell, Castle's, Thos. Green & Son, Ltd., Liberty & Co., Potter's Art Guild, and Ransomes, Sims & Jefferies.

SILVER BANKSIAN MEDALS.

Font Oaks Syringe Co., S. Pradal, A. Shanks & Son, and W. Voss & Co.

BRONZE FLORA MEDALS.

Doulton & Co., Lloyd, Lawrence & Co., and H. Scott & Sons.

BRONZE BANKSIAN MEDALS.

W. Duncan Tucker & Sons, Ltd., and Headley & Edwards.

SCHEDULE RECEIVED.

Liverpool Horticultural Association's first show of Sweet Peas, herbaceous flowers, Carnations and Picoetes, to be held in the Corn Market, Brunswick Street, Liverpool, on Wednesday, July 21. Secretary, Mr. Harold Sailer, Chartered Accountant, 31, North John Street, Liverpool.

GEORGE BUNYARD, ESQ., V.M.H.

(Chairman of the R.H.S. Fruit and Vegetable Committee which has just celebrated its jubilee.)
(see p. 23.)

Pod, Canadian Wonder (dwarf), Golden Wax-pod and Princess of Wales (climbing). In addition, there were Marrows, Globe Artichokes, Mushrooms, Kohl Rabi, Asparagus, Spinach, Radishes and Mustard and Cress.

Messrs. SUTTON & SONS, Reading, exhibited a fine collection of edible Peas, chiefly of fairly early varieties. There were 120 dishes in about 50 varieties. Of these, capital pods were staged of Early Giant, Superlative, Centenary, Duke of Albany, Dwarf Defiance, Pioneer, Duchess of York, World's Record, Improved William the 1st, several fine seedlings, also Green Marrow, and of smaller-podded forms Reading Wonder, The Pilot, Ideal, Bountiful and May Queen.

COMPETITIVE CLASSES.

The competition in the classes for fruit was very poor. Lord HOWARD DE WALDEN, Saffron Walden (gr. Mr. J. Vert), was the only com-

ends of the plot were Roses on tall stems, *Andromeda speciosa*, *Philadelphus*, *Clematis*, *Tree Ivies*, Japanese Maples, &c. Inside the square there were square beds planted with *Violas*.

Messrs. JOHN WATERER & SONS, LTD., American Nurseries, Bagshot, showed a group of about two dozen plants of *Kalmia latifolia* 2 to 4 feet high and proportionately broad. Interspersed amongst them were standards of Japanese Maples.

Messrs. JAS. CARTER & Co., High Holborn, London, showed a group of an irregular shape, and raised above the level of the field in the central parts, these last being planted with *Conifers*, *Golden Privet* and *Box*. The whole was a representation of a Japanese garden, and very pretty.

Mr. L. R. RUSSELL, Richmond Nurseries, Richmond, Surrey, showed an immense group consisting of tree and other *Ivies*, variegated and

NATIONAL ROSE.

JULY 2.—Of the societies which have been formed to advance the interests of some special flower, none is more popular than the National Rose. Its shows are important and popular functions, and especially the great summer exhibitions held in the Metropolis. That which took place on Friday of last week, although it will not rank high for the quality of the flowers, was, nevertheless, a magnificent show, and the numerous visitors were loud in their praises. Experts had correctly anticipated the blooms would exhibit indifferent quality, for they had seen their best flowers ruined by the repeated rains. Judged in the mass, however, the exhibits were attractive. It was only when the individual blooms were critically examined that the damaged petals and general lack of refinement were discovered. But if recent weather was unfavourable, the conditions on the exhibition day were ideal! No wonder then that the gardens were thronged with an appreciative audience, which in numbers constituted a record for these shows! It is known that particular Roses succeed best in certain seasons. Last year, it will be remembered, none was more beautiful or better developed than the varieties Maman Cochet and White Maman Cochet. In 1907 Fran Karl Druschki was magnificent. On the present occasion the charming Hybrid-Tea variety Mme. Melanie Soupert surpassed all other varieties. Its delicate petals suffused with carmine on a pale yellow ground were generally admired. All the red Roses, too, appeared extra fine, and of these we may instance Richmond, Liberty and Alfred K. Williams. There having been but little sunshine, these intensely coloured Roses, that in some seasons suffer from burning, were seen at their best. But we must not omit that queen of pink Roses, Mrs. Edward Mawley, which was shown in its full beauty by many exhibitors. The honours of the show largely rested with Irish growers, and no doubt climatic conditions contributed to their success, although we would not wish to detract from the skill of the exhibitors. New Roses were plentiful, and two of these received the Gold Medal of the Society, whilst six others were commended. The show was visited by her Majesty Queen Alexandra, who was accompanied by H.R.H. Princess Victoria.

CUT BLOOMS.

NURSERYMEN'S CLASSES.

In the championship class for 72 blooms of distinct varieties—the largest number required in an exhibit—it was seen what difficulty growers had experienced in securing the requisite number of good flowers. Even the winning blooms, shown by MESSRS. ALEX. DICKSON & SONS, LTD., Royal Irish Nurseries, Newtownards, co. Down, might easily have been better, but they won readily against their competitors. We append the list of varieties:—Helen Keller, Gustave Grünewald, George Hammond, a fine, new red Rose; Marchioness of Dufferin, Senateur Vaisse (scarlet-crimson), Mrs. Theodore Roosevelt, Gustave Piganeau, a fine, red H.P. variety; Florence Pemberton, Mme. Gabriel Luizet, Mrs. W. J. Grant, Lady Helen Vincent, Chas. J. Grahame, Kaiserin Augusta Victoria, Lady Ashtown (an excellent bloom); Mrs. G. W. Kershaw, Geo. C. Waud, a magnificent specimen, the tone being a reddish suffusion on orange; Duchess of Albany, Etienne Levet, Ellen Drew, Mrs. Ed. Mawley (very choice), Killarney, Mrs. John Laing, Marquis Jeanne de la Chataigneraye, a beautiful pale rose finely shown; Prosper Langier (scarlet); Her Majesty. Col. R. S. Williamson, Tom Wood, White Lady, Caroline Testout (a good flower), Alice Lindsell, Geo. Dickson, Mildred Grant (a well-developed bloom), Robert Scott, Thos. Miles, Mme. Melanie Soupert, Chas. Lefebvre, Countess of Annesley, Mrs. Bateman, Walter Speed, Lyon Rose, Dr. J. Campbell Hall, Gen. McArthur, Mrs. H. Brocklebank, Dr. Andry, Lady Ursula, Eric (a fine, new red variety), Lohengrin, Dean Hole (excellent), Mrs. R. G. Sharman Crawford, H. J. Watson, Bessie Brown, Hugh Watson, Ulrich Brunner, Mrs. R. G. Sharman Crawford (a noteworthy bloom), Richmond, William Shean, David McKee, Frau Karl Druschki, Duchess de Morny (a good specimen), The Bride,

Horace Vernet, Rhea Reid, A. K. Williams, Lady Barham, Mme. Jules Graveaux, Nita Weldon, Le Detroit, Bertha Gierneu, Gladys Harkness, Marchioness of Londonderry, Robert Baessler and John Cuff; 2nd, Messrs. B. R. CANT & SONS, Colchester. A selection of their varieties includes Mme. Jules Graveaux, Dr. William Gordon, Capt. Hayward, Robt. Scott, Laurent Carle, Bessie Brown, Mildred Grant, Mme. Eugène Verdier, Mrs. Theodore Roosevelt, Cleopatra, Nadia, Horace Vernet, Mrs. Dudley Cross, J. B. Clark, John Ruskin, Hugh Watson (shown well), and Mme. Melanie Soupert. 3rd, Messrs. F. CANT & Co. Outstanding examples shown by this Colchester firm included Capt. Hayward, Crown Prince, Exposition de Brie, Caroline Testout, and Mildred Grant.

Forty distinct varieties, shown in triplets.—In this important class there were five competitors. Messrs. A. DICKSON & SONS were again placed 1st, and the same remarks apply as in the preceding class. Their best examples were Dean Hole, Gen. McArthur (magnificent in its colouring), Mrs. R. G. Sharman Crawford, Horace Vernet, Etienne Levet, Bessie Brown, Chas. Reid (three magnificent flowers), Mme. Melanie Soupert, John Cuff, Geo. C. Waud, Mrs. Brocklebank, Lady Ashtown, Joseph Hill, Ulrich Brunner (very large blooms), Mrs. W. J. Grant, and Chas. J. Grahame. 2nd, Messrs. F. CANT & Co., Colchester, who showed smaller but finely coloured blooms. Prominent varieties were Chas. J. Grahame, Helène Guillot, Mildred Grant, Capt. Hayward, Lady Ashtown, Lohengrin, Liberty, Mrs. John Bateman, Harry Kirk, and Horace Vernet. 3rd, Messrs. B. R. CANT & SONS, Colchester. Chas. J. Grahame, Mildred Grant, Mrs. John Laing, Richmond, and Lady Ursula were the better blooms in their exhibit.

Forty-eight blooms of distinct varieties.—This class was fairly well contested. The 1st prize was awarded to Mr. GEO. PRINCE, Oxford, who had many blooms of fine quality and others only mediocre. Amongst his finer examples were Mrs. Edward Mawley, Maman Cochet, Mme. Melanie Soupert, Souvenir de Mme. Métral, Richmond, Auguste Comte, Chas. J. Grahame, Caroline Testout, J. B. Clark, and Betty. 2nd, Messrs. GEO. MOUNT & SONS, LTD., Canterbury, who showed as their best blooms, Dean Hole, Joseph Lowe, Mildred Grant, Hugh Dickson, Yvonne Vacherot, Betty, Maman Cochet, Mme. Abel Chatenay, and Souvenir de Maria de Zayas. The 3rd prize group, shown by Mr. W. LEGGETT, Rose Gardens, West Bergholt, Colchester, contained many large blooms, but generally the flowers lacked finish. Mrs. Edward Mawley, Lady Ashtown, Melea, and Papa Lambert were noteworthy specimens.

Twenty-four blooms of distinct varieties.—This proved a well-contested class, there being no fewer than 11 exhibitors. The 1st prize was awarded to Mr. HENRY DREW, Longworth, Faringdon, Berks. He showed Caroline Testout, Florence Pemberton, Chas. Lefebvre, Bessie Brown, Helen Keller, Betty, J. B. Clark (of splendid colour), Mildred Grant, Gladys Harkness, Robt. Scott, A. K. Williams, Oberhofgartner A. Terks (a large bloom), Ulrich Brunner, White Lady, Gustave Piganeau, Lady Ashtown, Countess of Annesley, Marchioness of Dufferin, Marchioness of Downshire, F. Michelon, Kaiserin A. Victoria, Victor Hugo, William Shean, and C. J. Grahame. 2nd, Mr. ELISHA J. HICKS, Twyford, Berks. This exhibitor showed a very even set of beautifully coloured blooms, but they were rather small. Very choice were Laurent Carle, Mme. Melanie Soupert, Betty, Richmond, Gustave Grünewald, Mme. Sigond Weber, Mildred Grant, Lady Ashtown, Lyon Rose, and Yvonne Vacherot. 3rd, Messrs. PERKINS & SONS, Coventry. This also was a good exhibit, Liberty, Capt. Hayward, J. B. Clark, and other red Roses being beautifully coloured.

Sixteen varieties, shown in triplets.—This also was a well-contested class, seven growers competing. Messrs. GEO. MOUNT & SONS won splendidly, showing Mildred Grant, Mrs. John Laing, Ulrich Brunner, Frau Karl Druschki, Richmond (finely shown), Prince de Bulgarie, Lady Ursula,

Joseph Lowe, Lady Ashtown, Caroline Testout, Mme. Melanie Soupert, Chas. J. Grahame, Mrs. David McKee, Mrs. Theodore Roosevelt, Maman Cochet, and Mrs. W. J. Grant. 2nd, Mr. G. PRINCE, with Lady Ashtown, Mrs. W. J. Grant, Mrs. R. G. Sharman Crawford, Mrs. Mawley, Caroline Testout, Mme. Jules Graveaux, Maman Cochet, J. E. Clark, &c. 3rd, Mr. H. DREW.

TEA AND NOISSETTE ROSES.

In this section the D'Umbrian Cup and the championship for Tea and Noisette Roses is awarded to the 1st prize winner in the class for 24 blooms, distinct. There was not such marked inferiority in these Roses as in the Hybrid Teas. Mr. G. PRINCE, Oxford, secured the premier place with a creditable exhibit. He showed Mme. Constant Soupert (a choice yellow variety), Innocente Pirola, White Maman Cochet, Souvenir de Pierre Notting (a beautiful bloom), Mme. Jules Graveaux, Molly, Mrs. Sharman Crawford, Maréchal Niel, The Bride, Souvenir de S. A. Prince (excellent in every respect), Melea, Golden Gate, and Muriel Grahame (cream, flushed with rose, a choice bloom). 2nd, Mr. DREW, who had some big flowers in good condition and others of inferior size and quality. A specimen of Mrs. Ed. Mawley was pre-eminent in size and beauty, and was awarded a medal as the best Tea Rose in the open classes. Other noteworthy flowers were White Maman Cochet, Cleopatra, Melea, Maman Cochet, Niphotos, Mme. Jules Graveaux, Golden Gate, and Mme. Vermorel. 3rd, Mr. MATTOCK, with small flowers.

In the class for 12 blooms, distinct, Messrs. J. BURRELL & Co., Cambridge, led with small but refined blooms, including Mme. Constant Soupert, Niphotos, Molly, Mrs. Sharman Crawford, Boadicea, Mrs. Ed. Mawley, and Melea. 2nd, Messrs. GEO. MOUNT & SONS. The competition in this class was poor.

Some large flowers were staged in the class for 14 varieties, shown in triplets, but the basal petals were much damaged by weather, so that the blooms appeared ragged. There were three exhibits, much the best being shown by Mr. PRINCE. Mr. DREW followed, and Mr. MATTOCK was 3rd. Mrs. Ed. Mawley was shown well in all the exhibits, and specially by Mr. MATTOCK. Other varieties that deserve mention are Maman Cochet, Melea, Mme. Constant Soupert, Mme. Jules Graveaux, Souvenir d'un Ami, and Cleopatra.

ROSES SHOWN IN VASES.

Bright groups were formed by nurserymen with high-class blooms shown in bouquets of seven of each variety. Each set of blooms was judged as a unit. The larger class was for 12 distinct varieties, so that 84 blooms were required. Messrs. D. PRIOR & SONS, Colchester, excelled with a group containing Ulrich Brunner, Bessie Brown, Killarney, Caroline Testout, Dean Hole, Maman Cochet, Liberty, John Ruskin, &c. 2nd, Messrs. ALEX. DICKSON & SONS. They showed well the big variety Bessie Brown, also Mrs. W. J. Grant, Ulrich Brunner, Mrs. Harold Brocklebank, and Lady Helen Vincent. 3rd, THE DEVON ROSARY AND FRUIT FARM, Torquay.

In the similar class for nine varieties, Mr. JOHN MATTOCK beat two other competitors, with moderate blooms of Mrs. Ed. Mawley, Souvenir de Pierre Notting (yellow), White Maman Cochet (pale lemon), Melea (yellow), Souvenir de S. A. Prince, Boadicea, &c. 2nd, Mr. DREW, with Melea, Muriel Grahame, and Mme. Jules Graveaux as his best varieties.

SPECIAL BLOOMS: OPEN CLASSES.

The best 18 blooms of a crimson Rose were shown by Mr. E. J. HICKS, Twyford, who staged excellent specimens of Richmond. 2nd, KING'S ACRE NURSERIES, Hereford, with the same variety.

The best white or yellow Rose, shown as 13 blooms in a Bamboo stand, was the lovely Mme. Melanie Soupert, Frau Karl Druschki taking the 2nd place. They were shown by Messrs. MCGREY & SON and THE DEVON ROSARY AND FRUIT FARM respectively.

A variety of soft pink tone named Lady Faire, somewhat similar to Mme. Abel Chatenay, was adjudged the best in the class for a Rose of any other colour. The exhibitor was Mr. WALTER BISHOP, Belgrave, Leicester. 2nd, Lady Ashtown, showed by MESSRS. ALEX. DICKSON & SONS.

The finest dozen blooms of the White Maman Cochet variety were shown by Messrs. F. CANT & Co., who beat Messrs. D. PRIOR & SON. These latter exhibitors showed best in the class for 12 blooms of Frau Karl Druschki and the same number of J. B. Clark. The white and red flowers made a charming combination.

Messrs. ALEX. DICKSON & SONS showed the winning blooms in a class for a new Rose, having the big, blush-tinted flower named Lady Helen Vincent. A yellow variety labelled W. R. Smith, shown by Mr. HUGH DICKSON, Belfast, was placed 2nd.

GROUPE OF ROSES

were shown by two exhibitors only, Messrs. HOBBS, LTD., Dereham, Norfolk, and Messrs. PAUL & SON, Old Nurseries, Cheshunt. The former firm was placed 1st for a showy group, mainly composed of pillar varieties. This was an excellent and effective exhibit, so far as the quality and beauty of the Rambler kinds was concerned, but it was not so representative as Messrs. PAUL'S display, which secured the 1st prize. Messrs. HOBBS, LTD., utilised hanging baskets along the outskirts of the pillar plants, and filled these with select blooms of Hybrid Tea and other large varieties.

The same two exhibitors contested in the class for an arch decorated with Roses, with the same result. The winners utilised Dorothy Perkins and Tausendschon; Messrs. PAUL & SONS had the varieties Wallflower and Goldfinch.

The big groups of cut blooms shown by nurserymen, each occupying an area of 100 square feet, filled a large portion of one tent, five growers staging collections. The 1st prize was awarded to Messrs. GEO. MOUNT & SONS for one of their usual fine displays, in which large blooms staged in tripods and epergnes are a feature. There were large sheaves of Richmond, Joseph Lowe, Mme. Melanie Soupert, Mrs. John Laing, Frau Karl Druschki, Mme. Ravary, and other elegant varieties, with innumerable small vases containing blooms of select kinds, and at the back pillar varieties. 2nd, Messrs. W. & J. BROWN, Stamford and Peterborough, with a representative collection, tastefully arranged. 3rd, Mr. J. MATTOCK.

DECORATIVE ROSES.

These were shown, generally, as pyramidal groups, arising from a tall table or stand, exhibited as far as possible to show the foliage and habit of flowering. The largest class was for 36 distinct varieties. Amongst three exhibits the best was put up by Messrs. F. CANT & Co. It was surmounted by a stand of the salmon-rose tinted Lady Waterlow, with Gustave Regis, Earlate, Marquis of Salisbury, Mme. Pernet Ducher, Gruss an Teplitz (red), Mme. Chedame Guinoiseau (yellow), &c. 2nd, Mr. J. MATTOCK, with Richmond, Belle Fleur, Lady Battersea, Clara Watson, Aglaia, Bardou Job, &c.

Mr. CHAS. TURNER, Slough, excelled in the smaller class for 18 distinct varieties, and again in the class for 18 distinct varieties of summer-flowering Roses, in which H.P., H.T., Teas, and China varieties were not admissible.

Messrs. GEO. MOUNT & SONS easily led in the class for 11 varieties, occupying an area of 9 feet by 3 feet, with a charming group. Richmond was superbly shown; Mme. Abel Chatenay and Liberty were likewise fine. In the centre were Ramblers, including Dorothy Perkins, Blush Rambler, and Hiawatha. 2nd, Mr. J. MATTOCK, with long sprays of Gardenia, Leuchtstern, Goldfinch, and Tea Rambler.

AMATEURS' CLASSES.

The championship class for amateurs was for 36 blooms of distinct varieties. The most successful exhibitor was CONWAY JONES, Esq., Hucclecote, Gloucester. His flowers were moderate as regards size, fresh-looking, but showing some traces of injury from rain. The predominant tints were light ones, from out of which the dark-tinted flowers showed up with great distinctness. Very beautiful blooms were those of the varieties Mildred Grant, Maréchal Niel, Caroline Testout, Countess of Caledon, Duchess of Portland, Bessie Brown, and Wm. Shean. Among the dark-coloured varieties we singled out Capt. Hayward (especially fine in most exhibits), Earl of Dufferin, J. B. Clark, Gustave Piganeau, Charles Lefebvre, A. K. Williams, and Ulrich Brunner. These crimson-coloured Roses were far superior to those of light colour in regard to condition. This exhibitor

took the Champion Trophy and a Gold Medal. 2nd, E. G. HOLLAND, Esq., Sutton, Surrey, with a fine collection of blooms; 3rd, E. B. LINDSELL, Hitchen.

Twenty-four blooms distinct varieties.—The premier prize was won by ALFRED TATE, Esq., Downside, Leatherhead, for an exhibit of superior blooms, of chiefly old, favourite varieties, but including such modern ones as Richmond, Mrs. W. J. Grant, Kaiserin Augusta Victoria. Particularly fine examples were noted of Mildred Grant, Horace Vernet, Dr. Andry, Etienne Levet, Helen Keller, and Gustave Piganeau. 2nd, Rev. T. G. HENSLOW.

Nine blooms of any Rose, except Tea and Noisette varieties.—Rev. J. H. PEMBERTON, Havering-atte-Bower, won the 1st prize with fine examples, and especially of the variety Bessie Brown. 2nd, E. J. HOLLAND, Esq., Sutton, with several rose-pink-coloured flowers, well developed and fresh-looking. 3rd, G. A. HAMMOND, Esq., Cambrian House, Burgess Hill, with Mrs. John Laing.

Special classes were provided for growers of fewer than 3,000 plants.

For twenty-four blooms, distinct varieties. E. M. EVERSFIELD, Esq., Denne Park, Horsham, was placed 1st for an exhibit containing fine blooms of A. K. Williams, J. B. Clark, Gladys Harkness, Captain Hayward, Dean Hole, Ulrich Brunner, and Mme. Melanie Soupert. The Veitch Memorial Medal accompanied this Award. 2nd, C. C. WILLIAMSON, Welstead, Canterbury, who showed excellent blooms of J. B. Clark, Caroline Testout, Kaiserin A. Victoria, and Mildred Grant, the others being of small size. Mr. EVERSFIELD was also placed 1st for 12 varieties, distinct, shown in triplets.

For twenty-four blooms, distinct, open to growers of fewer than 2,000 plants. W. H. HAMMOND, Esq., was awarded the 1st prize for fine blooms, quite uninjured by the weather. Very superior were Duke of Edinburgh, Mrs. W. J. Grant, Lady Ashtown, J. B. Clark, Mme. Melanie Soupert, Mamie, Hugh Dickson, Mrs. J. Laing, Mme. Jules Gravereaux, &c. The Christy Cup was included in the 1st prize. 2nd, Rev. J. A. L. FELLOWES, Bunwell Rectory, Attleborough, the flowers being mostly in fine condition.

In the class for 18 blooms of distinct varieties, Mrs. E. CROFT MURRAY, Perivale, Ryde, won the 1st prize with a capital lot of flowers, there being scarcely a weak one among them. Very fine were Comte Raimboud, Maman Cochet, Mrs. J. Laing, Frau K. Druschki (an extremely fine example), J. B. Clark and Mrs. Sharman Crawford. 2nd, G. R. BONNER, Esq.

Prizes were offered to growers of fewer than 1,000 varieties. Many competed in the class for twelve blooms of distinct kinds, and it is obvious that the more extensive growers do not show the better flowers. The 1st prize was awarded to Dr. LAMPLOUGH, Kirkstall, Alverstoke, for a fine collection, in which only one bloom was injured by rain. The best were Bessie Brown, Ulrich Brunner, Frau K. Druschki, and Mme. Melanie Soupert. 2nd, Rev. J. B. SHACKLE, Dropmore Vicarage.

For 12 blooms, distinct, open only to growers of 750 varieties, the 1st prize was won by HARRY RICHARDS, Esq., West Ridge, Ryde. Isle of Wight Roses this season have been extremely fine. We noted Kaiserin A. Victoria, Her Majesty, Hugh Dickson, Marquise Litta, Mme. J. Gravereaux, Caroline Testout, &c. This exhibitor was awarded the Graham Memorial Prize. 2nd, E. B. LEHMANN, Esq., Ifield Lodge, Crawley.

Competition was very keen in a class open only to growers of fewer than 500 plants. For nine blooms, distinct, Mr. E. A. MOULDEN, Bandon, Stevenage, showed best, having excellent blooms of White Maman Cochet, Marquise Litta, Ed. Mawley, and Capt. Hayward.

In an extra class for amateurs for 12 blooms of distinct varieties Dr. C. LAMPLOUGH excelled, with beautiful examples of White Maman Cochet, J. B. Clark, Helen Keller, Bessie Brown, and other equally fine blooms; 2nd, C. F. H. LESLIE, Esq., Epscombe, Hertford.

In a class for nine blooms of distinct varieties, E. F. BROWN, Esq., Lynton, Slough, was placed 1st. He showed superior blooms of Ulrich Brunner, Killarney, Mildred Grant and Dean Hole. ALFRED TATE, Esq., won the 1st prize for 18 distinct varieties of decorative Roses, having

Gracilis, Allister Stella Gray, Ruby Queen, Gloire de Rosames, Gloire Lyonnaise, Marquise Balbiana, Green Mantle and Celine Forestier; 2nd, the Rev. J. H. PEMBERTON.

For 12 varieties Lady SUTTON was placed 1st. There were also several minor competitions, in which Lady SUTTON, the Rev. J. H. PEMBERTON, EDWARD MAWLEY, Esq., ALFRED EVANS, Esq., H. R. DARLINGTON, Esq., Miss B. H. LANGTON, and C. T. GORDON CLARK, Esq., won the chief prizes.

Dinner-table decorations were many, and single-flowered varieties were those mostly employed. One of the best was arranged by Miss WEST, of Firth Dene, Reigate, who won the 1st prize.

TEA AND NOISSETTE ROSES.

In the class for 18 blooms of distinct varieties, the 1st prize and trophy were awarded to CONWAY JONES, Esq., and for 12 blooms of distinct varieties, the 1st prize and the Prince Memorial Trophy were awarded to the Rev. J. A. L. FELLOWS, of Attleborough, the blooms being fairly good ones.

In a class for four varieties, three blooms of each, F. SLAUGHTER, Esq., Steyning, showed a bloom of Maman Cochet which was so perfect and well-shaped that he was awarded the Silver Medal of the Society. Miss D. FISHER, Potterne, Devizes, took a 1st prize for six blooms, distinct. These were very fresh-looking; the best were Maman Cochet, Ed. Mawley, Mme. Cusin, Jules Gravereaux, and Medea.

DECORATIVE CLASSES.

The numerous competitions in this section brought an abundance of very charming arrangements; for instance, a bowlful of Wichuraiana Roses and Wichuraiana foliage. The winner of the 1st prize was Miss H. C. DUCKWORTH, Elmstead, Twickenham, who showed Jersey Beauty. Baskets of Roses formed a pretty feature; 1st, Miss O. C. ORPEN, West Bergholt, Colchester. It was simple and tasteful in conception, and the varieties of which it was composed were Irish Elegance and Irish beauty.

Mrs. H. WILLIAMS won the 1st prize for a bowl of Roses, and a Silver Bowl presented by C. E. Shea, Esq., vice-president of the Society.

MEDAL ROSES.

Premier blooms. (Nurserymen's Classes).—Silver Medals were awarded to Messrs. ALEX. DICKSON & SONS for the best bloom of a Hybrid Perpetual variety in their specimen of A. K. Williams; to Messrs. MCGREY & SON for the best Hybrid Tea variety in Mme. Melanie Soupert; and to Mr. H. DREW for a magnificent specimen of Mrs. Edward Mawley, a Tea variety. (Amateurs' Classes).—To Mrs. E. CROFT MURRAY for the premier bloom of a Hybrid Perpetual variety in Mrs. John Laing; to Mr. E. B. LINDSELL for the best example of a Hybrid Tea variety in Mildred Grant, and to Mr. F. SLAUGHTER for the premier bloom of a Tea Rose in his specimen of Maman Cochet.

GOLD MEDALS

were awarded to two new Roses shown by Messrs. HUGH DICKSON & SONS, viz.:

Countess of Shaftesbury.—A Hybrid Tea variety of good form, the petals being suffused with rose colour.

Lady Pirrie.—H.T., a refined flower, the colouring being reddish apricot, with a golden sheen.

CARDS OF COMMENDATION.

Climbing Lady Ashtown. Shown by Mr. F. M. BRADLEY, Peterborough.

Theresa.—A somewhat small flower, shaded rose and apricot. Fine in the bud stage. Shown by Messrs. A. DICKSON & SONS.

Thelma.—A single Rose with bright rose-pink petals, paler at the bases. Shown by Messrs. W. SPOONER & SON, Woking.

Muriel Jamison.—A single Rose of apricot tone. Shown by Messrs. HUGH DICKSON & SONS.

Sheila Wilson.—A large, showy, single variety. Colour red. Shown by Dr. J. CAMPBELL HALL.

Mrs. Herbert Stevens.—H.T., a finely-formed flower, with creamy-white petals. Shown by Messrs. S. MCGREY & SON, Portadown.

MARKETS.

COVENT GARDEN, July 7.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eps.]

— broilers	0 4-0 6	
— buttons, per lb.	0 6-0 8	

REMARKS.—Cherries generally are arriving in a much better condition, although there is still a considerable quantity of unsound fruit. Best varieties, such as Elton Heart and Early Rivers, sell freely. Gooseberries have been exceptionally cheap, except the yellow varieties. Strawberries are very plentiful, and are being sold at exceptionally low prices. English Peaches and Nectarines are in demand. Supplies of green Figs are short. English Tomatoes are a little firmer in price. Trade generally is quiet. E. H. R., Covent Garden, Wednesday, July 7, 1909.

Jerseys	5 0-5 6	
St. Malo	4 6-5 0	
Cherbourg	4 3-4 6	

REMARKS.—Supplies of old Potatoes are almost finished, Edward J. Newborn, Covent Garden and St. Pancras, July 8, 1909.

COVENT GARDEN FLOWER MARKET.

Another week of bad trade must be recorded. Supplies all round are excessive. Many growers of bedding plants have large supplies on hand, and ordinary flowering plants for decorative purposes are well supplied. Hydrangeas are plentiful, but they have not been so good in quality as usual this season; many of the flowers have been spoiled in the cultivator's endeavour to obtain a blue colour in them. Good blue-flowered plants sell readily, but those of an intermediate shade are of little value. The variety Thos. Hogg is nearly finished for the season, but H. paniculata grandiflora is good. Rambler Roses are plentiful, and it is difficult to estimate correct prices, for many are sold cheaply to effect a clearance. The pink-flowered Spiraeas have not sold so well as was expected. White Marguerites are good and plentiful. Enceas are nearly finished for the season. Some plants of Boronia are still seen, but their flowers are beginning to fade. Fuchsias, Zonal, Show and Ivy-leaved Pelargoniums are prominent. There are shorter supplies of Liliums. The yellow annual Chrysanthemums are good, also yellow Marguerites. Ferns including beautiful plants of the plumose varieties of Nephrolepis; Asplenium Nidus is also good, A. bifurcatum continuing popular. The broad-fronded Ferns sell well, but the slender crested varieties are not so much in demand.

CUT FLOWERS.

Trade is very uncertain. At the end of last week Liliums were scarce, and their value advanced. To-day, Wednesday, they are still dear, yet, before these notes are read, they may be cheaper again. Best quality Roses are not plentiful, but there are large quantities of ordinary blooms. Carnations in all colours are excessive. Salesmen do not reduce prices for good fresh blooms, but many that have been kept over for a day or two are sold cheaply to hawkers. Casual senders expect to receive top prices, but it more often happens that when irregular supplies are received there is also a surplus from regular senders. Hardy flowers are now a prominent feature. Pyrethrums are not quite so plentiful, but Peonies are abundant. Gaillardias, Coreopsis, Poppies, and Campanulas are present in large quantities. A. H., Covent Garden, July 7, 1909.

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending July 7.

The fifth cold week in succession.—Although this was a cold week, there occurred in it the first two unseasonably warm days for over a month, but even then the temperature in the thermometer screen in the warmest part of the day only rose 3° above the average for the time of year. On the coldest night the exposed thermometer fell to within 2° of the freezing-point. The ground is now 2° colder at 2 feet deep, and 4° colder at 1 foot deep, than is seasonable. Rain fell on 9 days, but to the total amount each day some than a quarter of an inch. There has been each day some slight percolation through the bare soil gauge, but for the last 3 days the gauge on which short grass is growing has been quite dry. The sun shone on an average for 6 hours a day, or for about half an hour a day short of the average duration at this period in July. Light airs and calms have alone prevailed during the week. The mean amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by 6 per cent.

JUNE.

Very exceptionally cold, wet and gloomy.—This was the coldest June of which I have any record—24 years. The days were, as a rule, very much more unseasonably cold than the nights. In fact, there did not occur a single warm day, for the time of year, during the month. On the warmest day the temperature in the thermometer screen only rose to 68°, which is the lowest maximum in June during the past 24 years. On the coldest night the exposed thermometer registered 2° of frost, which, however, is in no way remarkable. Rain fell on as many as 19 days, to the aggregate depth of 4 ½ inches, or more than twice the average fall for the month. In the last 90 years there has been here only one other June with as heavy a rainfall. The sun shone on an average for only 3 ½ hours a day, which is 2 ½ hours a day short of the average duration—making this the most sunless June for 21 years. The winds were, as a rule, light, and in the windiest hour the mean velocity only amounted to 12 miles—direction S.S.W. The atmosphere was remarkably humid for a summer month; indeed, in none of the previous 23 years has the amount of moisture in the air at 3 o'clock in the afternoon been as great. E. M., Berkhamsted, July 7, 1909.

DEBATING SOCIETIES.

REDHILL AND REIGATE GARDENERS.—On Tuesday, May 18, the members paid a visit to Gattin Park, the residence of the president, Sir Jeremiah Colman. The occasion was the first meeting of the summer session. Sir Jeremiah Colman, in welcoming the Association to Gattin Park once again, expressed the hope that the members would visit there many more times. At the invitation of Mr. H. P. Beatty the members and their friends paid a visit to "Capenor," Nutfield, on Tuesday, June 12. The company numbered about one hundred and fifty. Mr. F. Heron, the gardener, conducted the party on a tour of inspection through the gardens.

BRISTOL AND DISTRICT GARDENERS.—The second meeting of the new session was held on July 21. The president, Col. Carey Batten, gave an interesting half-hour's talk upon "Orchids." As an object lesson some seedling Cypripediums were shown, each potted in a different compost. Some were growing in leaf-mould, others in peat and loam, and others in peat and moss; there was little variation in the growth of any of the plants. The lecturer said he failed in growing Cypripedium bellidifolium until he planted it in the joint of a wall.

* * * The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as Supplementary Illustrations in this Journal.

Editors and Publisher.—Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the *Publisher*; and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the *Editors*. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

ADDRESSES: *G. & W. Cholsky*. The following are the addresses of some important foreign gardening papers: *The American Florist*, 322, Dearborn Street, Chicago, U.S.A.; *Horticulture*, 11, Hamilton Place, Boston, Mass., U.S.A.; *Florists' Review*, Caxton Building, Chicago, U.S.A.; *Canadian Horticulturist*, Grimsby, Ontario, Canada; *Die Gartenwelt*, Hevemannstr. 10, Berlin, S.W. 11; *Revue Horticole*, Rue Jacob, 26, Paris; *The Journal of Horticulture*, Block Place, Little Collins Street, Melbourne, Australia; *The Garden Magazine*, 133, East 16th Street, New York, U.S.A.; *Moller's Deutsche Gartner-Zeitung*, Erfurt, Prussia; *Journal d'Agriculture Tropicale*, 10, Rue Dleandre, Paris; *The Tropical Agriculturist*, Colombo, Ceylon; *The National Nurseryman*, Rochester, N.Y., U.S.A.

BEECH: *H. R. G.* It is difficult from such poor specimens to accurately determine the cause of the trouble, but we suspect it is due to the Beech coccus. If you find the main trunk and branches are infested with a white, fluffy insect in patches you may be certain this is so. The best remedy is to scrub the bark with a caustic wash. The foliage had also evidences of green fly, the leaves being sticky with the exudations known popularly as honey dew.

BOOKS: *H. E. Vegetables for Home Consumption and Exhibition*, by Edwin Beckett. This work is obtainable from our publishing department. Price 5s. 5d., post free.

CUCUMBER SPOT: *Croughton-under-Brackley*. The spotting is due to a fungus commonly known as the Cucumber disease. It has been claimed that carbolic acid placed about the house will prevent the disease spreading. In any case you should thoroughly cleanse the house when the crop is finished and bury the old soil in some out-of-the-way part of the garden. Do not plant Cucumbers in the same house for a season or two. In the meantime the disease may be prevented from spreading by syringing with sulphide of potassium, using half an ounce to two gallons of water.

DWARF TREES: *J. T. H.* (1) For the destruction of the thread worms in the pots apply lime-water to the soil once a week, and if this has not the desired effect, then make a solution of half-ounce sulphate of iron to one gallon of rain-water. Apply a watering with this once a week until the pests cease. (2) You do not say if it is the same plants which are affected by the leaf disease as are injured by the thread worms. Our opinion is that it is a fungus growth, and as sulphate of iron acts equally well as a fungicide as an insecticide, we recommend a watering of the iron solution as for No. 1. Then once a month give either a pinch or two of slacked lime to the soil, or a watering with lime-water, to which a little snot has been added. (3) We do not know exactly what literature you require. Apply to the publishing department of this journal for a list of horticultural books.

GARDEN TUITION: *E. Thunder*. You cannot hope to be successful with such training as you propose to acquire. You should endeavour to enter some nursery firm where you can obtain an insight into business matters as well as in plant culture. Both the Royal

Horticultural and the Royal Botanic Societies take pupils in practical gardening; we do not know of any similar institutions near London.

GLOXINIA: *E. P. & Co.* The abnormality is interesting, but we have seen similar instances.

GRAPE ROT: *Beginner*. The berries are affected with *Gloeosporium fructigenum*. The best specific is the ammoniacal solution of copper carbonate. Mix 5 ounces of carbonate of ammonia with 1 ounce of carbonate of copper and dissolve in about one quart of hot water. When thoroughly dissolved add 16 gallons of cold water.—*H. H. and F. G.* Cut out all the damaged berries and burn them. Spray the healthy bunches with sulphide of potassium or liver of sulphur, but be careful of the paint, as this chemical acts upon the lead, turning it black.

HOUSEHOLD SODA: *J. C.* Common household soda is of but little value as a plant food, partly because nearly all fertile soils contain a sufficient amount of this ingredient and, therefore do not require any artificial supply. Pear trees being large consumers of soda, may be given exceptional treatment. When the Pear tree has set its fruit, a good watering once a fortnight with household washing-suds containing soda has been found to give excellent results as to development of fruit. The suds must be applied cold. If it is desired to use household soda direct, dissolve half-an-ounce of soda in one gallon of rain-water and apply the liquid once a fortnight from the time the fruits set until they ripen.

HYDRANGEAS WITH BLUE FLOWERS: *G. B.* You will find considerable correspondence on this subject in the *Gardeners' Chronicle* for February 2, 9, 16, 23, and March 2, 1907.

LIQUID MANURES: *Anxious*. Undiluted cow's urine contains in each one ton weight 11 lb. of nitrogen, 51 lb. of potash, 3 lb. of lime, but no phosphoric acid. Therefore, when using this liquid manure, some phosphatic manure should be added. One ounce of superphosphate or 1½ ounce of basic slag should be added to each gallon of the liquid from the cow shed. The phosphate will assist both the ripening and colouring processes of the fruit.

MANURE FOR CARNATIONS: *Carnation*. The whole history of the Carnation shows that it is fond of lime, and may also be benefited by a slow but regular-acting manure. Both nitrate of soda and guano are too stimulating. First give to the beds a dressing of slacked lime or wood ashes, 4 ounces per square yard. Then break up and sift through a ¼-inch mesh sieve some dried cow dung, if it can be obtained, to which add some good fresh loam. Apply 8 ounces of the mixture per square yard of surface. Horse-droppings may be used instead of the cow dung if the latter cannot be obtained. Soot is an excellent manure for Carnations, because it not only feeds the plants, but checks wireworm, which is one of the worst enemies of the Carnation.

NAMES OF FRUITS: *H. B.* We cannot undertake to name Peaches unless a shoot with foliage is sent with the fruits. Correspondents should also furnish us with information respecting the flowers, whether they are large or small.

NAMES OF PLANTS:—*W. J. L.* We cannot undertake to name varieties of Roses.—*J. A. B.* 1, *Sedum amplexicaule*; 2, *S. Anacamperos*; 3, *Saxifraga crustata*; 4, *S. valdensis*; 5, *S. hypnoides*; 6, *S. moschata* var.; 7, *Sedum Aizoon*; 8, *S. acre*; 9, *S. spathulifolium*; 10, *S. asiaticum*; 11, *Polygonum vacciniifolium*; 12, *Cotula dioica*; 13, *Dianthus petraeus* var.; 14, *D. Requiinii*; 15, *D. deltoides*; 16, *Potentilla* sp. (no flowers); 17, *Alyssum montanum*; 18, *Phlox amena*; 19, *Peruettya mucronata*; 20, *Rhododendron ferrugineum*. (You send considerably more than the proper number—six—for naming at one time. A small donation to the R. G. O. F. would be appropriate.)—*Constant Reader*. 1, *Fleagnum umbellatus*; 2, *Mimulus glutinosus*.—*R. H. S. Langham*. *Philadelphus Lemoinei*.—*A. G.* 1, *Cordylino australis*; 2, *Hesperis matronalis*; 3, *Galega* sp. (no flowers); 4, *Anchusa sempervirens*; 5, *Veronica longifolia*; 6, *Funkia ovata*.—*G. H. B.* 1, *Lilium pyrenaicum*; 2, *L. PEARS FALLING: *E. P. D. & Sons*. The fruits suggest injury from the Pear midge, but they were almost decayed when received. As the maggots of this insect bury themselves in the soil after the fruits have fallen and remain in the pupal stage until the following spring, you must see that all such are collected and burned. Dress the soil about the roots with kainit.

POPPIES: *C. M. P.* The stalk of the flower has become cracked from some injury. From the wounded surface an exudation has resulted, and this has caused the dark patches. We do not think there is any disease to account for the trouble.

ROSE SHOOTS DAMAGED: *A. J. M.* The damage has been caused by one of the sawflies. You should examine the bushes early in the season and destroy by handpicking any of the grubs you can detect. Dusting the foliage with Hellebore powder and syringing the plants with some poisonous liquid, such as Paris green, are useful as remedies.

STRAWBERRY CULTURE FOR MARKET: *B. H.* As you have no experience, the remarks to *E. Thunder* will apply in your case. You should first enter the service of some grower who cultivates Strawberries for market. We fear that a knowledge of Citrus culture in Australia will be of very little use to you in cultivating Strawberries for the English market.

TOMATO PLANTS: *B. T. A.* The plants arrived in a wretched condition, but it appeared as though the trouble is due to the damping-off fungus (*Pythium*). This attacks seedlings, and especially those which have been kept too damp and in a stagnant atmosphere. Another year sow the seeds thinly.—*F. F. S.* The plants are attacked by a fungus (*Macrosporium solani*). The disease gains an entrance into the fruits when they are very young, and once they are attacked, spraying is of little or no use. For this reason your applications of liver of sulphur have been of no avail to save the affected fruits, although, as you state, it has checked the spread of the disease. It will be better to prepare some Bordeaux mixture and spray the plants at intervals, including the flowers and young fruits.

WORMS AND LAWNS: *W. B.* There are preparations on the market for destroying worms on lawns. They are used in the manner you describe. Besides these proprietary articles, you will find directions for making others with corrosive sublimate and quicklime respectively in the *Book of Garden Pests*, by R. Hooper Pearson, p. 31.

A MARKET FRUIT-GROWER'S YEAR.

A COLDER or less sunny June has rarely been known. In some parts of the country the rainfall was very heavy, while in others, including my own, it was below the average. Although rain was measured here on 15 days in June, the total fall for the month was only 1.63 in. Double that quantity would have been welcome, for Gooseberries, Currants, and other fruit. It is curious to notice that the Eastern Counties, usually the driest districts of England, had a much heavier rainfall than most, if not all, other counties, from 4 in. to nearly 6 in. having been measured at some stations in Essex and Suffolk. The rain and the cold weather were very injurious to the Strawberry crop, which would have been very heavy under favourable circumstances. Frost occurred on the ground level on several nights.

An extra heavy crop of any kind of fruit causes a glut in the markets, and the Gooseberry crop is subjected to this disadvantage in the present season. The bulk of the green fruit has been sold at 1s. to 2s. per half-sieve of 28 lb., with all expenses of picking, rail carriage, and marketing to be deducted. In many cases the berries were small, and therefore the prices were un-

remunerative, as the berries cost more to pick than larger berries, whilst the rail and marketing expenses were the same. London, as usual, has proved about the worst market in the country, and at the same time the most expensive in charges for delivery, portorage, and tolls. On two or three lots which I sent to Covent Garden, only 1d. to 2d. per half-sieve remained after deducting the expenses of picking, carriage, and marketing. Such a return, it is hardly necessary to say, is inadequate to cover the expenses incurred in cultivating the crop.

A MYSTERIOUS GOOSEBERRY DISEASE.

Hundreds of Gooseberry bushes in one of my plantations on a clay soil had to be left with the berries unpicked on account of a disease described by one authority as Botrytis, and by another as collar disease. The foliage is extremely small and discoloured, this being the appearance which is taken as a symptom of Botrytis; whilst the stems close to the ground are half dead, this condition giving rise to the verdict as to collar disease. My plantation was heavily manured with basic slag and sulphate of ammonia in 1908, and with kainit and nitrate of soda in 1909, and these manures did some good, but failed to restore the unhealthy bushes to a satisfactory condition. The planting was done in one of the wettest of winters, after the bushes had been heeled in for a couple of months, on the chance of improved weather occurring. They have borne very good crops ever since, and this is partly the cause of their unhealthy condition. Hundreds have died, and many more are dying. These will be replaced with Black Currants, which may succeed well in the cold clay.

AN APHIS SEASON.

Never before have I known aphides so numerous and persistent as they have been this year. Repeated sprayings of Apple trees have effected no lasting good, as fresh colonies of aphides appeared two or three days after millions of exposed ones had been killed. The damage done to an otherwise flourishing plantation of young Apple trees is incalculable. The attack on Plums subsided after a time, and has not been repeated. By the way, it is worth while to mention that the good old wash composed of soft soap and quassia has proved much more effective in destroying aphides in my experience than the more expensive nicotine. It appears, further, that the former mixture is not commonly made strong enough. In cases where it has been used in the ordinary strength, it has done comparatively little good; but where 12 lb. of soft soap and 12 lb. of quassia chips have been boiled together to make 100 gallons of wash, and this wash applied as a drenching spray, it almost entirely cleared a plantation of slight attacks of Apple sucker, and, for the time, of aphides. But for some weeks past winged aphides have been flying about the plantation of young Apples, infesting fresh foliage with colonies of their progeny.

With respect to the attempt to suppress the black aphid on Black Currant bushes referred to in my notes last month, the nipping-off of the terminals containing the pest, when they were few in number, was of but little use, as fresh attacks appeared all over the plantation. Spraying having very little effect, owing to the protection the aphides get under

leaves curved over the tips of the shoots, I am now trying the plan of dipping the ends of the infested shoots in a strong wash, the result of which is not known at the time of writing. It would be a tedious operation in a large plantation; but a gang of fruit-pickers would get over a considerable area in a day, and if the dipping proves effectual the result will be well worth the expense of the operation. It is strange that this Black Currant pest is not noticed by entomological authorities, as reports lately received prove it to be quite common.

The bad attack of caterpillars of various kinds referred to last month nearly defoliated Apple trees in orchards where spraying was neglected; but where arsenate of lead was used at the proper time the pests were poisoned most successfully. The chief injury to the foliage where spraying was practised was suffered whilst the caterpillars were feeding inside folded bunches of leaves. As soon as these expanded, and the pests fed on the poisoned foliage, their fate was sealed. If anyone would and could take aphides from me in exchange for all the caterpillars which trouble him, I would gladly effect the exchange, as I can defeat the latter, while the former beat me.

THE APPLE FAILURE.

At the beginning of May it was stated that Apple blossom was setting well. So all growers who wrote on the subject supposed at the time; but they were sadly disappointed later, as the trusses of embryo fruit dropped from the trees in numbers, leaving a light crop in most districts, if not in all. What was the cause? It is commonly said to have been frost; but it certainly was not so in my plantations, where the temperature never fell once below freezing point, at 4 ft. from the ground level, after Apples began to blossom. I attribute the failure to the persistence of very cold and sometimes strong wind during the blossoming period, and this impression is supported by the fact that the fruit is nearly all on the lower branches of the trees, the tops of most varieties being almost fruitless. Further, it is noticed that trees on the north and east sides of an orchard are nearly bare of fruit, while those protected from wind inside bear a much less scanty crop. My oldest plantation, composed of bush-shape trees, well sheltered, has a good bottom crop, but very little fruit on the upper branches, except in the cases of some of the most hardy varieties.

THE PLUM CROP.

Plums have fallen badly in many districts, and the crop appears to be a light one in the country as a whole, though with me it is a fair one generally, and a good one on some varieties, as no damage was done by frost here. For some unaccountable reason the profuse blossoming of Old Greengage, Coe's Golden Drop, and a few other choice Plums has been followed by scarcely any fruit.

THE BLACK CURRANT CROP.

This is another fruit crop concerning which reports are nearly all unfavourable. My crop on the variety Boskoop Giant on bushes three and four years from the planting is a fine one, whilst old bushes of Lee's Prolific bear miserably small bunches. Red Currants appear to be generally abundant. *A Southern Grower.*

CÆLOGYNE ASPERATA.

OUR illustration in fig. 15 represents a fine specimen of this rare species which was shown in the group staged by Messrs. Moore, Ltd., Rawdon, Leeds, at the Holland Park Show of the Royal Horticultural Society on July 6 and 7 this year.

Cœlogyne asperata (Lowii), which is widely distributed in the Malay Peninsula, was introduced by Messrs. Low & Co., from Sarawak, North Borneo, in 1849. Since that time it has been repeatedly imported, but although when the species has bloomed it has always been considered one of the largest and most beautiful of *Cœlogyne*s, the occasions on which it has flowered have been so widely separated that there are still many orchidists who have never seen it in bloom. That it should be so comparatively rare may be accounted for by the fact that its habits in its native home, where it is usually found in shady situations, on trees overhanging streams in the hot, moist lowlands, do not fit the plants to withstand the risks of a long journey. The stout pseudo-bulbs, often 6 inches in length, usually look healthy on arrival here, but in most cases the growth-buds are quite destroyed and the plants useless. Messrs. Moore seem to have been fortunate in getting some good plants, and in a warm, moist house this species thrives admirably and blooms well in company with *Cœlogyne pandurata* and other warm-house Orchids.

The flowers, which are nearly 3 inches across, have the sepals and petals white, changing to cream-white when mature. The side lobes of the lip are white, streaked with red-brown on the inner side, the middle lobe having warty orange-red and yellow ridges, the margin being pale yellow streaked with red-brown. The flowers are delightfully fragrant.

When growing, the plants require abundance of rain-water, and should not be rested by drying at any season, although when the pseudo-bulbs are fully made up a restricted supply and a cooler temperature should be given for a month or so before growth recommences.

NEW OR NOTEWORTHY PLANTS.***MUSS.ENDA SANDERIANA.**

A LARGE number of species of the genus *Mussenda* have been described from Africa and tropical Asia, but only a few are in cultivation in our stoves. The attraction of these shrubs lies in the petaloid sepal which is borne by one flower out of every three. The four other sepals are small and inconspicuous. In some plants the petaloid sepal is never developed at all, and in others only one or two flowers in the head of cymes bears it. These petaloid sepals may be red as in *M. erythrophylla*, or, more usually, white or cream coloured, and serve to attract insects to the somewhat inconspicuous, yellow or orange flowers. The species about to be described was obtained in 1909 in Laos, Indo-China, by Mr. Micholitz, and is an exceptionally handsome member of the white-sepalled section. It seems strong and grows readily, forming a good-sized head carrying from

* *Mussenda Sanderiana*, n. sp.—Frutex 5-6-pedalis, saepe prostrata, ramis 10-15 pedes longis, sericeo-tomentosis (sicis rufo-tomentosis); foliis sub-sessilibus lanceolatis acuminatis basiibus cordatis, pagina utraque dense tomentosis, marginibus undulatis, 3½ poll. longis 1 poll. latis, petiolo minimo; stipulis linearibus bifurcatis. Cymae terminales plures, dense sericeo-tomentose. Bractea linearis 1/10 poll. longae. Flores flavi sericeo sessiles. Sepala oblonga obtusa brevia sericea ovario multo breviora, sep. petaloides ovato obtuso vel subaucto albo parvis sericeo 3½ poll. longo, 1½ poll. lato, petiolo 1 poll. longo dense sericeo. Corolla tubulosa extus sericea, superne dilatata, 1 poll. longa, intus glabra. Stamina dimidio tubi sequantia, glabra. Stylus longior, stigmatibus 2 linearibus longis flavis. Laos, Indo China, alt. 1,000-2,000 metris (W. Micholitz).

six to eight large, pure white leaf-like sepals. Being of a compact habit, it should form an attractive stove shrub. In the wild state it attains a height of 5 or 6 feet, but is often prostrate on the ground. The leaves are close-set, lanceolate and cordate, nearly sessile, with at most a very short petiole. They are bright green in colour and entirely covered, as are all the vegetative organs, with soft, close, silky hairs. The cymes are numerous at the ends of the branches, with small, yellow, tubular flowers, and the petaloid sepals are large, over 3 inches long and half as wide, pure white, and covered with fine, silky hairs. It seems quite distinct from any described species in the form and covering of the leaf, the short calyx lobes, and other points. *H. N. Ridley, Singapore.*

***CALANTHE HENNISH, n. sp.**

THIS is one of the finest *Calanthes*. Its cream-white flowers, nearly 2 inches wide, with an ele-

65° to 70° F. would be sufficient in cultivation. Like all its allies, this plant contains indigo. *A. Loher.*

At the request of Mr. Hennis, the inflorescence and description of the *Calanthe Hennisii* were submitted to Mr. R. A. Rolfe before publication, and Mr. Rolfe has written to us as follows:—
“*Calanthe Hennisii*, Loher, is the Philippine representative of *Calanthe vestita*, but differs from the latter in having the scape, pedicels, and the back of the sepals more strongly villous, and the lobes of the lip rather narrower, while the bracts are relatively broader. The flowers are slightly smaller, white, with a slight tinge of sulphur, and a yellow throat to the lip. The pedicels assume a distinct indigo-blue tint on drying, and there is a tinge of the same colour in the sepals and petals. The species was collected by Mr. Loher at Montalban, in the Province of Rizal, in January, 1906, as shown by a good dried specimen preserved at Kew. The other Philippine species

FIG. 15.—CÆLOGYNE ASPERATA (LOWII): FLOWERS WHITE, WITH ORANGE-COLOURED LABELLUM.

gant, orange spot on the lip, last from five to six weeks. Its nearest relative seems to be *Calanthe rosea*, which, however, has smaller flowers and bulbs. Another merit of the plant is that it flowers in January and February. As its habitat is in the mountains, an average temperature of

* *Calanthe Hennisii*, n. sp.—Epiphytica, pseudobulbi 5-15 cm. alti, elongati, angulosi, virides, integri, apice 2-4-foliati; folia ovato-lanceolata, 23-35 cm. longa, 5-10 cm. lata, in petiolum brevem decurrentia, tennia, laete viridia, saepe sub anthesi decidua; scapi laterales, 30-50 cm. alti, albido-lanuginosi, 10-15 flori; bractea amplae, pallide virides, pilosae; flores lactei, 4-5 cm. diametri, patentissimi; sepala aequalia, ovata, acuminata, subtus pilosula; petala obovata, obtusa, sepalis subsequantia; labellum trilobum, lobi laterales obtusi, subidentati, patentes, lobris, intermedius bilobus, lobis obovatis obtusis, d. scus 3-lineatus, aurantiacus, fauce calcaris angusti lineare recurvo intus pilosulo; columna lata, labello adnata, and prominens; stigma basi longe ciliatum; pollinia aurantiaca, caudiculis granulosis extensis aurantiacis.

Habitat: Montes Luconiae, 800-1,000 m. altitud. Flora Jan.-Febr.

of this group is *Calanthe Elmeri* Ames (*Orchidaceae*, ii., pp. 155, 156, with fig.), based upon material collected at La Trinidad, Baguio, in the Province of Benguet (Elmer, n. 5886), which was also collected by Loher at Mariveles, in January, 1905, a dried specimen being also preserved at Kew. This has much smaller flowers than *C. Hennisii*; indeed, *C. Elmeri* is the Philippine representative of the Malayan *C. rubens*, Ridl., and possesses a similar range of colour, from rose to white. The two resemble each other so closely in the dried state that they will have to be re-examined for their distinctness when living flowers of *C. Elmeri* are available. Some of the species of the *C. vestita* group are rather difficult to define, but a revision of the group was attempted a few years ago (*Orch. Rev.*, ix., pp. 140-142), at which time nothing was known from the Philippines.”

NURSERY NOTES.

THE CRAVEN NURSERY.

THIS nursery is situated in the village of Clapham, near Lancaster. It is the property of Mr. Reginald Farrer, the author of *My Rock-Garden*, who resides at Ingleborough, a house not far distant. On a recent visit I noticed a splendid collection of Alpines in pots in a series of pits, many of the plants being rare species and varieties in the best of health. Of *Edraianthus serpyllifolius major* there were hundreds of robust specimens, whilst the genus *Saxifraga* was exceedingly well represented, among those noticed being *Saxifraga Burseriana Gloria*, a very fine form, with flowers almost as large as a florin, of which

off in a year or so in the open garden, however carefully its wants are studied. A pretty and interesting plant was *Audromeda tetragona*, collected on the Rocky Mountains, with stiff, upright stems about 7 inches in length set with drooping, white bells. There was a representative collection of *Campanulas*, including *C. alpina*, *C. Zoysii*, *C. hirsuta alba*, *C. albescens*, *C. Allionii*, *C. macrorrhiza*, *C. stenocodon*, *C. speciosa*, *C. Rameri*, *C. tridentata*, *C. pusilla pallida*, *C. barbata*, *C. Hostii alba*, *C. excisa*, and *C. garganica alba*. There was a fine assortment of *Sempervivums*. Of the *Primulas* the variety of *P. villosa* known as *P. nivalis* was bearing its snow-white blossoms, as was *P. helvetica alba*, with larger flowers than *P. nivalis*. Other *Primulas* were *P. Kelleri*, *P. Reinii*, *P.*

minata, *Iberidella rotundifolia*, *Edraianthus Kitaibelii*, *Viola pinnata*, *Petrocallis pyrenaica*, *Cytisus Ardouii*, *Saponaria lutea*, and the new *Lithospermum Zollingeri*. On one side of the nursery were a number of Maples and Cherries that had lately arrived from Japan. *Aquilegia glandulosa*, which often proves a difficult plant to keep, does splendidly, and there was a large batch of healthy plants, covering a space 20 yards by 6 yards, which had been raised from seed. *Ostrowskia magnifica* was also making strong growth, and seemed perfectly at home. *Oursia coccinea* was spreading freely, and evidently enjoyed its surroundings. At a little distance from the back of the house is a large and beautiful lake, which at this point is bounded by a perpendicular cliff. In the cliff-face a path

FIG. 16.—VIEW IN THE ROCKERY AT THE CRAVEN NURSERY.

there was a large stock; a hybrid between *S. Burseriana* and *S. Elizabethæ*, with yellow flowers, the new *S. Pauline* with yellow blooms, *S. Faldonside* (a hybrid from *S. Boydii*), the rare *S. porophylla*, the new Italian *S. Petrachii*, a variety of *S. Aizoon* with red stems, *S. Frederici-Augusti*, *S. lilacina*, *S. squarrosa*, *S. scardicavera*, *cervicornis*, and the rare *S. Stribnyi*. Among the *Androsaces* were *A. glacialis*, *A. Chumbyi*, *A. helvetica*, *A. lanuginosa*, *A. villosa*, *A. Lageri*, *A. sarmentosa*, the rare Italian *A. Mathildæ*, *A. primuloides*, *A. Chamæjasme*, *A. carnea*, and *A. vitaliana*. The beautiful *Eritrichium nanum* had expanded the first of its brilliant blue flowers and looked happy in the little pots of sandy soil, but, unfortunately, this lovely little Alpine is of a most capricious character, and usually dies

imperialis, *P. luteola*, *P. bellunensis*, *P. cynoglossa*, *P. glutinosa*, *P. denticulata alba*, *P. capitata*, *P. ciliata coccinea*, *P. serrata*, *P. apennina*, *P. multiceps*, and *P. marginata*, an exceedingly fine selection. Among the Pink family were noticed *Dianthus glacialis*, *D. frigidus*, *D. alpinus*, and *D. Seguieri*, while of the *Ranunculi* *R. glacialis*, *R. rntacifolius*, the Servian *R. nyssanus*, *R. gramineus*, *R. amplexicaulis*, and *R. Kermerianus* were present. Among other plants in the pits were *Calochorti*, *Cyananthus lobatus*, *Iris menuta*, *Corydalis chedanthifolia*, *Arabis rosea*, *Anemone baldensis*, *A. narcissiflora*, *Astragalus damicus albus*, *Heris Bernardiana*, *Gentiana Bigelowii*, *Codonopsis ovata*, *Lychnis Lagasceæ*, *Phlox carolina*, *Sisyrinchium angustifolium*, *S. filifolium*, *Jamesia americana*, *Castilleja acu-*

has been cut leading from the top by a gentle descent to the water's edge and then gradually ascending again. This work was carried out eighteen months ago, and in the crannies of the rock *Saxifragas*, *Violas*, *Aubrietias*, *Arabis*, *Veronicas*, *Ranondias*, and *Haberleas* were planted, and make already a good show. Where there was sufficient soil, seeds of Alpine plants were sown, and in a few years' time this picturesque spot will doubtless present a charming appearance. The gardens contain a fine collection of plants, among which was a healthy young specimen of *Embothrium coccineum*, great trees of which are such a marvellous sight in Cornwall in the month of May. It is doubtful, however, if the shrub will succeed in this district. *Rhododendron anthropogon*, *R. campylocarpum*, and *R. chamæcistus*

cistus were noticed, *Magnolia Kobus* was in full flower, and *Nandina domestica* was the picture of health. Other plants included *Daphne Cneorum*, *Eucryphia pinnatifolia*, *Olearia nitida*, *Ribes spathiana*, *Genista sagittalis*, *Anemone pennsylvanica*, which bears loose clusters of pure white flowers on long stalks, *Thalictrum foliosum*, *Nierembergia rivularis*, *Hyacinthus azureus*, *Erodium cheilanthifolium*, *Cotoneaster congesta*, *Chamaecerasus myrtillos*, *Polygonum Auberti*, *Erythronium*, *Iris gracilipes*, *Stuartia pentagyna*, *Shortia uniflora*, *S. galacifolia*, and *Saxifraga oppositifolia* in fine form. In a little pond fed by a streamlet, in the bed of which *Saxifraga peltata* is growing strongly, the choicer Water Lilies are cultivated, and on an island in the centre, just above the level of the water, *Primula rosea* was in full flower and marvellously strong. Close by the pond is a "moraine" composed of limestone chips mixed with about a sixth of soil. Here Alpines revel and many *Saxifragas*, *Campanulas*, *Androsaces*, and other gems find the conditions suitable. *S. W. Fitzherbert.*

FOREIGN CORRESPONDENCE.

NOTES FROM SWITZERLAND.

THE weather in June and the first week of July has been so bad that the Alpine Garden at the Rochers de Naye is now considerably more backward than was that at Pont de Nant at the end of May, as recently described in the *Gardeners' Chronicle*. The change cannot merely be accounted for by the difference in altitude. June 29 was the coldest day in June at Lucerne for about 50 years, the thermometer registering 6° C. in the morning of that day.

A visit to the Basle Botanical Gardens on June 27 was spoilt by a heavy downpour of rain, which prevented a proper examination of the gardens surrounding the Botanical Institute where Prof. Fischer resides. These gardens have occupied for 12 years the site of an old cemetery, and they are managed by Herr Urech. Among the Labiatae are very fine patches of *Salvia verticillata*, *Phlomis cashmeriana*, with its pink flowers, *Phlomis Russelliana* and *Scutellaria alpina* of the ordinary mauve colour, but with a pale yellow lower lip, which is a form of this most variable plant I had never seen. The *Staticeae* comprise *tatarica*, *speciosa*, *latifolia* and *Limonium*. I also observed *Ruscus racemosus* from the Orient, *Amsonia latifolia*, *Geranium cinereum* from the Pyrenees, *Teucrium pyrenaicum*, *Campanula turbinata*, *Senecio abrotanifolius*, *Chrysanthemum densum* from Syria, with pale yellow ray florets, *Vesicaria utriculata*, &c. Aquatic plants are a pleasing feature at Bâle, and they comprise the beautiful cream-coloured *Nymphaea Marliacina chromatella*, *Stratiotes aloides*, not found wild in Switzerland, *Typha Laxmannii* from Asia Minor, *Cicuta virosa* and *Butomus umbellatus*.

Prof. Carl Schroeter, of Zurich, was to have formally opened a new Alpine garden on the Rigi on Sunday, July 4, but owing to bad weather this event was postponed for a week. The garden is situated at Rigi Scheidegg at about 1,650 metres. Dr. Bachmann, of the Lucerne Gymnasium, is the director. The German Swiss are following in the footsteps of Mons. Corveon and his friends in starting these interesting and useful gardens, and it is none too soon. It will be interesting to see how Alpine plants generally thrive on the Rigi, and how they adapt themselves to the conglomerate or "pudding-stone" of which that mountain is chiefly composed.

I write from Engelberg in the heart of Switzerland, a charming village with an imposing church and monastery nestling in the valley beneath the famous Titlis. It is a wonderful district for

Orchids, which the local limestone seems to suit. A lady found no fewer than 25 kinds of Orchids here, including such rarities as *Cypripedium Calceolus*, *Malaxis monophyllos*, *Gymnadenia odoratissima* × *Habenaria alba* and *Cerallorrhiza Neottia* in plenty under the Fir trees.

Close to the church at Engelberg is a pretty little nursery ground and rockwork belonging to Herr A. Kuster.

Visitors to Switzerland who are interested in botany will find Schinz and Keller's *Flora der Schweiz*, translated into French this year by Profs. Wilczek and Schinz, a useful and convenient handbook. The *Flore de la Suisse*, which costs 10 francs, is a handy book of over 700 pages of thin paper and clear type, with a few small explanatory woodcuts. One of the best features of the book is its excellent index of every species and many synonyms. It is arranged according to the new classification of Engler and Prantl, and the nomenclature conforms with the Vienna rules. It is not merely a simple translation of the *Flora der Schweiz*, but it re-

CULTURAL NOTES.

GARDEN FRAMES.

THE raising of early crops of saladings, such as Radishes, Lettuces, Endives, Cress, and Mustard, and such early vegetables as Turnips, Kohl Rabi, and the small-growing varieties of Savoys and Cabbages, might be readily carried on in roughly-made frames made of planks 1½ inches thick, unpainted and unplanned, and covered with simple glazed lights. Such frames serve the gardener's purposes of retaining warmth in the soil placed in the frames, and protection against the vicissitudes of the weather, quite as well as the more expensive and troublesome cloches; moreover, they are less liable to be broken, and if a pane of glass gets broken it may be readily replaced.

In many Continental gardens these small wooden frames serve for all kinds of vegetable forcing, and even for the rooting of Pineapple suckers, also the raising and cultivation of

FIG. 17.—CORNER OF THE ROCKERY IN THE CRAVEN NURSERY.

(See p. 35.)

presents an entirely new edition carefully brought up to date. About 2,534 good species and many varieties are described, and habitats are given for the rarest plants, though not in such a manner that any harm can result to rare plants. It forms a convenient book for the pocket, similar in size to the pocket edition of Babington's *Manual* by Messrs. Groves. II. *Stuart Thompson.*

PAROCHETUS COMMUNIS IN JAVA.

THIS plant (figured in Bennett's *Plante javanica variores*, pl. 34, and in Wight's *Icones*, pt. ii., pl. 483) is by no means a rare species, as I have often found it here and in the immediate neighbourhood. The most interesting point about it is that the plant will climb if the long side branches are taken off; otherwise it is a shrub and not a creeping plant, as said in Miquel's *Flora van Nederlandsch Indië*, pt. i. p. 319. It is by no means creeping, for I have it climbing on a large stick, and it has reached already a height of 2 metres. *M. Buysman, Hortus Tenggerensis, Lawang, Java.*

Melons, Tomatos, Aubergines, early crops of Potatos, and the forcing of Asparagus. The frames usually employed measure 3½ to 4 feet in width, and 4 to 5 feet in length. The sash-bars are rabbeted in some cases with a plough plane, but more often by nailing a thin strip of wood along the middle line of the sash-bars, and if a thick coating of paint be applied when the glazing is finished, there need be nothing to fear from drip.

Warmth is afforded to the rich soil placed in the frames by a mass of well-prepared stable dung, or dung and tree leaves, or wool waste, taking especial care that this last material is put together in a very moist condition and firmly trampled. The hot-beds of the other materials named may be evenly built up to a height of 2 to 2½ feet, and trampled firm during the making. The sides of the frames should not be higher than 1 foot, and the beds should be made with a slight slope to the south in order that rain will not remain on the sashes.

There is more economy of warmth in the

materials if the hot-beds are constructed in an excavation made in the ground, 3 feet wider and longer than the frames and 2½ feet deep. Linings of either stable litter, mixed litter and tree leaves, or even rough mowings of grass, and, later in the season, of dry litter should be put round the frames. These linings may be used for supplying warmth to the beds of soil, or of providing merely against its escape. Care must be taken that no strong fumes enter the frames from below. Where there is a danger from this cause the lights should be raised ½ inch during the night. Guard against overhanging mats which might conduct the fumes into the frames. The beds should be brought up to within 6 inches of the lights. The warmth (top-heat) should not, as a rule, exceed 60° Fahr. by night, or 8° to 10° higher in cloudy weather by day; but with sunshine it may be allowed to rise to 75°, if plenty of fresh air is admitted. In affording ventilation, the cold air should be made to enter a frame at the side opposite to the direction of the wind. The applying of water to the soil will need great care. The avoidance of stagnant moisture in the frames is another point requiring close attention, especially in early spring, it being an easy matter to witness the ruin of an entire sowing from the damping-off fungus.

In the so-called "French garden," intercropping is the common practice; but it is combined with a good deal of wasted time, and should not be practised except by experts.

The beginner should rather keep his various crops separate, or, at the most, be contented with one or two in each frame.

Slight manurial top-dressings of rotten dung and finely sifted soil are of great use in this kind of frame culture, and of much service in forwarding the growth of the plants. Do not crowd the plants, or let them get spindly in the seed-beds before transplantation, nor apply water colder than the soil of the beds. *M.*

NOTICES OF BOOKS.

*** DARLINGTON'S "SOUTH DEVON AND CORNWALL."**

THIS little book of 250 pages is indispensable to tourists in the south-west. It contains a full and accurate description of the scenery and points of interest to be met with in the district, and is illustrated by over 80 photographic reproductions and five maps. It commences with a description of the chief railway routes, then gives a list of the best cycling tours, and passes on to consider the beauties of the land and objects of attraction to be seen between Exeter and Land's End, thoroughly analysing the charms of the south coasts of Devon and Cornwall. Among the towns and their environments dealt with at length are Exeter, Seaton, Sidmouth, Budleigh Salterton, Ottery St. Mary, Exmouth, Dawlish, Teignmouth, Torquay, Paignton, Brixham, Dartmouth, Salcombe, Brent, Princetown, Tavistock, Lydford, Okehampton, Plymouth, Looe, Polperro, Liskeard, Fowey, Falmouth, Truro, Penzance, Newlyn and Mousehole. In each case the most attractive tours in the neighbouring country are discussed. Forty-nine pages are devoted to Dartmoor, and its rugged tors, wild scenery and health-giving atmosphere are enlarged upon, and its prehistoric antiquities and ancient bridges described. Ample space is devoted to the Lizard, that splendid Cornish headland that attracts so many summer visitors, and to the neighbouring beauty-spots, Kynance Cove and Mullion. The book concludes with a chapter on the Isles of Scilly, the few inhabited islands of the group being considered separately. Naturally, mention is made of Mr. Dorrien-Smith's wonderful garden at Trecoo Abbey, where tender plants that will not grow on the mainland flourish to perfection. The little book is to be strongly recommended to all visitors to the south-west.

* Darlington & Co., Llangollen; price 2s. 6d.

EGYPT.

FRUITS IN UPPER EGYPT.

THE fruits which are grown in Egypt are both numerous and varied in kind, including Mangos and Bananas on the one hand, and Pears and Apples on the other. Strangely enough, the Apple is cultivated much more widely in Upper Egypt southwards to Sohag than in the Delta, where the climate is more temperate.

FIG. 18.—DAPHNE RUPESTRIS IN THE CRAVEN NURSERY.

(See p. 35.)

The variety common to the country is the yellow Paradise so largely used in Europe as a stock for the better kinds of Apples. The tree is small and straggling in habit, usually throwing up numerous suckers, which serve as an easy means of propagation.

The fruit is small and hard, but it nevertheless meets with a ready sale at about 4d. per lb. retail, being ready for use in a green state to

the advantage of being free from the scale insect, which has caused so much havoc in the Orange plantations further north. The great heat of summer is probably against the development of this insect. The Pomegranate, on the contrary, suffers greatly from the attacks of the larvæ of a butterfly, which eats out the centre of the fruit. The only preventive hitherto applied is that of enclosing the fruits in bags as soon as the flowers fade.

Other common fruit crops are the Fig and the Peach, the Apple holding a place almost equal in importance to that of the Peach. In the districts where perennial irrigation has not yet been introduced and the canals are dry in summer, the trees are watered from wells, the water being raised by means of a "sakieh" (native water wheel) or by means of a small centrifugal pump and oil engine. Apart from this, the expenses of cultivation are not great, and the returns are sufficient to leave a substantial profit to the cultivator. One point in favour of the Apple is that it does not suffer greatly by the ground being submerged in autumn. Where the old system of irrigation is still practised and the country flooded during high Nile, it is sometimes difficult to keep the water out of the gardens. Peach trees in particular are often injured by inundation. Better varieties of Apples are being introduced, but these will never assume importance as a commercial crop, nor is it probable that the country Apple will retain the place which it now holds as a fruit crop when other fruits become more common and the methods of distribution and marketing better organised.

The cultivation of Melons and Water Melons form an important industry, but apart from these and the tree fruits before mentioned, nothing is grown on a large scale, excepting, of course, the Dates, which cannot be regarded as a garden crop. Trees of Mangos, Japanese Loquats, Japanese Date Plums and Guavas which have reached the fruiting stage are only occasionally seen, although quantities are now being planted.

FIG. 19.—SAXIFRAGES IN THE CRAVEN NURSERY.

(See p. 35.)

wards the end of May. In Upper Egypt fruit-planting is extending more rapidly than in Lower Egypt, the Grape being one of the most important crops. The vines are grown on trellises supported by brick pillars. The erection of these and the planting of the vines usually costs about £100 per acre.

Citrus fruits also grow luxuriantly, and have

Fruit growing may thus be said to be yet in its infancy. Many tropical trees, such as the Avocado Pear, the Sapodilla Plum, the Annona, the Bread fruit, and Paw Paw, which can only be grown with partial success at Cairo, may be expected to grow well south of Assiut. The Passion fruit and Tree Tomato succeed even further north than Assiut. *L. W. B. G. 11*

THE ROSARY.

THE ROSE SEASON.

THE Rose season has opened most inauspiciously in Scotland, with tumultuous floods of thunder rain. This has been very unfortunate for the delicately-formed Austrian and Persian Briars, which are invariably the first to expand their flowers. Last year the flowering shoots of these Roses were destroyed by late frosts. This season, although heavy rains rendered useless many of the opening blooms, there were sufficient flower-buds left to make the present brilliant display. Here, in a greatly-sheltered garden, which hardly obtains sufficient sunlight owing to the presence of tall trees, Rosa Harrisonii and the Persian Yellow Rose, which can hardly be surpassed for artistic ornamentation, are associated with the loveliest Hybrid Briars of Lord Penzance, such, for example, as Jeannie Deans, Lucy Ashton and Meg Merrilies, with memorable effect. This is a combination of colours—soft yellow and bright crimson—which I would recommend to all cultivators, to whom the evanescence of such Roses is a secondary consideration to their supreme beauty. Another very valuable and attractive race of garden Roses are the Wichuraiana hybrids, which, for the most part, unlike the Austrian Briars, come into flower very late. Some of the finest of these are Dorothy Perkins, Lady Gay, and Hiawatha, of which the last-mentioned was especially luxuriant last year. To these I have added the lovely Kathleen and Christian Curle. White Dorothy, a graceful derivative from a well-known Wichuraiana, must also, ere long, be added to my collection. Amongst the finest new Roses are Mrs. David Jardine, which I find somewhat sparing of its splendidly formed and coloured blooms; Elaine, a beautiful Hybrid Tea, palest lemon-white in complexion, which I saw for the first time at the Temple Show last year; Molly Sharman Crawford, another variety of the most delicate beauty, with luminous foliage; Mrs. Stewart Clark, bright cerise in colour; and Beatrice, a richly-effective and free-flowering Rose, with reflexed petals and the characteristics of La France.

Rosalind, a dwarf Polyantha of great attractiveness, and Refulgence, a Hybrid Sweet Briar of brilliant scarlet colour, are also amongst the finest of recent acquisitions. We have not yet, however, acquired a climbing Medea, or a hardy Maréchal Niel! *David R. Williamson.*

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Some lesser-grown Orchids.—Among Orchids that are not generally sought after are the Schomburgkias, several varieties of which are really worth cultivation. *S. tibeticus*, *S. Kimballiana*, *S. Thompsoniana*, *S. Humboldtii*, *S. Sanderiana*, *S. chionodora* (a rare, pure white species), and its variety *S. c. rosea* are distinct growing plants and have hollow, horn-like pseudo-bulbs, with extremely thick, leathery, leaves. They are very easily kept clean, and under ordinary conditions produce strong flower-stems. The flowers of this genus are distinct in form and colour from most other Orchids, and they last an unusual length of time in a fresh condition. These plants have now commenced to grow, and, if necessary, should be given fresh rooting material. They thrive equally well in pots or baskets. Formerly it was considered that teak-wood baskets were the only suitable receptacles, but after repeated trials I find pots are more convenient, especially where a suitable position can be found for growing the plants. Schomburgkias do not require any great depth of compost. Therefore, the pots should be at least three parts filled with drainage materials, and the compost may consist entirely of *Osmunda* fibre, adding sufficient small crocks to make the drainage as perfect as possible, so

that when in full growth the plants may be afforded frequent and copious waterings. Pot each plant rather firmly, and make the compost immediately under the pseudo-bulbs especially firm. The plants will succeed in any of the warmer houses, but it is essential that they receive abundance of light, air, and moisture. When growth is completed, gradually reduce the amount of water at the root, and place the plants in an intermediate house where they will get the least amount of shade, but plenty of fresh air. Schomburgkias with fusiform pseudo-bulbs, as *S. crispata*, *S. Lyonsii*, *S. undulata*, *S. gloriosa*, and *S. rosea*, will grow well under similar conditions. Plants of this section that have their growth well advanced should not be disturbed by repotting. Such plants as *Arphyllum giganteum* and *A. spicatum* are not in general cultivation, but are pretty and attractive enough when seen with a dozen or more strong spikes of bloom. Both succeed in well-drained pots in the new Cattleya mixture. They should be grown in a light position in the cool intermediate house, affording them plenty of water during the growing period, subsequently resting them as Cattleyas, &c.

Neobenthamia gracilis.—This is a very pretty species when in bloom. Its small white and spotted flowers are produced in terminal capitate racemes, which last in perfection for several months. The plant grows freely in a warm stove-like temperature. Its tall, reed-like stems are very prolific in producing offshoots, which, unless required for propagation, should be removed immediately they appear, or the main stems will fail to produce flower-spikes. Grow the plant in well-drained peat and Sphagnum-moss, and afford copious waterings whenever the compost is dry. Frequent syringings not only encourage growth, but keep the thin leaves free from red spider, which, if there are any about, will be sure to attack this plant.

Ornithocephalus grandiflorus.—This species is rarely seen in collections. A plant is now in bloom at Burford, with several spikes of white and green flowers, which, on their first opening, appear like Lily of the Valley. The spikes of bloom will keep fresh for about two months, and are always attractive. The plants should be grown in a shady part of the intermediate house, either upon the stage, or suspended near to the roof glass. They thrive very well when subjected to the same kind of treatment as is generally afforded the cooler-growing *Cypripediums*. Use a compost of fibrous peat, chopped Sphagnum-moss, and leaf-mould.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir Edmund G. Loder, Bart., Leonardlee, Sussex.

Watering.—The month of July is usually hot and often very dry. This is not the case at the time of writing, but in the event of a change to characteristic summer weather, the watering of various plants in the flower garden, including many trees and shrubs, may need to be carried out. Even in showery weather plants in vases need to be watered, as most of the rain is thrown off by the spreading foliage. Strong-growing plants in such confined root areas should be given liquid manure occasionally. Certain hard-wooded plants that are often cultivated beneath the shade of large trees are also liable to get very dry in showery weather. When such fine-rooted plants as *Rhododendrons*, *Kalmias*, and *Camellias* become thoroughly dry, pains should be taken to see that the roots are thoroughly soaked with water, for in a dry condition the ball is apt to resist water. Take a little soil from around the stem of the plant and form a sort of shallow basin, and into this pour the water. It may be necessary in some cases to make holes in the ball by inserting a sharply pointed stick.

Bedding plants.—Many of these will need much attention in such matters as tying, pinching and pegging down of the shoots. Remove all faded flowers as soon as they are observed, and do not allow the plants to form seed-pods, as this would prevent them producing a succession of blooms. Dahlias must be protected from earwigs. Inverted pots partly filled with hay and secreted amongst the foliage, will serve as traps for catching this pest, but various kinds

of traps may be employed, it being important to destroy as many earwigs as possible.

Alpine plants and the rock-garden.—Prune any of the shrubs on the rock-garden that have become too large for their position, or mark them with a distinguishing label for transplantation in the autumn. Attend to the watering of small Alpine plants in the crevices of the rockwork, for in many of these positions rain seldom penetrates. Prick out seedlings of any Alpine plants as soon as they are large enough to handle. Continue propagation either by seeds or cuttings in order to maintain a stock of the species and varieties. Sow seeds of all the rarer species of *Primula* as soon as they are ripe. The seedlings from these will make strong plants by autumn if given careful attention. Remove all weeds from the rock-garden. As soon as the flowering season is past, regulate the groups of each plant in order to prevent any from overcrowding other plants or extending beyond the convenient size. Most of the species and varieties of *Dianthus* may be propagated from cuttings; by this method one can be sure that the purity of the stock is maintained. Among the *Campanulas* now blooming *C. muralis* (*Fortenschlagiana*) is one of the best. It is a densely-tufted plant, with bright green leaves and pale blue flowers. *Lithospermum prostratum* is almost always in bloom, the rich blue flowers having an excellent effect in masses. *Saxifraga longifolia* ceases to live after flowering; the plant, therefore, should be removed. When this has been done, add a little fresh soil and plant another specimen. If it is found difficult to make the soil adhere in the smallest crevices of the rockery, a little cow manure may be mixed with the soil.

Spring-flowering plants.—Continue to prick out seedlings of Wallflowers, Stocks, Pansies, Violas, and other spring-flowering plants as soon as they are ready. Do not allow any seedlings to become drawn and weakly before transplantation.

FRUITS UNDER GLASS.

By E. HARRIS, Fruit Foreman, Royal Gardens, Frogmore.

Pineapples.—Preparations must be made without delay for potting the main batch of Queen Suckers. It is important that the plants should become well established before autumn. A glass-covered pit, where there is very little head room, and where the conditions can be kept moist easily will suit them well until they need repotting. After thoroughly cleansing the pit, a hotbed of Oak leaves mixed with a little stable litter should be put in ready to receive the plants as soon as they are potted. The temperature of the bed should be kept at about 90° until the suckers are rooted, when it may be allowed to decline to 85° or even 80°. In whatever kind of structure the plants are placed, it is essential that the beds should be so arranged that they may be near to the glass after the pots have been plunged. The compost should be just moist when used for potting, being neither too wet nor too dry. All that is required for potting them at this stage is good fibrous loam, pulled to pieces by hand, shaking away the fine particles. The sizes of the pots must be regulated by the size of the suckers; but pots having a diameter of 6 or 7 inches will generally be found suitable. They must be well drained, so that the water will pass away quickly. In preparing the suckers for potting, several of the bottom leaves should be removed and a small portion cut off the base of the stem. Place the suckers fairly deep in the pot, and make the soil very firm about them. Assuming that the soil is in the proper degree of moisture at the time it is used, the plants will not require to be watered until they have made roots. The atmosphere must be maintained moist at all times, and the plants must be syringed two or three times each day with tepid rainwater. Until the suckers have made roots, they should be shaded from bright sunshine. Later, more air must be admitted to the frame, and less shading employed. Fire heat should be dispensed with whenever the weather conditions will allow of this being done, but there must always be sufficient heat maintained in the water pipes to prevent the atmospheric temperature falling below 70°.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. Ford, Pencarrow, Cornwall.

Hydrangeas.—Young plants of *Hydrangea hortensis* that produce single heads of flowers being the most useful for forcing purposes, a stock of cuttings should be inserted each year. For this purpose select short-jointed, strong shoots which have not flowered. If these are fairly matured they will root readily in an unheated frame; but if they are soft, they should be taken off with a heel of old wood attached, and the cutting pots or boxes placed over a mild bottom heat. Larger plants capable of producing two or more heads of flowers may be obtained easily by growing on these small plants after their flowers have faded, in which case the plants should be cut back to the first pair of plump buds below the flowers and encouraged to grow freely. When growth is completed, allow the plants all the air and sunshine possible so as to thoroughly mature their shoots.

Achimenes.—Plants coming into flower should be grown in a cool structure as they will succeed in; but a certain amount of humidity in the atmosphere is still necessary, and the plants must be shaded during the hottest part of the day. Weak manure water may be given to plants about to flower. Later batches should be afforded as much light as can be safely admitted, so as to induce sturdy growth.

Violets.—Violets intended for culture in frames must be carefully attended to during hot weather, or red spider will infest the leaves. To prevent this, keep the plants uniformly moist, and syringe them every day with clear water. Occasionally they may be syringed with weak soot-water or quassia infusion. All runners must be removed as soon as they appear, and the Dutch hoe should be frequently used. The present is a good time for overhauling the Violet frames, carrying out any needed repairs, and giving the woodwork a coat of paint.

Richardias.—Plants of *R. africana* in pots should now be kept quite dry at the root, and it is a good plan to turn the pots on their sides leaving them facing to the south. *R. Pentlandii* and *R. Elliotiana* may be placed in a sunny frame and gradually dried off: in a short time they can be stood in the open and treated as the common *Calla*.

Euphorbia (Poinsettia) pulcherrima.—These plants may now be placed for the summer in cold frames. If the tops of old or tall plants are inserted as cuttings they will furnish dwarf plants with heads but little inferior in size to those of the others. The simplest plan is to cut the stems half-way through, and in about a week or ten days, when the cut portion has callused, sever the remainder and insert the cutting in the ordinary manner.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Aphides.—I have rarely known these pests so troublesome as they have proved during the present season. Nearly all kinds of plant life are infested, particularly vegetables. Broad, Runner and Dwarf Beans are severely attacked, and it has been necessary to apply remedies frequently. Among the many suitable insecticides, quassia extract and soft soap are two of the most simple, effective and safe to use, if applied at proper strength. The plant should be syringed with the insecticide during the evening, and be given a thorough washing the following morning with soft water.

Turnips.—This season is very favourable for early Turnips, the unusually cool weather with frequent showers proving suitable for their growth. The quality, too, has been very fine. Successional sowings should be liberally thinned and the surface soil frequently stirred. Stimulants in the way of artificial or patent manures should be applied to poor land in showery weather. Small sowings of Snowball, Jersey Lily or Red Globe should be frequently made during the next month in the coolest part of the garden. The surface must be finely broken and the seed sown in shallow drills. After raking in, cover the surface thinly with freshly-cut lawn mowings.

Cucumbers.—Any plants in the houses, frames or pits which from any cause are unsatisfactory

should be rooted out, and the whole of the soil and material taken away. A fresh start may then be made with young plants. There is still plenty of time to produce good crops before the short days arrive. Plants growing satisfactorily and now in full bearing, if not overcropped, will continue to give good results for many weeks to come. Too frequently these plants become prematurely exhausted by an excess of foliage, overcropping, or allowing the fruits to remain longer on the plants than is necessary. The fruits should be taken off as soon as they attain sufficient size, and be put in a cool place, and the stalks immersed for a quarter of an inch in fresh water. Give the borders a surface dressing with some fresh material containing a little fertiliser about once a fortnight. See that the roots are kept thoroughly supplied with water and diluted liquid manure, applying the manure water at every alternate watering. Fumigate the plants occasionally with a nicotine vaporiser.

Tomatos.—Owing to the lack of sunshine, Tomatos have made little progress out-of-doors; but, provided the plants have been given proper attention, they should produce good results if the weather is good in late summer and autumn. See that the plants are secured either by staking or nailing. Remove all side growths and decaying leaves, and if the leaves are very strong, shorten them slightly. Dust the ground between the plants with finely-slaked lime, and make frequent applications of sulphur to the foliage.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Apricots.—In this neighbourhood Apricots are a deficient crop. In this and similar cases the best must be made of the fruits the trees bear. Do not allow any of them to become shaded by foliage, but pinch off a few leaves around each if this is necessary. Woodlice and earwigs, being destructive to Apricots, traps must be set for them. Such traps may be formed of pieces of Broad Bean stalks, or small pots partly filled with moss. These and any other kind of trap employed should be frequently examined in order to destroy any insects they contain. Secure the shoots to the wires and pinch out the secondary growths at a point beyond the first leaf. Bear in mind that trees growing against walls may require watering at the roots, even when this is not the case with trees growing in the open garden. Attend to the mulchings and renew any that may be necessary.

Peaches and Nectarines.—Continue to train the shoots of Peaches and Nectarines and pinch the lateral growths so that the fruits will be the better exposed to sunshine. If any shoots are noticed to be extra strong, it will be better to cut these out, as their presence is apt to rob the weaker shoots. If any of the trees have failed to fruit this season, advantage should be taken to cut out any old wood that can be spared, retaining only sufficient to furnish the space thinly with a moderate length of new growth, which is necessary for fruiting next season. Such thinning out of Peach and Nectarine shoots is indispensable in the case of trees growing out-of-doors, for unless the wood is perfectly ripened each season, it is impossible to obtain satisfactory crops of fruits. Peaches and Nectarines having now passed through the critical stoning stage, it may be assumed that the fruit still on the trees will ripen. Therefore, the cultivator will be able to determine whether any further thinning is necessary. Such thinning should be carried out without delay. Established trees now bearing full crops of fruit should be given occasional applications of liquid manure, or chemical manure, until the fruit commences to ripen, but not after that stage is reached. Healthy trees in full bearing, with their roots in a properly drained border, require large quantities of water, and the fruits will not develop to their best unless this is given, particularly during the time the fruits are swelling.

Loganberries and Blackberries.—Thin out the young shoots to the required number and secure them to stakes that they may not be damaged by wind. Train them as far as possible away from the fruit-bearing wood, in order to avoid shading the fruits. Loganberries being later to ripen than Raspberries, they are valuable for

making tarts and other purposes. The plants are usually very prolific, and they are certainly so this season. If bright sunny weather should succeed the weather we are now experiencing, they are like to be a very heavy crop.

PUBLIC PARKS AND GARDENS.

By W. W. PETTIGREW, Superintendent of City Parks, Cardiff.

The use of coal tar in the construction of footpaths.—Notwithstanding the advantages accruing from the use of asphalt or tar macadam as a surfacing material for footpaths in public places, there seems to be considerable prejudice on the part of gardeners against this material. When writing on the subject of path construction they still give details which only apply to ordinary gravel paths. Nevertheless, from the standpoint of health, comfort and economy, an asphalt walk is decidedly superior to one formed of gravel, and for these reasons we are, in this city, laying down paths of this character whenever and wherever opportunities arise.

Some two years ago I had occasion to mention in these columns a simple and efficient method of securing the benefits of an asphalt surface without incurring a very heavy outlay. This end was secured by sprinkling the walks with a coating of tar and afterwards covering them with fine gravel and rolling it into the tar—a process that, in a modified way, is now being carried out on the public highways in many towns in this country. Since that period we have adopted a slightly different and more expensive method of treating our park walks which is even more satisfactory—because more lasting—in its results. Instead of sprinkling the road surface with tar and then coating it with gravel, the tar and gravel are now mixed together before being spread on the paths. By doing this a material of nearly uniform cohesiveness is produced.

Details of the process.—The following details relative to this process may be of interest to those who desire to experiment in this direction: The gravel—a finely-broken limestone—is passed through a $\frac{1}{2}$ -inch screen, and the separated rough and fine gravel are kept in distinct heaps till required. To ensure success in mixing it with the tar, it is essential for the gravel to be thoroughly dry, and with this object in view it is, if practicable, advisable to have it stored and mixed under the cover of a shed. The tar must be applied to the gravel whilst the former material is at the boiling point, and for this reason a tar-boiler is an absolute necessity for carrying on this work. The boiling of tar, if not properly attended to, is not merely a difficult but a very dangerous process, for it may run over the sides and reach the furnace. By placing a piece of slack lime, about the size of a large hen-egg into a boiler containing about 20 gallons of tar, just as it reaches the boiling point, the ammonia gases are set free and all danger of boiling over is obviated. We find that a cube yard of fine gravel takes about 17 gallons of tar, while the rough only takes about 11 gallons. The gravel is turned over and stirred about while the boiling tar is being poured over it until it is thoroughly and evenly mixed, after which it is stored in a large heap until required for use. It is found to be an advantage to keep it stacked in this way for a few days rather than to take it out fresh and use it at once. In the latter case the tar is liable to exude from the surface and cause annoyance, whereas in the former it does not do this after being stacked for a time. The path over which this mixture is to be laid must first of all be "picked" up, remade, and slightly rolled. The rough, tarred gravel is then spread over it in a layer about $\frac{3}{4}$ inch in thickness and compressed together by means of a heavy roller. Fine gravel is thereafter laid for a depth of 2 inches over this, levelled with a steel rake and then thoroughly rolled and the surface covered with sand or fine limestone grit. By the constant application of a wet mop to the surface of the roller the tarred gravel does not adhere to it, and an even, smooth surface is given to the walk.

The cost.—Assuming the price of gravel to be 5s. 6d. the cube yard, the tar 3d. per gallon, and the rate of pay for labourers 7s. 2d. per day, the cost of making and laying tarred gravel complete is about 10d. per square yard.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, JULY 20—

Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. P. H. Biffen, on "Mendelism and Barley"). Roy. Scottish Arboricultural Soc. Annual Exh. at Stirling (4 days). British Gard. Assoc. Ex. Council meet.

WEDNESDAY, JULY 21—

Nat. Carnation and Picotee Soc. Sh. at Hort. Hall, Westminster. Truro Fl. Sh. Liverpool Hort. Assoc. Sh. Manchester Rose Sh. Cardiff & County Hort. Soc. Coming-of-age Exh. (2 days).

THURSDAY, JULY 22—

Roy. Ulster Agric. Soc. Sh. and Hort. Exh. (2 days).

FRIDAY, JULY 23—

Nat. Sweet Pea Soc. Exh. at Hort. Hall, Westminster. Southampton Roy. Hort. Soc. Carnation Exh.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last fifty years at Greenwich—63.2°.

ACTUAL TEMPERATURES.—

LONDON.—Wednesday, July 14 (6 P.M.): Max. 72°; Min. 59°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, July 15 (10 A.M.): Bar. 30.1; Temp. 69°; Weather—Sunshine.

PROVINCES.—Wednesday, July 14 (6 P.M.): Max. 65° Bury St. Edmunds; Min. 60° N. Scotland.

SALES FOR THE ENSUING WEEK.

FRIDAY—

Imports of Dendrobies, Disas, Odontoglossum crispum, &c., also Established Orchids, at 12.45; Japanese dwarf Trees, also Tree Ferns, &c., at 3, at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

The Life and Death of Seeds.

To all who have to do with plants, either economically or scientifically, the longevity of seeds is a question of interest and significance. In the literature of the subject is recorded a long series of more or less credible accounts of natural cases in which great longevity is attributed to seeds, even up to thousands of years. Only within the last two years, however, have we obtained unimpeachable data upon this subject. Prof. Becquerel in Paris and Prof. Ewart in Melbourne have lately published germination tests made upon the old seeds stored in museums since known dates. Of seeds older than 25 years, about 10 per cent. of the species gave positive results. The records are held by *Hovea linearis*, 105 years (Ewart), *Cassia bicapsularis* 87 years old and *Cytisus biflorus* 84 years old (Becquerel). In each case two or three seeds germinated out of ten that were tested.

Both observers notice that the species of greatest longevity belong mostly to the Leguminosae and have "hard seeds," that is seeds in which the testa is provided with a thick, continuous cuticle. Such seeds only admit water and swell up after they have been pricked or filed or stripped of their cuticle by strong sulphuric acid. The fact that seeds thus closely sealed up show the greatest longevity suggests that protection from some external influence is a factor in the preservation of viability.

Becquerel has established the further interesting point that not only are these "hard" integuments impervious to air, but that the dry seed-coat (testa) of an ordinary Pea or Bean is also quite air-proof; he found that no air was sucked through the seed-coat even in two years by a vacuum; the micropyle also is naturally hermetically sealed in some way and allows no air to pass. But if the air in contact with the testa is saturated with water vapour, then the testa slowly absorbs water and presently begins to allow air to pass by diffusion. As these phenomena hold with uncuticularised seed-coats it is concluded that pure cellulose walls are impervious to air when completely dried.

These dry integuments are also quite imper-

vous to other gases, and to ether, chloroform and alcohol; the germ in the seeds is thus hermetically sealed beyond the reach of poisons, and this explains why seeds are not killed when kept for months in ammonia, sulphuretted hydrogen, alcoholic corrosive sublimate and other noxious substances. Such results in the past have been held to prove that the dormant protoplasm of the seed was in some special resistant, insensitive condition. Now we know that the protoplasm of the germ is not reached unless the testa be perforated; if this be done, then the seeds never survive contact with such poisons.

A philosophical question of great significance for our conception of the nature of life underlies these enquiries into the longevity and vitality of seeds, namely the question whether it is possible for vital changes to be absolutely arrested without death—irrevocable death—resulting.

Some observers have held that the resting seed is in a condition of retarded vital activity; others that all vital activity is completely arrested. It is clear, even on the former view, that any vital changes in the seed are very slight and slow, so that experimentally it becomes very difficult to decide between these views; between no change and a just perceptible change. If it could be established that the living seed passes, on drying, into a state of complete rest, a state of "static equilibrium" as opposed to the dynamic equilibrium of the ever-changing living cell, then this important, fundamental question would be finally answered.

The resistance of resting seeds to extreme cold and to extreme desiccation supports the view that the protoplasm is here in a state of static equilibrium quite analogous with the condition of a charge of explosive before it is started into action by spark or blow.

Prof. Becquerel's work shows that it is impossible for a seed perfectly devoid of moisture to conduct the gaseous exchange involved in the process of respiration. Some observers have stated that resting dry seeds continuously produce carbon dioxide, while others have failed to confirm this. It now turns out to be chiefly a question of whether the seed contains enough water for its integuments to be permeable to gases. In this connection it must be remembered that so-called dry seeds of commerce contain 5 to 15 per cent. of water, and that it takes months to dry off all this water from them. It seems quite clear that if the seed is completely dried no detectable amount of respiration takes place within long periods of time.

As regards cold, all observers are agreed that the vitality of ordinary dry seeds is quite unaffected by exposure to the extreme cold of liquid hydrogen—250° C. It is generally held that all chemical change is in abeyance at such a temperature, and that, therefore, the seed cannot be in any other than a state of static equilibrium. This would seem to be true of such chemical changes as are essential parts of vitality, though, of course, a few violent chemical reactions do occur at this low temperature.

According to the modern conception of the relation between temperature and chemical change, with falling temperature every reaction will go slower and slower, but however low the temperature, change will be only retarded, not absolutely stopped. The resistance to cold cannot, therefore, finally settle this question.

We are, indeed, forced to conclude that the resistance of dry seeds to temperatures as high as 100° C. or even 120° C. favours the view of static equilibrium. If the protoplasm of resting seeds is entirely at rest in static equilibrium, then the viability of the seeds should endure indefinitely, like the explosibility of a properly stored charge of powder. It is, however, notorious that in a sample of stored seeds the percentage of germination steadily decreases. To what can we attribute this loss of viability? It is suggested that just as the proper working of a charge of powder may be destroyed by accidents of storage such as dampness, so in the case of stored seeds the falling off is due to changes wrought in them by oxidation or hydration.

Seeds are very hygroscopic and absorb water in direct proportion to the humidity of the air. Jodin has recorded the varying weight of seeds in different meteorological conditions, and one of the few, changing factors in an ordinary resting seed stored in air must be this alternate taking up and giving off of water. Possibly the ceaseless, slight molecular changes involved in this process slowly disorganise the viable protoplasm and in time cause the death of the seed. From such changes a "hard" seed would be exempt. It is therefore probable that complete desiccation and preservation in a dry environment are necessary conditions for testing the maximum longevity for any plant whose seeds are among the majority in which the testa is not impermeable to water.

Another change that goes on slowly but progressively is oxidation, oxidation of a purely chemical, non-vital character. Such chemical oxidation of the substances in the cells of the resting embryo might, in time, destroy the organisation needed to maintain viability, even if the organisation were, as regards vital changes, in a state of static equilibrium all along. If there is this risk, analogous to the rusting of machinery, then critical experiments upon the longevity of seeds must be carried out in the absence of oxygen as well as of moisture.

That stored seeds should in time die seems to us a natural thing, but it must not be forgotten that the death of seeds is biologically on quite a different plane from the death of individual plants. The natural death of the bodies of plants is an advantageous condition for the race that arose in the course of evolution and has become fixed. The death of seeds is not natural in this sense, not the outcome of internal processes, but it is accidental in the strict sense, brought on from without.

In order to test the longevity of seeds under conditions which prevent either of these slow changes, Prof. Becquerel has carefully dried seeds (by keeping them, after perforating the testa, at 45 C. in contact with strong desiccating agents for months), and has then sealed them up in glass bulbs in perfect vacua. These experimental seeds have been formally deposited with the Bureau of Standards in Paris, and their vitality is to be tested every ten years. Should they show no mortality, it is suggested that in this way standard plants may be handed down to remote posterity for comparison with the forms that evolution has produced in many generations of descendants. Only by such organised experiments as these, planned to endure beyond the life of an individual investigator, can these important questions be finally solved.

FIG. 20.—JUBILEE GROUP OF R.H.S. FLORAL COMMITTEE.

Front row (left to right): W. CUTHBERTSON, GEORGE GURDON, Rev. F. PAGE-ROBERTS, GEORGE PAUL (Vice Chairman), H. B. MAY (Vice Chairman), W. MARSHALL (Chairman), C. E. SHEA (Vice Chairman), J. T. BENNETT-POE (Vice Chairman), J. DOUGLASS, C. T. DYCKER, and W. T. WAKE.
 Second row: E. T. COOK, L. H. JENNIS, W. G. BARR, G. BECK, W. JAMES, W. BAIN, E. MAWLEY, R. W. WALLACE, C. R. FELLOPP, G. E. PEARSON, R. C. NOTCULF, J. GYLES, J. WALKER, W. J. BRAY, R. G. K. NEVILL, A. KINGSMILL, E. A. BOWLES (Vice Chairman), W. MILLS (Secretary), and J. DICKSON.
 Back row: A. TURBELL, H. J. CULUSH, J. F. McLEOD, W. JENNINGS, N. F. BARNES, H. J. JONES, W. HOWE, T. W. TURNER, W. F. THOMPSON, K. HOOPER PEARSON, and JAMES HUDSON.

R.H.S. GARDENS CLUB.—The association of Past and Present Students and Members of the R.H.S. Gardens Staff assembled for their second annual meeting at Wisley Gardens on Saturday, the 10th inst. Old members and the party from Vincent Square were met at Weybridge by conveyances, and enjoyed a pleasant ride through the beautiful commons and lanes to the gardens. The day, though overcast in the morning, proved delightful in the afternoon, and the party—several of them for the first time—inspected the gardens. Wisley is looking extremely beautiful just now, and especially fine are varieties of the Japanese Iris (I. Kämpferi), a winding ditch being a trail of brilliant colouring for a considerable length. In the wood a batch of *Lilium giganteum* is just now at its best. On all sides *Spiræa Aruncus* was brightening the surroundings with its huge wavy plumes of white blossoms. A notable feature was the trial of Peonies, although many of these flowers had been greatly damaged by the rains. In the plant houses Cannas were making a glorious show, but most admiration was expressed for the admirable crop of Grapes and the great vigour of the vines. A party of about 50 or 60 assembled in the laboratory for tea, under the chairmanship of the superintendent, Mr. S. T. WRIGHT, following which the business part of the meeting was proceeded with. The Rev. W. WILKS was appointed president for the year, and the members of the committee and other officers were also elected. It was proposed to hold these annual gatherings in a fresh place each year, but the general opinion was that Wisley, at any rate for the present, should be the venue, but the rules were altered enabling the committee to make the selection, with the understanding that it be Wisley for 1910. The secretary is Mr. R. J. WALLIS, Cudworth, Newdigate, Surrey.

"THE BOTANICAL MAGAZINE" for July contains descriptions and illustrations of the following plants:—

COELOGYNE VENUSTA, tab. 8262.—This species of *Coeogyne* was first described by Mr. ROLFE in the *Gardeners' Chronicle* in 1904, vol. xxxv., p. 259. The species was introduced from South-west China by Messrs. SANDER & SONS, St. Albans, and a plant flowered in 1904 in the Glasnevin Botanic Garden. The flowers are pale yellow, with white lip on which the lateral lobes and centre of mid-lobe are yellow. It succeeds in conditions usually afforded Himalayan *Coeogyne*s.

ALOË RUBROLUTEA, tab. 8263.—This tropical South-west African Aloë flowered in November, 1907, in the late Sir T. HANEURY's garden at La Mortala. Mr. ALWIN BERGER, who describes the species, states that this is probably the first time the plant flowered in Europe. *A. rubrolutea* is said to be plentiful in the neighbourhood of the Etasa Lake and on the mountains of the Klein Windhoek. Mr. DINTER reports the stem as reaching 8 feet high. In the wild state, therefore, the plant appears to come nearest in size to *A. dichotoma*. The species is not quite hardy, even at La Mortala, but it is a quick-growing plant, and presents no cultural difficulty apart from its sensitiveness to cold. It is a very ornamental greenhouse plant, and should, if possible, be given a place in the border with rich but gravelly soil. The flowers are brilliant red, with yellow markings. They are produced on a much-branched panicle.

RUBUS CANADENSIS, tab. 8264.—Mr. ROLFE describes this species as one of the most distinct and attractive of the many species of *Rubi* recently brought into cultivation. The Kew example was presented to the national collection by Professor SARGENT in 1902, and has since its introduction been cultivated under the name of

R. Millspaughii, proposed by Dr. BRITTON. Professor BAILEY has, however, definitely identified it with the true *R. canadensis* of Linnaeus. It is popularly known as the "Thornless Blackberry." It is believed to extend in a wild state from Eastern Canada through the highlands of New England, New York, and Michigan, to the mountains of North Carolina. In growth the plant resembles the common Raspberry, forming sturdy, erect stems 6 feet or 7 feet high. The flowers are white, and are produced in June in large racemose inflorescences.

PYRUS RINGO, tab. 8265.—The name Ringo, we are told by Dr. STAFF, first appeared in SIEBOLD'S *Catalogue raisonné* of 1856, and it was originally described by WENZIG in *Linnaea*, vol. xxxvii., p. 37. It is thought by SCHNEIDER that *Pyrus Ringo* represents a cross between *Pyrus spectabilis* and some form of the common Apple. It is a Japanese tree, and has long been in cultivation at Kew, where it is now about 14 feet high. No form of *Pyrus* in the Kew collection is better worth cultivation for the beauty of its fruits than *P. Ringo*. These usually hang from the branches in great abundance, and they develop an exceedingly bright yellow colour. There appears to be a variety which exhibits a pyramidal habit of growth, and others with more glabrous leaves than those of the type.

MAHONIA ARGUTA, tab. 8266.—This new species of *Mahonia* was first described in the *Gardeners' Chronicle* (1908, vol. xliii., p. 82) by Mr. J. HUTCHINSON, who is responsible for the present description. The figure published in the *Botanical Magazine* was prepared from a plant which has been in cultivation in a warm house at Glasnevin for over 30 years, and had developed into a tall, lanky shrub with terminal leaf tufts. In 1906 the plant was removed to a cool house and during the summer was placed out-of-doors, being again brought under glass in October. It responded to the new treatment by flowering in May, 1907, and again in 1908, as a result of a repetition of the treatment of wintering in a cool, airy house and plunging in the open air during the summer. The species is not likely to prove hardy in this country except in the milder parts of Ireland and in the south-west of England, and it is possible that even in these places it may require protection in winter. The flowers are pale yellow and the fruits dark blue.

MR. JAMES METHVEN.—This gardener retired from Blythwood recently after 45 years' service. It is satisfactory to record that, after so long a period of employment, Lord BLYTHWOOD, his late employer, has granted him a pension. Mr. METHVEN has settled at Kennoway, Fifeshire, his native home, and is still in the enjoyment of good health. We trust he may be spared long to enjoy his well-earned rest and pension.

MIDLAND AGRICULTURAL AND DAIRY COLLEGE.—The annual meeting will be held on Monday, July 26, at 3.15 p.m. The Duke of PORTLAND will address the meeting and present the diplomas and certificates gained during last session.

BIRTHDAY HONOURS.—Among the names included in the list of honours announced on the occasion of the KING's birthday was that of Dr. SCHLICH, F.R.S., who has been appointed a Knight Commander of the Order of the Indian Empire (K.C.I.E.). All interested in forestry are aware of the distinguished services which Dr. SCHLICH has rendered to that science. Another name in the honours list was that of FRANCIS GALTON, F.R.S., who receives a knighthood. Students of heredity will rejoice that this distinction has fallen to one who has devoted his life to the investigation of the most important and most difficult problem in biological science.

PUBLIC PARK FOR WREXHAM.—The Town Council of Wrexham recently invited competitive designs for laying out a public park. We are informed that the premium for the best design has been awarded to Messrs. J. CHEAL & SONS.

GROCCERS AND THE POISONS AND PHARMACY ACT.—The report of the Parliamentary Committee of the Grocers' Federation recalls that during the time the Poisons and Pharmacy Bill was before Parliament an effort was made to extend it so that the "right" of patent medicine licence-holders to sell proprietary medicines containing scheduled poisons might be restored. A statement was submitted to Parliament showing the public convenience which this permission would prove, while suggestions were made for safeguarding the public interest. "This right," says the report, "was not, however, conceded, while Parliament has now given the right to persons other than registered chemists to sell much more dangerous preparations, such as sheep-dips and weevil-killers." The report goes on to say that as these articles are much in demand at the stores of country grocers the Federation has issued to all the associations a booklet containing full particulars as to how licences for the sale of these articles may be obtained. *The Pharmaceutical Journal and Pharmacist*.

THE BOTANICAL GARDEN AT RIO DE JANEIRO.—Mr. J. BARBON RODRIGUES, junr., has been appointed director of the Botanical Garden, Rio de Janeiro.

BOTANICAL EXHIBITS AT THE ROYAL SOCIETY CONVERSAZIONE.—At the conversazione, held by the Royal Society at Burlington House on June 24 a number of objects of botanical interest were exhibited. These included specimens shown by the Director of Kew and by Dr. O. STAFF, F.R.S., of the wood *Lignum nephriticum*, plants of *Raphionacme utilis*, and a sample of rubber prepared at Kew from tubers of this plant. Photographs of the transverse sections of timbers to serve as means of timber identification (exhibited by R. A. ROBINSON); alien aquatic plants from the Reddish Canal, near Manchester (shown by Professor F. E. WEISS); and preparations of fossil plants from Japan, collected and exhibited by Dr. MAVIC STOPES.

PROFESSOR DR. PAUL SORAUER.—This eminent plant pathologist and professor at the University of Berlin celebrated his 70th birthday on June 9. He is the author of the *Handbuch der Pflanzenkrankheiten*, now appearing in its third edition (PAUL PAREY, Berlin), and other works.

TRAPPING MOTHS.—The periodical havoc which is wrought by caterpillars in defoliating forests in Germany has led German foresters to seek a new method for dealing with these pests. According to *Chambers's Journal*, December, 1908, the well-known attraction of the moth to the candle has supplied the idea for the novel procedure which seems to have been eminently successful in its application. A powerful electric searchlight is set up some half a mile from the forest, and beneath the light a funnel-like vessel, furnished with exhaust fans, is placed in position and connected with a chamber for the reception of the moths. The light is turned on to the forest. The moths leave its darkness, wing their way to the light, are caught in the draught of air set up in the funnel-shaped receiver and swept into the trap prepared for them. The success of the device may be gauged by the fact that on one night alone 3 tons of moths were caught, and so prevented from producing the eggs from which the plague of caterpillars would have hatched.

THE ROYAL HORTICULTURAL SOCIETY'S FLORAL COMMITTEE.—To further mark the jubilee of this Committee, the members, at the invitation of the chairman, Mr. WILLIAM MARSHALL, V.M.H., were photographed as a group on the first day of the Holland Park Show. We now reproduce this interesting photograph in fig. 20. All the members were present excepting Mr. JAMES HUDSON and Mr. J. W. BARR. Our artist has been able to place Mr. HUDSON with his companions, but Mr. BARR having gone to Scotland immediately after his recent wedding, no photograph of this member could be obtained in time for our purpose.

NURSERY FIRM EMPLOYES OUTING.—A party of about 150 persons comprising members of the staff of Messrs. CLIBRANS, Altrincham and Manchester, held their annual picnic on Saturday, July 10, a visit being paid to Colwyn Bay. The weather was gloriously fine. Colwyn Bay was reached at 8.45 a.m., and after breakfast visits were made to places of interest in the district, including The Dingle, Nant-y-glyn Valley and the Pwllerochan Woods. At the luncheon Mr. W. R. CLIBRAN said he was delighted to be present at so enjoyable an outing. The party left Colwyn Bay at 9.20 p.m., arriving home about 12.30 p.m.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

EARLY WASPS.—I have this day (July 13) destroyed six nests of wasps in the pleasure grounds here, an exceptionally early period to find so many of these pests. Has the comparatively dry, cold winter favoured the queen wasps, as we had very few nests last summer. Cyanide of potassium in a liquid form poured into the holes is the best remedy. *J. Mayne, Bilton, Devon.*

CARNATIONS LATE THIS SEASON.—No doubt many other growers of Carnations of the Souvenir de la Malmaison type have experienced the same difficulty as Mr. Grubb (see p. 19). Our main batch of these plants is quite 14 days later than usual, the variety Princess of Wales being especially slow in developing. A few blooms may be had at almost any season by introducing selected plants into a warmer temperature, but to attempt to hasten the flowering of the main batch usually results in many ragged blooms, composed chiefly of outer petals and a malformed centre. *Foreman, Ingestre Gardens, Stafford.*

PHYTEUMA COMOSUM.—A plant of this rare species has grown well at Leonardslee this season, and has borne 26 inflorescences. The blue and white spherical heads of flowers show to singular advantage in the clefts of a large rock. The plant is somewhat difficult to establish, but afterwards it succeeds very well. There are nearly 20 species and varieties of *Phyteuma*. In addition to the one mentioned, we have four others, viz., *P. orbiculare* (which is now in flower), *P. Michellii*, *P. humile* and *P. Sieberi*. *W. A. Cook, Leonardslee Gardens, Horsham.*

CHLOROSIS IN VINES.—A few days since I witnessed the result of an interesting experiment in a roomy, span-roofed vinery at Byram Park, in this county. A few months ago it was decided to inarch a rod of last year's growth of Cannon Hall Muscat on to a vine of Gros Colmar growing at one end of the vinery in question, the well-known "bottle" process being practised. In due time the vine broke into growth, and the union was completed, young shoots being produced into the water. After growing some 3 or 4 feet, the leading growth showed signs of chlorosis, the young leaves turning yellow, and there were also signs of the well-known rust on the point of the growth. Mr. Taylor, the gardener, decided to put a few grains of sulphate of iron into the water contained in the bottle, with a view to checking the disease. In a few days there were

signs of improvement in the colour of the young leaves, and a gradual disappearance of the rust. The rod has now reached the apex of the vinery roof, and is, to all appearances, quite healthy. *Yorkshire Gardener.*

SPECIMEN FUCHSIAS.—In the opinion of many visitors to the recent Holland Park Show, one of the most interesting of all exhibits was the magnificent group of specimen Fuchsias shown by J. Friedland, Esq., Whiteknights Park, Reading. Altogether, there were half-a-dozen pyramidal-shaped specimens, some 10 feet high or thereabouts, each plant being laden with blossoms. The pots were completely hidden by the lowermost branches, with their drooping masses of flowers. Such an exhibit is rarely seen in London, but in the West of England specimen Fuchsias may be seen at some of the country shows. With this mode of culture, the

Rhododendrons, except the Alpines, are nearly over, I was struck by the fresh beauty of *Rhododendron maximum*, 12 feet high, loaded with blossoms. The trusses are of medium size, well shaped, and the flowers campanulate, white, with a yellow blotch and maroon spots on the upper lobe, the stigma and calyx very clammy. There are varieties bearing flowers of different shades of rose. The value of this species consists in its late period of bloom. Half the flowers are still unopened; thus the Rhododendron season, which began here with *R. × Nobleanum* in January, will have been continuous for seven months. In habit, *R. maximum* is not dissimilar from *R. ponticum*, but at this season, when in bloom, it presents a different appearance from others of the family, owing to the annual growths having shot forth among the flowers, adding to the beauty of the display by their vivid light green. *Herbert Maxwell.*

FIG. 21.—NEW H.T. ROSE "LADY PIRRIE"; COLOUR, REDDISH APRICOT WITH GOLDEN SHEEN. (Awarded National Rose Society's Gold Medal, June 2, 1909.)

name of James Lye has been for many years identified, and some at least of those shown at Holland Park were of Lye's raising. A noteworthy item is the fact that double-flowered varieties are not at all popular for cultivating as large specimens. The reason is that they do not flower so profusely as the single kinds, and, furthermore, the heavy, double blossoms are far more liable to drop when moved than the lighter ones. In the description of new varieties, a great feature is usually made of the fact that the blossoms are very large, which is, in some respects, a decided drawback, as they are more sparingly produced, and if one or more drop from a shoot their absence is very noticeable. W.

RHODODENDRON MAXIMUM.—This North American species, which received its specific name "greatest" before Sir Joseph Hooker introduced the loftier kinds from the Himalayas, has been eclipsed in popularity by a profusion of brilliant hybrids, and is now seldom planted. Some of us, however, prefer cultivating natural species, and to-day (July 5), when all other

STRAWBERRY GROWING IN HAMPSHIRE.—Respecting *E. S.*'s remarks upon Strawberry culture for market (p. 1), the public may realise to what extent Strawberries are grown in Hampshire when I say that on Monday, June 28, no fewer than 101,000 baskets were sent away from Swanwick, a small station on the Southampton and Netley line, and almost as many on the following Wednesday. Assuming the baskets contained 5 lbs. each, this would represent a total of 225 tons of fruit in one day. This is but one station, and there are at least 10 in the neighbourhood. Then, many growers do not use the railway, but send the fruit direct into the towns. London is the great centre for distribution, but many growers of the best fruit send direct to Glasgow, Edinburgh, Belfast, and other northern centres. Oxford and Winchester consume a great amount of Strawberries, presumably at the colleges. The cross-handle chip basket is generally in use in this district; it has a wider capacity than the wicker basket, therefore the fruit carries better than it would if it were deeper in bulk; the baskets, too, are slightly "springy."

Market men are keenly alive to any improvement to be found in new varieties. For instance, Bedford Champion, one of Laxton's newer varieties, is being tried by the more enterprising of the growers, and with good results. What is required is an early ripening variety of large size, good flavour, and firm flesh, enabling the fruit to travel well. Bedford Champion appears to combine all these points, and, being of vigorous growth, this is also in its favour. The Laxton is valued highly. The plants bear prodigious crops, and in a season like the present they continue to bear for a long time. Royal Sovereign is what is termed the sheet anchor of the growers; it combines perhaps in a greater degree than any other sort all the essential qualities. Leader is immensely popular with some growers who require extra large fruits, but in regard to flavour it does not hold a high position. The best in this respect is still Sir Joseph Paxton, commonly known as "Joe's," but unfortunately this variety does not succeed so well as formerly. Its constitution, like certain sorts of Potatoes and various flowers—Chrysanthemums, for instance—has deteriorated beyond recovery. It is an exception now to find a good breadth of this Strawberry, but where it does succeed it is the best. Noble is so indifferent in its flavour that but few plants are grown, and these on account of their earliness. *E. Molyneux.*

SOCIETIES.

ROYAL HORTICULTURAL.

HORTICULTURAL SUNDRIES AT THE HOLLAND PARK EXHIBITION.

Mr. JOHNSTON, New Park, Cranleigh, showed heavy, light, and medium loams; also peats for potting hard-wooded plants.

Specimens of garden tubs, with and without holes in the bottom, unpolished or unpainted, with and without handles, of brass or iron, were shown by Mr. T. J. ELVIN, who showed tubs of various shapes to fit into angles of buildings, in walks, &c.

THE MEATH HOME OF COMFORT, for epileptic women and girls, at Godalming, showed basket-ware—neatly-made, tasteful models; also trays, crates, trugs, and fruit-gathering baskets.

THE FRENCH CLOCHE CO., Caxton House, Westminster, showed samples of cloches and crates.

Mr. R. T. JACKSON, 171, Piccadilly, exhibited Rose bowls and flower vases in great variety of form. This exhibitor showed preserved fruits. He is an importer of American fancy groceries and fruits in syrup, preparations of table delicacies carried out by two ladies—Miss Martin of Willowbrook, and Miss Levity, of Rochester, both in the State of New York.

Messrs. W. VOSS & CO., Millwall, London, E., showed Knapsack sprayers, also large and small syringes fitted with nozzles of an ingenious kind, vaporisers for distributing Nicotyl, &c.

Messrs. D. DOWELL & SON, pottery merchants, Ravenscourt Avenue, Hammersmith, were exhibitors of dark-brown, glazed ware, formed after the patterns of Roman pottery unearthed at Silchester, including bowls for growing Narcissus bulbs in water, vases, plant saucers, deep pots for bulb culture, &c.

Messrs. WAKELY BROS. & CO., Bankside, London, showed their famed manure made from spent hops. It is entirely odourless, and is now being used by some of the leading nurseries.

Messrs. J. WEEKS & CO., 72, Victoria Street, Westminster, exhibited models of culture houses, tubular boilers, &c.

Messrs. T. J. SYER & CO., 45, Wilson Street, London, showed garden tools of all kinds. A practical sprayer at a cheap price is made by this firm, and which is much in use for spraying walls in schools with disinfectants, as well as for spraying insecticides and fungicides on fruit bushes and trees.

Messrs. DE LUZY FRÈRES, showed the National Knapsack sprayer, besides a variety of other kinds; also bellows with short and long nozzles, a simple syringe or sprayer with a long attenuated bent delivery pipe, and the piston of wood—simply a plunger.

Messrs. W. WOOD & SON, LTD., North British Wharf, Wood Green, London, showed punnets in chip, fastened together with thin wire clamps; crates for the same for market purposes; Willow trays, hampers, long, flat baskets for use in gathering cut flowers, spraying implements,

wood-wool, raffia, labels, garden thermometers, and other instruments, labels, sprayers, sprayers, fumigators, manures of all kinds, and insecticides. Added to these were samples of garden soils, Mushroom spawn, Orchid "fibre," Orchid baskets, &c.—a very important display. Messrs. WOOD & SON had also a great variety of Bamboo canes, garden and park seats, water barrows, watering pots, plant barrows, hose reels, wheelbarrows, &c.

Messrs. J. PITHER, LTD., Mushroom spawn makers, Uxbridge, showed samples of well-made spawn in brick form, and a quantity of excellent Mushrooms.

THE ALPHA FIRE EXTINGUISHER, LTD., ROSS, Hereford, exhibited their speciality for fire extinguishing, together with pipes, nozzles, and bamboo pipes for reaching objects at a height unreachable except by means of a ladder. This apparatus is useful in spraying fruit trees.

Messrs. J. HILL & CO., 100A, Queen Victoria Street, London, E.C., showed fine cutlery, the "Scouts" cooking set, garden tools, also preserving pans and bottles.

Messrs. CHAS. TOOPE & SON, Stepney Square, and High Street, Stepney, E., showed a quantity of heating apparatus for burning oil fuel.

Messrs. CHAS. P. KINNELL & CO. showed the Anglican boiler, which needs no setting of brick-work, and a very powerful, horizontal tubular one.

Messrs. W. COOPER & NEPHEWS, Berkhamsted, showed various liquids for fumigating soils, spraying fruit trees, killing weeds, fumigating plants under glass, &c.

Mr. W. J. ROBERTSON, Cowleigh Road, Malvern, showed the spraying specialities of MM. Bernard, Maris, and Antoine, of Paris.

Messrs. CORRY & CO., LTD., 13, Finsbury Street, E.C., showed insecticides, dressings, manures, implements, &c.

Messrs. CASTLES, LTD., Millbank, Westminster, S.W., made a good show of their so-called "Man of War" Oak garden furniture.

Messrs. JAS. CRISPIN & SONS, horticultural builders, Bristol, exhibited span-roofed garden frames, and a small greenhouse that exhibited several new features in construction.

The well-known firm of ALEX. SHANKS, engineers, Arbroath, were the exhibitors of mowing machines ranging from the biggest horse-drawn to the smallest hand machines.

Span-roofed frames were shown by Messrs. STORRIE & STORRIE, Glencarse, Perthshire.

Tents and seats were exhibited by C. & W. BUSWELL, of Victoria Works, Torquay.

Messrs. T. GREEN & SON, Leeds and London, made a display with lawn mowers both large and small, including the "New Monarch."

Messrs. HEADLEY & EDWARDS, engineers, Cambridge, showed garden seats, bathing tents, garden hose reels, &c.

Messrs. LIBERTY & CO., Regent Street, London, W., showed bordering to flower-beds and parterres in terra cotta.

Messrs. DUNCAN TUCKER & SONS, horticultural builders, Tottenham, London, N., showed greenhouses with span roof of quite simple but strong construction, garden seats, plant tubs, and garden frames. A plant case, called by the exhibitors the "Caloricult" system, was likewise one of Messrs. D. TUCKER & SONS' exhibits.

THE SOUTH LONDON HORTICULTURAL STORES, Woodside, S.E., had a small, select exhibit of garden hose, insecticides, garden appliances, samples of soils, garden seats, summer-houses, &c.

Messrs. RANSOMES, SIMS, & JEFFERIES, Ipswich, showed lawn mowers, petrol-driven, in five sizes, i.e., 2 feet and 3½ feet in width of cutter.

Mr. ALEX. HAMILTON, of 11, Conduit Street, London, showed tubs for garden shrubs, seats, chairs, &c.

Mr. RILEY, Herne Hill, S.E., showed summer-houses, both large and small, and furnished with ornamentation in rustic work.

SOUTHAMPTON HORTICULTURAL.

JUNE 29, 30.—The annual summer show was held on the County Cricket Ground.

For 48 blooms of distinct varieties of Roses there were three competitors. Messrs. B. R. CANT & SONS, Colchester, won the 1st prize easily with large, well-developed blooms, but, as was to be expected, showing damage due to the unfavourable weather. The following varieties were the most noteworthy: Bessie Brown, Mme. Jules Gravereaux (the premier

bloom in the show), Mildred Grant, Captain Hayward, Dean Hole, Mme. Melaine Soupert, Comte de Raimbault, Liberty, Marçhal Niel, Comtesse de Ludre, and Rosomaine Gravereaux. 2nd, Mr. H. DREW, Longworth, Berks.

The class for Tea or Noisette Roses was interesting. For 12 blooms Mr. DREW won the premier place with neat flowers of Maman Cochet, Mrs. Miles Kennedy, White Maman Cochet, Mme. Jules Gravereaux, Mrs. Ed. Mawley, and Medea as the best examples. Messrs. B. CANT & SONS were awarded the 2nd prize. 3rd, Messrs. ROGERS & SON, Red Lodge Nurseries, Southampton.

In the class for garden or decorative varieties, in six bunches of not fewer than three sprays of each kind, Messrs. JARMAN & CO., of Chard, were the only competitors, and were awarded the 1st prize for a good display.

Several classes were provided for gardeners and amateurs, the principal being the class for which the Munt Challenge Cup was offered. The schedule required 18 distinct blooms, and five exhibitors competed, the collective groups making a good display. Mr. E. PERCY SUGDEN, Uplands, Wimborne, won the trophy with good blooms of a medium size, chief of which were White Maman Cochet, Dean Hole, Avoca, Captain Hayward, Lyon Rose, and Mrs. Ed. Mawley. Dr. CHARLES LAMPLOUGH, Alverstoke, was placed 2nd.

Groups of miscellaneous plants added much to the attractiveness of the exhibition. For a group of miscellaneous plants arranged for effect, Mr. T. Hall (gr. to Lord SWAYTHLING, South Stoneham House, Southampton), won the 1st prize with a fairly good arrangement, in which Schizanthus was used freely.

Cut flowers were, as usual at this show, a prominent feature. For 12 bunches of hardy border flowers, Mr. B. LADHAMS, The Nurseries, Shirley, Southampton, won the 1st prize easily with a characteristic selection of choice subjects. 2nd, Mr. W. PALMER, The Nurseries, Andover.

Sweet Peas were well shown, and 11 classes were provided for them in the schedule. The results were remarkable for the success of one exhibitor—Sir R. BAKER, Ranston, Blandford (gr. Mr. Usher), who secured the leading award in nine of the classes with exceedingly fine blooms, well displayed. He showed Clara Curtis, Prince of Asturias, Helen Lewis, Mrs. A. Ireland, Etta Dyke, John Ingman, The King, Mrs. Hardcastle Sykes, Elsie Herbert, Constance Oliver, Lavender, G. Herbert, Mrs. C. W. Breamore, Yellow Hammer, Gordon Anketell, and other choice varieties. Mr. H. H. LEES, Warblington, Havant, secured the 2nd prize in most of the classes with good specimens of leading varieties.

Mr. ELLWOOD was placed 1st for black Grapes with good bunches of Black Hamburg. Mr. J. WESTON (gr. to L. WALKER MUNRO, Esq., Rhinefield, Brockenhurst), had the best white Grapes in rather green-berried Foster's Seedling.

Peaches were best shown by Mr. W. PALMER, Andover Nurseries, and Nectarines (a fine dish of Cardinal) by Mr. W. Gregory (gr. to H. D. BROUGHTON, Esq.). Mr. WESTON had the best Melon—the Peer—in a keen competition with six other growers. Mr. HALL won in the class for two dishes of Strawberries with the varieties Bedford Champion and Royal Sovereign.

The Hon. VICARY GIBBS, Aldenham House, Elstree, Herts. (gr. Mr. E. Beckett), won Messrs. Sutton & Sons' special prize for six dishes of vegetables. Mr. ELLWOOD secured Messrs. Toogood's prize for six, and Messrs. Carter's chief prize for six dishes, with exceedingly fine Peas, Cauliflowers, Tomatoes, Potatoes and Carrots.

Trade exhibits were numerous and good. Gold medals were awarded to Messrs. TOOGOOD & SONS, Southampton, for Sweet Peas; Messrs. SUTTON & SONS, Reading, for fruit and vegetables; Messrs. B. LADHAMS, LTD., Shirley, Southampton, for herbaceous flowers, Roses, &c.; Messrs. WATERS, Balcombe, Sussex, for an exceedingly good display of Carnations; and to Messrs. OAKLEY & WATLING, florists, Southampton, for wreaths, baskets of flowers, &c. Silver-Gilt Medals were awarded to Mr. C. BRIDGEMAN, Winchester, for Sweet Peas; and Messrs. BENNETT, GUERTSEY, for Carnations. Silver Medals were granted to Messrs. DOBBI & CO., Rothbury, for Irises; Mr. LEWIS, Havant, for Sweet Peas; and Mr. FRANK LITTLE, Gosport, for Gladioli.

WOLVERHAMPTON FLORAL FETE.

Coming-of-Age Exhibition.

JULY 13, 14 and 15.—The Coming-of-Age this year of the Wolverhampton Floral Fête has been marked by an exhibition of which the town may be justly proud. It would have been still better had the season been more genial for certain flowers such as Roses and Sweet Peas, that are always special features at these shows. In another direction, however, there were contributions of greater ambition than formerly, these being attracted by the offer of a special silver vase valued at £50 (or £50 in cash) to the exhibitor of the most meritorious and effective display in the show. This Coming-of-Age memorial was awarded to Messrs. BAKERS, Wolverhampton, for a very extensive water and rock-garden, with collections of cut flowers—the largest exhibit in the show. At the luncheon the Mayor (Councillor Fred Evans) made an interesting presentation on behalf of the committee to Alderman Craddock, who has been connected with the management of the fête since its commencement, and latterly has filled the office of chairman of the general committee. The presentation took the form of a silver Rose bowl suitably inscribed. In returning thanks for this, Alderman Craddock said the expenditure on the first floral fête was £800, it was now £5,500. Their income then was £900, and now it varied from £5,000 to £4,000. The committee had handed over to the borough for the improvement of the park and other open spaces something like £6,000. He remembered when between 25,000 and 30,000 people visited the show in the three days, but last year the exhibition was visited by 50,000 people on a single day! A great debt of gratitude was due to such men as Mr. Green (who started the movement), Mr. T. J. Barnett, and Aldermen Dickinson and Saunders.

The weather on Tuesday morning was threatening, but no rain fell until after 2 p.m., when a series of violent rain-storms commenced that interrupted the speeches at luncheon and destroyed the pleasure of the afternoon.

So far as the management of the show was concerned Mr. F. T. Beck, Chairman of the Horticultural Committee, Mr. W. E. Barnett (secretary), and the committee are entitled to congratulations.

GROUPS OF PLANTS.

The first class was one for a display of miscellaneous plants, in or out of bloom, and flowers, grouped for effect on a ground space in the centre of the tent, not exceeding 50 feet by 12 feet. The prizes offered in this class amounted to £100. Messrs. J. CYPHER & SONS, Cheltenham, were awarded the 1st prize. Their arrangement showed some movement away from the method practised by the most popular exhibitors of groups in recent years. There were no rustic bridges, cork arches or other adornment of the kind. Indeed, the group on the present occasion was similar (so far as the arrangement of the plants was concerned) to those exhibited at Shrewsbury some 15 or so years ago—a group of miscellaneous plants arranged sparsely over a groundwork of Ferns and Moss, and small pyramidal groups at the corners to give effect to the whole. Cut flowers are allowed in the groups at Wolverhampton, and probably the use of these brightens the exhibits in the view of the general public, but the habitual allowance of cut flowers is likely to have a tendency to discourage high condition in the plants themselves. An exhibitor of inferior plants may do much with cut flowers to hide their lack of the highest cultural condition. Messrs. CYPHER, however, treated their groups as artists, and the choice cut flowers were very skilfully arranged, both in regard to position and colour. The 2nd prize was won by Mr. W. A. HOLMES, Chesterfield, and the 3rd by Mr. W. VAUSE, Leamington. In the companion group for ornamental foliage plants there were four exhibits, Mr. W. A. HOLMES, Chesterfield, gaining the 1st prize with a first-rate group, in which the various plants were of extra quality; 2nd, Messrs. J. CYPHER & SONS; and 3rd, Sir G. H. KENRICK, Edgbaston (gr. Mr. J. V. Macdonald).

In the class for a smaller group, a very pretty

arrangement from J. A. KENRICK, Esq., Edgbaston (gr. Mr. A. Cryer), was awarded the 1st prize, whilst the 2nd prize went to Mr. W. R. MANNING, Dudley.

Class 4 was for a group of flowering plants, one kind only, to occupy a ground space of 50 square feet. The choice of plant being left to the exhibitor, there were collections of tuberous-rooted and fibrous-rooted Begonias, Hydrangea hortensis, rambling and Polyantha Roses and Ericas. The 1st prize was well deserved by a magnificent group of tuberous-rooted Begonias shown by Messrs. BLACKMORE & LANGDON. The varieties represented in this group were of the highest quality, and the culture was beyond praise. The 2nd prize was awarded to the Roses from Messrs. HOBBIES, LTD., and the 3rd to Ericas from Messrs. J. CYPHER & SONS.

J. A. KENRICK, Esq., won the 1st prize in a competition for the best collection of decorative plants and cut flowers arranged on a space not exceeding 6 feet by 4 feet, and the 1st prize for six stove and greenhouse plants.

There were two exhibits in the class for 20 plants in pots not exceeding 8 inches in diameter, at least eight to be in bloom. The 1st prize was won by Messrs. J. CYPHER & SONS, and the 2nd by Mr. W. VAUSE, Leamington, but in neither case were the plants of extraordinary character.

The best exhibit of 12 plants of Gloxinia was from B. H. MANDER, Esq., Trysull, near Wolverhampton (gr. Mr. C. Weaver). These were good specimens in 7-inch pots.

The special competitive Begonias could not be compared favourably with these shown by Messrs. BLACKMORE & LANGDON in the group class already noticed. The best collection of 12 plants was shown by Mr. MANDER.

The best exhibit of six Caladiums was shown by J. A. KENRICK, Esq., Edgbaston (gr. Mr. A. Cryer), and the best group of half-a-dozen Zonal Pelargonium plants by Lieut.-Col. C. T. MANDER, Compton.

ROSES.

We have said already that Roses are one of the great features at these shows: it is in keeping, therefore, that the most important class compares with the biggest class in the N.R.S. schedule, and requires 72 distinct Roses in each exhibit. On this occasion there were three exhibits—one from Ireland and two from England. The Irish exhibit gained the 1st prize for Mr. HUGH DICKSON, Belfast. Messrs. FRANK CANT & Co., Colchester, were awarded the 2nd, and Messrs. R. HARKNESS & Co., Hitchin, the 3rd prize. The best exhibit was well ahead, both in the quality and size of blooms, but they were not equal to the best exhibition standard. We will mention some of the better blooms. These were: Col. R. S. Williamson, Mildred Grant, Charles Grahame, Königin Carola, Mrs. W. J. Grant, W. K. Smith, Captain Hayward, Mrs. Ed. Mawley, Lady Helen Vincent and Mme. Melanie Soupert. In the 2nd prize exhibit, the variety Mrs. Ed. Mawley appeared to good advantage, and the collection contained a large but somewhat ill-formed flower of the modern variety William Shean.

In the class for 48 blooms, distinct, the 1st prize was awarded for a collection from Messrs. J. TOWNSEND & SONS, Worcester—a very commendable exhibit of medium-sized Roses. Messrs. PERKINS & SONS, Coventry, were 2nd; Mr. HUGH DICKSON, Belfast, 3rd; and Messrs. F. CANT & Co., Colchester, 4th.

Messrs. J. TOWNSEND & SONS won the 1st prize for 12 trebles, and they were followed by Mr. HUGH DICKSON, Belfast, and Messrs. R. HARKNESS & Co.

In the class for 24 Rose blooms, distinct, Mr. W. J. MATTOCK, Oxford, gained the 1st prize, and Messrs. J. TOWNSEND & SONS the 2nd prize.

Class 13 was one for new Roses of 1936, 1907 or 1908. The varieties that won the 1st prize for Mr. HUGH DICKSON were as follows:—Lyon Rose, Lady Helen Vincent, Milly Crean, H. Armytage Moore, Renee Wilmart Urban, Laurent Carle, Harry Kirk, Lady Ursula, Mme. Legend Weber, Mrs. Aaron Ward, Baron Armgard von

Biel and Comtesse Icy Hardegg. Messrs. PERKINS & SONS, Coventry, were 2nd.

The best dark Rose exhibited in 12 blooms was Hugh Dickson, shown by Mr. HUGH DICKSON. The same variety gained the 2nd and 3rd prizes, and the only other dark Rose entered in the competition was Captain Hayward. Bessie Brown, exhibited by Messrs. J. TOWNSEND & SONS, was the best light Rose, and Her Majesty, from Messrs. PERKINS & SONS, was awarded the 2nd prize.

As so often happens at exhibitions, the best Tea Roses were shown from Oxfordshire. In the class for 12 blooms, distinct, the 1st prize was won by Mr. W. J. MATTOCK. He showed Muriel Grahame, Mrs. Ed. Mawley and White Maman Cochet in excellent condition. The 2nd prize was won by Messrs. F. CANT & Co.

Garden Roses were shown by some of the leading exhibitors. The 1st prize for 12 bunches was won by Mr. J. MATTOCK, and he was followed by Messrs. F. CANT & Co.

The only display of climbing Roses in pots was made by Messrs. HOBBIES, LTD., who staged a number of varieties on a space 8 feet by 5 feet, and gained the 1st prize.

Mr. ELISHA HICKS, Twyford, Berks., had the best vase of cut Roses, Mr. W. J. GARNER being 2nd. Mr. W. J. GARNER, however, had the best bowl of Roses.

In the amateurs' classes, R. F. HOBBS, Esq., Worcester, won the 1st prize for 36 blooms, distinct, for 24 blooms, distinct, six trebles, 12 Roses, distinct, and 12 Tea Roses, distinct. W. FROGGART BRULORD, Esq., Tettenhall (gr. Mr. F. Finch), was awarded the 1st prize for 18 blooms, distinct, and 12 blooms, distinct. R. W. WILSON, Esq., Compton (gr. Mr. Boucher), had the best bowl of Roses, and the Marquis of NORTHAMPTON the best vase of cut blooms.

SWEET PEAS.

The 1st prize for 18 varieties in an open class was won by Mr. T. JONES, Ruabon, for a collection of strongly-grown, well-coloured flowers, the varieties being The King, Mrs. A. Ireland, Othello Spencer, Anrora Spencer, Audrey Crier, John Ingman, The Marquis, Etta Dyke, Marquise Willis, Princess Victoria, Mrs. C. Foster, Clara Curtis, Minnie Christie, Evelyn Hemus, Helen Lewis, Elsie Herbert, Olive Bolton, and Constance Oliver. There were three exhibits, but there had been more entries. 2nd, Sir R. BAKER, Bart., Blandford (gr. Mr. A. E. Usher); 3rd, Messrs. HOBBIES, LTD., Dereham.

The next class was limited to amateurs. It required 12 varieties, and the prizes were given by Mr. Henry Eckford. The 1st prize was gained by Sir R. BAKER, Bart. Queen Alexandra was shown with excellent effect in this collection. 2nd, Mr. J. HAYCOCK, Ruabon.

In Mr. Robt. Sydenham's classes for 12 distinct and six distinct varieties the 1st prize in the former class was won by Sir R. BAKER, Bart., and the 2nd by Mrs. CHAPPELL, Warwick (gr. Mr. T. Parry), and in the latter by Mr. J. HAYCOCK, Ruabon, and A. ASHWORTH, Esq., Gresford (gr. Mr. W. H. Shaw).

In Messrs. Baker's class for six varieties, the 1st and 2nd prizes were won by Sir R. BAKER, Bart., and Mr. T. JONES respectively.

The only other firm offering prizes for these flowers were Messrs. Webb & Sons, Stourbridge, and the 1st prize was again won by Sir R. BAKER, Bart., the 2nd prize being gained by WATSON SMITH, Esq., Stourbridge (gr. Mr. H. Davis).

OTHER CUT FLOWERS.

A class was arranged for Pansies and Violas, in which the flowers were disposed on a space not exceeding 7 feet by 3 feet. The Viola blooms were arranged in glasses, but not tied up in sprays in the usual manner, for every flower had its stem in the water, and the blooms were relieved with Viola foliage and other suitable greenery. The 1st and 2nd prize exhibits were arranged on a black velvet ground with high mirrors at the back. The effect was good, for although the schedule permitted the Pansies to be

shown in the usual way, this was not done, but the blooms were placed in glass vases like the *Violas*. The 1st prize was won by Messrs. W. PEMBERTON & SON, Bloxwich, and the 2nd by Messrs. J. BASTOCK & SON, Moseley, Birmingham.

Delphiniums were staged on the ground in groups, so that the flowers were well within view. It is a mistake to put such tall flower-spikes as these on tables, although it is done occasionally at competitive exhibitions. Messrs. BLACKMORE & LANGDON were awarded the 1st prize; Messrs. J. GIBSON & Co., Bedale, the 2nd; and J. A. KENRICK, Esq., Edgbaston, the 3rd prizes.

The collections of hardy border flowers were arranged in spaces of 15 feet by 5 feet, and the banks of bloom these collections furnished appeared to be of unusual height. The 1st prize was awarded Messrs. J. GIBSON & Co. for a group in which *Poppies*, *Pæonies*, *Irises* and *Gaillardias* were the most effective patches of colour. The 2nd prize was gained by Messrs. HARKNESS & SON, and the 3rd by Messrs. GEORGE BUNYARD & Co.

The best 12 bunches of hardy garden flowers in a considerable competition in a class for gentlemen's gardeners and amateurs came from Lieut.-Col. C. T. MANDER, who had a very good group.

FRUIT.

Although this show is too early to have extensive exhibits of fruit, nevertheless this important branch of gardening was represented. There were four exhibits in a class for four bunches of *Grapes*. The 1st prize collection was shown by Lord SAVILE, K.C.V.O., Ollerton, Notts (gr. Mr. Doe). He had *Madresfield Court*, *Black Hamburg*, *Muscad of Alexandria* and *Buckland Sweetwater*; 2nd, J. DRAKE, Esq., Market Rasen (gr. Mr. W. Parker). Lord SAVILE was awarded the 1st prize for two Bunches of *White Grapes* showing *Muscad of Alexandria*.

The best black *Grapes* were *Black Hamburg*, shown by Lord SAVILE.

There were two classes for *Melons*. The 1st prize for a green-fleshed fruit was awarded the Earl of ORMSKIRK for a variety named *Countess of Ormskirk*. The best scarlet-fleshed variety was *Sutton's Scarlet*, a small fruit of this being shown by Lord SAVILE.

There were classes for six *Peaches* and six *Nectarines*. In the former class the 1st prize was awarded the variety *Royal George*, as shown by Lord BAGOT, Rugeley (gr. Mr. T. Bannerman); *Diamond* was 2nd, shown by Lord Savile. For *Nectarines*, the EXECUTORS of Sir P. A. Muntz, Bart., Rugby (gr. Mr. H. Blakeway), obtained the 1st prize for *Early Rivers*, and the 2nd prize was given to the Earl of LATHOM for excellent fruits of the variety *Pineapple*.

Strawberries, shown in collections of three dishes each, were remarkable for large size, whilst having plenty of colour. The varieties in the 1st prize exhibit from the Marquis of NORTHAMPTON, Northampton (gr. Mr. A. R. Searle), were *Gunton Park*, *Kentish Favourite*, and *Royal Sovereign*. The 2nd prize was won by Lord HATHERTON, Teddesley Hall, Penkridge (gr. Mr. H. Taylor). He had *Mentmore*, *Bedford Scarlet*, and *Royal Sovereign*.

The best *Tomatoes* in a class for three dishes were the variety *Princess of Wales*, being moderate size fruits of perfect form and very heavy. They were shown by Mrs. J. EVANS, Wolverhampton (gr. Mr. R. Maybury).

There were only two exhibits in a class for a collection of eight dishes of fruit. The 1st prize was gained easily by Lord SAVILE. His *Madresfield Court Grapes* were remarkably good, being long, well-formed bunches, in which the size and colour of berries were alike excellent. His *Muscad of Alexandria* was scarcely less satisfactory. In addition to the *Grapes*, there were *Peaches Stirling Castle* and *Dymond*, *Nectarines Dryden* and *Imperial Downton*, *Figs Brown Turkey* and a seedling *Melou*. The 2nd prize was awarded to J. DRAKE, Esq., Market Rasen (gr. Mr. W. Parker).

The most important class in the fruit section was one for displays of growing fruit trees in pots, to be arranged on spaces of 20 feet by 9 feet. Quality of exhibits, taste in arrangement, and general effectiveness were the points to be considered by the judges. There were only two exhibitors, Messrs. T. RIVERS & SON and Messrs. THE KING'S ACRE NURSERY Co., Hereford. Messrs. RIVERS' group well deserved the 1st prize awarded it, for the fruits the trees bore were

nearly all ripe or ripening, and the quality throughout the heavily-cropped trees was exceedingly high. *Lady Sudeley Apple*, *Grand Duke* and *Late Orange Plums*, *Black Alicante Grapes*, and *Yellow Shadocks* contributed high colour to the group, and, therefore, heightened the effect. The group from THE KING'S ACRE NURSERY Co. was likewise commendable from most points of view, and certainly the vines were of the highest quality and condition. But the fruit generally was less ripe and, therefore, less effective.

VEGETABLES.

Prizes for collections of vegetables were offered by several of the seed firms. There were five exhibits in Messrs. Sutton & Sons' class for six dishes, and the 1st prize was awarded the Duke of PORTLAND, K.G., Worksoop, Notts. (gr. Mr. J. Gibson). His "dishes" were *Superlative Potato*, *Perfection Tomato*, *Centenary Pea*, *New Red Intermediate Carrot*, *Magnum Bonum Cauliflower* and *White Leviathan Onion*; 2nd, the Marquis of NORTHAMPTON (gr. Mr. Searle).

An equal number of competitors entered in Messrs. Webb & Son's class for eight dishes. In this case the Marquis of NORTHAMPTON was awarded the 1st prize. He showed *Monster White Turnip*, *Early Mammoth Cauliflower*, *Reliance Globe Beet*, *Express Potato*, *Supreme Beans*, *Victory Tomato*, *Intermediate Carrots*, and *Duke of Albany Peas*; 2nd, F. E. MUNTZ, Esq., Hockley Heath (gr. Mr. H. S. Foster).

In another class of Messrs. Webb's for six dishes, the 1st prize was won by WATSON SMITH, Esq., Stourbridge (gr. Mr. H. Davis).

In the gentlemen's gardeners' and amateurs' classes, the 1st prize for six varieties of fruits was won by Lord SAVILE; 2nd, Lord BAGOT, Rugeley (gr. Mr. T. Bannerman); and in that for a collection of 10 kinds of vegetables, by the Duke of PORTLAND; 2nd, the Marquis of NORTHAMPTON.

FLORISTS IN DECORATION.

The best featherweight bouquet was an arrangement of *Oncidiums* and *Odontoglossums*, with a few other *Orchids* and trailing growths of *Asparagus*, &c. It was shown by Messrs. PERKINS & SONS, Coventry. Mr. W. J. GARNER, Altrincham, was 2nd. Messrs. PERKINS & SONS were also awarded the 1st prize for a bridal bouquet and two bridesmaids' bouquets. The bride's was formed of white *Odontoglossum crispum*, *Panacratium*, *Lily of the Valley*, &c., and the bridesmaids' of pink *Carnations* and *Lily of the Valley*. Mr. W. J. GARNER was 2nd in this class, and Mr. J. E. KNIGHT, nurseryman, Wolverhampton, 3rd. Messrs. J. CYPHER & Co. also won the 1st prize for a hand bouquet.

The competition in the classes for dinner-table decorations was numerous, and the displays needed a large share of one of the tents. In the amateurs' class Miss F. JENKS, Codsall, won the 1st prize for an arrangement of *Sweet Peas*, a pale-coloured variety; *Adiantum Ferns* and *Selaginella* were used for greenery to the rejection of natural foliage.

In the open class there were eight exhibits, and the 1st prize was won by Messrs. J. TOWNSEND & SONS, Worcester, who employed very pretty *Roses*, but somewhat marred the good effect by using *Francoa ramosa* with them.

HONORARY EXHIBITS.

Messrs. BAKER'S, Wolverhampton, furnished almost one-half of the tent containing the plant groups, showing as the main feature a water-garden planted with *Japanese* and other *Irises*, *Spireas*, *Sarracenias*, *Gunnera manicata*, and a host of other species suitable for the purpose. This exhibit was of a most comprehensive character, arranged on a space measuring 100 feet by 20 feet, and showed much skill in design and execution. In addition to a water and adjoining rock-garden, the Messrs. BAKER'S showed a group of hardy flowers, a very large exhibit of cut *Roses*, and a big collection of *Sweet Peas* and *Gladioli* in variety. There were 40 tons of stone employed in forming the rock and water-garden. The exhibit was awarded the special 50-guinea Vase and two special Gold Medals.

The Hon. VICARY GIBBS, Aldenham House Gardens, Aldenham (gr. Mr. E. Beckett), made an extensive exhibit of vegetables, inclusive of upwards of 70 dishes. The assortment and

quality of these vegetables were alike of extraordinary merit. (Special Gold Medal.)

Messrs. J. BACKHOUSE & SON, LTD., York, exhibited a rock-garden, 8 feet or 10 feet high and 40 feet long, with a water-garden in the front. The arrangement and planting of this exhibit was carried out with skill, and excepting the placing of some of the stones in a perpendicular fashion the effect was as natural as could be possibly obtained in a temporary show. Even the stone had an appearance opposed to newness. (Gold Medal.)

Messrs. W. CUTBUSH & SONS, Highgate Nurseries, London, made an excellent display in the form of a group containing such pot plants as *Codæiums*, *Carnations*, *Coleus*, *rambling Roses*, and many other plants, whilst the interspersing of tall vases of cut *Carnations* helped to make a very fine effect. (Gold Medal.)

Mr. THOS. S. WARE (1902 LTD.), Feltham, Middlesex, showed a large group of hardy flowers, staged to produce a good colour effect. (Silver-gilt Medal.)

Messrs. JARMAN & Co., Chard, showed lovely *Centauras*, also *Roses*, *Sweet Peas*, and *Zonal Pelargoniums*, in all cases the exhibits being cut blooms. (Silver Medal.)

Messrs. WEBB & SON, Wordsley, Stourbridge, had an imposing exhibit, the centre of this being formed of the stand exhibited by the firm at the Holland Park Show, but a table 7 feet wide was added around the base. On this enlarged stage Messrs. WEBB exhibited *Sweet Peas*, *Gloxinias*, *Celosias*, and other flowers, also choice *Melons* and a large assortment of vegetables. (Gold Medal.)

Messrs. THOS. W. DARLINGTON, Warton, Carnforth, had an exhibit of *Sweet Peas*, arranged in tall vases and baskets, &c. (Small Silver Medal.)

Mr. VINCENT SLADE, Tannton, had a collection of bunches of *Zonal Pelargonium* flowers. (Small Silver Medal.)

A group of miscellaneous stove and greenhouse plants was exhibited by THE CORPORATION of WOLVERHAMPTON (gr. Mr. A. Webster). (Silver-gilt Medal.)

Mr. CHAS. BARNETT, Nurseryman, Albrighton, near Wolverhampton, exhibited *Tomatos*, *Irises*, and other produce. (Bronze Medal.)

An extraordinary exhibit of *Gladioli* was made by the proprietors of LILLEY'S BULB FARM, Guernsey. The *Colvillei*, *ramosus* and *nanus* types were represented in much variety. A very interesting exhibit. (Silver-gilt Medal.)

Messrs. CLIBRANS, Altrincham and Manchester, showed a group of plants of *Aralia sinensis alba marmorata*, having this effective plant in 8-inch and 10-inch pots. (Silver Medal.)

Mr. ROBERT SYDENHAM, LTD., had a very fine and dainty exhibit of *Sweet Peas*, arranged in silvered rustic ware. (Silver Medal.)

Mr. W. N. PATTISON, Nurseryman, Shrewsbury, exhibited *Violas* (Bronze Medal), and Mr. H. N. ELLISON, West Bromwich, a group of *Ferns* (Bronze Medal).

Mr. C. H. HERBERT, Hazlewood Road Nurseries, Acock's Green, Birmingham, showed a group of cut flowers of their new perpetual-flowering *Pink*, known as "Progress." It is a distinct shade of purple, and very fragrant. In a mass this seedling was very effective.

Mr. C. F. WATERS, Deanland Nursery, Balcombe, Sussex, made an extensive exhibit of cut *Carnation* flowers, having a large number of varieties. (Silver-gilt Medal.)

Miss S. S. THOMPSON, Alfred Road, Handsworth, exhibited a group of cactaceous plants. (Bronze Medal.)

Messrs. B. LADHAMS, LTD., Shirley, near Southampton, made a grand display of hardy flowers in the cut state. *Pinks*, *Gaillardias* and *Scabious* were the principal kinds. (Silver Medal.)

Messrs. GUNN & SONS, Olton, Warwickshire, staged an attractive group of *Phloxes*. Although so early in the season some of them had been brought into flower in an unheated house. (Silver-gilt Medal.)

Messrs. HEWITT & Co., Solihull and Birmingham, had a large exhibit of miscellaneous plants and cut flowers. (Silver-gilt Medal.)

Messrs. DONNIE & Co., Rothsay, contributed a choice assortment of *Sweet Peas* arranged in tall glasses; also a number of *Violas*, shown in sprays. *Pansy* flowers displayed on boards, and *Zonal Pelargoniums*. (Gold Medal.)

Messrs. DICKSONS, Chester, exhibited a group

of Delphiniums, Carnations and general hardy flowers. (Silver-gilt Medal.)

Messrs. JOHN PEED & SONS, Roupell Park Nurseries, Norwood, London, exhibited a fine group of Caladiums. (Gold Medal.)

Messrs. T. RIVERS & SON, Sawbridgeworth, had a number of fruit trees in pots (apparently an overflow from the competitive exhibit), and a large quantity of gathered Oranges. (Silver-gilt Medal.)

Two exhibits were staged on the grass without the tents, one from Mr. J. E. KNIGHT, Nurseryman, Wolverhampton (Silver-gilt Medal), and the other from Messrs. T. B. DOBBS & Co., Wolverhampton. (Silver Medal.) In both exhibits there were rustic arches and similar garden furniture, also bedding and other plants.

BRIGHTON ROSE AND SWEET PEA.

JUNE 29, 30.—Unfavourable weather attended the opening day of this show, and although, generally, the exhibition was a success, exhibits of Roses were disappointing. Sweet Peas, however, were well represented.

In the class for a group of Roses, including plants and cut blooms, occupying an area of 15 feet by 8 feet, Messrs. GEO. MOUNT & SONS, Canterbury, won the 1st prize easily, with a splendidly-arranged group. The varieties Frau Karl Druschki, Richmond and Joseph Lowe were finely displayed. 2nd, Mr. G. W. PIPER, Uckfield; 3rd, HARRY YOUNG, Esq., Withdean Grange, Brighton (gr. Mr. Edward Jones). The 1st prize included a silver cup, together with the Society's Silver-gilt Medal. The exhibit was also awarded the Corporation Challenge Bowl, presented for the most meritorious exhibit in the show. Messrs. GEO. MOUNT & SONS excelled in the class for 48 blooms of distinct varieties. The 2nd prize was awarded to Mr. FRANK WOOLLARD.

A Challenge Cup and the Society's Silver Medal were offered as the 1st prizes for a collection of Sweet Peas, artistically arranged, with any cut foliage or foliage plants, on a table 4 feet square. Mr. JAS. BOX, Lindfield, was the most successful exhibitor. Mr. C. F. WATERS, Balcombe, and E. J. JOHNSTONE, Esq., Burrs Wood, Groombridge (gr. Mr. A. T. Pashett), won the 2nd and 3rd prizes respectively.

Mr. A. T. PASHETT was placed 1st for a collection of Carnations, occupying a table measuring 4 square feet; 2nd, Mr. C. F. WATERS.

Miss MABEL HOWELL showed the best dinner-table decoration in strong competition.

In the class for a collection of vegetables, Col. DUDLEY SAMPSON, Buxshalls, Lindfield (gr. Mr. Geo. Porter), was placed 1st; and he was followed by F. BARCHARD, Esq., Horsted Place, Uckfield (gr. Mr. Tonrie).

A circular group of miscellaneous flowering plants, arranged in a space 10 feet in diameter, was best shown by Mr. EDWARD JONES; 2nd, S. C. WITTING, Esq., Hollingberry Copse, Brighton (gr. Mr. G. Chandler).

NATIONAL FEDERATION OF FRUIT AND POTATO TRADES' ASSOCIATION.

JULY 6.—We are informed that the following resolution was passed by the Executive Committee of the Federation at a meeting held at the Tavistock Hotel, Covent Garden, on the above date. Copies of the resolution were sent to the Chancellor of the Exchequer and others:—

"That this Federation learns with great dismay that it is proposed to impose further burdens of taxation upon land, and respectfully desires to call the attention of the Chancellor of the Exchequer to the following points affecting the market-gardening industry:—

"1. Market-gardeners send daily consignments at a very early hour to populous centres, and are therefore compelled to carry on business within the 'collection and delivery' area of a railway station.

"2. As market-gardeners cannot move further out for the above reason, the only effect of the undeveloped land tax on their industry would be to increase the heavy burdens already imposed upon them.

"3. If market-gardeners should succeed in throwing any portion of this increased burden upon their customers, the result would be to

increase the cost of two most important items in the nation's food supply, i.e., fruit and vegetables.

"4. Market-gardeners employ more hands per acre than the ordinary agriculturist, and for this reason ought to share the exemption from the undeveloped land tax conferred upon every other trade, business, or industry, except agriculture.

"5. The proposed increment duty will also bear very hardly upon the market-garden industry. As building development advances, the market-gardener has to move, and has to expend large sums on erecting new greenhouses and other buildings, and especially in heavily manuring the new soil. By selling his interest in the land for more than he gave, the market-gardener is at present able to provide a fund towards such new outlay, but on such occasions the industry will suffer severely if in future the State insists upon taking 20 per cent. of the increment, under the provisions of the Finance Bill."

SOUTHEND-ON-SEA HORTICULTURAL.

JULY 6, 7.—The annual summer exhibition was held at the Palace Hotel on these dates in unfavourable weather. The exhibits of Roses, Sweet Peas, vegetables and plants were excellent, as also were the several elegant floral decorations.

Groups of miscellaneous plants arranged for effect were much admired. The one arranged by Mr. W. G. HATCH, Southend-on-Sea, secured the Gold Medal, being much superior to all others not only in the quality, suitability and variety of the plants employed, but also in the tasteful and elegant manner in which they were disposed.

Messrs. F. CANT & Co., Braiswick Rose Gardens, Colchester, won the 1st prize in the class for 48 distinct varieties of Roses, thereby winning the Challenge Cup in addition to a money prize; Messrs. D. PRIOR & SON, Colchester, followed closely, and Mr. W. LEGGETT, also of Colchester, was placed 3rd. The 1st prize stand contained grand blooms of well-known varieties.

In the class for 18 Tea or Noisette Roses of distinct varieties, Messrs. D. PRIOR & SON, Colchester, had the best stand, showing, amongst others, fine examples of Muriel Graham and Mrs. W. J. Grant; 2nd, Messrs. F. CANT & Co.

AMATEURS' CLASSES.—The Rev. J. H. PEMBERTON, Romford, won in the class for 24 blooms, not fewer than 18 varieties, with good solid blooms of Frau Karl Druschki, Bessie Brown, Dean Hole, Mildred Grant, Caroline Testout, Horace Vernet and Helen Keller; 2nd Mrs. BARNES, Rochford.

Four medals of the National Rose Society were awarded to premier blooms as follow:—To H.T. Fran Karl Druschki, shown by Mr. F. H. FIELDGATE; to H.T. Dean Hole, shown by Mr. A. TALBOT; Tea or Noisette, Mme. Jules Graveureux, shown by Mr. C. A. L. BROWN. The medal for the best bloom staged in local classes was awarded to Mr. A. TALBOT for a bloom of the variety Dean Hole. As already stated, Mr. W. G. HATCH was awarded a Gold Medal for his excellent display of miscellaneous plants, and Dr. G. F. JONES, J.P., Westcliff-on-Sea, received a Silver-gilt Medal for an interesting collection of Cacti.

PURLEY ROSE AND HORTICULTURAL.

JULY 10.—Purley is situated in one of the most popular residential districts in Surrey. Whilst sufficiently distant from London to be almost unaffected by the smoke and fogs of the Metropolis, it is within easy access of the City, being only 15 miles from London Bridge. The scenery is charming, scarcely less so than at Caterham, which is only a few miles away. Everyone at Purley has a good garden, and to this fact is due the large measure of support accorded the horticultural society. The annual exhibition was held on Saturday, the 10th inst., in the grounds of Upper Woodcote, the residence of the president, William Webb, Esq. The feature of the exhibition were the Roses. The extra good quality of these flowers appeared to surprise all present, the standard being very high, notwithstanding the wet weather. In the trade classes the largest, that for six blooms, distinct, was won by Messrs. B. R. CANT & SONS, followed by Messrs. FRANK CANT & Co., and Messrs. D. PRIOR & SON, all of

Colchester, in this order. The 1st prize for 12 trebles was won by Messrs. D. PRIOR & SONS, Messrs. F. CANT & Co. being 2nd. Tea Roses were best shown by Mr. GEO. PRINCE, Oxford, who won the 1st prize for 12 blooms, distinct. The best garden Roses exhibited by nurserymen in the county of Surrey were from Messrs. W. SPOONER & SON, Woking; Messrs. GEO. JACKMAN & SONS, Woking, being 2nd.

In the open classes, the leading prizes for Roses were won by A. TATE, Esq., Downside, Leatherhead (gr. Mr. W. Mease). His collection of 18 blooms, distinct, was of quite extraordinary merit. Amongst his best blooms were Bessie Brown, Florence Pemberton, Dean Hole, and Mme. Melanie Souper. The variety last mentioned was exceedingly pretty, showing a fine development of the yellow shade characteristic of this flower. Mr. TATE's blooms gained 1st prizes in several other classes, including those for six trebles and 12 Roses, distinct. Dr. T. E. PALLET, Earls Colne, Essex, also had some good blooms in the open classes. The best of the local classes for Roses was won by A. E. PROTHORPE, Esq., Purley.

Sweet Peas were not up to proper exhibition standard. There were several classes and entries were made in each of them.

There were many exhibits of decorated dining tables, but most of these, whilst pretty in themselves, were too crowded with flowers. In the Rose class an exhibit of Mme. Abel Chatenay gained the 1st prize, and in the general class the 1st prize was given to an exhibit consisting of Shirley Poppies of unusually good quality. There were also classes for decorative plants, and for vegetables.

Numerous exhibits of a non-competitive character were displayed, the following firms, amongst others, being represented: Messrs. PAUL & SON, Cheshunt, Mr. THOS. BUTCHER, Croydon, THE GUILDFORD HARDY PLANT CO., Messrs. J. CHEAL & SONS, JACKMAN & SONS, G. & A. CLARK (DOVER), JNO. LAING & SONS, Mr. H. HENLEY, Mr. JNO. R. BOX, and Mr. FRANK BRAZIER.

The secretaries are Mr. H. E. Molyneux and Mr. L. M. Thudichum.

SALTAIRE ROSE AND NATIONAL SWEET PEA.

JULY 13.—The Saltaire, Shipley and District Rose Society has only been established for a period of six years, but it has been admirably managed by an enthusiastic and hard-working committee, under the able direction of Mr. Ernest Wright (hon. sec.) and Mr. F. Jowett (chairman), with the result that it now ranks among the important provincial organisations. In its early days it welcomed the National Rose Society, and on the occasion of its present show it had associated with it the National Sweet Pea Society. It was hoped, notwithstanding the comparatively early date, there would be an excellent show, but the weather completely upset the calculations, and the result was a poor entry as well in the Rose and Sweet Pea classes as in the general section devoted to varied flowers. If, however, there was a sparsity in the number of exhibits, there was a quality which, considering the weather experienced since the commencement of the growing period, was remarkably good. Among the Sweet Peas and the Roses alike there was a preponderance of blooms that were clean and unspotted and showed little signs of the adverse conditions under which they had been produced. The arrangement of the show was excellent, and, with favourable climatic conditions, the display would no doubt have been conspicuous both for splendid quality and extent.

SWEET PEAS.

In a class for 12 varieties, distinct, limited to Yorkshire, the Lord Mayor of Bradford offered a silver Cup value five guineas, in addition to the first prize, and the winner was Mr. S. F. Brotherston (gr. to F. SAMUELSON, Esq., Brackenbrough Hall, Thirsk), who exhibited bright bunches of Evelyn Hemus, John Ingram, James Grieve, King Edward, Etta Dyke, Helen Lewis, The Marquis, Audrey Crier, Prince of Asturias, Aurora, Mrs. Mander, and Countess Spencer. Mr. W. HESLINGTON, Littlethorpe, Ripon, was 2nd.

MARKETS.

COVENT GARDEN, July 14.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.]

Cut Flowers, &c.: Average Wholesale Prices.

Table listing cut flowers and their prices, including Asters, Carnations, Coreopsis, Cyrtopodiums, Eucharis grandiflora, Gaillardias, Gladiolus, Gypsophila, Iris, Lilies, Marguerites, Mignonette, Myosotis, Odontoglossum, Paonies, Pelargoniums, Poppies, Pyrethrums, Richardia africana, Roses, Niphetos, Bridemaids, C. Testout, Victoria, C. Mermet, Liberty, Mme. Chateau, Mrs. J. Lang, Richmond, The Bride, Ulrich Brunner, Spiraea, Stokes, Sweet Peas, Tuberoses.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing cut foliage and their prices, including Adiantum, Agrostis, Asparagus plumosus, Berberis, Croton, Cycas, Ferns, Galax, Grasses, Hardy foliage, Honesty, Ivy-leaves, Myrtle, Moss, Myrtle, Smilax, Tuberoses.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing plants in pots and their prices, including Ampelopsis, Aralia, Araucaria, Aspidistras, Asparagus, Boronia, Calceolarias, Chrysanthemum, Clematis, Cocos, Calceolarias, Coreopsis, Crassulacae, Croton, Cyperus, Latania, Lilium, Crassulacae, Croton, Cyperus, Lily of the Valley.

Plants in Pots, &c.: Average Wholesale Prices (Contd.).

Table listing plants in pots and their prices, including Lobelia, Marguerites, Yellow, Mignonette, Musk, Pelargoniums, Rhododendrons, Roses, Polyantha varieties, Ramblers, Saxifraga, Selaginella, Spiraea japonica, Verbena, Rhodanthus.

Fruit: Average Wholesale Prices.

Table listing fruits and their prices, including Apples, Apricots, Bananas, Cherries, Currants, Figs, Gooseberries, Grape Fruit, Grapes, Tuberoses.

Vegetables: Average Wholesale Prices.

Table listing vegetables and their prices, including Artichokes, Asparagus, Beans, Beetroot, Cabbages, Cardoons, Carrots, Cauliflowers, Celery, Chucory, Cucumbers, Endive, Horseradish, Lettuce, Mint, Mushrooms, Onions, Peas, Potatoes, Radishes, Salsify, Spinach, Stachys, Turnips, Watercress.

REMARKS.—Nearly all the English Cherries are badly cracked, and when received in the market quite wet, so that they are not sound enough for transmitting to provincial buyers. Strawberries are exceptionally cheap; the berries are arriving in a very wet condition and the returns have scarcely paid the growers for the cost of picking them. French Black Currants are dearer on account of lessened supplies, Cherries from France are now finished. English Peaches and Nectarines are much cheaper, there being practically no demand for the smaller fruits. A consignment of West Indian Red Bananas arrived this week and met with a ready sale. The Grape trade is quiet. Trade generally is quiet. L. H. R., Covent Garden, Wednesday, July 14, 1909.

Potatoes.

Table listing potato varieties and their prices, including Bedfords, Early Favourite, Epicure, White Beauty, Sharpe's Express, Kente, Sharp's Express, Epicure, May Queen, Jersey, St. Malo.

The Edwards Challenge Trophy, which is competed for annually in the provinces, was offered for the second time, but there were only two exhibitors. Mr. T. STEVENSON (gr. to A. MOCATTA, Esq., Woburn Place, Addlestone, Surrey), who won last year, was again successful with a splendid collection, comprising Mrs. Henry Bell, John Ingman, Nora Unwin, Prince of Asturias, Lavender George Herbert, Evelyn Hemus, Clara Curtis, Mrs. Hardcastle Sykes, The Marquis, Helen Lewis, Audrey Crier, and Elsie Herbert. Mr. W. Hopkins (gr. to F. W. WELLESLEY, Esq., Westfield, Woking) was an excellent 2nd, having John Ingman, Mrs. Hardcastle Sykes, The King, Evelyn Hemus, Clara Curtis, and Zephyr in grand form. Mr. F. J. HARRISON, Rosedene, Ulverston, won the Broomdale Trophy, open only to employers of one gardener, for 12 varieties, distinct, with a fine exhibit, in which Apple Blossom Spencer, Mrs. Henry Bell, Mrs. Hardcastle Sykes, and Clara Curtis were good. Mr. D. M. PIKE, Railway Hotel, Newark, was 2nd.

The only exhibitor in a class for six varieties, to be chosen from a specified list, was Mr. T. STEVENSON, who received the premier award. Mr. W. HOPKINS won an open class for 12 varieties, distinct, having Helen Pierce, Elsie Herbert, Clara Curtis, Constance Oliver, Kitty Clive, and Nora Unwin, all in splendid colour. Mr. D. M. PIKE was second. In the class for six specified varieties, Mr. A. A. ELLIOTT, Ripon was 1st. Mr. F. J. HARRISON won the 1st prize for six selected sorts, and also for a similar number with waved standards. Mr. A. A. ELLIOTT was 1st with a bunch of Queen. Messrs. JONES & SONS, LTD., Shrewsbury, won the open-to-all class for 18 bunches, to be chosen from the society's classification lists. Their best flowers were Constance Oliver, Queen Alexandra, Mrs. Hardcastle Sykes, Lord Nelson, Mrs. Collier, and Marbled Blue. Mr. C. W. BREADMORE was 2nd. For 12 bunches, distinct, waved standards, Messrs. JONES & SONS were 1st, Messrs. BOLTON BROS. 2nd, and Mr. C. W. BREADMORE 3rd. Messrs. BOLTON BROS. were successful in the classes for twelve and six American varieties. Mr. T. STEVENSON was by far the most successful exhibitor in the single bunch classes; the competition was poor. Mr. STEVENSON also showed well in the decorative classes, as did Messrs. JONES & SONS.

ROSES.

The weather had affected the Roses as badly as the Sweet Peas, with the result that competition was poor, but nevertheless many splendid flowers were staged. Messrs. A. DICKSON & SONS, Newtownards, were splendidly 1st for 72 distinct varieties, among the best of which were Lady Ashton, C. J. Graham, Mrs. Edward Mawley, Frau Karl Druschki, Mildred Grant, Nita Weldon, Mrs. Roosevelt, Marie van Houtte, Mrs. W. J. Grant, and Mrs. R. G. Sharman Crawford, THE KING'S ACRE NURSERY CO., LTD., Hereford, was 2nd. Precisely the same order was maintained in the classes for 16 trebles and 36 distinct single blooms, the average of quality being good throughout. For 24 blooms, distinct, Messrs. A. DICKSON & SONS retained the leading position, with Messrs. G. & W. H. BIRCH 2nd. Messrs. A. DICKSON & SONS won the 1st prizes for 24 H.T.s., 12 Teas and Noisettes, 12 blooms of Bessie Brown, and a similar number of Wm. Shean. For 12 blooms of A. K. Williams or Hugh Dickson, THE KING'S ACRE NURSERY CO., LTD., led with the first-named variety. Mr. TOM PARK was the most successful exhibitor in the amateurs' section.

NON-COMPETITIVE.

The groups arranged "not for competition" were not numerous, but they added immensely to the charm and interest of the general display. Mr. R. BOLTON, Warton, Carnforth, had a superb display of Sweet Peas; G. C. WAUD, Esq., Baildon, a grand group of miscellaneous stove and greenhouse flowering and foliage plants; Messrs. BACHELOR & SONS, Ripon, magnificently-grown Nephrolepis in variety; Messrs. W. ARTINDALE & SONS, Sheffield, Violas and hardy flowers; Messrs. BACKHOUSE & SON, York; CONWAY & SONS, Halifax; MAWSON BROS., Windermer; and DICKSON'S, LTD., Chester, hardy herbaceous flowers; Miss HEMUS, Messrs. BOLTON BROS., and Messrs. E. W. KING & CO., Sweet Peas; and Mr. F. J. BELL, Whitley Bay, Violas and Sweet Peas.

REMARKS.—Trade is steady with very fair consignments from Kent and Bedfordshire. The Lincolnshire crops are not quite ready.—*Edward J. Newborn, Covent Garden and St. Pancras, July 11, 1909.*

COVENT GARDEN FLOWER MARKET.

I am frequently asked what there is among new plants worth taking up for market. It is difficult to recommend any particular subject. I have recently inspected several Palm nurseries. I find that *Areca lutescens* is fairly plentiful. Best plants of this Palm in 4½ inch pots do not sell for more than 24s. per dozen. *Cocos Weddelliana* varies from small plants sold at 6s. per dozen to those of much larger sizes. Those in 4½ inch pots realise from 24s. to 30s. per dozen, and slightly larger ones are worth from 36s. to 42s. per dozen. Specimen plants in 8½ inch pots sell for 5s. to 7s. 6d. each. *Cocos flexuosa* is not in character early in the season, and is then only serviceable as a tall plant; the lowest price for useful plants being about 15s. to 21s. each. *Kentias* vary but little. It would pay those who stock this Palm to buy small, healthy plants, and grow them on, as seeds are getting scarce every year. *Litaneas* are more plentiful. I find one grower who decided to discontinue their cultivation a few years ago is growing them again. Of *Phoenix*, *P. Robellini* now takes the lead as the most elegant species. Fine plants in 4½ inch pots are procurable at 80s. per dozen, and larger plants vary from 6s. upwards. *P. rupicola* does not sell very as a market plant, although best specimens realise good prices; clean healthy plants in 4½ inch pots are worth from 30s. to 42s. per dozen. *Rhapis humilis* will never be a cheap Palm; some small plants are procurable, but the lowest price quoted by one large grower is 60s. each. Of *Scaevolas* I have seen very few small plants during the past season. *Aralias Veitchii* and *gracillima* sustain fairly good prices for perfect plants, but those with defects, however slight, are of little value, the same applies to *A. elegantissima*. Some growers have been treating these plants too liberally. I do not often recommend poor soil or the use of peat where plants will grow in loam, but I find that with all the fine-leaved *Aralias* they develop out of character if grown in rich soil. *Juncus bermudiana* is a popular plant, and well-conditioned plants grown under glass make good prices; those in 4½ inch pots sell at from 24s. to 30s. per dozen, and larger ones at 7s. 6d. each. *Aspidistras* are not making quite such good prices as formerly, the very best plants in 4½ inch pots may be bought at 30s. to 36s. per dozen, and many are sold for less than these prices. *Crotons* do not vary much, the well-coloured broad-leaved varieties are most in demand. A few years ago it was quite the reverse. It is the same with *Ferns*, the broad-fronded showy sorts now sell most readily. The plumose *Nephrolepis* of which we now have so many varieties have not yet become general favourites in the market, but the florists are beginning to recognise their value. Much of their present unpopularity is caused by the methods adopted in their culture. Many growers keep them too warm and moist. I have proved that they will grow well out-of-doors during the summer, and under glass they require little, if any, shade. *Asplenium Nidus* continues a favourite Fern. The variegated *Pterises* are more appreciated than formerly, the best crested variety is *P. Alexandra*, and growers should discard all other crested forms for this one. Amongst *Adiantums*, *A. scutum* is one of the best as a pot plant. When grown well, in a position exposed to the light, *A. Farleyense* is one of the best. *A. elegans* has quite taken the place of *A. canetum*, except where dwarf plants are required. In flowering plants there is little that is fresh to record. Supplies are large, and many growers have large stocks.

CUT FLOWERS.

There is but little variation in cut flowers; supplies are more than equal to all demands. This applies particularly to *Carnations*, *Liliums*, and *Roses*. Of the last-named those from the open air, in most instances, damaged by the bad weather. *A. H., Covent Garden, July 14, 1909.*

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending July 14.

The sixth cold week in succession.—During the past week the day temperatures proved variable, but were all more or less cold for the time of year. On the coldest day the temperature in the thermometer screen at no time rose higher than 57°—which is 13° below the average maximum for the middle of July. The nights, however, were, on the whole, of about seasonal warmth. The ground is at the present time 4° colder at 2 feet deep, and 3° colder at 1 foot deep, than is seasonal. Rain fell on four days of the week, to the aggregate depth of ½ of an inch. Small quantities of rainwater have each day passed through the bare soil gauge, but the gauge on which short grass is growing has remained quite dry for the last 10 days. The sun shone on an average for only 4½ hours a day, or for as much as 2 hours a day short of the usual duration for the first half of July. Light airs alone prevailed during the week, the direction being exclusively some westerly point of the compass. The mean amount of moisture in the air at 3 o'clock in the afternoon exceeded a seasonal quantity for that hour by as much as 11 per cent. *E. M., Berkhamsted, July 14, 1909.*

ENQUIRY.

PENTSTEMON MENZIESII DOUGLASSII.—May I enquire if any reader of the *Gardeners' Chronicle* has a plant of this *Pentstemon* exceeding 6 inches in width? It appears to be a rare plant, as I have never seen it catalogued. *B. Woods.*

ANSWERS TO CORRESPONDENTS.

BEECH TREES: *F. E. A.* See reply to *H. R. G.* in the last issue, p. 32.

BLACK CURRANT SHOOTS: *P. & Sons.* Wet and cold weather has injured the leaves. No disease is present.

BOWLING GREEN: *A. B. C.* The best plan is to use good turf obtained locally, as the sward will contain Grasses suited to the district. All the best lawns of this description are made with turf, obtained often at a great expense. You will find details for forming bowling greens in the issues for August 29, 1908, p. 176, and January 16, 1909, p. 43.

CHERRIES FOR NAMING: *G. B. J.* The fruits were decayed when received. They were probably the variety *May Duke*.

CHRYSANTHEMUMS: *H. F. R.* No disease is present. The leaves are injured by excess of moisture and too strong a solution of potassium sulphide. One ounce in 3 gallons of water is sufficient quantity of this fungicide for spraying plants.

CUCUMBER PLANTS INJURED: *M. Y. C.* The stem of the Cucumber plant sent for examination bears signs of injury in the central portion, which has been tunnelled in two places from the crown upwards, to a distance of nearly 2 inches. There was no trace of the depredator; we cannot say, therefore, what has caused the trouble, though the tunnels appear to have been produced by the larva of a beetle (perhaps *Agriotes*), or a small moth. The centipede (*Polydesmus* sp.) sent with the plant is not responsible for the injury. If you will forward examples of the pest, we will advise you as to remedial measures.

EXAMINATIONS: *Enquirer.* Apply to the secretary of the Royal Horticultural Society, Royal Horticultural Hall, Vincent Square, Westminster.

GARDENER'S NOTICE: *W.* It is the custom in many places to give a week's notice in the case of journeymen in a Botchy; in other instances we have known a month's notice given and received. Head-gardeners, and journeymen also, should have a proper understanding at the time of engagement as to the notice that will be expected on either side. Such an arrangement would prevent disputes afterwards. If the wages are due to the journeyman, they should certainly be paid to him, even if he has left the gardens in the meantime.

GRAPES DISEASED: *A. F. H.* The berries are affected with the spot disease. See reply to *H. H.* in the last issue, p. 32.

GRUBS ATTACKING CARNATIONS: *K. & B.* We can only conjecture what the pests are, but we suspect weevils. Send us examples, and we will endeavour to assist you.

HEATING APPARATUS: *H. J.* There are already on the market several systems for heating greenhouses by means of gas or oil. In the issue for August 29, 1908, p. 175, we described and illustrated a serviceable boiler and circulating system known as the "Little Nipper." Obtain the opinion of some person or firm who specialise in the heating of greenhouses. You will find a list in our advertising columns.

INCARVILLEA: *H. W.* The injury is caused by the mycelium of a fungus in the soil. Sprinkle a thin layer of sulphate of potash on the ground and fork it in lightly. Afterwards apply water if the weather is dry.

MELONS: *Reader.* No disease is present. The injury is due to some cultural defect, and harmless fungi have settled on the injured spots.—*W. R. H.* The soil is too saturated with water. Afford plenty of ventilation early in the morning in the house in which they are growing.

NAMES OF PLANTS: *M. W.* 1, *Nephrolepis todeoides*; 2, *Adiantum Capillus-veneris*; 3, *Cypripedium barbatum*; 4, *Adiantum formosum*; 5, *Hemantus natalensis*; 6, *Asplenium bulbiferum Colensoi*—*H. B.* 1, *Ceanothus azureus*; 2, *Escallonia maritima*; 3, *Spiraea Menziesii* var. *triumphans*; 4, *Cotoneaster buxifolia*—*W. E.* 1, *Abutilon vitifolium*; 2, *Viburnum* sp., probably a variety of *tomentosum*—*D. P.* 1, *Acer truncatum*; 2, *A. Pseudo-cerasus* var. *purpureum*; 3, *Veronica Teucrium*; 4, *Rubus* sp. (send when in fruit);

5 and 6, varieties of *Prunus Padus*.—*J. C.* *Syringa pkinensis*.—*C. S. & Co.* *Cupressus macrocarpa*.—*J. G. & Co.* *Senecio Heritieri*.—*Miss Eubank.* *Aristolochia Clematites*, *Cistus ladaniferus*, *Heliotrope* (garden variety), *Orchis maculata*.—*R. V. & Sons.* *Scilla peruviana*.—*G. C.* *Vaccinium Vitis Idæa* ("Cowberry").—*Thanker.* 1, *Mesembryanthemum conspicuum*; 2, *Hieracium aurantiacum*; 3, *Dianthus superbus*.—*C. B.* 1, *Galium saxatile*; 2, *Lotus uliginosus*; 3, *Stellaria graminea*; 4, *Prunella vulgaris*; 5, *Crepis virens*; 6, *Matricaria Chamomilla*.—*L. W.* What miserable specimens, and merely shoots without flowers. 1, *Gasteria* sp.; 2, not recognised; 3, *Salvia* species; 4, *Aconitum Napellus*; 5, *Chrysanthemum uliginosum*; 6, not recognised; 7, *Achillea* sp.—*B. T.* 1, *Oncidium serratum*; 2, *Lælia Dayana*; 3, *Epidendrum O'Brienianum*; 4, *Dendrobium infundibulum*; 5, *Sophranitis cernua*.—*Herbert.* 1, *Rhyncostylis* (*Saccolabium*) *retusa*; 2 and 5, both varieties of *Vanda Bensonii*; 3, *Aërides odoratum*; 4, *Dendrobium crystallinum*; 6, *Cypripedium superbiens* (*Veitchii*).—*H. C., Worcs.* *Iris ochroleuca*.—*A. C. H.* *Cypripedium barbatum*, *Rhyncostylis retusa*, and *Spathoglottis plicata*.—*C. W. P.* 1, *Listera ovata* (Twayblade); 2, *Viola* sp.; 3, *Claytonia perfoliata*.—*Hollywood.* *Scilla peruviana*. The Pea is probably the Crown or Mummy Pea.—*W. E. M.* *Saponaria Vaccaria alba*.—*S. J. W.* The specimen was insufficient: it is probably *Lemnanthes Douglasii*.

NECTARINE FRUITS SPLITTING: *Hortus.* The trouble is due to excessive moisture at the roots. Next season overhaul the border and see that the provision for drainage is ample.

NEPENTHES: *C. H.* Messrs. James Veitch & Sons, Chelsea, cultivate a collection of these plants, but we do not know if they have those you instance. It is not surprising that examples in their natural habitat attain to the size you mention. *N. Northiana* has pitchers 12 to 16 inches in length, and 3½ to 5 inches in breadth. Pitchers 10 to 12 inches long are not uncommon in several species.

PEACHES: *Enquirer.* The fruits were over-ripe when packed, and arrived in a smashed condition. You did not observe the conditions printed in the last issue. See reply to *H. B.*, p. 32.

PEAS DYING: *Subscriber.* The injury is caused by a fungus, *Thielavia basicola*. Water the roots thoroughly with a solution of sulphate of potash, at the strength of 1 ounce in 1 gallon of water.

POTATO DISEASE: *W. C. H.* Potato blight is present on the leaves. Spraying with Bordeaux mixture is the only thing you can do to save the crop.

RASPBERRIES: *K. S.* The plants are perfectly healthy, but the flowers have not been fertilised, probably due to excess of rain having destroyed the pollen.

ROSE LEAVES: *E. W. Dell & T. S.* The foliage is injured by scorching. No disease is present.

VINES: *S. J. E.* After reading your letter, we do not think that the injury to the vines was caused by disordered drains. Any imperfection in the drainage of the border would not be likely to injure pot plants in the same house; it is much more likely that there is some communication between the house and the stoke-hole. At certain times the fumes of sulphur from the furnace may gain access into the vinery. The presence of such fumes would fully account for the condition of the foliage of the various plants you describe. A thorough examination should be made to determine whether this is the cause of the trouble.

VIOLA PLANTS EATEN: *C. W.* The injury is caused by a millipede, *Julus pulchellus*, eating the roots. Water the plants with a solution of nitrate of soda, using 2 ounces in 1 gallon of water.

CASTLE ASHBY.

(See figs. 22, 23, 24 and 25.)

THE place of the Ash trees—Asebi or Esseby as it was originally called—is situated a distance of about eight miles from the county town, and is the seat of the Marquess of Northampton. The history of Castle Ashby takes us back to very early times. Asebi is mentioned in the *Domesday Book*, not that the present mansion (see fig. 23) dates from so remote a period, for in the fifteenth century a chronicler wrote of "a castle that now is clene down, and is made but a septum for bestes." The manor, together with the remains of the old castle, were purchased by Sir William Compton in the sixteenth century. This gentleman's great-grandson, William, became the first Earl of Northampton, and from the time of his occupation dates most of the modern glories of the place. This nobleman married a wealthy heiress in the person of Elizabeth, only child of Sir John Spencer, who was Lord Mayor of London in 1593, and thus the name of Spencer was added to the family titles. The history of the Spencers contains many interesting incidents—the danger of abduction by pirates, to which Sir John was exposed owing to his great wealth; the runaway marriage of his daughter, the reconciliation by the interposition of Queen Elizabeth, and even his funeral, at which a thousand men attended in mourning cloaks or gowns, and 320 poor men, every one of whom was given a basket, which

contained a black gowne, four pounds of beef, two loaves of bread, a small bottle of wine, a candlestick, a pound of candles, two saucers, two spoons, a black pudding, a pair of gloves, six herrings, six sprats, two eggs, and a dozen points (small laces for securing their garments).

But we must turn our attention to the gardens and pleasure-grounds, although a few words on the mansion may not be inappropriate. The castle forms a huge, rectangular building in stone, and although additions have been made by succeeding generations of the family, no part is incongruous, the stately pile appearing as though designed by some one master mind.

The balustrading around the roof is a dominant feature (see fig. 23). The words, "Nisi Dominus custos custodiverit, frysta vigilat qui custodit eam" ("Except the Lord, the Keeper, keeps the house, in vain he watches who keeps it"), and "Nisi Dominus aedificaverit domum, in vanum laboraverunt qui aedi-

with a hedge of Box, interrupted at intervals by fastigate Yews and Portuguese Laurels, the latter being clipped in the form of half-spheres rising from a main stem. These Laurels are exceedingly handsome, but it is regrettable that two of them—there are 30 in all—have suffered damage. These two are situated at a spot where cold winds sweep past the south-east corner of the castle. The flower-beds are planted in summer time with Coleus, Irisine, Ivy-leaved Pelargoniums, and Lobelia compacta. A flight of steps leads to what is known as the lower enclosed garden. This is shown in the foreground of our illustration in fig. 23. The stone vase seen in the centre is a beautiful example of the sculptor's art. There are four main beds cut in the sward, and these have as their design monograms of the Compton and Spencer families. We saw them planted with Violas and Cerastium tomentosum, their confines being a dwarf line of Box, a simple but effective combination.

[Photograph by H. N. King.]

FIG. 22.—CHURCH AT CASTLE ASHBY AS SEEN FROM THE EAST TERRACE.

ficant eam" ("Except the Lord build the house, they have laboured in vain who build it") are formed in the stonework.

The south front enjoys a magnificent landscape. A wide, sunken lawn is bounded by a terrace wall, having stone vases at intervals, and then commences a magnificent avenue of Elms, that stretches for a distance of four miles. The grandeur of this vista is enhanced by its great width. But these stately lines of trees form only one feature of the landscape. They do not approach close to the house, and therefore a view from the mansion on this side enables other features of the park, so extensive that its confines cannot be discerned, to come into view.

From a garden point of view the east front is the more interesting. It overlooks an Italian garden (see fig. 24), a bizarre of flower-beds, paths, and turf, with two imposing water basins and fountains. It is bordered

Proceeding, the visitor reaches another enclosed part, known as the Laurel garden (see fig. 25), there being large beds of *Cerasus laurocerasus*, and a beautiful water basin containing *Nymphæas*. A terrace wall divides this pleasure-ground from the park, the balustrading having classical quotations formed in stone.

The illustration in fig. 22 shows the parish church of Castle Ashby as seen from the east terrace. The church and churchyard contain the remains of the Earls of Northampton and their families. In the church itself are numerous monuments of older members of the family, whilst in the churchyard are several erected in more recent times. The wall of what was formerly a Palm house forms one of the limits of the churchyard and a fine background to a pretentious tombstone erected to the memory of the late Marchioness. There is a new Palm house, which

dominates a large pleasure-ground with four sunken lawns forming large panels, and having at intervals pyramidal-trained Conifers, including some magnificent golden Yews. There is also a large Mulberry tree near to the central walk, the trunk of which we found to be 7 feet in girth at breast high. The exterior walls of the Palm house are clothed with Austrian Copper and Persian Yellow Roses. Opposite the entrance to this building is a water-basin or Lily pond, planted with *Richardia africana* and *Aponogeton distachyon*. There are many fine Palms, and on pillars are trained *Brugmansia*, *Abutilon Thomsonii*, *Streptosolen Jamesonii*, Fortune's Yellow Rose, and other plants of a climbing habit. Fortune's Yel-

Numerous paths intersect this part of the garden, and the eye constantly alights upon some new feature, such as a pergola, herbaceous border, a small lawn enclosed by tall hedges, and even glasshouses, which are very numerous. Then there is a large herb-garden, quarters planted with Roses, and, finally, the part devoted to kitchen-gardening, there being 4 acres for this purpose enclosed by walls and as much outside. The vegetables and fruit trees all exhibited the best of culture, reflecting the skill of the gardener, Mr. Searle, and his staff. It is not necessary for us to describe in detail the numerous crops of vegetables, nor the vinerias, Peach houses, orchard houses, conservatory, Banana pit, and numerous other plant-houses. These presented an excel-

high, with Tobacco-like leaves, and an inflorescence which certainly does not suggest a member of the Compositæ, the very small flowers, arranged on a large, loose panicle, with gracefully pendulous branches clothed with red, involucral bracts, having more the appearance of the plume of the Pampas Grass. The plant is popular for conservatories and for sub-tropical bedding, the strong Balsamic odour of the leaves and the elegance of the flower panicles being its chief attractions. It sets seeds freely under cultivation, and these should be sown not later than July.

About 20 years ago the late Baron Mueller, then Director of the Melbourne Botanic Gardens, sent to Kew seeds of a *Humea* which he thought was

FIG. 23—CASTLE ASHBY, NORTHAMPTON.

low Rose is also extensively cultivated in other houses. Next to a fernery solidly built of stone is a duplicate house, the entire roof inside being covered with this charming Rose. This season no fewer than 3,000 blooms have developed on these plants. The house is rather dark, in consequence of the luxuriant foliage of the Roses, but the walls are clothed with Oak-leaved Pelargoniums, Heliotropiums, and *Cestrum aurantiacum*. A flight of stone steps outside leads to the roof, from which a view of the Palm house and the gardens can be obtained, a feature being a Carnation garden planted in the design of the Union Jack in red, white, and pink-flowered varieties, viz., Agnes Sorrel, Uriah Pike, Keopsake, Gloire de Nancy, Leander, and Mrs. Nicholson. The Carnation garden is surrounded with broad hedges in Yew and Box, the latter being 9 feet through.

lent appearance, and readers are already aware that the satisfactory results of Mr. Searle's efforts may frequently be seen at the more important competitive exhibitions.

NEW OR NOTEWORTHY PLANTS.

HUMEA ELEGANS GIGANTEA.

HUMEA ELEGANS was introduced from Australia, where it is a native, about a century ago. It flowered in the garden of Lady Hume, Wormleybury, Herts., and was named in compliment of her by Sir James Edward Smith, who published a figure of it in his *Exotic Botany* in 1804. It is a robust-growing biennial, 6 to 9 feet

either a new species or a well-marked variety of *H. elegans*. Plants were raised, and they flowered in the temperate house, but, failing to set seeds, they were not perpetuated. Two years ago seeds of *Humea* were again sent to Kew from the Melbourne Botanic Gardens, and the plants raised from them are now in flower in the temperate house. Although scarcely distinct enough to rank as a species, this *Humea* may well be named the gigantic variety of *H. elegans*, as it is about 20 feet high, with a stem an inch in diameter, and the largest leaves are 15 inches by 5 inches. The panicles are correspondingly large, and there are dark red and pink forms. A *Humea* of these proportions can be grown only in tall conservatories, except in sub-tropical countries, where it ought to prove very serviceable. W. W.

NURSERY NOTES.

LAXTON BROTHERS, BEDFORD.

Few firms have obtained such excellent results in the raising of new Strawberries as have been achieved by this Bedford firm. Messrs. Laxton Brothers have also introduced into cultivation some of the finest culinary Peas, of which Gradus alone may be instanced as a distinct break quite different from anything before seen in early varieties. Then with Roses, Pelargoniums, and other flowers, several leading sorts have originated with this firm. Although Messrs. Laxton are always more or less connected with Strawberry culture and raising, it must not be inferred that their nursery is a Strawberry farm only. Their specialising so largely in this fruit has given many the impression that this is their sole business, but their stock is general and includes hardy fruits in particular. It is a very busy season in any nursery at the present time, and particularly so at this one at Bedford. Not only is the Strawberry season at its height, but there is the work of attending to the rooting of the layers, the majority of which are sent out in small pots. There is much work connected with the examining of the many thousands of seedlings, some of which are fruiting for the first time, and others after one or more previous crops. This repeated inspection is necessary, because, whilst some new varieties do not justify themselves in their first season, others fail to maintain the qualities they have previously shown in their second or later croppings. There is also the training of many thousands of fruit trees of all kinds, the budding of Roses and other plants, and the hundred and one details connected with a general nursery.

To consider the culinary Peas first. Messrs. Laxton, if they did not grow Strawberries, would probably be known as specialists in culinary Peas. Their work in this direction commenced about 1865. Mr. Thomas Laxton, the father of the present members of the firm, was induced to take up the hybridisation of Peas and other plants by Charles Darwin. His first success was with Supreme Pea. This was raised from Ne Plus Ultra and the old Sugar Pea, a variety

Charmer, and Earliest of All, until we come to Gradus, the first really hardy dwarf Pea of the Marrowfat type. This was a great acquisition and the forerunner of a class which has quite ousted the older type of Pea that had been used for early cropping. Their next effort was seen

crop also is very prolific, the pods being well filled with large Peas. This variety Messrs. Laxton regard as their finest early Pea. The firm's work in raising new Strawberries is well known, and the variety Royal Sovereign, which was put into commerce in 1893, has

[Photograph by H. N. King.]

FIG. 25.—LAUREL GARDEN WITH LILY POND AT CASTLE ASHBY.

in the variety Thomas Laxton, a very large-podded, first-early Pea of the wrinkled Marrow type. But both Gradus and Thomas Laxton grow to a height of 3 feet, and something was wanted to take the place of the still dwarfier kinds, in which the haulm does not exceed

enjoyed a greater popularity than any other variety. The first seedling which they introduced into commerce was the variety Traveller, and this was followed by many others, including King of the Ealies, Captain, Noble, The Laxton, The Bedford, Reward, Laxton's Latest, Leader, Bedford Champion (the largest of all Strawberries), Progress, Reliance, Cropper, &c. This list constitutes some of the best varieties, especially in the matter of cropping, size of fruit, and robustness of constitution. But a demand arose for varieties possessing greater flavour, such as is found in the Queen variety, which, however, has several defects, such as small berries, and is shy in bearing. With this end in view, Messrs. Laxton started breeding especially for flavour, with the result that they have placed on the market three Strawberries of especial merit in this direction, namely, Pineapple, Epicure, and Connoisseur. None of these varieties has large fruits, but all are prolific, and produce fruits of good colour and excellent flavour. Epicure was raised from British Queen and Fillbasket, and the rich flavour of the first-mentioned parent has been transmitted to the seedling. The free-bearing character of Fillbasket has also been inherited by the progeny, and with this is combined a vigorous constitution. Pineapple is a mid-season variety, somewhat conical in shape and very luscious, having a bright scarlet skin. This variety is recommended for forcing purposes. Connoisseur is descended from Scarlet Queen and Fillbasket. It ranks as an early variety, and as it sets very freely, it should prove an acquisition for cultivation under glass. Varieties capable of prolonging the fruiting season are valuable. Many growers now depend on Givon's Late Prolific, but this has a defect, as the plant often throws all its energies into one or two fruits, the others failing to swell. We noticed numerous instances of this in plants of this variety at Bedford, and it was curious that the flowers where the inflorescence branched, even in the secondary branching of the truss, were those only which gave promise of

[Photograph by H. N. King.]

FIG. 24.—ITALIAN GARDEN AT CASTLE ASHBY, NORTHAMPTON.

with an exceptionally large pod, which did not fill well. Then followed such standard kinds as Alpha, William I., Dr. Hogg, Marvel, Omega, Fillbasket, G. F. Wilson, Minimum, John Bull, William Hurst, Evolution,

18 inches or 2 feet. This was secured in the seedling named Laxtonian, which, whilst sown in the nursery on the same date as Gradus, Thomas Laxton, and others of that type, had pods several days in advance of these. The

maturing. In the variety *Utility*, sent out by Messrs. Laxton for the first time this year, this defect is not present. The fruits are of good colour, the plant crops well and is robust. Another new variety for 1909 is *Rival*, raised from Givon's Late Prolific and Royal Sovereign; but the very latest in cropping is Laxton's Latest (1904). It was interesting to observe the great number of seedling Strawberries in all stages, from those pricked off in boxes in the houses to great breadths in the open. Here was seen as wide divergence as could well be. Some were short in the foliage and compact, others tall and spreading, some had not more than a single truss of bloom, others produced great sheaves of flowers and fruits. Sometimes the stalk of the inflorescence was quite short, and in other cases it grew far beyond the foliage. We were especially interested in one variety which had its fruits in hundreds. We were informed, however, that the berries lacked flavour and were of a poor colour, but, like many other seedlings not worthy of placing into commerce, it will be used for breeding purposes. Then again some good things have to be passed over because they are so like existing varieties.

The market growers require a special type of Strawberry. They need one with a hardy constitution and heavy cropping quality; one that produces a solid fruit so that it will not bruise readily in transit, and one in which the seeds are set deeply so that the skin is not injured by rubbing. We were shown several, at present unnamed, that have the making of good market varieties. One in particular, raised from The Laxton and Bedford Champion, will probably be utilised for commercial purposes. Of all the Strawberries we saw amongst the named kinds, none was fruiting with greater freedom than The Cropper, and this notwithstanding that the same plants last year furnished the stock plants of this variety.

The layering is very carefully performed. The runners are spread out, and when of a suitable size the first plantlet, or at the most the second only, is placed into small pots, which are plunged into the ground. Last year 180,000 of these little pots were employed. The parent plants are not allowed to fruit, all their energies being directed to the formation of runners, and they are plants in their first year. We were impressed with a new variety of Red Currant named *Perfection*. Quite small bushes were carrying large bunches of finely-coloured berries, some of the racemes having 15 to 20 berries, and we were informed that as many as 24 have been counted on the largest. A very interesting class of fruits is being raised from the plants of the Blackberry family. The firm's finest acquisition in this connection is the Laxtonberry, which was raised from the Loganberry crossed with Raspberry Superlative. The Dewberry (*Rubus caesius*) has been crossed both with the Raspberry and the Loganberry, although it was too early to see what the fruits were like. The Blackberry has also been hybridised with the Loganberry, and altogether there were several hundreds of these seedlings.

Amongst Apples, Pears and Plums, much work has been expended in endeavouring to obtain novelties. The firm has placed into commerce a new Plum, of which we saw a well-fruited specimen. It is a large, black fruit, raised from Grand Duke and the Czar. It is in season between Early Prolific and Victoria. Many of these seedling Apples, Pears and Plums have been several years in the nursery, and their fruiting is being anticipated with interest. Some are carrying their fruits for the first time this year. They are all unnamed at present. One of the most promising is a cross between Allington Pippin and Worcester Pearmain. Peaches have also been crossed with Nectarines, Plums with Peaches, and Cherries with Plum.

In addition to those subjects named, there are great breadths of Roses, fruit trees of all kinds, hardy flowering plants, shrubs, and, in glass-houses, Carnations, Ferns, and many other subjects. Especially interesting was a house filled with *Eucharis grandiflora*, the plants being extremely healthy and all magnificently flowered.

ORCHID NOTES AND GLEANINGS.

VANDA BENSONII.

THE great variation in the size and colour of the flowers of this Burmese species has been shown in a marked degree in the flowers submitted recently by several correspondents. The one extreme, whilst being of the true shape of *V. Bensonii*, has the flowers of a uniformly pale olive-brown tint, minutely spotted with darker brown. The lip is whitish, with the diverging lobes at the apex light brown. This is probably the variety *tristis* or var. *anchorifera* of gardens. The intermediate form is near to typical *V. Bensonii*, the reverse of the segments being white, the surface yellowish, closely dotted with purple-brown. The side lobes of the lip and the spur are white, the front tinged with rose-purple. The other extreme is a much showier form, veined with pale violet on the reverse side, the surface yellowish, veined with dull purple and spotted with the same colour on the basal halves of the segments. The base of the lip is white, tinged with blue, and with an orange blotch beneath the column, the front being rose-purple. The Burmese Vandas are pretty garden plants, though they seldom last many years under cultivation. The most prolific source of their decline and failure is doubtless that, under cultivation, they are kept too warm and moist during the winter-time. It is singular that those who carefully rest and keep dry the deciduous *Dendrobiums* from the same localities as the Vandas and *Saccolabiums* continue to give excessive heat and moisture to Vandas, for no other reason than that they are evergreen. After the end of March Vandas require heat and moisture, but during the dead of winter they should be rested by being kept cool and comparatively dry, though not so dry as the resting deciduous species.

ORCHIDS AT BELSIZE COURT, HAMPSTEAD.

THE interesting gardens of J. S. Berghem, Esq. (gr. Mr. Page), although in London, contain a remarkable collection of plants, many of them reputedly difficult to grow, yet here they have been successfully managed for many years.

Curious plants of all kinds are a special feature, a selection of insectivorous plants including a fine lot of *Nepenthes*, *Sarracenias*, *Droseras* and *Pinguiculas*; a representative selection of succulent plants, with the columnar habited *Euphorbias* and *Cacti* arranged to show the similarity of the growth of totally different plants from widely-separated arid regions; and a set of plants showing movement, such as *Desmodium gyrans* and *Mimosa sensitiva* are never-failing sources of interest.

In the Orchid houses a selection of the singular species takes precedence, although the showy varieties are well grown, especially so the fine lot of *Dendrobium Phalenopsis Schröderianum*, and *D. Dalhousianum*.

At the present time the collection of *Cataseptums* has several dissimilar species in bloom, ranging from the curious *C. callosum*, with narrow, quaintly-arranged segments, to the more massive *C. tridentatum*, with a fleshy labellum, having three prominent teeth at the opening. With them are arranged a good example of the

Swan Orchid, *Cymoches chlorochilon*, with four large flowers on one spike; another of *C. peruvianum*, with two pendulous spikes, one of which bears about 40 curious, chocolate-red spotted flowers. Overhead are some interesting *Bulbophyllums*, including two fine specimens of *B. barbigerum*, with several racemes of its curious feathery-lipped flowers, which are constantly moving with the currents of air. The rare *Megacalinium triste* has just passed out of flower. Other pretty species are *Platyclinis filiformis*, with about 50 of its gracefully-drooping racemes of yellow flowers; *Oncidium Krameri*; *Cypripedium concolor* and other *Cypripediums* exceptionally well flowered; and *Anguloa Clowesii*, with several large, pale-yellow blooms. These, with a profusion of flowers of *Gloriosa superba* on the roof, well-flowered *Eucharis grandiflora*, coloured leafed *Codiaeums* and *Dracenas*, and scarlet-spathed *Antburiums*, make an interesting display.

CODIAEUMS.

MANY of the warm-house plants that a generation ago were esteemed for their handsome foliage have dropped into comparative obscurity, but some are still grown to a considerable extent.

The *Codiaeums*, known generally in gardens as *Crotons*, are still favourites, and some of the forms are largely cultivated, not only in private gardens, but also in many of the principal market nursery establishments. Some of the more slender-growing kinds form ideal table plants; while the larger and bolder varieties make elegant specimen plants. For this reason they are often employed in vases or in similar receptacles. In the arranging of ornamental groups of stove plants, *Codiaeums* are in great demand. The leaves also are largely used for decorative purposes by florists.

Although the garden varieties of *Codiaeums* are very dissimilar from each other in the shape of the leaves and their colouring, also habit, they are all forms of *Codiaium variegatum*, also known as *C. pictum*. This plant is a native of Malaya, but it is a common shrub in tropical countries, where, under the influence of the brilliant sunshine, it acquires a richness of colouring seldom seen in European gardens.

Although two or three *Codiaeums* have been grown in our stoves for many years, the great stimulus to their culture was the number of new and distinct forms introduced by the late John Gould Veitch during his travels to the South Sea Islands from 1864 to 1866. According to *Hortus Veitchii*, no fewer than 23 distinct kinds were collected during that journey. In addition, several varieties have been received from Australia, chiefly from Sydney, some of these, in all probability, having emanated from the Pacific Islands. Numbers have been raised in other parts of the world, including Great Britain.

In making a collection of *Codiaeums*, a rigid selection is necessary. Taken as a class, the narrow-leaved kinds are the more popular; but on the Continent those with broader foliage are extensively grown. As the leaves vary so much in colour according to their position on the plant and the treatment given, no definite line can be laid down as to the exact markings of any one variety. The following selection may be considered a good and representative one:—

Aigburth Gem (different shades of crimson, leaves curiously interrupted); *angustifolius* (very narrow, golden-yellow leaves); *Barome James de Rothschild* (the broad leaves are heavily suffused with crimson; the plant forms a bushy specimen); *B. Comte* (similar to the last named; this makes a handsome specimen, the leaves being bright orange in colour); *caudatus tortilis* (peculiarly-twisted leaves of a rich golden-yellow); *Chelsonii*

(very narrow, twisted leaves, orange-red in colour); Countess (bright yellow, narrow leaves). These last three are particularly desirable grown as single-stemmed plants for table decoration. Delight (medium-sized leaves, heavily marked with ivory white); elegantissima (very long, narrow leaves, of a bright yellow colour); Emperor Alexander III. (broad, bright red leaves; the plant makes a handsome specimen); Etna (fiery

green, with a bright rose-coloured centre); Musai-cus (bright crimson, medium-sized leaves); Nestor (leaves of medium width, blotched with red and yellow); Reidii (stout, broad leaves of various shades of cream, pink and red); Sinitzi-anus (narrow, interrupted leaves, coloured green and yellow); Thomsonii (trilobed leaves, the centre being yellow and bordered with green); Van Oerstedii (a very distinct variety, with short,

leading. Owing to this variability, it is useless, except in a few instances, to attempt the naming of *Codiaeums* from leaves alone.

The plants are propagated by means of cuttings, the general time for inserting them being the spring and early summer. The cuttings should be selected from clean, well-coloured shoots that have passed their succulent stage, and are in what is termed a half-ripened condition. The placing of several cuttings in one pot cannot be advised in the case of *Codiaeums*, particularly if they are desired as small plants. In this latter case, the preservation of every leaf that can possibly be saved is an advantage, hence it is a good plan to insert each cutting singly in a small pot, which should be quite clean inside. As the spreading leaves occupy a considerable space, and propagating cases are, in the stove, limited, a good plan is to put three small sticks around the side of the pot and to tie the leaves into a partially upright position.

The pots containing the cuttings should, if possible, be plunged in a gentle bottom heat, under which conditions they will soon form roots. They need to be shaded from sunshine, and the lights of the propagating case must be kept closed till the cuttings are rooted. As soon as this stage is reached, fresh air should be admitted until the plants are inured to the ordinary atmosphere of the stove. They may then be shifted into larger pots, using a compost consisting of good yellow loam and peat or leaf-mould in equal parts, adding a liberal sprinkling of sand. The plants will also thrive in any ordinary potting compost.

Further details consist in affording the plants as much light as possible and a liberal amount of sunshine, shading them during the hottest part of the day only. The plants are sometimes attacked by scale, but the worst enemy is red spider, which not only disfigures the leaves, but causes them to drop. This pest is best combated by a free use of the syringe, taking care to direct the spray on the under as well as the upper sides of the leaves. The structure in which they are grown should be kept freely damped. When the pots are well furnished with roots, a little weak liquid manure and soot-water mixed may be given the plants occasionally. If the plants are needed for indoor decoration, some less objectionable fertiliser must be substituted. W.

ERIGERON MACRANTHUS VAR.

UNDER the name *Aster mesa grandiflora*, an ornamental border plant was distributed a few years ago by François Gerbeaux, of Nancy, who stated that the plant was raised in his nursery, and was supposed to be a hybrid between an *Aster* and an *Erigeron*. At the meeting of the Royal Horticultural Society on June 22 last, flowers of this plant were shown by Messrs. W. Cutbush & Sons, and deservedly secured an Award of Merit. However, the plant does not belong to the genus *Aster*, but appears to be a seedling form of *E. macranthus*, which it closely resembles in habit and flower. *E. macranthus* is a variable species, with a wide range of habitat over the Rocky Mountains of North-western America, extending south to New Mexico. Among the collected wild specimens are some with larger flowers than those in the present plant; these were called *E. grandiflorum* by Nuttall. This name, however, was made a synonym of *E. macranthus* by Asa Gray in the *Flora of North America*. The name *Aster mesa I* cannot find published in any botanical work, and there certainly appears to be no evidence of *Aster* influence in the present plant. The correct name should be *Erigeron macranthus* var. The plant is a very decorative subject, and, being of easy cultivation, like the better-known *E. speciosus*, it is well worth growing in the herbaceous border. It has an erect habit, forming bushes about 2 feet in height, and bearing numerous well formed flowers of a bright tint of satiny-purple. W. Irving.

FIG. 26.—ERIGERON MACRANTHUS VAR.: COLOUR OF FLOWERS, SATINY-PURPLE.

red leaves; the habit is bushy); Flambeau (narrow, brilliant-red leaves); Golden Ring (narrow, golden-yellow, twisted leaves); Laingii (narrow, somewhat twisted leaves, the centre of the leaf and the footstalk being reddish yellow); Lucy (narrow leaves, rich orange-green, blotched with crimson); Mortii (very broad leaves, heavily marked with golden-yellow); Mrs. Icton (olive-

narrow, green leaves, spotted with yellow; this makes a small bush); Warrenii (leaves long and twisted, olive green, yellow and red, one of the finest for all purposes); and Williamsii (fiery-red leaves of medium width).

As above stated, the leaves, even on one plant, vary so much in colouring that the approximate descriptions may, to some, appear mis-

THE ALPINE GARDEN.

APHYLLANTHES MONSPELIENSIS.

THIS plant has proved perfectly hardy in cold places far north of the Forth. There are few cultivated plants which resemble it, and its hardiness will commend it to those who are interested in flowers of distinct appearance. The stems resemble those of a Rush, and are about a foot in height. On them are produced the little heads of blue flowers, about an inch across at the top. The flowers are of a pretty shade of violet-blue, and are produced from June to August.

Aphyllanthes monspeliensis is generally treated as a border plant, but its proper position is in the rock-garden, where it will grow well if planted in a sunny place in sandy soil, not too high up. Propagation is effected by division.

STENANTHIUM ROBUSTUM.

THIS North American plant is one of two species which constitute the genus *Stenanthium*, and, so far as I am aware, the only one which has yet been brought into commerce by British nurserymen; indeed, it is only within the last year or two that this species has been offered for sale. I have no knowledge that it will stand the average winters of the northern parts of the United Kingdom.

Last year I was much impressed by seeing a good group of *Stenanthium robustum* growing by the side of a little streamlet, just away from its margin, and in such a place that its roots received plenty of moisture. There it showed to great advantage, the long plumes of white flowers, from 3 to 4 feet high, being exceedingly beautiful; so beautiful, indeed, that it is difficult to do justice to them without laying oneself open to a charge of exaggeration.

S. robustum is a native of several of the States of America, and, as it loves a moist soil in its own land, so it seems to love one here, although it does not always follow that what suits a flower in its native habitat will answer for it in our climate. With the *Stenanthium*, however, it will be found advisable to give it a moist soil, for in such a medium it will give the best results. It is curious that *S. gramineum* or *angustifolium* prefers a dry soil in its habitats. The favour now shown to *S. robustum* will probably lead to the introduction in gardens of its congener, *S. Arnotti*.

The Week's Work.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Strawberries in pots.—Plants intended for early forcing next season must be placed in their final pots as soon as they are sufficiently rooted. Every effort should be made to have them well rooted and the crowns matured before autumn. Prepare enough soil for potting the whole batch, and place it under cover to keep in workable condition. Strawberries require a rich rooting medium. Here we use the first spit from an old pasture, and this is chopped and mixed with an 8-inch pot-full of $\frac{1}{2}$ -inch bones to each barrow load of soil, the whole being turned two or three times. Very light soils need a quantity of well-decomposed farmyard manure and a little soot in addition to the bones. Pots $5\frac{1}{2}$ inches in diameter will be large enough for the early batches, but 6-inch pots must be used for later plants. Care must be taken to see that the pots are well cleaned and properly drained. A little soot sprinkled over the crocks will prevent worms entering. When potting, endeavour to so arrange the plants that the crowns are just above the surface of the soil; ram the soil firmly in the pots. It is a good plan, after potting, to place the plants in the shade for two or three days until they recover from the check, then stand them on a bed of ashes or gravel in a position fully exposed to sunshine; syringe them each morning and afternoon until they are well established. Apply water very

carefully till the roots are active, and should there be continuous heavy rains place the plants on their sides. Remove all runners and side crowns.

Cucumbers.—Cucumber plants require much attention at this time of the year to encourage them to produce a steady supply of fruits. They have a tendency to make an unnecessary amount of growth, and if this is not kept properly regulated and thinned, the plants soon become exhausted. Do not allow them to carry more fruits than are needed to maintain the supply. Cut the fruits before they become too large, and place them in a cool cellar, where they will keep in good condition for several days. The plants must be given frequent top-dressings of loam and decomposed horse manure, also an occasional sprinkling of some approved fertiliser. The roots will require copious supplies of water, well saturating the soil each time water is afforded them; liquid manure may be given twice a week. Syringe the plants twice a day and frequently damp down the paths to encourage a moist atmosphere in the house. Avoid overheating the water pipes, otherwise red spider will make its appearance. An occasional syringing with a mixture of soft soap and sulphur will tend to keep the plants clear of this pest. Make another sowing for supplying fruits during autumn.

Cucumbers in unheated frames.—So far the weather has not been favourable for the development of Cucumbers in frames. Air must be admitted with care during cold, stormy weather, otherwise growth will be stunted and the plants will be attacked by aphid. Should this pest appear on the leaves, lightly fumigate the frame with a nicotine compound. Plants in full bearing should be liberally watered and fed with manures; an occasional top-dressing may also be afforded them.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Fruit gathering.—This work will necessitate considerable time and care during the present month, for many of the soft fruits ripen almost at the same time. It is desirable that fruit intended for preserving should be gathered when perfectly dry. The practice of using the best Strawberry fruits for dessert and subsequent gatherings for preserving is a good one. Vicomtesse Héricart de Thury should be included in all collections. It is of good flavour, possesses an excellent constitution, and crops abundantly. Raspberries require to be examined at frequent intervals, as the fruits ripen rapidly and commence to decay very quickly afterwards. Being so extremely soft, they require extra care in handling. In cases where it is necessary to send Raspberries and other soft fruits a considerable distance by rail, those intended for culinary purposes are best packed in wide-mouthed bottles. Such bottles can easily be packed amongst the vegetables in boxes or hampers. Black Currants being liable to split this season, owing to the wet weather, it is necessary to gather the earliest fruits as soon as they ripen, leaving the remaining fruits on each bunch to ripen afterwards. Red and White Currants may be left hanging much longer than Black ones. They will therefore afford a succession of fruit for a long period. Those who have planted Red and White Currants against a wall with a north aspect may expect a supply of fruit even late in autumn, especially if the shoots have been cut back as advised in previous Calendars in order the better to expose the fruits. Gooseberries intended for dessert should be packed in shallow boxes or punnets, care being taken to preserve the stalk of the fruit intact. If it is necessary to send them some distance, the berries should be picked before they are perfectly ripe, but those for home consumption, if allowed to become fully ripe upon the bushes, will have the better flavour. The fruiting season is prolonged if plants are cultivated as cordons against a wall facing north, or as bushes in a border under the shade of such a wall. Warrington is a variety of unusual reliability. Early Cherries are splitting badly, and it is not advisable to attempt to pack fruits which have split, as they decay quickly. Culinary Cherries, including the Morcello, should be thinned as soon as the fruits commence to ripen. The thinnings may be used for the making of tarts, whilst the best fruits

will be useful for preserving when fully ripe. Such cherries will usually keep in good condition for a considerable time upon the trees if the weather is favourable, but they should be closely watched, and on the first signs of shrivelling or decaying, the whole crop should be gathered.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Epidendrum.—Plants of *E. radicans* which have been in flower for several months past should have their flower-spikes removed very soon after growth has recommenced. If large specimens are required, the scendent shoots should be tied around neat stakes, keeping the top of the young growths well up towards the light. In collections where space is of consideration, and many cut flowers are required, it is a good plan to cut off the shoots, that did not flower this season, into lengths of about 2 or 3 feet, tie each stem to a tall stick, and insert six or eight into a 6-inch pot in well-drained peat and Sphagnum-moss. The old growths and flower-stems frequently produce offshoots, which may be removed and potted up in the same manner, or they may be planted out and trained around pillars, or against a wall, the bright orange-scarlet flowers being useful and attractive. The fine, bright, vermilion-red *E. Schomburgkii* is also a plant well worth growing in considerable quantity; its large panicles of bloom last for several months in good condition. *E. xanthinum*, *E. ellipticum*, *E. elongatum*, *E. evectum*, *E. thaguense*, *E. cinnabarium*, *E. crassifolium*, *E. pristes* and *E. arachnoglottis* produce their flowers in terminal clusters, and are all useful plants; the following hybrids, *E. Boundii*, *E. Dellense* and *E. O'Brienianum*, may also be included. All of these species and hybrids may be treated the same as *E. radicans*. They thrive well in the same kind of compost, but are not so free in producing offshoots as that species. Choose a light position in an intermediate house, for the plants, and let them remain there during the whole year. When well-rooted, they require copious waterings at all seasons. Such species as *E. alatum*, *E. aromaticum*, *E. atropurpureum*, *E. ciliare* and *E. Randii* are best grown in the Mexican house, while *E. memorale* and *E. bicornutum* prefer a light position in the warmest house. Any of these plants that require more space may be repotted when growth begins. The material used should consist chiefly of *Osmunda* and *Polypodium* fibres, and they should be potted as previously advised for *Cattleyas*. *E. prismatocarpum*, now starting into growth, may also be repotted in the same materials; a light position in the *Cattleya* or intermediate house is the most suitable place for it. Other species as *E. Cooperianum*, *E. Frederici-Guilielmi*, *E. myrianthum*, *E. syringothrysis*, *E. porphyreum* and *E. vitellinum* all do best when subjected to cool intermediate treatment. *E. Wallisii*, *E. Endresii* and the hybrids *E. Endresio-Wallisii*, *E. elegantulum* and *E. Clarissa* should be grown in a light position in the cool house during the summer months, and be given a very little warmth when the nights begin to turn cold.

Odontoglossum.—Any plants of *O. Rossii*, *O. Cervantesii*, *O. Madrense*, *O. Humeanum*, *O. aspersum* and the rare *O. Galeottianum* that require more root room, or fresh material to root in may be given attention at once, for by this time the young growths will be making roots. These dwarf species require small pans and a shallow compost consisting of *Osmunda* and *Polypodium* fibres. Suspend the plants in the cool house, and afford copious waterings until the flowering season is past. *O. grande*, *O. Schlieperianum*, *O. Inseyi* and its variety *leopardinum*, now making their growth, will require plenty of water at the root until the new pseudo-bulbs are completed.

Lycaste.—*L. Skinneri* and its varieties, also *L. Balliæ*, *L. costata*, *L. cruenta*, *L. macrobulbon*, *L. lanipes*, *L. gigantea*, *L. Peppi*, &c., are cool, moisture-loving plants. Whilst care should be taken not to over-water them at this period, they may be watered copiously when they commence to form their new pseudo-bulbs. Do not allow water to lodge in the centre of the partially-developed growths, or they will be likely to decay.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. Ford, Pencarrow, Cornwall.

Cyclamen.—If last season's plants have been kept with a view to their blooming in winter, these should be turned out of their pots, and the greater part of the old soil shaken from the roots. After this has been done repot the combs into clean pots of a similar size, or just a little larger, but do not use unduly large pots. After repotting, the plants should be placed near to the glass in an unheated frame or pit. Syringe them every morning and evening. Do not ventilate the frame much or apply much water to the roots of the plants until growth has recommenced, when they may be treated in the same manner as the seedlings that were raised last autumn. Cyclamen need always to be watered with great care, but the surroundings should be kept damp, otherwise red spider will be likely to put in an appearance.

Gloxinia.—Place the plants which have finished flowering in a cool house or frame, where the combs will mature well. They may be given frequent applications of weak manure water so long as the foliage remains green, but afterwards the supply must be gradually decreased until it is withheld altogether. Having been kept in somewhat dry conditions during the flowering period, the plants may exhibit signs of red spider or thrip. In this case fumigation with a nicotine vaporiser will be necessary.

Lachenalia.—The bulbs having rested sufficiently should now have the dry soil shaken from them. Sort the bulbs into three or more sizes, so that each size may be potted separately, and thus produce uniform specimens. Some gardeners cultivate Lachenalias in shallow pans of soil, but 5-inch or 6-inch flower-pots are best for most purposes. A suitable compost is one consisting of loam three parts and leaf-mould and dried cow manure one part, adding a good sprinkling of coarse sand. For 5-inch pots, six or seven of the largest-size bulbs will be sufficient, but in the case of smaller bulbs a greater number may be placed in each pot. Stand the pots on a base of ashes in an unheated frame. Keep the conditions as cool as possible until the end of the year, at the same time preventing cold draughts which disfigure the foliage.

The tropical houses.—If there should be a spell of hot weather, the fires which heat these houses may be discontinued during the day-time. Indeed, it may not be necessary to use them even by night for a few weeks. Considerable care will be necessary, however, in attempting to do without them altogether, because high temperatures by day are sometimes followed by unusually low temperatures at night. During a time when fire heat is not in use, the afternoon syringing must be done sufficiently early to allow the foliage to become dry again before sunset, and it will not be necessary to damp the houses in the afternoon.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Cabbage.—Seeds should be sown towards the end of the present month for raising plants to mature next spring. A further sowing should be made in the second week in August. There are always complaints as to spring Cabbages running to seed prematurely; the principal cause of this is sowing the seeds too early. They should not be sown before July 20. Select an exposed position for the seed bed where the soil has not been cropped for a year at least with any of the Brassica family, and that has not been lately manured. Rake the surface soil finely before sowing the seeds, and afterwards protect them against birds by the use of nets. The three favourite varieties here are Ellam's Early, Sutton's April, and Flower of Spring. Ellam's Early and Sutton's April mature quickly, and possess excellent quality. Flower of Spring is later, but it produces larger heads. We have never found that true stocks of these varieties when sown at the proper time "bolt" to any appreciable extent.

Coleworts.—These should be cultivated in all gardens. The earliest plants are now ready for putting into their permanent quarters. The ground should be prepared in the same way as for ordinary Cabbage, making it very firm, and planting Coleworts in rows 1 foot apart each

way. Apply a good watering immediately after planting, and stir the surface of the soil frequently with the draw hoe. Rosette Colewort and London Hardy Green are two of the best varieties of these small-growing Cabbages.

Winter greens.—It is time that all these were already planted in their respective quarters, but if by any chance the work has been delayed, let the later ones be planted immediately upon well-prepared ground. Sturdy plants of Savoys, if planted even now on a south border or in a good open place in the garden, will produce satisfactory heads.

Carrots.—Make further sowings of Short Horn varieties in frames placed on old hot-beds, which have already been occupied with early crops, such as Potatos, Beetroot, or Turnips.

Letuce.—Sow small quantities of seed of both Cos and Cabbage varieties about every 10 days. Hick's Hardy White is one of the very best Cos varieties for sowing after this date.

Endive.—Make sowings of both curled and round-leaved varieties every fortnight. Plant out the seedlings on well-prepared ground as soon as each successive batch is ready.

Shallots.—These having practically finished their growth, may now be lifted and laid on a sunny border to become thoroughly ripened. If the weather remains unfavourable for this, remove the Shallots to a cool house, pit, or frame, spreading them out that they may dry perfectly.

Radishes.—Sow the varieties Early Rose and Black Spanish for autumn and winter use.

Peas.—See that the later Peas are properly supported that the growths will not fall down or become cramped. However well these may have been staked, it is sometimes necessary to tie the leading growths with raffia, especially in cases where the plants exhibit unusual strength.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardslee, Sussex.

Layering Carnations.—This work should be proceeded with as soon as the plants have finished flowering. It is advisable to raise a number of fresh plants each year, as these give much better results than older plants. Before proceeding to layer the shoots, remove a quantity of the old soil about the plants, and replace it with a few inches of fresh material, as recommended in the issue for July 3, p. 5. Select the most suitable shoots, and remove some of the foliage from the part that is to be layered. With a sharp knife make a long, deep cut in a slanting direction, and with a peg press the cut portion into the soil. Take care to see that the slit portion is not closed; press the soil tightly around the stem, and afterwards sprinkle a little more fresh soil about the layer, but do not heap it in a mound, as in that case it would be difficult to thoroughly soak it in dry weather. Roots grow more freely when the soil about the shoots is kept moist. Pinks may be increased readily by cuttings, which may be either placed under hand lights or inserted closely together in a small trench beneath a wall on a border. The soil must have sharp sand mixed with it to keep it porous, but the ground should be trodden firmly when the cuttings are in position.

Polyanthus.—The old plants of Polyanthus that have been laid in for the purpose should now be divided. The stools are best pulled apart and each crown inserted separately. Cut away most of the old roots, leaving them only about 1½ inches long. Plant them in well-prepared soil on a north border. Some leaf-mould and decomposed cow manure should be incorporated with the staple. Plant the roots firmly, and guard the plants against slugs. Young plants of Polyanthus raised this season should have the soil about them stirred with the hoe to prevent weeds and promote aeration.

Violets.—Do not allow runners to remain on the plants. Stir the soil frequently with the hoe, and afford the roots water as often as necessary.

Roses.—Budding may be commenced as soon as the bark will part freely from the wood. Showery weather is favourable for Rose budding, and should the weather after the buds are inserted prove hot and dry, spraying with clear water must be carried out. Roses are propagated

readily from cuttings. The shoots root well in an old hot-bed frame, and they need to be kept shaded from the sunshine. A little manure forked into the soil is beneficial to Roses in July and August.

Liliums.—See that the flower-spikes are properly staked and tied as they develop. L. auratum and its varieties will need care to prevent the flower-spikes being broken by wind or heavy rain. Attend to the staking also of such plants as Dahlias and Hollyhocks. Certain other plants that do not need strong stakes can be supported by twiggy branches, and if these are placed in position now the growths will hide them when the plants are in bloom later.

General work.—Much time must be spent in keeping the beds and borders tidy by the removal of old flower-heads, decaying leaves, and weeds. The mowing of the grass verges and the rolling of the paths will also demand constant attention.

THE APIARY.

By CHLORIS.

Foul brood.—There is little need to go into the history of the disease known as foul brood, except to say that many are of opinion that it has been imported into this country by feeding bees on foreign honey containing the disease germs. The disease is very common in all parts of the country, and can only be stamped out by the concerted action of apiarists. Some bee-keepers confuse this disease with chilled brood.

What it is and how to detect it.—Foul brood is caused by a microscopic germ. It behoves all who have foul brood in their hives to do all in their power to prevent the spread of the disease. They can do this by examining hives on still days, so that the wind shall not assist in the dispersal, and by invariably washing the hands in some disinfectant immediately after every manipulation of the hive or hives. There are two kinds of foul brood—one which creates a terrible, unbearable smell, and is difficult to cure, and the other of a mild nature, nearly without smell, and easy to cure. Since chilled brood is often mistaken for foul brood, it may be well to describe this. Chilled brood is not due to disease. It generally occurs during cold weather, when clusters of bees congregate in masses to secure greater warmth; consequently some brood is exposed and dies. The young brood, which was nearly pearly-white whilst living, turns grey, and then nearly black, and the bees drag them out of the hive. When the brood is dead and it is attacked by the disease "foul brood," it turns brown and never black. When sealed brood has been attacked by disease, the cappings, instead of being slightly convex, become concave and are punctured. If a piece of stick be inserted in a cell thus indented, and then withdrawn, it will be found that there is adhering to it a coffee-coloured, evil-smelling, sticky matter, which will assume a thread-like appearance before breaking. The bees remain about the entrances and seem to have no desire to work. Those who have modern or bar frame hives can easily discover the disease in its earliest stages, and thus are in a better position to fight it successfully. Generally speaking, if the colony attacked be weak, it is best to destroy the bees, frames and quilts, and then thoroughly cleanse the whole hive with disinfectants. The usual and best disinfectant is Calvert's No. 5 Carbolic. Take some boiling water and thoroughly scrub all parts inside and out with carbolic soap. Then thoroughly paint every portion with carbolic solution—one part of Carbolic No. 5 to two of water. If the colony be strong and the queen young and vigorous, shake the bees into an empty skep and feed them for 48 hours on good syrup; during this period the diseased bees will have died. The bees may then be placed in a perfectly clean hive on as many frames as they will cover—from four to six. The frames should be fitted with full sheets of foundation, and the bees must be fed for a few days. The skep in which the bees found a temporary home should be burned. The entrance to the hive should only permit one bee at a time to leave and enter the hive, for when bees are being fed there is great danger of robbing, and this is not desirable, for two reasons: (1) the bees may not be vigorous enough to defend themselves, and (2) if the disease is present, the visiting bees will be the means of spreading it.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

Editors and Publisher.—Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

APPOINTMENTS FOR THE ENSUING WEEK.

WEDNESDAY, JULY 28—
Midland Carnation and Picotee Soc. Exh. at Birmingham Bot. Gardens (2 days). Newcastle Fl. Sh. (3 days).
Haywards Heath Fl. Sh. Leamington and County Fl. Sh. (2 days).

FRIDAY, JULY 30—
Cheadle and Cheadle Heath Floral and Hort. Soc. Sh. (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last fifty years at Greenwich—62.5°.

ACTUAL TEMPERATURES:—
LONDON.—Wednesday, July 21 (6 P.M.): Max. 69°; Min. 58°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, July 22 (10 A.M.): Bar. 29.8; Temp. 65°; Weather—Overcast.

PROVINCES.—Wednesday, July 21 (6 P.M.): Max. 68° Buckingham; Min. 59° Lincoln.

The Principles of Mendelism.

(See Supplementary Illustration.)

Nearly 50 years ago a man grew some Peas in a garden. The Peas were soon forgotten and the man died. But years afterwards several botanists of distinction, delving into old papers, discovered what the man had written about his Peas. With that rediscovery the whole trend of thought in matters relating to heredity suddenly changed. Few probably realise how great that change has been and what an enormous influence it must come to exert on all pursuits in which a knowledge of heredity plays part. The work is so new and so upsetting that many may well have hesitated to trust to it for guidance in their breeding operations until they had received from high quarters some definite assurance of the practical value claimed for it. That assurance they now have. Professor Bateson's book* has supplied this want, and there is a peculiar fitness in the fact that the first great exposition of the Mendelian principles of heredity should have come from one who has done more than any man alive to proclaim the extraordinary value of Mendel's work and to extend the field of research which Mendel himself opened up. It is high

praise, but none too high, to say that no book so full of moment for the development of horticulture has been published since Darwin's treatise on the Variation of Animals and Plants under Domestication. Like that great work, Professor Bateson's book is a storehouse of facts, a book to be drawn upon for inspiration, a book to be consulted in difficulty. Those who remember Professor Bateson as president of the last international congress of genetics held in London need no reminder of the firm and sympathetic grip with which he handled the problems which confront the breeder of plants. High expectations were then formed of the book upon which it was understood he was engaged. Those expectations have been amply fulfilled in the present volume, and it is not too much to say that the practical man who resolutely masters it will be able to conduct his operations, whether they be the raising of novelties or their fixation, with exceptional advantages over his less enterprising competitors.

We are sometimes asked by the horticulturist what the Mendelian principles can do for him. He will tell us that he understands Mendel's Law in such simple and familiar cases as that of the Pea, where the cross between a tall and a dwarf gives only tall, which themselves give rise to a generation composed of three dominant tall to one recessive dwarf. But he goes on to explain that the cases with which he is constantly meeting are very different. For example, that, though the hybrid shows resemblances to the parents, it is as a rule quite distinct from either parent, and from the hybrid may come all manner of different forms. Can Mendelism give any rational explanation of such cases as these, and if so, can it be of any use to him in fixing those of the new forms that he wants to keep? For because he does not meet with the stock 3 : 1 ratio staring him in the face at every turn, he is apt to discredit the whole Mendelian teaching as irrelevant to the type of problem with which he is most brought into contact. Such criticism may best be answered with reference to a concrete instance, and the coloured plate which we have been permitted to reproduce from Professor Bateson's book is the record of a typical experiment.

Two white Sweet Peas, Emily Henderson and Blanche Burpee, were crossed together, and the cross resulted in nothing but purples of the type called Purple Invincible. From the seed of these hybrid purples came the second, or F₂ generation, as it has been termed, consisting of eight different forms. Blanche Burpee and Emily Henderson both reappeared, and there were many purple Invincibles. But in addition to these there appeared five new coloured types, of which three were purples and two were reds. Now let us examine into how far the results of this cross can be made to tell us of the nature of the new forms and of the chances of getting them to come true.

Inspection of the F₂ generation shows that the flowers may be regarded as either possessing or not possessing a definite and limited number of alternative pairs of characters. Any given plant may be coloured or white, purple or red (if coloured), with deep-coloured or with light-coloured wings, with a hooded or an erect standard. Painted Lady, for instance, is a coloured, red form

with light wings and an erect standard: Duke of Sutherland is a coloured, purple form with dark wings and a hooded standard. All the different forms are the outcome of different combinations of these four alternative pairs of characters. One point, however, should be noticed. There are no reds with a hooded standard. In this family there is an incompatibility between those two characters, red and hood, such that plants carrying the one cannot carry the other. Now let us imagine that we wish for a true strain of the Duke of Sutherland variety. How far will the knowledge of the facts already acquired simplify our task? Duke of Sutherland is a hooded form like the original Blanche Burpee. Hood is alternative and recessive to the erect form of standard; for the original hybrid purple had an erect standard. Hence Duke of Sutherland must breed true to the hooded standard. Again, inspection of the F₂ generation will show us that among the coloured forms those with light wings are three times as numerous in the F₂ generation as those with dark wings. Dark wing is recessive to light, and the dark-winged Duke of Sutherland must consequently come true to that character. Further, we have already seen that there is an incompatibility between the red and the hooded characters such that the hooded forms cannot produce reds and vice versa. There remains yet white: what are the chances of a Duke of Sutherland throwing white? Since colour was originally made from two whites, it follows that the ratio of coloured to whites in the F₂ generation is 9 : 7, and that, of every nine, coloured forms, one will not throw whites. Out of every nine Duke of Sutherlands therefore which appear in the F₂ generation one will be completely fixed and will continue to breed true without any further selection. In order to obtain it the grower has only to collect the seeds of, say, two or three dozen of the F₂ plants, and to sow them separately. He will be practically certain to hit upon one or two which throw no whites, and could at once put the seeds from these on the market with complete confidence that the variety would continue to come perfectly true to type.

But it may sometimes happen that a type cannot be got fixed, and Professor Bateson gives us a pretty instance of that in the present case. Were a breeder seized with the desire to establish as a race the erect purples, he would find that no matter how strenuously he selected they would never cease to throw hooded purples and also reds. This, again, could have been predicted from the knowledge that the hooded and red characters are here incompatible. What we wish to emphasise is that the whole of the striking and apparently complicated results arising from this cross are in strict accordance with Mendelian principles, and are in reality simple if regarded from the proper point of view. From a knowledge of the original parents, the form of the hybrid, and the composition of the F₂ generation, the breeder can predict the chances of any form being got true to type in a single further generation. For the rapid raising and fixation of new forms, the moral of these Mendelian experiments is perfectly clear. Large numbers of plants must be raised in the F₂ generation, and the forms required must be tested *individually*, in order

* Mendel's Principles of Heredity, pp. 396, with 6 coloured plates and 33 figures. 12s. net. (Cambridge; University Press.) 1909.

to pick out those which are already fixed. And where plants are liable to cross fertilisation by insects, it is essential that they should be protected from such visitors.

In the light of Mendelian knowledge, selection is a term that will probably have to undergo some revision. Let us illustrate our meaning by returning to the Duke of Sutherland Sweet Pea. This variety is one of the rarer forms in the families we have just been considering, occurring about once only in every 30 plants. And, as we have already

process of selection. He would succeed simply because, on the laws of chance, he is in time bound to strike purples which are not carrying white. By replacing chance with intelligence, he could accomplish in one generation what he is to-day content to take several generations to effect.

Of one thing the grower may feel certain. Mendelism has come to stay. Even in its present, early stages it can be of considerable value, and, in view of the developments which may confidently be looked for during coming

enthusiasts, and we trust that their number will ever grow, for whom horticulture is the chosen occupation of their leisure and who pursue the fascinating subject of hybridisation through a love of the material on which they work and a desire for more intimate knowledge of all that concerns it. To these workers Professor Bateson's book must come as a wonderful stimulus. Rightly read, it will clear up many things that were mysterious, it will bring together much that seemed remote, and will suggest the likeliest

FIG. 27.—PORTION OF MESSRS. BAKERS' EXHIBIT AT THE WOLVERHAMPTON SHOW.

This display was awarded a Vase for the best exhibit in the Show, and two Gold Medals. (See ante, p. 44.)

[Photograph by Bennett Clark.]

seen, eight out of every nine on the average will throw whites. For the thorough-going selectionist, the method of establishing the variety is to collect and sow together the seeds of several purples. He gets, of course, a considerable number of whites. The seed of several purples is again collected in this generation. Again whites come, but probably this time fewer. By continual repetition of this "selection" process he looks forward to eventually establishing the pure purple. In time he will undoubtedly do so. But it will be through no inherent virtue lying in his

paths, we should like to feel that the great firms are alive to its possibilities. Breeding has at last become a science. That is the gist of Professor Bateson's book. And if, like the manufacturing chemists, the iron masters, and the brewers, those who are occupied commercially with hybridisation place upon their staffs experts versed in the scientific aspects of their undertakings, we feel sure that they will never have cause to regret their enterprise.

But, after all, the commercial side is not the only side of the matter. There are many

paths for fresh adventure. Lastly, to him of greater soul this book may come to mean much more. For if he catches the creative note that underlies it, there will reach him also a vision of what it all may some day come to mean for the world, and a joyous feeling that he, too, may be privileged to add a few lines to that new edition of the book of life of which the foreword was written by Mendel in his own garden years ago. If we have interpreted our author aright, it is to these disciples above all that his message is addressed.

BRITISH GARDENERS' ASSOCIATION.—We are informed that on Wednesday next, July 28, meetings of gardeners will be held in connection with the summer show of the Horticultural Society of Northumberland, Durham, and Newcastle-on-Tyne, by permission of the chairman and council. The first-meeting will be held at 2.30 p.m. in the Recreation Ground, North Road, Newcastle-on-Tyne, in a special tent provided by the executive council of the B.G.A., and will be addressed by Mr. J. WEATHERS, general secretary of the association. Another meeting will be held in the same place at 7.30 p.m. Members of the B.G.A. have the privilege of entering the flower show on the first day at half-price (1s.) up to 5 p.m. on showing their cards of membership at the gate.

THE PRODUCTION OF WHEAT IN THE BRITISH EMPIRE.—The *Journal* of the Royal Society of Arts reports a paper by Mr. A. E. HUMPHRIES dealing exhaustively with the prospects of Wheat cultivation in the United Kingdom and the Colonies. The author also discusses the "rust problem," and alludes to the remarkable discoveries of Prof. BIFFEN at Cambridge, due to the application of Mendelian principles to the breeding of Wheats.

HORTICULTURAL EXAMINATIONS.—The Royal Horticultural Society's annual general examination on the principles and practice of horticulture took place on April 21 last. The following details have been furnished us by the secretary:—151 senior candidates (over 18 years of age) entered, of whom 19, or upwards of 12 per cent., obtained a place in the first class; 69, or upwards of 45 per cent., gained a second class; and 60, or nearly 40 per cent., are placed in the third class. Three candidates only failed to satisfy the examiners. In addition to these, four students resident in India entered for the examination, the questions set by the other examiners being specially adapted to India by the kind assistance of Lieut.-Colonel PRAIN, F.R.S., and of these four candidates three obtained a second class and one failed altogether. In their report to the council the examiners (the Rev. Professor GEORGE HENSLAW, M.A., V.M.H., and Mr. JAMES DOUGLAS, V.M.H.) lay stress on the fact that the answers to the questions on the "Principles of Horticulture" were very satisfactory, especially those on Physiology, which were certainly the most important, and which, they are glad to say, were generally answered. The examiners also report that they were pleased to find that several of the candidates were well instructed in the somewhat new subjects of Ecology and Mendelism. It is necessary, however, to again urge the importance of candidates studying the instructions printed at the head of their paper before beginning to answer the questions. Fourteen candidates, for example, attempted to answer all the eight questions in "Operations and Practice," instead of confining themselves (as they were instructed) to four. In some cases, again, candidates were so prolix in their answers—had so much to say—that they only left themselves time to reply to three questions instead of to four. It is therefore necessary to again urge the importance of candidates practising conciseness in answering questions, otherwise they waste their own time and the examiners' also. The questions on "Practice" were for the most part very well answered. Although the same questions were this year set to the juniors (under 18 years of age) as to the seniors, an entirely different standard was looked for in their replies. One hundred and forty junior candidates entered, of whom 17, or upwards of 12 per cent., have been placed in the first class; 41, or 30 per cent., in the second; and 60, or nearly 43 per cent., in the third; 22 failed altogether. With regard to

"Principles," the examiners report that as a rule it was only quantity and not quality that was deficient. As far as the students had learnt there were no serious mistakes, and the answers, were distinctly encouraging. In "Operations and Practice," again, the examiners report that, considering the age of the candidates, the answers were very satisfactory, and they specially note that many of them showed a fair knowledge of the different kinds of manures and of their application to the different kinds of soils.

FREAM MEMORIAL PRIZE.—The Board of Agriculture and Fisheries have awarded a Fream Memorial Prize of the value of £7 1s. 8d., to Mr. WM. LAWSON, Guildhouse, Forth, Lanark, a student of the West of Scotland Agricultural College, who obtained the highest marks at the examination held in April last for the National Diploma in Agriculture.

THE BRUSSELS EXHIBITION, 1910.—An informal meeting of horticulturists was held recently in the Lecture Room of the Royal Horticultural Society, Vincent Square, at which representatives of the Council of the Royal Horticultural Society, of the National Chrysanthemum Society, and of other horticultural organisations were present. The principal object of the meeting was to receive the chairman of the executive committee of the British section of the exhibition, the Right Hon. the Earl of LYTTON, to hear from him particulars of the work and operations of the Royal Commission, and to afford to horticulturists the opportunity of obtaining detailed information with a view to their sending exhibits to the exhibition. The chair was taken by Sir ALBERT ROLLIT, who told the meeting what had already been done in preparation for the exhibition. Lord LYTTON stated the principal reasons why exhibitors should come forward to represent the British horticultural industry. There will be space for the maintenance of a permanent garden in the grounds, and periodical flower shows will be held. The Rev. W. WILKS, with several members of the Council, Mr. HARMAN PAYNE, and others requested information, and the proceedings closed with a cordial vote of thanks to Lord LYTTON for his attendance and speech. The new department of the Board of Trade which deals with foreign exhibitions has greatly simplified the business of exhibiting for this and future occasions. It is hoped there will be representative exhibits of all the trades of this country at Brussels. Full particulars may be had from the Director, Board of Trade (Exhibitions Branch), Queen Anne's Chambers, Westminster.

EXHIBITIONS OF THE AMERICAN SOCIETIES.

—The first exhibition of the National Sweet Pea Society of America was held on July 7 and 8, in the Museum of Natural History, New York. The organisation of the society formed the first part of the proceedings, a set of rules being drawn up and adopted, and the officers appointed. Later, Professor CRAIG read a paper on "Variety Testing with Special Reference to Sweet Peas." A considerable display of Sweet Peas and other flowers was made in the exhibition hall. —The thirty-fourth annual convention of American Nurserymen was held at Rochester on June 9, 10, and 11. The society has, during the past year, been engaged in much work of a legislative nature, especially in studying the nurseryman's interest as affected by the tariff laws, and rules governing the inspection of imported nursery stock. The new president for 1909-10 is Mr. F. H. STANNARD, of Messrs. F. STANNARD & Co., Ottawa, Kansas. —The seventh annual meeting of the American Pæony Society was held at the Cottage Gardens Nursery Co., Queens, L.I., on June 11 and 12. The society held its meeting under

most agreeable circumstances. In a field immediately adjacent to the exhibition hall there was a splendid collection of Pæonies in different stages of development. Exhibits were staged on the first day and judged early the following morning. The president, Mr. C. W. WARD, was prevented by illness from being present, and Professor CRAIG presided in his absence. The report of the committee on nomenclature was given by Professor CRAIG and Mr. L. D. BATCHELOR, who has immediate charge of the Pæony plots at Cornell. Professor CRAIG drew attention to the publication of a bulletin giving the culture, history and botany of the Pæony, together with accurate descriptions of a select list of varieties.

INTERNATIONAL EXHIBITION AT LE TOUQUET-PARIS-PLAGE.—To the other permanent attractions of the popular French holiday resort of Le Touquet are to be added this year those of an international horticultural exhibition. The exhibition will consist of two parts, the one a "permanent" exhibition opening on July 1, and continuing till the end of September; the other, a temporary show, which is to last from August 21 to August 29. The exhibition, which is under the patronage of the National Horticultural Society of France, will be divided into 18 sections, among which may be noted the following:—Sections I.-V.—Greenhouse and hot-house plants: prizes being offered for plant novelties and for fine culture. VI.-X.—Plants grown in the open air: flowering plants, Conifers, Ferns, &c. XI.—Floral art: displays serving for the adornment of rooms, &c. XII.-XIII.—Fruit and vegetable cultivation. XIV.—Horticultural education. XV.—Landscape gardening. XVI.—Fine art in its relations with plants. The plan of the exhibition is now published, and we are glad to say that an ample and well-situated space has been reserved for British horticulturists.

DEATHS IN AMERICA.—The losses recorded last week in the American gardening papers include the following names:—ABRAHAM GARRISON BURNETT, formerly a florist in Maiden Lane, New York, died in Bronxville, N.Y., on Monday, July 5, at the age of 72. DAVID MILLER, aged 83 years, died at Washington Heights, near Camp Hill, Pa., on June 25. Mr. MILLER had lived a retired life since he removed to Washington Heights about five years ago. He was born at Lampeter Square, Lancaster Co., September 18, 1825. At the age of 12 he moved with his parents to Green Hills, near Carlisle; here he conducted the Green Hills Nursery. He moved to Boiling Springs in 1875 and to Camp Hill in 1879. Mr. MILLER was the originator of the Cumberland Raspberry. PHILIP PURCELL, a florist of Bay Ridge, N.Y., died on Saturday, June 26, at the age of 59 years. ADAM C. ULLRICH, one of the pioneer florists of Ironton, died on June 27. He was born in 1826, in Mutterstadt, Germany, and settled in America in 1847.

FUNGUS DISEASE OF FUNTUMIA ELASTICA.—A new "Canker" disease affecting this tree is described in the *Kew Bulletin*. The trunks are attacked, the bark becomes thickened and cracked, and eventually large wounds are formed. The injury has been found to be primarily due to a species of Nectria.

IRIS REMBRANT.—In the sketch of this new bulbous Iris, raised by Mr. C. G. VAN TUBERGEN, reproduced in fig. 2, p. 3, it was made almost to appear as if the foliage were similar to that of the rhizomatous section. This was a mistake, the leaves of the new Dutch strain are long, linear, and deeply channelled, like others of the Niphon section.

FLOWERS IN SEASON.—We have received a number of sprays of interesting flowering shrubs from Earl ANNESLEY'S garden at Castlewellan. Mr. THOS. RYAN, the gardener, states that many of the plants have developed into large specimens, some of them being 20 feet in height and as much through. The list includes *Drimys Winteri*, *Abeia floribunda*, the flowers being reddish-purple; *Hydrangea arborescens*, *Escallonia Phillipiana*, *E. langleyensis*, *Lomatia ferruginea* (see Supplementary Illustration, Sept. 28, 1907), *Escallonia pteracladon*, a free-flowering species; *Cornus Kousa*, *Olearia macrodonta*, *Haleisia hispida*, the racemes of whitish flowers develop from the old wood; *Schizophragma hydrangioides*, the specific name describes the plant, the inflorescence is a corymb, the outer flowers being much larger than the others; *Cestrum Parqui*, the racemes of yellow flowers are somewhat like those of *Ribes aureum*; *Desfontainia spinosa*, *Senecio Greyi*, the under-surfaces of the leaves are covered with a white tomentum; *Sophora grandiflora*, the tree is 15 feet high and 12 feet wide; *Olearia argophylla*, the flowers are borne in a laxer manner than those of *O. stellulata*, and the leaves are longer and silvery beneath; *Abutilon vitifolium purpureum*, *Weigela Eva Rathke*, and *Calycanthus floridus*.

Several varieties of *Pæonies* have been sent us by Messrs. KELWAY & SON, Langport, Somerset. Very handsome were those labelled Grizzel Muir (white, flushed with pink at the base), Sir Madha Singh (a large crimson flower), Mrs. Manning (crimson), Duchess of Somerset (a large pale pink bloom), Mrs. Asquith (a pretty pink flower of large size), and Marchioness of Lansdowne (a small flower of bluish-pink shade).

—Messrs. WM. PAUL & SONS, Waltham Cross, have sent us blooms of their beautiful new *Rose Juliet*, which gained an Award of Merit at the meeting of the Royal Horticultural Society in Tuesday last. The colouring is a distinct break in *Roses*, and in addition the blooms are large and of beautiful form. —Messrs. R. VEITCH & SON, Exeter, send sprays of several interesting shrubs, also the curiously-flowered *Periploca græca*, *Lonicera Hildebrandtii* has very large yellow flowers. The most showy subjects sent are two varieties of *Ceanothus* named *Marie Simon* and *albus plenus*. Another handsome flowering plant is *Philadelphus Yokohamisi*. The others include *Stephanandra Tanakae*, *Pheumium Hookeri*, *Caragana argentea* and *Senecio Greyi*.

THE RECENT INTERNATIONAL EXHIBITION AT BERLIN.—The total receipts at the Great International Horticultural Exhibition at Berlin in April last amounted to 140,603 marks, in which is included the contribution of the Minister of Agriculture, 10,000 marks, and a sum of 20,000 marks contributed by the Society. The expenses have been about equal to the receipts; but as the cost of lighting, installation, removal, and the repairs to the Zoological Hall is not so far included, the guarantors may yet be called upon to pay a small contribution.

A NATIONAL CEREAL-BREEDING STATION.—In the course of a paper read before the recent Conference of the National Association of British and Irish Millers, Mr. A. E. HUMPHRIES, of Weybridge, made the valuable suggestion that a National Cereal-breeding Station should be established. Mr. HUMPHRIES pointed out that the committee of the association known as the Home-grown Wheat Committee had for its object the breeding of ideal British Wheats—that is, such Wheats as come nearest to satisfying the requirements of the grower, the miller, the baker, and the consumer. He referred to the well-known facts that, whereas the miller wants a strong Wheat, the strength of English Wheat has decreased. The lack of this quality of strength in English Wheat is often attributed

to climate, but Mr. HUMPHRIES maintained that Wheat of great strength can be produced in this country, and that this can be done without detriment to yield of grain or quantity and quality of straw. He urged that the idea that Wheat growing could not pay in this country was erroneous, and maintained that what was wanted was that breeders should do for cereals what has been done for cattle and horses. The proposal recommending the establishment of a national station for the breeding of cereals was put to the conference by the president, Mr. J. M. FROST, of Chester, and was carried unanimously. There can be no doubt that such a station would confer an enormous benefit on agriculture, and we hope that effect will be given in the near future to this resolution. We are hearing constantly from this and that quarter that this or that improvement is impossible; that all possible advances have been already made; that, for example, if better Wheat could be produced in this country, it would have been done long ago. This sort of argument—if it may be dignified by such a name—is unscientific, and to all such pessimistic thinkers we would apply the famous advice of John Hunter: "Don't think—try." The trying in this case, however, must be on so large a scale as to be beyond the range of single individuals, and hence the need of a national station for the breeding of cereals.

THE PREVALENCE OF EELWORM.—From information received by the Board of Agriculture it appears that considerable damage has been done to the Oat crop by the stem eelworm (and also by the frit fly). The stem eelworm commonly attacks Wheat, Oats, Hops, Clover, and Onions, and also various garden plants, as, for example, *Chrysanthemums*. Leaflets describing the life-history of the pest and giving advice as to its treatment may be obtained gratis from the Secretary, Board of Agriculture, Whitehall Place, London, S.W.

PUBLICATIONS RECEIVED.—*Artificial Manures, Their Chemical Selection and Scientific Application to Agriculture*, by M. Georges Ville. New edition. Revised by Sir William Crookes, D.Sc., and John Percival, M.A. (Longmans, Green & Co.) Price 10s. 6d. net.—*The Foundations of the Origin of Species*, by Charles Darwin. Edited by his son Francis Darwin. (Cambridge University Press.) Price 7s. 6d. net.—*The Book of Nature Study*, by Bretland Farmer, D.Sc. Vol. IV. (Caxton Publishing Co., Surrey Street.) Price 7s. 6d. net.—*The Garden Week by Week Throughout the Year*. An illustrated Handbook to Gardening Operations and the Culture of all Important Plants. By Walter P. Wright. (London: Grant Richards, 7, Carlton Street, S.W.) Price 6s. net.—*Winning a Living on Four Acres*, by Fred. A. Morton. (London: A. C. Piffard.) 6d. net.—*Trees and Shrubs of the British Isles, Native and Acclimatised*, by C. S. Cooper, and W. Percival Westell, F.L.S., and illustrated by C. F. Newall. (Parts V, VI, VII, and VIII.) (London: J. M. Dent & Co., 29 and 30, Bedford Street, W.C.) Price 1s. each net.—*The Journal of the British Gardeners' Association*. (July) Price 1d.—*Botanical Magazine*. (July.)—*East Coast Holidays*. The Great Eastern Railway Company's Handbook, to be obtained free from the Superintendent of the Line, Liverpool Street Station, London, E.C.—*The Journal of the Board of Agriculture*. (July.) (London: Board of Agriculture and Fisheries.) Price 4d.—*The Women's Agricultural and Horticultural International Union's Monthly Leaflet*. (London: Lower Sloane Street, S.W.) Price 2d.—*Practical School Gardening*, by Percy Ellford, M.A., and Samuel Heaton. (Oxford: Clarendon Press.) Price 2s.—*Fertilisers and Manures*, by A. D. Hall. (London: John Murray, 50a, Albemarle Street, W.) Price 5s. net.—*Proceedings and Journal of the Agricultural and Horticultural Society of India for July to December, 1908*. (Calcutta: Agri-Horticultural Society of India, 17, Alipur Road, Alipur.)—*Annual Report of the Bee-Keepers' Association of the Province of Ontario, 1908*. (Toronto: Ontario Department of Agriculture.)

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

PLANT ECOLOGY.—In T.'s article* on Prof. Warming's work on ecology, he says that the author "assumes that plants 'possess a peculiar inherent force, by the exercise of which they directly adapt themselves to new conditions, &c.'" To assume so much appears to be to renounce the attempt at real scientific explanation altogether. What T. calls an "assumption" is really a logical conclusion from a world-wide induction, coupled with an abundance of experimental verification. No scientist can have, even if he wished it, more proof. The former is based on the very "plant associations" which Dr. Warming and Dr. Schimper before him have so well described. For example, when you find that similar physical conditions are always characterised by similar plant associations, in that the members of the plant-groups have, respectively, the same vegetative structures in adaptation to their environments, whatever be the natural orders to which they belong, you cannot escape from the induction that there is a similar cause and effect—that the plants *respond* to the "direct action" (Darwin's term) of the environment and so "adapt themselves" to it. Dr. Warming's "assumption" is, therefore, an inductive proof of the identity in the cause. Thus, the Cactaceæ and Aloe-like Amaryllids of Mexico are just like the fleshy Euphorbias and the true Aloe of Africa. Their massive structures being storehouses of water in all alike. In this case no experimental proof is required, any more than for the conviction that the earth revolves on its axis every 24 hours; for which no proof is possible. Take an opposite case, viz., a hydrophytic association. A large number of Dicotyledonous aquatic plants of widely different families have their submerged leaves finely dissected; while, if they have others floating or in the air, they are complete. The accumulation of coincidences establishes the conviction that water is the cause (through response) of the dissected leaf, especially when it is seen that if a leaf be half in and half out of the water the former half is dissected but not the latter. But experimental evidence is to hand. Mr. McCallum, starting with the *a priori* assumption that the protoplasm was so supersaturated that it was unable to make a complete leaf under water—to put his "working hypothesis" to the test—dissolved nutritive salts in the water, with the view of setting up osmosis. The result was just what he anticipated, that subsequent leaves were completely formed though submerged. The plant he experimented with was *Proserpinaca palustris*, which has lanceolate, serrated blades in the air, but pectinated ones below water. Similarly spinescence is simply the result of drought, and has nothing to do with any teleological assumption of self-protection from browsing animals. Pears and Plums, as well as Barberry, Furze, and Rest-Harrow, when grown in a garden or in continuously moist soil and air, soon develop their spines into leafy shoots. In Dr. Schimper's work may be found an abundance of similar illustrations taken from all kinds of associations. The result of observations is everywhere the same. Induction, or the accumulation of similar facts, comes first. Then experimental verification follows, as seen in *Animals and Plants under Domestication*,† the title of Darwin's work, wherein he first expounded the same ecological view as modern ecologists hold, telling us that the "results of the direct action of changed conditions of life" are either "indefinite" or "definite"; if the latter, then "a new variety will be formed without the aid of natural selection." He did not then realise that there is *no* alternative, that nature has not two distinct and diametrically-opposed methods of making species, but only one, i.e., by the "definite" method. Darwin told Prof. M. Wagner in 1876 that to have overlooked this was his greatest mistake.‡ Consequently, we find it frequently introduced in the sixth edition of *The Origin of Species* (1878). Darwin was thus the pioneer in modern ecology; we are but his followers, and are endeavouring to establish the results from a new starting-point. *George Henslow*.

CARROT FLY IN NORTH HAMPSHIRE.—Very serious damage has been done to Carrot beds in North Hampshire by the Carrot fly, causing great loss to allotment growers and small holders. In over 30 cases enquired into the complete crop is destroyed. The crops were sown at dates varying from the middle of March to April 22. Most had been thinned, but some not; in about half the cases the ground had been previously double-trenched. The fly was first noticed on June 28. In many cases, where the crop was believed to be sound, the fly has been found on closer inspection. In one large garden at Oakley the appearance of the fly was noticed on July 9, but the crop is now growing well. *R. S.* [Every effort should be made to enable the young Carrots to grow quickly and without check. For this reason thinning should be done early, and, if the weather is dry the crop should be watered frequently. A sprinkling of guano or some other quick-acting fertiliser should be afforded. The watering of attacked plants with water containing one ounce of petroleum to the gallon is recommended, also frequent doses of salt water. Avoid wetting the foliage with these liquids.—Eds.]

A NEW CUCUMBER.—I have forwarded two fruits of a new Cucumber named Nelson's Prolific, a cross between Locket's Perfection and Telegraph. The fruits are from 1 foot to 1½ feet in length, and straight; the plants are very prolific. *Wm. Jno. Nelson, The Limes, Acombe, Yorks.* [Good solid fruits of the Telegraph type, rather pale in colour.—Eds.]

SOCIETIES.

ROYAL HORTICULTURAL

JULY 20.—The fortnightly exhibition, held on Tuesday last in the Society's Hall, Vincent Square, Westminster, was representative of all branches of horticulture. The building was well filled with groups of flowering plants, including many Orchids, and there were large exhibits of vegetables, also fruit trees in pots. A gold medal was awarded for a group of Souvenir de la Malmaison Carnations shown by C. F. RAPHAEL, Esq., Shenley, and a similar award was conferred for a collection of fruit trees in pots shown by MESSRS. JAMES VEITCH & SONS, LTD. Other notable exhibits were groups of Roses, Delphiniums, Sweet Peas, Eremuri, Lilliums, Cacti, Ferns and collections of hardy flowers.

The FLORAL COMMITTEE granted six Awards of Merit to novelties, and the ORCHID COMMITTEE conferred two Awards of Merit and three Botanical Certificates.

The FRUIT and VEGETABLE COMMITTEE made no award to a novelty, but confirmed certain marks awarded to Cabbage Lettuces at Wisley.

At the 3 o'clock meeting in the lecture room an address on "Mendelism and Barley" was delivered by Mr. R. H. Biffen.

Floral Committee.

Present: W. Marshall, Esq. (Chairman), and Messrs. Henry B. May, John Green, Geo. Renthe, Chas. T. Drury, W. Cuthbertson, J. T. Bennett-Poc, Chas. E. Shea, W. P. Thomson, E. H. Jenkins, W. J. James, Arthur Turner, Chas. E. Pearson, Chas. Dixon, J. F. McLeod, Jas. Hudson, Jno. Jennings, R. Hooper Pearson, R. W. Wallace, J. W. Barr, W. J. Bean, E. A. Bowles, and Jas. Walker.

The excellent group of Carnations shown by C. F. RAPHAEL, Esq., Porter's Park, Shenley (gr. Mr. A. Grubb) was comprised of varieties of the Souvenir de la Malmaison type. It was an extensive and boldly-arranged group, a number of large Nephrolepis Ferns being disposed at intervals and afforded a pleasing relief to the flowers. Many of the Carnations were of the Princess of Wales variety, these being shown in large, well-flowered plants, the individual blooms being remarkably fine. King Oscar, a variety with scarlet blooms, was grouped on either side of the pink-flowered variety, and there were in addition groups of Maggie Hodgson (clove), the Old Blush, and The Colonel (scarlet), whilst in the middle of the group was a batch of the yellow Miss Audrey Campbell. (Gold Medal.)

Another fine display of Carnations was shown by MESSRS. WM. CUTBUSH & SONS, Highgate,

London, N. Here tall vases were utilised for displaying the blooms, most of which were of the perpetual-blooming type. At the back were tall epergnes of bamboo, these being grouped at their bases with pink-flowered Astilbes and Ferns, whilst the upper parts were filled with choice blooms of Carnations. In the body of the exhibit arose tall vases containing excellent flowers of Enchantress, Victory, White Enchantress, Mrs. T. W. Omake (pale pink), and other popular kinds. The group was arranged with skill for general effect. (Silver-gilt Banksian Medal.)

MESSRS. STUART LOW & Co., Enfield, Middlesex, showed varieties of Souvenir de la Malmaison Carnations, many of them novelties raised at Bush Hill. The exhibit was arranged as a pyramid arising from a circular plateau. We noticed a large plant of the variety Irene with 15 large blooms, and others in the bud stage. The colour is a pale shade of pink. It was raised by Messrs. Low, as also were Lady Mary Hope (terra cotta), Irene (salmon-pink), Maggie Nettle-fold (a large bluish-pink flower), The Colonel (cerise), Sunset and Sunrise. The remaining portion of the group was composed of fine flowers of standard kinds. In another part of the hall the same firm displayed Roses in variety. (Silver Flora Medal.)

MESSRS. JAMES VEITCH & SONS, LTD., Chelsea, showed an extensive group of perpetual-blooming Carnations, the collection containing most kinds in commerce. The same firm exhibited a number of small plants of Solanum Wendlandii, each specimen having a large inflorescence of the pretty blue flowers. They showed remarkably fine culture, and were the best flowered plants we have seen. In addition were Cannas in variety, well-flowered plants, although small, of Romneya Coulteri, a climbing Sollya, S. Drummondii, with small blue-coloured bell-shaped flowers; a magenta-coloured Lobelia labelled L. Ertorda and Lillium miriophyllum, resembling L. Brownii. (Silver Flora Medal.)

Mr. JAMES DOUGLAS, Edenside, Great Bookham, Surrey, showed Carnations of the florist's type, the best being Ellen Douglas (silvery grey), T. E. Henwood (pink), Hercules, Miss Willmott (coral pink), Cardinal and Agnes Sorrel (mauve).

Mr. L. R. RUSSELL, Richmond, staged a floor group of Caladiums; each plant was well furnished with foliage, although the leaves were not extra large. Such beautiful varieties as Candidum (white and green), Mikado (red and green), Pictum (small green and white leaves), Golden King, General Berger (rose suffusion on green), and Leonard Banse (silver) were well shown.

MESSRS. H. B. MAY & SONS, The Nurseries, Edmonton, showed Nias, Abutilon triumphans with rose-coloured flowers, Allamanda grandiflora, and a large batch of plants of Acalypha hispida. Messrs. MAY also showed a collection of Ferns, in which crested and plumose varieties of Nephrolepis were a feature. (Silver-gilt Banksian Medal.)

MESSRS. WM. BULL & SONS, Chelsea, showed ornamental-leaved plants of stove and greenhouse varieties, as a setting to their exhibit of Orchids.

A group of Cacti exhibited by Messrs. H. CANNELL & SONS, Swanley, proved a pleasing change from the usual exhibits. The collection embraced more than 200 plants, the genera represented being Echinocactus, Mammillaria, Cereus, Opuntia, Euphorbia, Senecio, Cotyledon, and Crassula. Amongst the more interesting we observed Euphorbia grandicornis, having formidable spines along the ridges of the stem; Astrophytum myriostigma (known popularly as the Bishop's Hood); Pilocereus senilis (Old Man Cactus); Cereus peruvianus monstrosus (called by some Rock of Ages); Cotyledon edulis (used sometimes as a salad); Cereus Sargentianus (with a dense row of stiff spines along the furrows); Opuntia robusta; Echinocactus Grusonii (golden Cactus); and the exquisite little Mammillaria micromeris, with rosettes of hairs that absorb water like a sponge. (Silver Flora Medal.)

MESSRS. H. J. JONES & Co., Hither Green, Lewisham, showed varieties of Phlox decussata, Gaillardias, a stand of Scabiosa caucasica, and, along the front some bunches of Zonal Pelargoniums, a red-leaved Coleus, and a row of Adiantum Ferns, with Abutilon Thompsonii intermixed. Three good Phloxes are Independence (white), Ideal (orange-red), and Eugene Danzavilliers (mauve and white).

MESSRS. JAMES CARTER & Co., High Holborn, arranged an archway with vases of Sweet Peas, the manner of exhibiting being novel and much admired. It formed a connecting link between the firm's exhibits of culinary Peas and Tomatos on either side of the central transept. (Silver-gilt Banksian Medal.)

MESSRS. CARTER, PAGE & Co., London Wall, made a large exhibit of Sweet Peas, representative of about 70 varieties. We noticed fine blooms of Constance Oliver, Elegance, Prince Olaf, Helen Lewis, George Herbert, Mrs. W. Wright, Lady Althorp, Queen Alexandra, and other popular varieties. (Silver Flora Medal.)

Mr. W. J. UNWIN, Histon, Cambridge, showed these dainty flowers in great assortment. Each vase contained large, brightly-coloured spikes of such varieties as Evelyn Hemus, Mrs. Harcastle Sykes, Constance Oliver, and Clara Curtis.

MESSRS. KELWAY & SON, Langport, Somerset, showed varieties of Sweet Peas, also Gaillardias and a quantity of fine spikes of Delphiniums.

MESSRS. DOBBIE & Co., Rothesay and Marks Tey, exhibited a small but select group of Sweet Peas, having many novelties, including Mrs. A. Ireland, Masterpiece, Improved Mrs. Henry Bell, Clara Curtis, and New Crimson.

Mr. F. LILLEY, Guernsey, showed varieties of Gladioli, as on former occasions. (Silver Banksian Medal.)

MESSRS. R. & G. CUTHBERT, Southgate, showed new varieties of Ivy-leaved Pelargoniums. The best were Mrs. Hawley, bearing large trusses of bloom with purplish-red flowers; Sabrina (scarlet, with a faint flush of purple), Resplendent (purplish-red), Southgate Perfection (purplish mauve), Beauty of Castle Hill (pale rose), and Holly Wreath (with silvery variegated foliage). Hydrangea alba grandiflora was shown very finely, the large corymbs being composed of flowers of the purest white. (Silver Banksian Medal.)

An interesting group of hybrid Delphiniums was shown by G. FERGUSON, Esq., Weybridge (gr. Mr. F. W. Smith). The best was Nulli Secundus (see Awards). There were others showing less of the black centre, notably Gradation. Some showed yellow colouring in the centre, the best of this type being Flava. Miranda has creamy-yellow petals with a lemon-shaded centre. Amongst blue-flowered varieties, a notable plant was the one labelled Lady Faudel Phillips, the large flowers being of the shade of blue seen in the Gentians. Faroda has pretty pale blue flowers. (Silver-gilt Flora Medal.)

Roses were extensively shown by MESSRS. WM. PAUL & SONS, Waltham Cross, Herts. A large table was filled with epergnes, vases and boxes of choice varieties, the epergnes occupying the middle portion of the display with a standard plant of a climbing variety at intervals, and here and there a Dracaena. The collection embraced such handsome varieties as Liberty, Frau Karl Druschki, Grace Darling, Wm. Shean, Mrs. Isabelle Milnes, Lyon Rose, and Joseph Hill. (Silver-gilt Flora Medal.)

Other exhibitors of Roses were Mr. W. R. CHAPLIN, Waltham Cross, and MESSRS. R. HARKNESS & Co., Hitchin.

Mr. AMOS PERRY, Enfield Chase, Middlesex, staged a group of Delphiniums that extended almost the entire width of the building, a group of Lilliums completing the exhibit. Of the Delphiniums the more noticeable were Danube (Cambridge blue, tinged with pale mauve), Queen Wilhelmina (palest blue, flushed with mauve), Alfred Henderson, Duke of Connaught (a rich Gentian blue), Pedro Hamel (dark plum colour), the spikes attain to a height of 9 feet, and Jubilee, a semi-double-flowered variety of pale blue colour. The Lilliums included L. giganteum, a white form of L. Krameri, L. Grayi, and varieties of L. elegans. (Silver Flora Medal.)

MESSRS. ARTHUR CHARLTON & SON, Summer-ville Nursery, Tunbridge Wells, showed seasonal border flowers, including many Delphiniums, one labelled The Navy being of deepest blue colour. There were also Phloxes, Campanulas, Irises, Thalictrums, Lychnis Chalcedonica, &c.

FROM THE GUILDFORD HARDY PLANT NURSERY many interesting and uncommon garden plants were exhibited. Lysimachia clethroides has a large spike of whitish blossoms. (Euthanas, Campanulas, Delphiniums, Astromerias, Phloxes and Irises were shown in great assortment.)

MESSRS. G. & A. CLARK, LTD., Dover, made an exhibit of herbaceous flowers, amongst which we noticed the handsome red-flowered Gilia

coronopifolia, also a fine variety of Scabiosa caucasica labelled Pride of Riverslee. (Silver Banksian Medal.)

Messrs. R. WALLACE & Co., Kilnfield Nurseries, Colechester, showed some superb blooms of Iris Kæmpferi, a batch of hybrid Eremuri, Liliums Brownii, L. auratum platyphyllum and L. elegans, together with Delphiniums and many Ferns for greenery. (Silver Flora Medal.)

Mr. G. REUTHE, Keston, Kent, showed seasonable border flowers, one of the brightest being Anthemis Kitaibellii (a rich shade of yellow). We also noticed Campanula Marnelmeri, Veratrum album, Sollya heterophylla, with blue bell-shaped flowers, and Gentiana thibetica, having heads of whitish flowers set in four large bracts. (Silver Banksian Medal.)

Messrs. WARE, LTD., Feltham, showed a rock-garden exhibit, amongst which we noticed the dwarf Geranium lancastricense, Pratia repens, a trailing white-flowered plant; Betonia grandiflora, having large mauve-coloured blossoms borne in a spike, Lychnis Haageana, of richest scarlet, and Orchis elongata.

Messrs. J. CHEAL & SONS, Crawley, exhibited garden flowers in variety. (Silver Flora Medal.)

AWARDS OF MERIT.

Delphinium Nalli Secundus.—An excellent white or pale cream-coloured variety with dark centre. Shown by F. FERGUSON, Esq., Weybridge.

Eremurus Sir Michael.—A seedling variety from D. Shelford, which it greatly resembles. Shown by Messrs. WALLACE & Co.

Nymphaea Mooreana.—This Nymphaea was sent to Mr. Hudson by a friend in Australia some eight years ago. It took a few years to establish itself, but has now been flowering for five or six years past. The friend in question, when at Gunnersbury and inspecting the Water Lilies there, said that they had in Australia a better yellow variety than N. Marliacea chromatella, and he promised to send a plant on his return. It has proved better in colour than N. M. chromatella, whilst it is equally as floriferous. In foliage it is also distinct, the leaves possessing greater substance, whilst they are not mottled or marbled, as in that variety. The flowers when expanded are more rounded, the petals being shorter and broader. In colour it is deeper, being more distinctly yellow. Mr. Hudson was not informed as to its origin. It has proved to be perfectly hardy and of good constitution. Shown by LEOPOLD DE ROTHSCHILD, Esq.

Rose Juliet.—In this Rose Messrs. W. PAUL & SON, of Waltham Cross, have raised and introduced the most distinct in colour that has appeared for very many years past. The petals are rich yellow at the base for about 1 inch upwards, and the underneath side of each petal is cream-coloured. The remaining portion of the front or upper side of the petal is a distinct shade of red very difficult to describe. It may be said to resemble the colour of the Orchid Cochloda Noezliana! The extraordinary sheen observable over the whole flower is probably due in some measure to the yellow colouring at the base. At any rate, the new Rose may be recommended as a charming variety for the garden, introducing, as it does, a distinct and pleasing tint of colouring. It has to be said, however, that the blooms lose all this extra attractiveness directly they have fully developed, the fully-blown flower exhibited being scarcely recognisable as the same variety. Messrs. PAUL state that the plant grows about 6 feet thick. It has thick, dark green foliage, and may be grown as a pillar Rose. It is a cross from a H.T. variety and one of the Briars, possibly the Austrian Briar, but of this fact we are not informed.

Spiraea Veitchii.—Some flowering sprays of this new Spiraea were exhibited by Messrs. JAS. VEITCH & SONS, Chelsea. We have seen the plant itself in the Coombe Wood nursery earlier in the month, when the flowers were a much purer white than they were on the sprays shown. It is a shrub of exceedingly graceful habit, making slender, arching growths 6 feet to 8 feet long in one season, which become covered with flowers on the upper side from end to end the next season. The flowers are produced in corymbs 2 inches to 3 inches across. The leaves are of a rather bluish-green, oblong-lanceolate and toothed towards the end. The species

is a native of Central China, where it was discovered by Mr. E. H. Wilson, and it is a member of the same great group of Spiraeas as S. canescens. Two nearly allied species have also been introduced from China by Messrs. VEITCH, viz., Henryi and S. Wilsonii. We believe it is Mr. Wilson's opinion that S. Veitchii is the finest of the three, and probably the best of all the Chinese species. It ought to make a charming shrub for a lawn where it can be given room for the full display of its elegant, arching branches. Like all the Spiraeas it will need a rich, loamy soil to develop to perfection.

Sweet Pea Edna Unwin.—This is an excellent bright red flower with purple shade in the wings. It may be described as a larger, better form of St. George. Shown by Mr. J. UNWIN, Histon, Cambs.

Orchid Committee.

Present: Harry J. Veitch, Esq. (in the Chair); and Messrs. Jas. O'Brien (hon. sec), Sir Jeremiah Colman, Bart., de E. Crawshay, G. F. Moore, R. G. Thwaites, Gurney Wilson, F. M. Ogilvie, W. Bolton, W. Boxall, F. Sander, J. Forster Alcock, A. A. McBean, C. H. Curtis, W. Cobb, J. Cypher, W. H. Hatcher, J. Charlesworth, H. G. Alexander, A. Dye, H. A. Tracey, H. Ballantine and W. H. White.

Sir TREVOR LAWRENCE, Bart., K.C.V.O., Burford (gr. Mr. W. H. White), showed a magnificent dwarf specimen of the beautiful rose-coloured and white Vanda Miss Joaquim (teres × Hookeriana) with five spikes of large flowers, and a number of dwarf plants of the bright cinnabar-scarlet Habenaria rhodocheila with a profusion of flowers. Mr. W. H. White was awarded a Cultural Commendation for each of these exhibits. Sir TREVOR LAWRENCE also showed the deep violet-purple Calanthe japonica atropurpurea and Cirrhopetalum papillosum.

Sir JEREMIAH COLMAN, Bart., V.M.H., Gatton Park, Reigate (gr. Mr. Collier), staged a charming little group of rare and curious species, amongst which were the elegant white Bulbophyllum laxiflorum, B. coccinum (white, tinged with rose), B. biflorum (each spike bearing two long purple-tinted blooms), Cirrhopetalum Macraei (a pretty Ceylon species), Nephelaphyllum pulchrum, Masdevallia trichate, and the chaste, pure white Spathoglottis plicata alba (see Awards). The hybrids in these species were Odontoglossum Astarte (Harrayanum × tripudians); the showy Lælio-Cattleya Epicasta Gatton Park variety, and the new Lælia Gattonensis (L. anceps Dawsonii × L. cinnabrosa) which in shape resembles L. tenebrosa, one of the agents in its composition, and has bright chrome-yellow sepals and petals and deep elaret-veined lip.

F. MENTETH OGILVIE, Esq., The Shrubbery, Oxford (gr. Mr. Balmforth), was awarded a Silver Flora Medal for a fine group, principally of good forms of Odontoglossum crispum. The gem of the collection was O. crispum Madonna, with a fine spike of snow-white flowers with chrome-yellow crest to the lip. The best spotted form was O. crispum Mrs. J. W. Whiteley, with handsomely blotched sepals. Considering the lateness of the season, all the flowers were remarkably fine.

Colonel G. L. HOLFORD, C.I.E., C.V.O., Westonbirt (gr. Mr. H. G. Alexander), sent Lælio-Cattleya purpurato-Schilleriana Westonbirt variety, a handsome rosy-lilac flower with ruby-purple front to the lip, and L.-C. Radium (purpurato-Schilleriana × Warscewiczii), a large and profuse-flowering hybrid of bright colour. The sepals and petals were rose-purple, and the elongated front of the labellum, glowing ruby-crimson, darkest at the base.

DE B. CRAWSHAY, Esq., Rosefield, Sevenoaks (gr. Mr. Stables), showed Odontoglossum Queen Alexandra variety Magnificence, a superb hybrid which is the best of Mr. CRAWSHAY'S fine strain of this cross. The massive spike bore very large flowers, broad and flat in the segments, the large shield-shaped white lip 1½ inches long and nearly as broad, being handsomely marked with violet, the sepals and petals yellow, nearly covered with olive-brown blotches. Mr. CRAWSHAY also showed O. Astarte (Harrayanum × tripudians) and O. Nerissa rosefieldensis (mævium × crispum), both improvements in their classes, and Odontiodia gattonensis (O. Kegeljami × Cochloda Noezliana), originally described from Sir Jeremiah Colman's specimen in the *Gardener's Chronicle*. Mr. CRAWSHAY'S plant plainly indi-

cated the parentage, there being more of the yellow of O. Kegeljami visible on the red surface of the flowers than in the original.

Messrs. CHARLESWORTH & Co., Haywards Heath, were awarded a Silver Flora Medal for an effective group of good and rare Orchids, the centre being composed of several grand plants of the best bright blue-tinted Vanda cœrulea, with which was a good example of the rare Vanda Charlesworthii, a natural hybrid between V. cœrulea and V. Bensonii. The flowers are prettily tessellated with a peculiar shade of blue, the lip being violet with white ridges. Sobralia macrantha alba magnifica had a fine large snow-white bloom; Bifrenaria tetragona, a cluster of curious wax-like flowers; Bulbophyllum barbigerrum, Disa sagittalis, Satyrium ochroleucum, S. membranaceum and other rare species were noted; Cattleya Mossie alba variety, with very fine white flowers, with a pale pink freckling on the front of the lip, and C. Gaskelliana alba; a finely-flowered patch of the best orange scarlet Epidendrum vitellinum, the fine Dendrobium superbum giganteum (macrophyllum giganteum) of the original type, its flowers strongly aromatic; Miltonia vexillaria albiflora with very large white flowers slightly tinted with rose; and a selection of hybrid Odontoglossums were included in this exhibit.

Messrs. SANDER & SONS, St. Albans, were awarded a Silver Flora Medal for a good and interesting group, which included some Odontoglossums, the best of which were the massive and darkly-blotched O. crispum-Harrayanum Brugense, raised by Messrs. SANDER from seeds borne by a blotched O. crispum fertilised with O. Harrayanum, and the new O. ardentissimum Starlight (see Awards). Among others noted were a pretty Sophro-Lælio-Cattleya between C. Harrisoniana and Sophro-Lælia læta, some good Cypripediums, including C. Lord Derby; Vanda cœrulea of good quality; the deservedly favourite Cattleya Warscewiczii Sanderiana, with many fine rose and ruby-crimson flowers; several Brasso-Cattleya Pluto, a very beautiful Lælio-Cattleya Ophir with flowers of fine shape having deep yellow sepals and petals and a rose-freckled front to the lip; L.-C. Clive var. Broomfieldensis, with a finely-coloured flower, and other Lælio-Cattleyas.

Messrs. STUART LOW & Co., Royal Nurseries, Bush Hill Park, were awarded a Silver Flora Medal for an effective group, in which their importation of Cattleya Gaskelliana showed great variation in the flowers of the plants staged, which ranged from white to rose and purple. One very remarkable variety had the labellum of a deep violet purple with a lighter margin. Among the Odontoglossums, O. crispum Annie had finely-blotched flowers. O. Pescatorei bore a branched spike of 35 blooms, Oncidium macranthum and other Oncidium were well flowered, Brasso-Cattleya Pochontas alba (E. Eldorado alba × B. Digbyana) was a charming white flower with fringed labellum and petals, and very fragrant; Cypripedium Juno Drewett's variety, bore an excellent flower.

Messrs. WILLIAM BULL & SONS, Chelsea, showed a batch of light-coloured Lælio-Cattleya Norba (L. xanthina × C. Mossie).

Mr. JAS H. HILL, Burgess Hill, staged a small group of Miltonia vexillaria, Oncidium macranthum, and other Orchids.

C. J. LUCAS, Esq., Warnham Court, sent Brasso-Cattleya Madame Chas. Maron.

W. THOMPSON, Esq., Walton Grange, Stone (gr. Mr. Stevens), showed Odontiodia Charlesworthii superba, very finely grown and with two stout spikes of flowers from the leading pseudobulb. (Cultural Commendation.)

Mr. GURNEY WILSON, Haywards Heath, again showed his fine white Brasso-Cattleya Digbyano-Mossie Glenholme variety, with four flowers, and which had previously obtained an Award of Merit.

EUSTACE F. CLARK, Esq., Teignmouth, sent a flower of his Cypripedium Eustaceanum (superbiens × Argus).

Mr. GEO. BAILEY, Burgess Hill, sent four Odontoglossum crispum.

AWARDS.

AWARDS OF MERIT.

Spathoglottis plicata alba, from Sir JEREMIAH COLMAN, Bart., Gatton Park, Reigate (gr. Mr. Collier).—A very beautiful and remarkable albino of the pretty purple species. The plant bore a

had of pure white flowers, with a slight yellow tinge at the base of the lip. The variety is supposed to be unique.

Odontoglossum ardentissimum "Starlight" (*Pescatoriæ* × *crispum* Starlight), from Messrs. SANDER & SONS, St. Albans.—A remarkable variety with a strong resemblance in its markings to *O. crispum* Starlight, the numerous small purple spots on the inner parts of the pinkish segments being disposed in a similarly attractive way. The lip is white, of good shape, and has some red-brown blotches in front of the crest.

BOTANICAL CERTIFICATE.

Nephele phyllum pulchrum, from Sir JEREMIAH COLMAN, Bart.—A dwarf plant with stalked leaves bearing cordate blades prettily marked with olive brown on a yellowish ground. The dwarf flower-spikes bore several green and white flowers.

Megaclinium Arnoldianum, from Messrs. SANDER & SONS, St. Albans.—A pretty species, with the general appearance of *M. falcatum*, but with flowers of a lighter tint. The habit of the plant is also different, and the angular pseudobulbs of a lighter green.

Oncidium pumilum, from Mr. GURNEY WILSON, Glenthorne, Haywards Heath.—A dwarf, fleshy-leaved, Brazilian species, with only rudimentary pseudo-bulbs and bearing a branched inflorescence some 4 inches in height with small yellow flowers.

Fruit and Vegetable Committee.

Present: G. Bunyard, Esq. (Chairman), and Messrs. A. H. Pearson, J. Cheal, H. S. Rivers, J. McIndoe, O. Thomas, J. Harrison, W. Bates, J. Jaques, A. Dean, E. Beckett, E. Hobday, P. D. Tuckett, G. Reynolds, H. Parr, and G. Wythes.

The chief exhibit was a superb collection of Peach, Nectarine, and Fig trees in pots, and of flat-trained Gooseberry bushes, also in pots, shown by Messrs. JAS. VEITCH & SONS, Chelsea. Peaches and Nectarines, all either three or four-year-old trees, were heavily fruited, the 36 plants being in luxuriant health; of Figs there were 16, and of Gooseberries 36 plants. The Gooseberries were trained as cordons, some with five leading shoots and about 3 feet in height, all laden with fine fruits. Some of the best were Langley Beauty, Langley Gage, Keepsake, Forester, Gipsy Queen, Speedwell, Broom Girl, Early Sulphur and the Pilot. The Peach trees included the varieties Peregrine, Duchess of Cornwall, Duke of York, and Royal George. The Nectarines were Cardinal, Early Rivers, Pineapple, and Lord Napier. Of Figs the chief sorts were Bourdissette Noire, Osborne's Prolific, and Brown Turkey. (Gold Medal.)

Messrs. T. RIVERS & SONS, Sawbridgeworth, staged four aged Cherry trees in pots. The trees were fairly well fruited, thus proving that pot trees will continue in a fruiting condition for many years. (Silver Banksian Medal.)

Vegetables were largely exhibited. The chief group was a remarkable collection of heavily-fruited Tomato plants in 10-inch pots displayed by Messrs. SUTTON & SONS, Reading. There were about 100 plants, pleasingly grouped in a carpet of Ferns. Of red kinds we noticed Early Market, Eclipse, Abundance, Magnum Bonum, Best of All, Satisfaction, Princess of Wales, Winter Beauty, Al, and Peachblow. Yellow kinds were represented by Golden Nugget, Dwarf Gem, Sunbeam, Golden Queen, Golden Perfection, and Chiswick Peach. The plants were examples of high culture. (Silver-gilt Banksian Medal.)

Messrs. JAS. CARTER & Co., High Holborn, had a very representative collection of edible Peas in dishes, there being some 150 kinds. They were all sown on the same date in the open field, the earliest were getting ripe, whilst very late ones, such as Rearguard, required yet some three weeks to fill the pods. Fine samples of Quite Content, Harvestman, Duke of Albany, International, Superlative, Leviathan, Stratagem, Early Morn, Centenary, Telegraph, Daffodil, and others were plentiful. There were many seedlings in the exhibit. (Silver-gilt Banksian Medal.)

Messrs. JAS. VEITCH & SONS filled a long table with a representative collection of vegetables, including (as a background, secured to wirework) several dwarf Peas, such as Chelsea Gem, Lang-

ley Gem, The Sherwood, and Green Daisy. In dishes were pods of Telegraph, Gradus, Duke of Albany, Little Marvel, International, Quite Content, Laxtonian, and many others. The group also embraced a representative collection of Cabbage. In addition to these there were Cos Lettuces, Tomatos, very fine Pearl Cauliflowers, Scarlet Model Carrots, Green Marrows, &c. (Silver-gilt Banksian Medal.)

COMPETITIVE CLASSES.

The only exhibit of two boxes of Cherries came from the gardens of Mrs. ENGLISH, Addington Park, Surrey (gr. Mr. J. M. Smith). The fruits were of medium size and named Bigarreau and White Heart. The only exhibit of three dishes of Currants was shown by E. G. PRESTON, Esq., Kelsey Park, Beckenham (gr. Mr. M. Webster), and comprised fine White Dutch, Red La Versailles, and superb Black Boskoop Giant. The 1st prize was awarded in each case.

AWARDS TO CABBAGE LETTUCES.

A deputation of the FRUIT COMMITTEE visited the Wisley Gardens on the 13th inst., for the purpose of examining a trial of Cabbage Lettuces. The stocks comprised 110, and each one included two rows of some 50 plants. The breadth thus comprised some 11,000 plants. All were from a sowing made in the spring on the same ground. Necessarily, many of the stocks under whatever names sent, were the same. One section or type being represented by no fewer than 12 stocks. In some few cases the plants had all bolted, but these were of the old Winter Hammersmith type, thus showing their unfitness for summer cultivation. Some varieties, such as the small early Tennis Ball, Commodore Nutt, or Tom Thumb type, had fruited very early, and were already bolting to flower. Those varieties or stocks it was recognised were the best suited for frame culture. The finest type was that designated as "All the Year Round" or "White Dutch," which gave remarkably fine stock. So also did two stocks of a very green Dutch form, and two stocks of a very red variety with solid hearts. There were several of the blood-spotted or Passion Lettuces, and the Dutch with reddish-tinted leaves. Also of the large rough-leaved Drumhead, Malta, or Neapolitan form, all of which were excellent. Having classed the various stocks into types or under heads, the deputation selected from each the best and truest stocks for later mention. Representative heads of these Lettuces, some 22 diversely-named varieties, were placed before the full Committee on the 20th inst., being grouped into the following types:—Drumhead or Malta, Red-leaved or Marvel, White-leaved or German Giant, Ideal, and Paris Market, Tennis Ball or Tom Thumb type, Passion Lettuces, with red-spotted leaves, and All the Year Round section. The selected stocks were each awarded three marks. Their names will be published in the Society's *Journal*.

NATIONAL SWEET PEA.

ANNUAL OUTINGS.

EACH year the National Sweet Pea Society organises a series of trials of new varieties. The Floral Committee inspects the plants when in bloom, and upon their condition bases the awards of merit or certificates for those of conspicuous excellence. This season the plants at the University College, Reading, where the trial is conducted, were late in flowering, and the Floral Committee did not pay its first visit until the 16th inst. No awards will be made until the second inspection.

On the 17th inst. about 80 members of the Society—of whom no fewer than 40 went direct from London—visited the trials. There were exactly 350 rows. Included in these rows were standard varieties, novelties and seedlings. The plants were splendidly grown, and there were not more than a dozen failures. The most interesting feature was the mixtures among nearly all the American Spencers, while a few home-grown varieties, old as well as new, were very little better. Some of the most promising new, or comparatively new, varieties were Kathleen Macgowan, Gwendoline, Rosabelle, Marian Cautley, Mrs. Henry Bell (Dobbie's strain), Clara Curtis (Unwin's strain), Mrs. Tigwell, Mrs. C. W. Breadmore, Spencer America, Edrom Beauty,

Orange King, small, but rich in colour; Florence Wright, Splendour Spencer, a rose flake (No. 289) from Unwin; George Stark, and Dazzler No. 7. After spending about three hours in the gardens the members of the party were entertained at tea on the lawn by Mr. Owen Ridley, chairman of the Board of Governors of the college. The excellent manner in which the plants had been grown for the Society reflected the greatest credit upon Mr. Charles Foster and his successor, Mr. Drew.

The Society had arranged a far more ambitious programme for the 13th inst., since the members were invited to leave Liverpool Street Station at 8.45 and proceed thence to Witham, Kelvedon and Coggeshall, the home train leaving Kelvedon just after 7.30. Some 50 or 60 members availed themselves of the opportunity, and the first gathering was in the grounds of Messrs. Cooper, Taber & Co., Ltd., Witham. This is one of the leading British wholesale seed firms, and, like other houses, it conducts elaborate trials. There were plenty of Sweet Pea plants, but flowers were comparatively few owing to the exceptional lateness of the season. Any reader of the *Gardeners' Chronicle* who desires to see a complete Sweet Pea trial should go to Messrs. Cooper, Taber & Co.'s grounds about the 28th inst., and they will see much that is interesting and instructive. Failing the Sweet Peas, the members of the National Sweet Pea Society turned their attention to the culinary Peas. The trial is a magnificent one, and it was extremely difficult to get the visitors out of the quarters even to partake of the excellent lunch which the firm had provided. From Witham the party proceeded in conveyances, provided jointly by Mr. Wm. Deal and Messrs. E. W. King & Co., to Mr. Deal's home fields at Kelvedon, where there were about 13 miles (single rows) of Sweet Peas on sticks to be inspected. Whether any individual traversed the entire distance I cannot say, but all appreciated the splendid plants and purity of the stocks. After partaking of tea, which Mr. and Mrs. Deal prepared, brakes were requisitioned for Coggeshall under the direction of Mr. Ernest King, head of the firm of Messrs. E. W. King & Co. The rows of plants were remarkably true both in the small variety trials and in the groups—some extending to half an acre—grown for seed. Mrs. and Miss King had also prepared tea for the guests. *Orache*.

SCOTTISH HORTICULTURAL.

JULY 6.—The monthly meeting of this association was held at 5, St. Andrew Square, Edinburgh, on this date, Mr. Whytock, the president, was in the chair, and there was an attendance of about 100 members.

A paper was read by Mr. W. H. Massie, of Messrs. Dickson & Co., the Royal Nurseries, Craigmillar, on Roses. Mr. Massie referred to the importance of selecting proper stocks for the various types of roses, and in dealing with their cultivation he laid much emphasis on proper pruning. He considered there was still great possibilities in the raising of new kinds.

One new life member and eight new ordinary members were elected.

Among the exhibits was a batch of seedling Aquilegias, shown by Mrs. SCOTT ELLIOTT, Teviot Lodge, Hawick. The Committee highly commended the strain.

The paper for the monthly meeting on August 3 will be on "The Flora of Tamahill," by Mr. A. Johnstone, Hay Lodge, Edinburgh.

NATIONAL ROSE AND LUTON AND DISTRICT SWEET PEA AND ROSE.

JULY 14.—The provincial exhibition of the National Rose Society, like the great metropolitan show, was favoured with beautiful weather. The exhibition was held at Luton, in conjunction with the Luton and District Sweet Pea and Rose Society. The competition, in the leading classes, was very keen. The Roses, taken as a whole, were surprisingly fine, and only once before has so many blooms been staged at a provincial show of the Rose Society. Throughout the whole of the afternoon the Wardown Park, in which the exhibition took place, was crowded with visitors.

The competition in the Jubilee Trophy class

for 36 blooms of distinct Roses was very keen, there being no fewer than nine competitors. The 1st prize was won by Mr. HUGH DICKSON, Belfast; 2nd, Messrs. A. DICKSON & SONS, Newtownards, Co. Down; 3rd, Messrs. D. PRIOR & SON, Colchester.

The 1st prize in the class for 72 varieties of Roses was awarded to Messrs. A. DICKSON & SONS; the 2nd to Messrs. B. R. CANT & SONS, Colchester; and the 3rd to Messrs. FRANK CANT & Co., Colchester.

Messrs. G. & W. H. BURCH, Peterborough, were awarded the 1st prize for 36 blooms; Mr. W. LEGGETT, Colchester, and Messrs. J. BURRELL & Co., Cambridge, taking the 2nd and 3rd prizes respectively.

In the leading class for Tea Roses, Mr. GEORGE PRINCE, of Longworth, Berks., was awarded the 1st prize, while Mr. HENRY DREW, Longworth, Berks., and Messrs. B. R. CANT & SONS were respectively placed 2nd and 3rd.

The Challenge Cup offered by Mr. Harry Kirk

Theodore Roosevelt, shown by Mr. HUGH DICKSON; the best Hybrid Perpetual, Ben Cant, shown by Messrs. B. R. CANT & SONS; and the best Tea, Mrs. Edward Mawley, exhibited by Mr. GEORGE PRINCE.

(Amateurs.)—The best Hybrid Tea was Mme. Melanie Soupert, shown by Mr. W. H. CALVERT, Helen's Bay, Co. Down; the best Hybrid Perpetual, Her Majesty, shown by Mr. R. FOLEY HOBBES, Worcester, and the best Tea, Mrs. Myles Kennedy, shown by Mr. W. O. TIMES.

GOLD MEDAL ROSES.—There were many new seedling Roses exhibited for awards, and those following were awarded Gold Medals:—

Leslie Holland, H.T.—A shade of bright crimson, shown by Mr. HUGH DICKSON.

Mrs. Hubert Taylor, T.—Creamy-white, tinted pink, shown by Messrs. ALEX. DICKSON & SONS.

Miss Ethel A. Malcolm, H.T.—Creamy-white, with peach shading towards the centre.

Sir John Llewellyn, Bart., presided at the lunch kindly provided by Mr. Rothschild, and after the usual loyal toast, proposed Mr. Rothschild's health, also a cordial vote of thanks to Mr. Harry J. Veitch for the admirable way in which he had enabled them to profit by their host's hospitality. Mr. Veitch, in his reply, made a well-merited reference to the services of Mr. Jennings, the head-gardener, who acted as guide on this occasion.

The weather, fortunately, was delightful, the only reminder of bad weather being a few minutes of threatening, misty rain, when, after lunch, the party was driven over to Mentmore, the Earl of Rosebery's estate. Returning to Ascott, tea was provided, after which the party returned to London with pleasant reminiscences of another delightful outing added to the list of those which it has been the privilege of the members of the club to enjoy for many years past.

MIDLAND COUNTIES SWEET PEA.

JULY 19.—The second annual show was held in the Arboretum, Walsall, in connection with the Walsall Florists' Society, on the above date. The show was not so extensive or the quality of the flowers equal to those exhibited at Wolverhampton a year ago. Very few non-competitive exhibits were sent, due largely to the cold, wet, sunless season and the difficulty of Sunday travelling.

OPEN TO MEMBERS OF THE SOCIETY.

In the principal class, which was for 24 varieties, Mr. W. MARPLE, Penkridge, was the only exhibitor. The collection included very good flowers of Helen Lewis, Countess Spencer, Nora Unwin, Marquis, Evelyn Hemus, Audrey Crier, King Edward, Paradise Ivory, Stark's White, Mrs. Routzahn, John Ingman, Elsie Herbert, and St. George.

Mr. MARPLE also won the 1st prize in a class for 12 varieties.

AMATEURS.

Of the four contestants in the class for 18 varieties, Mr. G. KERTLAND, 49, Burleigh Road, Wolverhampton, took the lead with rather small but good flowers of Elsie Herbert, Mrs. Collier, Mrs. C. Foster, Helen Lewis, Nora Unwin, John Ingman, and Syeria Lee. 2nd, Mr. JOHN E. CULLWICK, Grange Road, Wolverhampton.

The best collection of 12 varieties was shown by Mr. A. LONGSTON, Wychbold, Droitwich, with good examples of Olive Ruffle, George Herbert, Nora Unwin, Constance Oliver, St. George, Zephyr, and Elsie Herbert.

The 1st prize in a class for nine varieties was won by Mr. A. W. THORPE, Lichfield, with Cod-sall Rose, Helen Lewis, Minnie Christie, Etta Dyke, Mrs. C. Foster, Elsie Herbert, The King, Mrs. H. Sykes, and John Ingman.

A class for 12 varieties was reserved for growers residing within five miles of the exhibition. Only two entries were made, and the flowers were of indifferent quality.

In a class for six varieties having waved standards, Mr. BURD, Cannock Road, Penkridge, won the 1st prize with a very handsome set of flowers; 2nd, Mr. A. W. THORPE, Lichfield; 3rd, Mr. A. LANGSTON, Droitwich.

SINGLE-BUNCH CLASSES.

In the single-bunch classes 1st prizes were awarded as follow:—White: Etta Dyke, shown by Mr. JOHN E. CULLWICK, Grange Road, Tetterhall. Blush or pink: Mrs. Hardeastle Sykes, shown by Mr. G. KERTLAND, Wolverhampton. Scarlet or crimson: Queen Alexandra, from Mr. A. W. THORPE, Lichfield. Rose, carmine, or cerise: John Ingman, shown by Mr. E. SHORTHOUSE, Hammerwich. Orange: An unnamed variety from Mr. T. E. DALTON, The Wergs School, Wolverhampton. Yellow or buff: Harold, shown by Mr. E. SHORTHOUSE. Lavender or pale blue: Frank Dolby, shown by Mr. J. PERKS, Min-y-don, Wolverhampton. Maroon: Tom Bolton, from Mr. A. W. THORPE. Bicolor: Mrs. A. Ireland, from Mr. A. LANGSTON. Striped, flaked, or marbled: Helen Pierce, shown by Mr. T. W. KENDRICK, Tetterhall. Fancy: Mrs. Routzahn, from Mr. G. KERTLAND.

SPECIAL PRIZES.

Messrs. Bakers, Wolverhampton, offered four prizes for 12 varieties of Sweet Peas. Mr. G. KERTLAND, Wolverhampton, obtained the 1st

FIG. 28.—HYBRID TEA ROSE MISS ETHEL A. MALCOLM: COLOUR CREAMY-WHITE WITH PINK SHADING.

(Awarded a Gold Medal by the National Rose Society.)

for nine blooms of the variety Harry Kirk was won by Messrs. FRANK CANT & Co.

In the leading class for decorative Roses, Mr. J. MATTOCK, Headington, Oxford, secured the 1st prize for 18 distinct varieties, and also the 1st prize in the class for 12 varieties.

The Jubilee Trophy class open only to amateurs attracted as many as 12 exhibitors. Mr. E. B. LINDSELL, Hitchin, was awarded the 1st prize, and he was followed closely by Mr. ALFRED TATE, Leatherhead, while the 3rd prize was taken by Mr. F. DENNISON, of Leamington.

In the class for 36 varieties of Roses the Rev. T. G. W. HENSLOW, Chippenham, was awarded the 1st prize; Mr. E. B. LINDSELL and Mr. A. TATE being placed 2nd and 3rd respectively.

In the principal class for growers of fewer than 2,000 Roses, Mr. W. O. TIMES, Hitchin, secured the 1st prize, and Mr. E. B. LEHMANN, Crawley, Sussex, won the 1st prize in the leading class for growers of fewer than 1,000 plants.

The best blooms in the show were adjudged as follows:—

(Nurserymen.)—The best Hybrid Tea, Mrs.

Mrs. Maynard Linton, H.T.—A white bloom tinted with flesh colour. Both these varieties were shown by Messrs. S. MCGREY & SON, Portadown, Ireland.

A card of commendation was awarded to Messrs. A. DICKSON & SONS for "Duchess of Wellington," a bright orange-yellow coloured garden Rose.

HORTICULTURAL CLUB.

(ANNUAL OUTING.)

JULY 15.—By invitation of Leopold de Rothschild, Esq., a party of members and friends numbering between 60 and 70, and including many ladies, visited the beautiful estate of Ascott, Leighton Buzzard, on the above date. Mr. Harry J. Veitch, who undertook the arrangements, saw to the provision of saloon carriages at Luton and brakes at Leighton. The party inspected the delightful gardens at Ascott, the renowned stud farm, where several teams of race-horses were paraded for the visitors' pleasure, and the stag hounds.

prize with good examples of Helen Lewis, Nora Unwin, John Ingman, Mrs. H. Sykes, Frank Dolby, Evelyn Hemus, Marquis, Mrs. Routzahn, Countess Spencer, Marjorie Willis, Apple Blossom and Elsie Herbert.

Messrs. Bakers also offered prizes in another class open to gentlemen's gardeners only. 1st, Mr. W. H. SHAW, Horsley Hall Gardens, Gresford.

Mr. Robert Bolton's prizes were for three bunches of Sweet Peas. Mr. J. PERKS, Wolverhampton, the only competitor, showed excellent flowers of Marjorie Willis, Marquis and Constance Oliver.

Mr. Robert Sydenham's prizes were offered for nine varieties. 1st, Mr. G. KERTLAND, with shapely flowers of St. George, Clara Curtis, George Herbert, Frank Dolby, Mrs. Routzahn, Etta Dyke, Syeria Lee, Evelyn Hemus and Paradiso.

have an area of 50 acres, by Mr. Kirk, who proved an instructive guide. The pleasure grounds, kitchen garden, Melon, Tomato and Orchid-houses, Pine stoves and frame ground were visited, and, after making a detour through the pleasure grounds, the mansion—built in the old Scottish baronial style—was reached. The rockery, flower garden, conservatory, Nectarine, Peach and orchard-houses and stove were duly inspected. The system of growing vines in separate compartments, advocated by Mr. Kirk in his book on the vine, was seen in practice in one of the vineries.

BRITISH GARDENERS' ASSOCIATION. (LONDON BRANCH.)

JULY 10.—On this date the members of the London branch of the above association visited

MANCHESTER AND NORTH OF ENGLAND ORCHID.

THE session of 1908-1909 is now completed.

A. WARBURTON, Esq., Haslingden, proved to be the principal prize winner of the year, taking the "Bromilow" Cup offered for the best general displays, the "Charlesworth" Cup for plants not previously certificated in Manchester, and the "Ward" Cup for *Odontoglossums*.

H. J. BROMILOW, Esq., Rainhill, Liverpool, was the winner of the "Sanders" Cup offered for *Cypripediums*.

J. MCCARTNEY, Esq., Bolton, won the "Low" Cup offered by Messrs. Hugh Low & Co. for *Cattleyas* and *Laelias* only.

Z. A. WARD, Esq., Northenden, gained the highest number of points outside the above competitions, and was awarded a Gold Medal, R.

FIG. 29.—AN EXHIBITION GROUP OF GLOXINIAS AS CULTIVATED BY MESSRS. SUTTON AND SONS, READING.

In Messrs. Webb and Sons' class there was only one exhibitor, Mr. W. H. SHAW, Gresford, who was awarded the 1st prize.

HONORARY EXHIBITS.

Honorary exhibits of Sweet Peas were received from three trade firms, viz., Messrs. W. H. SIMPSON & SONS, Birmingham (Gold Medal); MESSRS. BAKERS (Gold Medal), and Messrs. TOM B. DORES, both of Wolverhampton.

STIRLING AND DISTRICT HORTICULTURAL.

JULY 10.—On this date about 70 of the members visited Norwood, Alloa, the seat of J. Thomson-Paton, Esq., whose gardener is Mr. Alex. Kirk, the well-known Grape grower. The party was conducted through the grounds, which

Aldenharn House, Elstree. The party was conducted through the gardens by the gardener, Mr. Edwin Beckett. Hardy *Nymphaeas* were very fine, and some magnificent colour schemes, obtained by the bold grouping of various trees and shrubs, such as *Acer*, *Cornus*, *Prunus*, *Salix*, *Populus*, *Betulus*, *Sambucus*, and *Ligustrum*, were much admired. After passing through the fruit houses and kitchen gardens, the party was met by the Hon. Vicar Gibbs, and was conducted by him through the remaining portions of the pleasure grounds.

The outings arranged for August include visits to Messrs. J. Veitch & Sons' nursery at Coombe Wood on August 14, and to Battersea Park on August 23. Gardeners who are not members of the association are invited to attend these outings. Particulars can be obtained from Mr. A. G. Barnes, 154, Dunstons Road, E. Dulwich.

ASHWORTH, Esq., Newchurch, being placed 2nd.

In the small amateur section, Mr. C. PARKER gained a Gold Medal, Mr. H. ARTHUR a Silver-gilt medal, and Mr. J. STOTT a Silver Medal.

S. GRATRICK, Esq., Whalley Range, has been very successful in gaining Certificates, but he did not enter in any of the competitions. His collection of *Cypripediums* is unequalled in the North of England.

In the session 1909-1910 just commenced, the following are to be competed for:—Messrs. Sander & Son offer a cup for *Cypripediums*; Messrs. Charlesworth & Co. again offer a valuable challenge cup for new plants; Z. A. Ward, Esq., presents a cup for *Odontoglossums* grown by amateurs who do not employ a gardener; Mr. J. Robson gives a gold cup for *Odontoglossums*, and Messrs. Stuart Low & Co. offer a cup for *Cattleyas*, *Laelias*, and hybrids in this section of Orchids. P. W.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

JULY 12.—The monthly meeting of this society was held at the Royal Horticultural Hall, Vincent Square, Westminster, on Monday last. Mr. Chas. F. Harding occupied the chair. Eight new members were elected. The death certificate of the late Mr. William Colton was produced, and a cheque for £71 10s. 2d. was ordered to be paid to his nominee. The usual quarterly payments from the Benevolent Fund were made, and two lapsed members' accounts paid out.

CARDIFF AND COUNTY HORTICULTURAL.

JULY 21, 22.—This society held its twenty-first annual exhibition on these dates. The event took place in the beautiful grounds known as the Sophia Gardens, situated on the banks of the River Taff, which passes almost through the centre of the city and close to the castle, a seat of the Marquis of Bute. Every effort was made to obtain an exhibition of sufficient importance to fittingly mark the Coming-of-Age of this society, and these were eminently successful. A deputation from the Royal Horticultural Society visited the show, and bestowed a number of awards, in addition to those granted by the Welsh Society. The Cardiff and County Horticultural Society is not only the most influential in the principality, but it has prospered so in recent years that its show may now be classed with the first six in these islands. The lead thus given to horticulture in Wales and in some of the western counties of England is deserving of all praise. We are obliged to hold over our detailed report of the show until next week.

NATIONAL CARNATION & PICOTEE. (SOUTHERN SECTION.)

JULY 21.—The annual exhibition was held in the Royal Horticultural Hall, Vincent Square, Westminster, on Wednesday last. Notwithstanding the backwardness of the season, a large number of exhibits was staged, and the blossoms themselves appeared to show no signs of injury from the inclement weather. There were 56 classes, and, with one exception (Class 53, for a vase of seedlings, undressed, with Carnation foliage, that have bloomed at least the second year), they were well filled.

In the First Division there were five classes for dressed flowers and four for undressed blooms. In the five classes 18 blooms had to be shown, the two great rivals for honours being Mr. JAMES DOUGLAS, Great Bookham, Surrey, and Mr. CHAS. BLICK, The Warren Carnation Nurseries, Hayes, Kent. Mr. DOUGLAS was 1st with dressed flowers of bizarres and flakes, selfs, fancies, white-ground Picotees, and yellow-ground Picotees. Mr. BLICK being 2nd in each case. In the classes for undressed blooms, Mr. DOUGLAS was 1st for six self-coloured blooms, including Daffodil, Miss Willmott, Cardinal, Mrs. Griffith Jones, Mrs. T. E. Henwood, and Miss Agnes Sorrel, Mr. BLICK being 2nd.

Mr. DOUGLAS was also 1st with six fancies—Lord Steyn, Mrs. Penton, Highland Lass, Pasquin, Erl King, and Miss A. Young; Mr. BLICK being again 2nd.

In Class 8 for six varieties of yellow-ground Picotees, Mr. BLICK won the 1st prize with Daisy Boston, Her Majesty, Princess Juliana, Colleen Bawn, F. W. Goodfellow, and Miss Winifred. Mr. DOUGLAS was 2nd.

For 12 distinct varieties of selfs, fancies, and yellow-ground Picotees in Class 9, Mr. DOUGLAS was 1st with Liberté, Daffodil, Mrs. R. Berkeley, A. Sorrel, Lord Steyn, Cardinal, Miss Willmott, Pasquin, Amy Robsart, Peregrine, Santa Claus, and a new seedling. Mr. BLICK was 2nd.

In the Second Division, which was open to the trade, like the First Division, there were some very fine blossoms. Mr. H. R. TAYLOR, of Cheam, won the 1st prize in Class 10 for 12 dressed Carnation blooms, bizarres, and flakes, not fewer than nine varieties, in Class 11 for 12 selfs, not fewer than nine varieties, and in Class 13 for 12 white-ground Picotees, not fewer than nine varieties. He was 2nd in Class 14 for 12 yellow-ground Picotees.

Mr. H. MATHIAS, of Stabington, took the 1st prize for 12 fancies in Class 12 and for 12 yellow-

ground Picotees in Class 14, being 2nd for 12 bizarres and flakes in Class 10, and for 12 white-ground Picotees in Class 13. Messrs. PHILLIPS & TAYLOR, of Bracknell, secured 3rd prizes in Class 11 and Class 14. Mr. W. SYDENHAM, of Melbourne, Derbyshire, having a similar prize in Class 12 for 12 fancies.

In the section for undressed blooms, Mr. H. LAKEMAN, of Thornton Heath, was 1st for four vases of selfs.

In Class 16, Miss SHIFFNER, Mr. R. MORTON, of Woodside Park, and Messrs. PHILLIPS & TAYLOR, of Bracknell, won 1st, 2nd, and 3rd prizes, respectively for four vases of fancies.

In the class for four vases of yellow-ground Picotees, Mr. H. R. TAYLOR, Cheam, was 1st, and in that for nine distinct varieties of selfs, fancies, and yellow-ground Picotees in separate vases, Mr. H. MATHIAS won the 1st prize.

Class 19, for six blooms of bizarres and flakes, was won by Mr. J. FAIRLIE, of Acton, with the varieties J. S. Hedderley, Geo. Melville, Wm. Skirving, Sportsman, Merton, and a maroon-coloured seedling.

In Classes 20 (six selfs), 21 (six fancies), 22 (six white-ground Picotees), and 23 (six yellow-ground Picotees), the 1st prizes went to Mr. LINZEE.

In Classes 24 to 34, Mr. CHARRINGTON took four 1st prizes for pink or rose selfs, dark-red or maroon selfs, buff or terra-cotta selfs; and two 2nds. Mr. J. FAIRLIE took 1st prize for three white selfs; 2nd prizes for three yellow-ground Picotees and three yellow-ground fancies; and 3rd prizes for maroon or dark-red selfs, fancies, six selfs, and yellow-ground Picotees. Mr. C. A. LINZEE took four 1st prizes, viz., for yellow selfs, yellow-ground Picotees, fancies, and six selfs, fancies, and yellow-ground Picotees; also taking the 4th prize in five other classes. Mr. C. A. PHILBRICK took a 2nd prize in this section for yellow selfs, and a 3rd for yellow-ground Picotees. Mr. SHELDON, of S. Woodford, took 1st for selfs and yellow-ground fancies, and 4th for yellow-ground Picotees, whilst Mr. F. E. GRAY took 3rd for yellow-ground fancies, and Mr. GRYPSPERDT, Croydon, 2nd for selfs.

In Classes 35 and 36, for six vases of selfs and six vases of fancies, dissimilar, Mr. J. H. LININGTON won the 1st prize.

In the classes open to all, Mr. JAMES DOUGLAS swept the board of the 1st prizes in six out of the nine classes, and came 2nd in Class 40 for nine white selfs, and 3rd in Classes 39 and 44 for nine rose or pink selfs, and for nine yellow-ground Picotees respectively.

Mr. R. MORTON took 1st prize in Class 40 for nine white selfs; he also took 2nd in pink and rose selfs, dark red or maroon selfs, 3rd for yellow-ground fancies, and 4th for fancies other than yellow-ground. Other prize-winners in this group were Mr. H. R. TAYLOR, 1st with Miss Willmott in the rose selfs, 3rd in Class 41, 2nd in 44, 2nd in 46, and 3rd in 47; Mr. H. LAKEMAN, 4th in Classes 39 and 40; Messrs. PHILLIPS & TAYLOR, 1st in Class 44 for yellow-ground Picotees, 3rd in Class 41, 2nd in Classes 42, 43, 45 and 47, and 4th in Class 46. In this particular group it is interesting to observe that although the classes had been specially designed to encourage entries from the trade growers, yet this year there were a very large number of amateur competitors in them.

For seedling bizarres and flakes, selfs, and white-ground Picotees, Mr. H. R. TAYLOR took the 1st and 2nd prizes in Classes 48, 49 and 51, Mr. H. MATHIAS securing the 1st prize in the yellow-ground Picotees with Libra.

Cup prizes.—H. R. Taylor, Esq., having offered two cups for competition, one was won by Mr. C. A. LINZEE for the highest aggregate number of points in the third division (Classes 19 to 34), and the other cup was won by Mr. TAYLOR himself for the highest points in the second division (Classes 10 to 18).

The "Cartwright Challenge Cup," value 20 guineas, offered by R. Chetwynd Cartwright, Esq., was won for the second time by Mr. JAMES DOUGLAS, the best exhibitor in Classes 39 to 47. This trophy also carries with it a Silver-gilt Medal in addition to the prize-money to commemorate the event.

Mr. C. A. PHILBRICK won the Silver Medal for the highest number of points gained in the fourth division (Classes 35 to 38 inclusive) by any one competitor.

A new feature of the show was the granting of "premier" awards for dressed and undressed flowers. Mr. DOUGLAS secured the honour for dressed bizarres, fancies, and white selfs; Mr. TAYLOR for scarlet flakes (Torchlight) and white-ground Picotee (Fort Rose), also securing the 1st prize for undressed blooms of "Onward" in the light-ground Picotees. Mr. DOUGLAS took the "premier" award for his lovely undressed flower of the self-coloured Cardinal.

The show was excellently managed and staged by Mr. T. E. Henwood, the secretary, assisted by his son and the members of the committee.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending July 17, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The weather was generally unsettled and cloudy, but there were several fair or bright intervals in most parts of the Kingdom, and in some western and south-western localities there was very little rain. Thunderstorms or thunder only occurred in various stations in England on Tuesday, and at Kew on Thursday.

The temperature was below the average generally, but just equalled it in Ireland S. The divergence amounted in nearly all districts to less than 2°, and was less than during the week immediately preceding. The highest of the maxima, which were recorded on irregular dates, ranged from 77° in England E. and the Midland Counties, and 74° in England S.E. to 66° in the English Channel. On Sunday the thermometer remained below 55° at many eastern stations, and only touched 52° at Skegness. The lowest of the minima were registered in most places early in the week, in Scotland E. and N. the respective values were 37° and 39°, and elsewhere the readings ranged from 40° in Scotland W. to 46° in England N.E. and the Midland Counties, and to 51° in the English Channel. The lowest grass readings reported were 55° at Marchmont and Aspatria, 56° at Hereford and Armagh, and 57° at Glasgow.

The mean temperature of the sea.—On the north-east coast of Scotland and also at some stations on the south-west coasts of England and Ireland, the water was warmer than during the corresponding week of last year, but generally it was colder. The actual temperature ranged from 60.7° at Plymouth, and about a degree lower at Margate, Eastbourne, and Seafeld to 52.7° at Burnmouth and 50.7° at Lerwick.

The rainfall was rather more than the average in England N.E. and N.W. and Scotland W., but less elsewhere. Late on Thursday or early on Friday the fall amounted to about an inch at Stonyhurst and Southport. At Kilkenny and Scilly the week was quite rainless.

The bright sunshine was very deficient generally, but exceeded the average in Scotland E. The percentage of the possible duration ranged from 14° and 19° respectively in Ireland N. and S., and 22° in Scotland N., 23° in England S.E. and 24° in the Midland Counties to 34° in the English Channel and to 35° in Scotland E.

THE WEATHER IN WEST HERTS.

Week ending July 21.

The highest temperature yet registered of this summer.—During the past week there were three warm days, and but one cold night. On the warmest day, however, the highest reading in the thermometer screen was only 76°. This, although only about 6° warmer than the average maximum for the time of year, proved the highest temperature as yet recorded here during the present summer. The ground temperatures have risen during the week, but the readings are at the present time still 1° colder than is reasonable, both at 1 and 2 feet deep. Rain fell on three days, but to the total depth of less than half an inch. The percolation through the soil gauge on which short grass is growing ceased at the beginning of the month, but there are still small quantities of rain-water coming each day through the bare soil gauge. The sun shone on an average for 7½ hours a day, or for 1½ hours a day longer than is usual at this period in July. Light winds have prevailed during the greater part of the week, and the direction has been exclusively some westerly point of the compass. The mean amount of moisture in the air at 3 p.m. exceeded a reasonable quantity for that hour by 3 per cent. E. M., Berkhamsted, July 21, 1909.

SCHEDULES RECEIVED.

Abingdon Horticultural Society's summer show on August 19. Secretary, Mr. J. H. Viner, 3, The Abbey, Abingdon.

Cambridge Horticultural Society's autumn show, to be held on Wednesday and Thursday, November 3 and 4. Hon. sec. Mr. A. Mathew, 20, Trinity Street, Cambridge.

Northampton Municipal Horticultural Society's exhibition of flowers, fruits, and vegetables, to be held on Wednesday and Thursday, August 4 and 5, at Kington Park, Northampton. Secretary, Mr. James B. Palmer, 26, Cyril Street, Northampton.

Kingstown Horticultural Society's exhibition, to be held in the People's Park, Kingstown, on Wednesday, August 11. Hon. secretaries' address: Municipal Schools, Kingstown.

Altrincham and District Chrysanthemum Society's exhibition, to be held on Friday and Saturday, November 5 and 6, in the Pill Hall, Hale. Hon. secretary, Mr. Wm. Hazlehurst, 20, Ashley Road, Altrincham.

TRADE NOTE.

THE GARTON-COOPER SEED CO., LTD.

THIS private company has been registered with a capital of £20,000 in £10 shares. Its purpose is to carry on the business of cultivators and buyers of plants and seeds (particularly the new breeds of plants and seeds originated by J. Garton, of Warrington, suitable for American cultivation), and to adopt an agreement between Garton, Ltd., J. Garton, Sir Richard P. Cooper and R. A. Cooper (trading as William Cooper and Nephews), and the company. The registered office is at the offices of Messrs. Gartons, Ltd., Thynne Street, Warrington.

* * * The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as Supplementary Illustrations in this Journal.

ADIANTUM FERNS: *Mrs. E.* We suspect your treatment is at fault. Ferns, in common with other plants, should be allowed plenty of space, so that light may reach them on all sides and air circulate freely about them. The usual fault is in the matter of watering; Ferns must never be allowed to become dry at their roots, and the atmosphere of the greenhouse must always be kept moist. Over-watering is equally to be avoided. Ferns need manurial stimulants occasionally, for which purpose weak liquid manure and clear soot-water are to be recommended.

APPLE TREES KILLED: *M. T. M.* The grub that has caused the damage is probably the larva of the goat moth. The wood smelled strongly of paraffin; perhaps in your endeavours to kill the insect by this means you completed the destruction of the tree. A wire passed into the burrow will generally destroy the intruder.

ASTERS DYING: *R. L.* The plants are affected by Aster disease, *Erysiphe cichoracearum*. Burn all the diseased plants and spray the healthy ones with a fungicide.

BEANS UNHEALTHY: *W. J.* No disease is present. The roots have been injured by centipedes. Apply a little soot and a sprinkling of sulphate of potash and lightly fork it into the soil.

BEECH COCCUS: *D. P. H.* This pest is often confined to the trunk and main branches of the tree, when it can be eradicated by scrubbing the bark with some strong insecticide. As your trees form a hedge, scrubbing may not be practicable, in which case you must resort to spraying. The following is recommended in the *Board of Agriculture Leaflet* on this subject:—1, The trees should be sprayed, when in the dormant condition, with the following emulsion-soda wash, as used at the Woburn Fruit Farm: Paraffin, 2 gallons; soft soap, 1½ lb.; caustic soda (98 per cent.), 6 lb.; water, 28 gallons. In order to prepare the wash the soft soap should be dissolved in a gallon of boiling water; the paraffin should then be added and the mixture churned thoroughly until a cream-like mass results. The thoroughness of the churning is important. The 6 lb. of caustic soda should next be dissolved in the remaining 27 gallons of water and then poured into the paraffin emulsion. The whole should be well mixed and used immediately. Recent experimental work at Woburn, however, indicates that there are advantages in using a wash composed of:—Sulphate of iron, ½ lb.; lime, ¼ lb.; paraffin (solar distillate), 5 pints; caustic soda (98 per cent.), 2 lb.; and water to make 10 gallons. This may be prepared for use by proceeding as follows:—(a) Dissolve the sulphate of iron in about nine gallons of water; (b) shake the lime in a little water, and then add a little more water to make it into a "milk"; (c) run *b* into *a* through a piece of coarse sack to remove grit; (d) pour the paraffin into the mixture *c* and churn the whole thoroughly; (e) add the caustic soda in powdered form just before

using, and stir thoroughly. In using either of these mixtures the face and hands must be protected, as the mixtures are caustic in character. One advantage of the caustic soda is that it helps to clear the tree of such growths as lichens and algae.

BOILER: *C. W.* You should advertise if you wish to make the boiler known to the public.

BOOK: *J. W.* No book, however excellent, will enable you to become a first-class gardener unless you supplement knowledge so gained with practical experience. Thompson's *Gardener's Assistant* (new edition, by William Watson, Curator, Royal Gardens, Kew; six volumes, cloth, 8s. 4d. each; also in two volumes, Roxburghe binding, 52s.) will be useful for cultural information. Other good works will be found in the list of garden books obtainable free from our publishing department.

BUTTONHOLE: *Calypso.* You must be guided largely by the material you can best obtain, and its suitability for the purpose. In any case the flowers must be of neat habit and small size.

COLTSFOOT: *G. W. W. & Co.* The Coltsfoot is one of the most troublesome weeds with which the farmer has to contend. The only mode of destroying it is by picking out every fragment of the root-stock, which operation will be most successful in spring, the plant suffering more from disturbance whilst it is in flower than at any other time. The Coltsfoot weed is always an indication of nitrogen exhaustion in the soil; therefore, after the land has been thoroughly cleaned of all particles of root in the spring, apply a manurial dressing of 3 cwt. superphosphate and 2 cwt. nitrate of soda per acre, and sow the ground with Oats.

CUCUMBER CULTURE: *E. M.* The leaves will be liable to scorching in summer-time if wetted when the sun is shining fully on them. This can be avoided by lightly stippling the glass.

EELWORMS ATTACKING CARNATIONS: *Enquirer.* These noxious pests spread with such rapidity that it is advisable to burn any plants affected, and to sterilise the soil in which they were growing. Some good in checking the trouble has resulted by using sulphate of potash as a manure. The makers of Apterite claim that it will kill eelworm with certainty. Vaporite is also recommended.

EPILOBIUM: *W. H. Y.* The white variety of *Epilobium angustifolium* is a well-known plant. It is cultivated in gardens as *E. a. alba*. It also occurs wild.

GRAPES: *Muscat, Cheshire, and W. H.* The trouble is due to shanking. Shanked Grapes have generally browned, shrivelled stalks.

GRASS UNDER CHESTNUT TREES: *J. McF.* Afford liberal doses of liquid manure to the turf and a sprinkling of sulphate of ammonia. Next spring lightly fork the turf and sow with a mixture containing a large percentage of *Poa nemoralis* and *P. trivialis*. Light top-dressings of rich soil should be afforded at intervals.

HORTICULTURAL STATION AT MERTON: *B. D. G.* Money to found this horticultural institution was left by the late Mr. John Innes, and is known as the Innes Bequest. Particulars were given in the issues for January 30, p. 72, and February 13, p. 105.

LUCOMBE OAK: *J. M.* This is generally believed to be a hybrid between *Quercus cerris* and *Q. suber*. It was raised by Mr. Lucombe, a nurseryman of Exeter, about the year 1762. You will find much information on the subject in the issues for September 13, 20, 1902, pp. 195 and 221.

MARKET WEIGHTS: *J. McA.* The following are the weights, approximately, of the fruits you mention, as recognised in Covent Garden Market: Black Currants (sieve), 48 lbs.; Gooseberries (sieve), 56 lbs.; Cherries (sieve), 48 lbs.; Strawberries (peck), 12 lbs.; Spinach (bushel), 20 lbs.; Beans (bushel), 30 lbs.

MELONS DISEASED: *Mrs. D.* The leaves are attacked by a fungus—*Cercospora melonis*. Spray the plants at intervals of four days with liver of sulphur, using one ounce in three gallons of water. Afford plenty of ventilation in the house even at night-time.

NAMES OF PLANTS: *H. S. J.* 1, *Veronica decussata*; 2, *Buddleia globosa*; 3, *Deutzia crenata purpurea-plena*; 4, *Spirea japonica* (syn. *callosa*); 5, *Adiantum Waltonii*.—*Parasite.* 1, *Orobancha* sp.; 2, *Hypoxis villosa*.—*W. M.* *Oxalis Ortgiesii*. (The stamps have been placed in the R.C.O.F. box.)—*A. H.* *Sutherlandia frutescens*, the Cap. "Bladder S nna," a native of South Africa. This plant requires the protection of a cool greenhouse in winter, except in sheltered spots in the south-west, where it survives mild winters. It is used in some of the London parks for summer bedding, notably Finsbury Park.—*P. A. E.* 1, *Meliantus major*; 2, *Crataegus speciosa*; 3, *Syringa Josikaea*; 4, *Kalmia latifolia*.—*W. T.*, *Wigan*. *Dendrobium moschatum*.—*Torbay.* *Asclepias curassavica*.—*R. H.* 1, *Oncidium flexuosum*; 2, *Oncidium pubes*; 3, *Odontoglossum Lindleyanum*; 4, *Masdevallia simulata*; 5, *Pleurothallis rubens*; 6, *Odontoglossum Haridum*.—*T. M. F.*, *S. Wales.* 1, *Lastrica rigida*; 2, *Cystopteris regia*; 3, *Asplenium fontanum*, syn. *Halleri*; 4, *Polystichum Lonchitis*, if a mature specimen.—*M. J.*, *Deron.* 1, *Hedychium Gardnerianum*; 2, *Eucomis regia*.—*P. J. P.* *Tecoma jasminoides*, so far as we can judge by the decayed flower.—*H. P. M.* 1, *Erigeron speciosus*; 2, *Achillea l'tarmica flore pleno*; 3, *Galega officinalis*.—*Mrs. B.* *Cotoneaster frigida*.—*E. W. P.* *Cranbe cordifolia*.—*A. H.* 1, *Campanula turbinata*; 2, *C. rhomboidalis*; 3, *C. Portenschlagiana*; 4, *Linnaria pallida*; 5, *Veronica spicata*; 6, *Aster alpinus albus*.

NECTARINE FRUITS DISFIGURED: *A Reader.* The injury is not caused by a fungus, but is due to some cultural defect. Too much moisture at the roots will cause stone fruits to become cracked.—*G. B.* The damage is due to the Peach-rot fungus (*Penicillium glaucum*). Moisture condensing on the fruit favours the growth of this disease. The ventilators of the Peach house should be opened early in the morning, and the atmosphere kept drier at all times.

ROSE LEAVES DISFIGURED: *H. J. M.* The blotches are caused by a fungus—*Septoria rose*. It is too late to do anything this season. Next spring spray the bushes with a solution of liver of sulphur at a strength of one ounce in three gallons of water, commencing when the foliage is young.

ROSE SHOOTS: *H. T. H.* There is no disease present on the shoots. The general symptoms appear to indicate an excess of humic acid in the soil.

ROSES FAILING TO GROW: *William Haddon.* Ants are the cause of the trouble. Drench the soil with a solution of sulphate of ammonia—one ounce in one gallon of water. Ants' nests may be destroyed by pouring paraffin into their burrows.

SELACINELLA: *G. R. L.* The common greenhouse species, *S. Kraussiana* and *S. denticulata*, are hardier than is generally believed. If you refer to an account of Grimston Park, Yorkshire, published in the issue for July 25, 1903, you will find it stated that *S. denticulata* has established itself in the grass there and is perfectly hardy.

STRAWBERRIES: *W. B. & P. J.* We cannot undertake to name varieties of Strawberries.

TOMATOS FAILING TO COLOUR: *J. J. A.* The defect has been attributed to a lack of potash in the soil.

WORMS IN LAWNS: *Herbert.* Lime-water would not damage the turf, but it would destroy many of the worms. You can purchase specifics ready for use from sundriesmen and nurserymen, or you can employ ½ ounce of corrosive sublimate (poison) in 15 gallons of water. Do not allow poultry to eat the dead worms, as the substance is very poisonous.

IN THE KARINTHIAN MOUNTAINS.

THE little village of Heiligenblut sits tight at the end of a narrow mountain valley, its chalets clustering close round the tall, squeezed-looking church. And at the valley's end, high over everything, towers the gleaming pinnacle of the Gross Glockner, an awful spire of pure snow, rising supreme above half-a-dozen huge gables of granite at the head of the glen. The road towards the snows winds upwards from Heiligenblut very steeply on the right-hand side of the valley over banks that now, in mid-July, are all ablaze with the reckless splendour of *Dianthus sylvestris*, abundant and richly rosy everywhere as I have never seen it before. *Aster alpinus* is just coming into bloom, and *Campanula barbata* is even more backward in bud. Among these are the golden showers of *Biscutella levigata*, and the paler but more brilliant yellow of *Erysimum ochroleucum*. The pink spikes of *Habenaria conopsea* are common here, but *Orchis ustulata* is a rarity; and rare, too, is *Hermidium Monorchis*, but rarest of all is the beautiful, snow-pure form of *Dianthus sylvestris*, and the ghostly-pale variety of *Campanula linifolia*.

A little higher and the road curls round into the woodland, and here, on open banks and sunny glades, are *Primula farinosa* and the gorgeous sapphire stars of *Gentiana utriculosa*, which it is no good collecting because the plant is only an annual *Campanula pusilla* is coming into bud here on every stony bank, amid the low tyrian-purple masses of *Calamintha alpina*. Higher and higher yet: the Alpenrose is now blooming everywhere in the more open places amid the trees, and, far more interesting, *Daphne striata*: but to me it is a great disappointment, for the plant is so completely inferior to *D. Cneorum*, until at last, high on a bank I discovered a pure albino form which is nearly as lovely as *D. Blagayana*. Incomparably the

most beautiful inhabitant of these woods, though, beating even the waxy-white sweet *Pyrola uniflora* on moss banks by the tree roots, is *Atragene alpina*, sending its flights of glorious purple Clematis-like flowers in drifts and scuds and flights and galaxies far up through the Pine boughs, far down over the rock faces, and over and about every dead bush or tree stump by the way. I had never before realised the full beauty of this, nor its strength as a climber and capacity for coming thinly up on one frail stem through 10 feet or more of boscage, until it emerges into the light at the top of bush or bough and there breaks into a wide spray of blossom. But let no one be rash enough to attempt the taking of its abominable, great, endless root!

As the woodland thins out towards the upper Alps, new plants begin to occur—*Saxifraga Aizoon* on every rock, thickly clustered, *Gentiana verna*, and, most miraculous of all, growing down by the roadside and gutters like any common weed, that daintiest and most difficult of rarities, *Dianthus glacialis*, of which, bright and splendid and neat as it is, I will only say, alas and alas, that it is not the far more gorgeous *D. alpinus*, of which botanists pronounce it to be only a form! But now the road comes well out into the open and up on to the Alpine slopes, where only a few huge Larches still stand among the grasses, gaunt and ghastly and dying. And here the early Alpine flora is still rich. *Gentiana verna* and *G. acaulis* (a bad type), *Myosotis alpestris*, *Androsace obtusifolia*, *Potentilla alpestris*, *Primula farinosa*, *Ranunculus alpestris*, and *Anemone alpina*—a surprise, this, on the granite. *Primula minima* is over, *Arnica*, *Campanula barbata*, *Aster alpinus* not yet out, *Lilium Martagon* is rare, and generally flowerless in the grass; *Edelweiss* occurred in one poor, spindly bud among the herbage.

So we reach at last the Glockner House Inn, and strike off above it again, higher and higher over the Alpine grass and gullies of the mountain, filled as yet with snow. And here is *Primula minima* still in gorgeous bloom in these damp, shady hollows. And, alas! that this huge-flowered wee-growing *Primula* should have the same grim magenta taint which disfigures *Saxifraga oppositifolia*. I choose this comparison, for the two colours are so like that, as I first saw the *Primula* down in a gulch, I took it, afar off, for the *Saxifrage*. The *Saxifrage*, indeed, occurs with it on rockier ledges, but less commonly down here. The *Primula* makes a good third of this Alpine herbage, and from its carpets sprout *Lloydia serotina* and *Anemone alpina*, which here seems faintly inclined to verge towards the variety *sulphurea*. A little lower, in heaps of stone and on stony banks, abounds the ineradicable little white *Anemone baldensis*, above a turf which is full of the rare but not, I am afraid, dazzlingly brilliant, *Ranunculus rutefolius*. *R. pyrenæus* is also here, but passing out of bloom. Down on the ledges of the gullies grows *Saxifraga cæsia* and abundant *Edelweiss*, and that interesting rarity, the true *Saxifraga Rudolphiana*, minute as *squarrosa* in growth, with dark-purple flowers like those of *S. oppositifolia*, but deeper in colour. All purples, though, and all other colours, are wiped clean out by the gorgeous violet bells of *Primula glutinosa*, which here begins to abound. I have never

seen a more impressively beautiful wild plant than this, hanging out its heavy tyrian clusters over the sodden moor grass. It is more purple than *P. capitata*—a genuine match for any Royal Violet, no less in colour than in refreshing sweetness of scent. If only it flowered in cultivation as willingly as it grows! *Soldanellas alpina* and *pusilla*, on melting snow slopes, are but little appreciated after seeing the *Primula*; nor even the pretty pale golden stars of *Gagea Liotardii* down by the rivulets.

Higher and higher now, towards the last snow slopes and screes of barren shale. To my horror, *Myosotis alpestris* remains *alpestris* even here, and makes not a move towards becoming *M. rupicola*. *Silene acaulis* is common; so are yellow *Drabas* and *Hutchinsias* and *Saxifraga oppositifolia*. But of the high Alpine flora, no trace. *Androsace glacialis* appears once in a few poor, little, thinly-flowered plants of an anæmic white form, but, after that, is not seen. The rare *Saxifraga Kochii* is the last moraine is a fat and fleshy thing, and certainly not so attractive as *biflora* or even *oppositifolia*. As for *Cerastium glaciale*, I know it by heart. And, oh! the utter uninterestingness of these high slopes of the primary formations! Think of the myriad treasures I should have got here at the snow's edge on limestone or dolomite. But on this horrible granite there is nothing but dullness. There isn't even *Ranunculus glacialis*. Though I hunt through many hours, over many screes all spotted with dowdies, not a single trace do I find, not so much as a bud or a capsule, of *Eritrichium nanum*. And why, why has even *Androsace glacialis* refused to reappear at this, its proper level? Shows its good sense! I hastily will follow its example and trot down again from these infertile granites, and away from Heiligenblut to the goodly land of dolomite. *Reginald Farrer, July 19.*

REMOVAL OF THE STYLE IN CUCURBITACEOUS FRUITS.

It is sometimes said that the fruits of Cucumbers and Melons become larger and ripen faster if the withered styles are allowed to remain on the maturing fruit. In order to test the truth of this statement, I carried out tests with Melons, Cucumbers and Luffas.

Two flowers, growing in similar positions on the plant, were pollinated, and when they had withered I removed the styles of one of the flowers and left those of the other intact.

The rate of growth of the developing fruits was determined daily, and the records demonstrate that the removal of the withered styles at a time when the fruit is still very small makes no difference whatever in Cucumbers, Melons or Luffas to the rate of growth of the fruits. I give the following extracts from the records which have led to this conclusion:—

CUCUMBERS.

- A₁ = fruit with intact styles.
- A₂ = fruit from which styles were removed.

MEASUREMENTS IN INCHES.

	July 11.	July 16.	July 21.	July 24.
A ₁	2 $\frac{3}{4}$	5 $\frac{1}{2}$	12 $\frac{1}{2}$	16 $\frac{3}{4}$
A ₂	2 $\frac{1}{4}$	5 $\frac{1}{2}$ *	13 $\frac{1}{2}$	16 $\frac{3}{4}$

Similar results were obtained with Melons and Luffas. The Cucumbers were pollinated in order to ensure uniformity of conditions. *K. M. Pearce Gould, Whiteknights.*

* Styles removed.

NOTES FROM GLASNEVIN.

RHODODENDRON YUNNANENSE.

THIS *Rhododendron* is a native of Western China, having been found in Yunnan by the Abbé Delavay. A plant obtained from Messrs. Jas. Veitch & Sons flowered at Kew in 1897 (see fig. 161 in *Gard. Chron.*, June 23, 1906). Owing to the presence of lime in the soil, most *Rhododendrons* do not succeed at Glasnevin, but this species does remarkably well here. It forms an erect shrub (see fig. 30) 5 feet high by 4 feet through; the evergreen leaves are 2½ to 3 inches long, elliptic-lanceolate in shape, covered with stiff hairs. In May it is usually one of the sights of the garden, for the flowers are produced in such profusion that scarcely a leaf can be seen. The type plant figured in the *Bot. Mag.*, t. 7614, has flowers 2 inches across the short, funnel-shaped corolla. The flowers are white, with red, oblong spots on the upper corolla lobes. The Glasnevin plant differs slightly in colour, for the corolla is a creamy white, and the spots and anthers are yellow. Planted in close proximity

FIG. 30.—RHODODENDRON YUNNANENSE, FLOWERING IN GLASNEVIN BOTANIC GARDENS.

is the ordinary type, but so far it has not flowered so freely as the yellow-spotted variety, which is a decided acquisition to the flowering shrubs.

CRATEGUS TANACETIFOLIA.

THIS Tansy-leaved Thorn is an Oriental species, and can be recommended as a specimen plant for lawns. Near to the entrance of the Glasnevin Botanic Gardens is an exceptionally fine specimen, about 27 feet in height, with a spread of 30 feet, the girth of the stem being 6 feet. At a distance, when in flower in May and June, it somewhat resembles a gigantic Guelder Rose, for the white flowers are large and borne in close corymbs. The leaves are deeply pinnatifid, and both these and the young shoots are very downy. The flowers are about an inch across, and have a strong fragrance. They are succeeded in autumn by a crop of globose yellow fruits, resembling small Apples, and with the same smell. Although the fruits are not very palatable, children seem to relish them. Tourn-

fort describes how eagerly his Armenian companions gathered and ate the fruits. He also mentions that the trees were the size of Oaks. C. F. Ball, Royal Botanic Gardens, Glasnevin, Co. Dublin.

NOTICES OF BOOKS.

* ILLUSTRATIONS OF CONIFERS.

THE first volume of this work, which has recently been published, seems to show that the interest in Conifers, which was greatest between 1840 and 1860, is again reviving, though it is not so active as it was when California and Japan were virgin fields, and new introductions were more numerous than at present. Mr. Clinton Baker, who inherited one of the finest collections of Conifers in the Midland Counties, at Bayfordbury, near Hertford, has been happily moved to put on record the notable work of his grandfather, who, during a long life, was one of the most ardent arboriculturists of his time. It is to be hoped that others will follow his example, for, in the course of my endeavours to

world has been ransacked, not more than five or six seem to find our climate generally congenial, and of these only the Scots and the Corsican Pine can, in most places, be looked upon as profitable trees to plant on a large scale. Mr. Clinton Baker, having realised the difficulty of identifying the species from descriptions alone, has illustrated his work with excellent photographs of the cones and leaves of all the species which he possesses or could procure, and, though the variation in the size and appearance of both cones and leaves grown in England is often so great that they cannot always be recognised with certainty even by experts, yet these illustrations will be of great service. The analytical key to the genus, which was prepared after much labour and study by Dr. A. Henry for the *Trees of Great Britain and Ireland*, and is here printed in advance of its publication in the fifth volume of that work, will aid the identification materially, and a short notice of the origin and history of the trees, with measurements of the specimens which have survived at Bayfordbury, though not adding much to Veitch's *Manual of the Coniferae*, are carefully done. The plates, letterpress and type are well printed by Simson and Co., of Hertford, and the book, when complete, will form a nice addition to the country house library. An admirable photograph of the splendid group of Lebanon Cedars on the lawn at Bayfordbury, planted in 1765, forms the frontispiece of the work, which, we believe, will be shortly completed, and serve as an encouragement to other landowners to go and do likewise. H. J. Elwes.

* TREES.

THIS volume, concerned especially with Form as displayed in the habit of the commoner trees and shrubs, has a useful appendix devoted to seedlings, which was left unfinished by the author; but, as the editor points out, is sufficiently complete to be of great value to students. It is well illustrated by drawings of numerous seedlings drawn to scale.

The earlier portion of the book contains much interesting information as to the characteristic features of trees and shrubs, their general habit and branching, nature of bark, &c.

A chapter entitled "Non-typical Shoots," dealing with such structures as the shoots of aquatic plants, corms and rhizomes, does not appear to have any special connection with the other portions of the book, the examples being chiefly herbaceous plants.

The Week's Work.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardslée, Sussex.

Roses.—Continue to remove the decaying flowers from the plants and frequently stir the soil in the bed by means of the Dutch hoe. Some of the older varieties have done exceedingly well in spite of the adverse weather. General Jacqueminot, for instance, has succeeded in the wet weather much better than most others of the same colour. Amongst some of the best dwarfs this season may be mentioned Mme. Abel Chatenay, Mrs. R. G. Sharman Crawford, Margaret Dickson, Ulrich Brunner and Liberty.

Herbaceous plants.—Up to the present time we have had to remove weeds by hand, as the ground has been too wet for hoeing. A larger number of stakes has been necessary than usual owing to the extra vigorous growth the plants have made. Unless sufficient supports are given the plants to keep them to a tidy shape, half their charm is lost. The Michaelmas Daisies or perennial Asters will need particular attention in this respect, and should be supported before they begin to fall over. Late sowings of Sweet Peas may also be instanced as plants requiring attention.

* By the late Marshall Ward, Sc D., F.R.S., Cambridge Biological Series, Vol. V. Form. (Cambridge University Press.) 4s. 6d.

* By H. Clinton Baker. 4to. (Hertford; Privately printed.) 1909.

Shrubs.—Many shrubs still require pruning. Cuttings of the earlier-flowering varieties may now be prepared from half-ripened wood, making each cutting 8 inches to 1 foot in length. Insert them in fine soil containing some sharp sand and road scrapings, making each cutting very firm in the soil. The more tender varieties may be inserted under hand-lights or in an unheated frame. Cuttings will make very nice plants by spring, when such species as *Olearia*, *Weigela*, *Ceanothus*, and *Philadelphus* may be planted for another season on a well-prepared plot of land. In 1911 they will be ready for planting in the shrubberies or borders.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. Ford, Pencarrow, Cornwall.

Acalypha.—If cuttings are now propagated they will make, during the present season, plants of sufficient size for placing in vases. The cuttings may be placed singly in pots or three may be inserted around the side of each pot. Plunge them in a brisk bottom heat and shade the cuttings from sunshine. As soon as the cuttings have rooted and become hardened after removal from the propagating case, they should be potted singly. Later they will need a shift into pots of a slightly larger size.

Pelargonium.—Plants of the show and fancy sections of *Pelargoniums* should now be pruned. Show *Pelargoniums* should have nearly the whole of the current year's growth cut away, but the fancy varieties must not be pruned so severely. In each case the pruner must be guided by the shape of the plant. After the plants are pruned and cleansed, they should be placed in a cold frame, affording each specimen plenty of room for development. The frame should be liberally ventilated. Lightly syringe the stems at least twice a day, but, for the present, do not give them any water at the roots.

Souvenir de la Malmaison Carnations.—These and other summer-flowering *Carnations* should be layered immediately they have finished blooming, so as to obtain strong plants for flowering next season. The best method is to turn the plants out and replant them in prepared soil in frames. Only healthy plants should be used for propagating. If necessary, the foliage should first be thoroughly cleansed. Tall plants should be planted nearly on their sides to allow the shoots to lay on the soil. In making the layers, care should be taken not to make the cut more than an inch long, as this will be found quite enough. When the layering is finished, give the soil a good watering and close the frame. The frame must be kept somewhat close and the soil moist until the layers are sufficiently rooted to be severed from the parent plant. After that stage, gradually increase the ventilation.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Terete-leaved Vandas.—The flowering period of *V. teres* is now over. If the stems have grown too tall, cut them off at about 2 feet from the top, and insert five or six pieces into a 6-inch pot, keeping the cuttings at equal distances apart. Tie each stem to a neat stick, and fix the stakes in the pot with broken crocks, filling the pot to about three parts of its depth with these, and surfacing with freshly gathered *Sphagnum-moss*. Another good plan is to fix the stems to upright teak rafts, about 4 feet in length, each raft consisting of three or four rods, each rod $\frac{3}{4}$ of an inch in diameter and at least 1 inch apart. Do not use square rods, for if the sharp edges of the wood are planed off the roots will be more easily entwined around them. The lower part of the raft with the plant affixed to it should be inserted in a suitable sized pot, filling up the pot with crocks and moss as previously advised. The remaining part of the stem from which the tops have been removed, if kept in a warm and moist atmosphere, will soon produce fresh growths and roots, and in this way the plant may be propagated. *V. Hookeriana* may be treated in a similar manner soon after its flowers fade, which is generally about the beginning of September. The hybrid *Vanda* known as *Miss Joaquim*, having just passed out of flower, should now be treated in the same manner as *V. teres*. When in full growth,

terete-leaved plants should be exposed to direct sunshine and treated to copious overhead syringings several times a day, using tepid rain-water. *V. teres* should thrive admirably in a house where such species as *Laelia anceps* succeed well—such, for instance, as is generally known as the Mexican house; whilst the other species and the hybrid mentioned grow better at the sunniest end of the hottest house. When these plants grow freely, they produce a large number of roots. When the roots are long enough they should be carefully tied to the teak rods, making the point of each root touch the wood, to which they will quickly adhere. The plants will then produce more flowers on the spike than when the roots are allowed to ramble about in the air. Other terete-leaved *Vandas*, such as *V. Kimballiana* and the pure white *V. Watsonii*, are growing and rooting freely in a light, moist position in the *Cattleya* house. They should be put in crocks and *Sphagnum-moss*, and be given copious waterings at the roots until their flowers expand.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Figs.—Thin out the young growths upon *Fig* trees, leaving only sufficient to thinly furnish the allotted space. Expose the fruits to the sun as much as possible, for *Figs* have very little flavour when ripened under the shade of dense foliage. Old-established trees now carrying heavy crops should be given dressings of some suitable fertiliser at intervals, following the dressings by immediate applications of water. Place a liberal mulching around each tree, unless this has already been done. Young trees do not as a rule need much manure, as its use encourages the production of shoots of greater strength than is desirable.

Raspberries.—As soon as the fruit has been gathered the old fruiting canes should be cut off at the ground level and removed to the fire heap. After their removal, it will be easy to determine how many young canes will be required to cover the trellis or poles. All others should be removed as soon as possible. The ground in the *Raspberry* quarters should be lightly hoed over and thoroughly cleansed. The canes which will fruit next season will afterwards have every opportunity to grow strongly and mature their shoots.

Autumn-fruiting Raspberries.—Keep the shoots of autumn-fruiting *Raspberries* thinly disposed. Make the ground perfectly free from weeds, and place a mulch over the roots of the surface. In the event of a spell of dry weather, it will be necessary to apply water to *Raspberries* growing on light and gravelly soils.

Black Currants.—When the fruit has been cleared from the *Black Currant* bushes, any thinning that is necessary can be carried out. Thin out the shoots somewhat severely, as this is necessary to keep the bushes in a good cropping condition. Encourage the young growths which spring from the base, as these usually produce the finer fruit. The aim of the grower should be to have as much young wood in the bushes as possible. Any bushes which may have been neglected in the past, if treated according to the directions I have given, will soon exhibit improvement. The variety *Boskoop Giant* is in all respects better than the older varieties. It is so vigorous that the bushes are seldom attacked by any insect pests. The fruits are large and bright, and they are yielded in great abundance.

THE KITCHEN GARDEN.

By E. BRACKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Potatoes.—Most of the early varieties are now sufficiently advanced to be lifted and stored. It is important to remember that all kinds of *Potatoes* should be lifted immediately they have perfected their crop. If this were always practised the trouble with *Potato* disease would not be experienced in anything like the degree now common. Even if the outer skins are not sufficiently ripened to prevent rubbing during the lifting operations, this will cause no harm to the tubers; Nature will soon provide them with another.

Later crops.—If green winter vegetables are planted between rows of late *Potatoes*, the

Potato haulm must be carefully laid down. This often proves an advantage to both crops, as each is the better exposed to sunlight and air.

Cardoons.—Keep this crop thoroughly well supplied with water, both at the roots and overhead. See that each plant is made secure by staking; let the blanching be done by piecemeal, using strips of brown paper and baybands.

Onions.—Owing to the adverse season, *Onions* grown for large bulbs are not nearly so satisfactory as they once promised to be, but no doubt on lighter lands than ours they will be good. During the next ten days or a fortnight *Onions* should be thoroughly watered at the root twice a week with properly diluted farmyard manure water. Any unsatisfactory plants and all rubbish should be carefully removed from the beds. Autumn-sown *Onions* of last year should now be lifted and ripened before storing them. The silver-skinned varieties are not good keepers, and consequently they should be used first.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Early vines.—It is of the utmost importance that the vines in this house should be well matured and the buds plumped up before the time of pruning. Climatic conditions having been so unfavourable, it may be necessary to have a little warmth in the water-pipes. Any laterals still growing may be removed, but it is advisable to defer the shortening of the main shoots for two or three weeks longer. Continue to syringe the foliage in the evening of fine days. The hose, or garden engine, may be used occasionally to give the vines a thorough wash, care being taken not to damage the leaves by applying the water with too much force. If mealy bug makes its appearance, the rods should be scrubbed two or three times during the autumn with strong soapy water. Early vines growing in well-drained borders will be benefited if occasional waterings of diluted liquid manure are given them. Borders requiring renovating should now be given attention. If there are both inside and outside borders, no fear need be entertained for next season's crop, as the inside border only need be dealt with in the first year. Following such renovations, however, it is advisable not to subject the vines to hard forcing until a season has passed. In cases where the roots are restricted to the inside of the house, the vines should not be forced at all in the first season, but allowed to come on naturally. Turning to the actual work of renovation, sufficient loam should first be at hand and in proper workable condition to enable the work to be done as expeditiously as possible. Broken bricks, lime rubble, wood ashes and coarsely-crushed bones should be incorporated with the soil, determining the quality of these ingredients by the nature of the staple, but remembering it is better to give too little manure than too much. Dig out a trench at the outside of the border down to the drainage, making it about 3 feet wide, then gradually fork out the soil from among the roots, carefully preserving as many roots as possible, and taking particular care not to damage any of the larger roots. The quantity of old soil to be taken out must be determined by its condition, but in any case it will be safe to expose the roots to within 2 or 3 feet of the vines. Before commencing to add the new soil, ascertain that the drains are quite clear. Should the sub-soil be of a cold, retentive nature, a layer of concrete should be placed over the surface to prevent the roots from growing downwards. Provide ample drainage to allow water to pass freely away, say, about 9 inches or a foot, according to the depth of the border, and place a layer of turves, grass downwards, over the surface of the drainage. After this has been done, commence to add the new soil in layers about a foot deep and see that each layer is made quite solid. Lay in the roots towards the surface, spread them out evenly over the soil, and cut back any damaged portions of the smaller roots, shortening all of them. The width of the new border should not be more than 4 feet at the commencement, but more soil can be added at intervals of two or three years until the whole space is filled up. If the vines have only inside borders, the house should be kept rather close for a week or 10 days following the operation, and the vines should be kept during bright weather. Syringe the vines twice daily, and give the new soil a good soaking with clear water.

REPORT ON THE CONDITION OF THE OUT-DOOR FRUIT CROPS.

[FROM OUR OWN CORRESPONDENTS.]

THE WORDS "AVERAGE," "OVER," OR "UNDER," AS THE CASE MAY BE, INDICATE THE AMOUNT OF THE CROP; AND "GOOD," "VERY GOOD," OR "BAD," DENOTE THE QUALITY.

FULLER COMMENTS WILL BE GIVEN IN THE FOLLOWING NUMBERS. SEE ALSO LEADING ARTICLE ON PAGE 76.

FIG. 31.—GROUP OF NINE SPECIMEN PLANTS OF *CŒLOGYNE CRISTATA* IN THE GARDENS OF EARL CAWDOR, GOLDEN GROVE, LLANDILO (GR. MR. FRANK SURMAN). THE PLANTS ARE IN 6-INCH POTS; THEY HAVE NOT BEEN REPOTTED FOR THREE YEARS.

[Photograph by D. C. HARRIS, Llandilo.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Illustrations. The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

- THURSDAY, AUGUST 26—Peebleshire Hort Soc. Sh. at Peebles.
- TUESDAY, AUGUST 31—Roy. Hort. Soc. Coms. meet. (Lecture at 8 p.m. by Mr. James Hudson, on "The Gardens by the Lake of Como").

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—62.5°.

ACTUAL TEMPERATURES:—LONDON.—Wednesday, July 28 (6 P.M.): Max. 67.3°; Min. 56.8°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, July 29 (10 A.M.): Bar. 39.9; Temp. 65°; Weather—Overcast.

PROVINCES.—Wednesday, July 28 (6 P.M.): Max. 66° Brighton; Min 54° Durham.

SALES FOR THE ENSUING WEEK.

FRIDAY—600 Cattleyas Mossiae and other imported Orchids; also choice Established Orchids, Freesias, Liliums, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

The Fruit Crops. In the present issue we print our annual reports on the condition of the hardy fruit crops in Great Britain and Ireland. These appear to afford good grounds for a large amount of satisfaction. Take the Apple crop, for instance. The returns show a crop quite equal to that of last year, and certainly better than that of 1907. Last year, out of 275 instances, there were 185 which indicated average or over average crops, and 90 that were under the average yield. This year there are 246 returns, and 165 of these show crops equal to, or above the average, and 81 below what is considered a normal crop. But whilst the proportion of under-average crops is seen to be much about the same as last year, it has to be pointed out that a greater number of correspondents now

report the crop as over average; therefore, the prospects of the yield appear to be even better than in 1908, which was certainly to be reckoned amongst our best Apple years. It is a matter for congratulation that growers in the northern parts of the country, and particularly in Scotland, who do not always share in the good crops obtained in England, report this season in favour of a better Apple yield than for several years past. Out of 42 returns from Scotland, only nine of these estimate the crop as under-falling the average. This is a great improvement on last year, when there were 30 under-average crops out of a total of 45 returns. In Wales and Ireland equally satisfactory estimates are returned; in each case they are better than those published a year ago, as may be seen from the grand totals of the two years printed on this page for comparison.

Pears have been stated to be only a very moderate crop, but our present returns scarcely bear out the earlier forecast. In Scotland there are 17 under-average crops out of 40 reported upon; in England 69 out of 171; in Wales 5 out of 13; and in Ireland 4 out of 15. Our tabulated figures show a crop of double the value of that of last year; indeed, the yield so far is better even than in 1907, a season when Pears were unusually plentiful. If we consider the figures relating to Plums, they are equally promising. Last year there were 126 reports of average or over-average crops out of a total return of 272; this season there are 163 out of 240 returns. It will be remembered, however, that the yield of Plums in 1907 was far above the average, and better than is indicated by the figures of either last year or this season. It is somewhat curious that the present crop of Plums is heaviest in Scotland and Ireland, and lightest in England and Wales; in most seasons the distribution is of a totally-different character. Cherries are an unusually heavy crop, for out of 233 returns, only 29 are reported to be under the average, whilst last year there were 85 under-average crops out of a total return of 258.

In the next subject, that of Peaches, we have an instance in which early flowering was a decided advantage to the crop. We do not mean that Peaches and Nectarines flowered earlier this season than usual; as a matter of fact, they were later, but naturally they bloom earlier than Apples and Pears, and this season the weather was more genial during their flowering period than it was for the later kinds. This fact is further demonstrated by the Almond, which, blooming at almost the same period as Peaches, had exceptionally genial weather, with the result that

Almond trees in all the districts round the metropolis are bearing such crops of fruit as are very rarely seen on these trees. Reverting to the crop of Peaches and Nectarines, we find that, out of 174 returns, 159 report average or over-average crops, and only 15 of our correspondents have stated the crop to be less than average. This is the more satisfactory when it is remembered that last year, out of 177 reporters, as many as 104 indicated crops below the average yield. Apricots were the greatest failure last season, for, out of 159 returns, there were only eight average crops, and not one was reported above the average. This year, out of 164 returns, there are 119 that indicate crops equal to, or above the average, and 45 below average. Small fruits, which for our purposes are made to include Gooseberries, Black and White Currants and Raspberries, were good crops last year, but they are even more plentiful this year. Of 242 correspondents, only seven report these crops as being below the average; last year there were 42 deficient crops out of 272 that were reported upon. It may be added that Black Currants are the least satisfactory among the small fruits.

There have been many complaints recently of the glut of Strawberries, but our reports show that, if the present crop has been a plentiful one, that of last year was even more bountiful. There were 275 returns then, and only four of these reported deficient crops. This year there are 21 described as under the average out of 242 returns. The glut may be partially explained by two circumstances: first, the recent weather having been cold and wet, it was not calculated to strengthen the public demand for soft fruits; and, in the second place, the berries themselves have been so large, watery and devoid of flavour the public has exhibited little appreciation for them. It is worth recording that in some instances the wholesale price offered to the cultivator is said to have been as low as one halfpenny per pound. No wonder that we hear of cases in which the berries have been given gratuitously to anyone who cared to gather them. There is much room for improvement in Strawberries, for many modern varieties, whilst possessing good cropping qualities and large-sized fruits of attractive appearance, are deficient in flavour. So impressed were we that greater attention needs to be given to this quality, and therefore to the selection of varieties for cultivation, that we invited our correspondents who so kindly furnish us with the details of the fruit crops to take part in a Strawberry election. They were asked to state what they considered to be the three best early, mid-season and late Straw-

GRAND SUMMARY, 1909.

Records.	Apples.	Pears.	Plums.	Cherries.	Peaches and Nectarines.	Apricots.	Small Fruits.	Strawberries.	Nuts.
Number of Records	(246)	(243)	(240)	(233)	(174)	(164)	(242)	(241)	(146)
Average	102	125	119	128	84	72	78	102	71

SUMMARY OF 1908 FOR COMPARISON.

Records.	Apples.	Pears.	Plums.	Cherries.	Peaches and Nectarines.	Apricots.	Small Fruits.	Strawberries.	Nuts.
Number of Records	(275)	(272)	(272)	(258)	(177)	(159)	(272)	(275)	(161)
Average	138	69	103	127	57	8	155	103	63
Over	47	7	23	46	16	—	75	164	13
Under	90	196	146	85	104	151	42	4	80

berries, and, in addition, which varieties they found to possess most flavour. The results are interesting, and we purpose publishing them in a future issue.

The only crop that we have not so far alluded to is that of Nuts, which is slightly better than last year. It will be seen, therefore, that the present promise for fruit is exceptionally good, for rarely have we published more satisfactory returns in the 40 years or so which have elapsed since the practice of collecting reports was established. It is to be hoped that no adverse circumstances will arise to seriously prejudice the chances of harvesting the yield thus promised, but it has always to be remembered that in this country the vagaries of climate may have that effect. At the present time the dull wet weather which has characterised the summer season still prevails, therefore more sunshine is needed if we are to have a bountiful harvest of well-ripened, good-flavoured fruit. We hope that a change of this character will be forthcoming in the near future.

London International Exhibition.

We have very great pleasure in publishing the following communication from the Council of the Royal Horticultural Society relating to a proposal to hold an international horticultural exhibition in London.

From time to time horticulturists from these shores visit foreign countries to take part in international courtesies of this nature, and they are always welcomed with cordial hospitality. They learn many lessons from these visits and obtain much enjoyment from the greetings of friends from various parts of the world. But it is desirable that we should not continue to leave these things entirely to our Continental friends. After the lapse of forty-three years, it is again Britain's turn to act as host, to arrange an exhibition that shall adequately represent the horticulture of the country, commercial as well as ornamental—one capable of interesting foreign visitors, and of conveying to them some instruction. If a genetic conference is held in connection with such an exhibition, both events will gain some advantage from the other, and the visit of scientific men from abroad will be made the more memorable. It is frequently claimed that British horticulture is at the least equal to that practised in any part of the world, and we are not disposed to question the truth of the statement. But if this be so, it is one of the best of reasons for adopting the proposals now put forward by the premier horticultural society in this country. In March last, being present at the Berlin Show, we expressed in these columns how desirable it is that British horticulturists should again organise an exhibition on the lines of the ever-memorable one of 1866. We therefore commend the Royal Horticultural Society's scheme to the sympathetic consideration of our readers, trusting it will meet with general support.

"From time to time, in recent years, international horticultural exhibitions have been held at various centres on the Continent as at Paris, Berlin, Ghent, Turin, etc. The last occasion on which Great Britain took part in these international courtesies was in 1866, and it has occurred to the Council of the Royal Horticultural Society that it is time that our country made an effort (say in 1911) to return some part of the hospitality

which foreign countries have so often extended to this country during the 40 years which have elapsed since such a gathering was held in London. It has further been suggested that in connection with it a fourth conference should be held on genetics, i.e., on the origin, breeding, and heredity of plants.

"The first point to be considered is, of course, the financial one. In the case of the 1866 International Show at South Kensington the balance-sheet gives an expenditure of £13,000, and although this was more than covered by the receipts, it is only prudent to endeavour to raise such a sum. And this may be done, as it was in 1866, by a combination of a general guarantee fund and a definite subscription fund, every guarantor of 25 guineas receiving a ticket admitting to the show on the opening day, and on one other day; and every subscriber of one guinea receiving a ticket admitting on the opening day.

NATIONAL CHRYSANTHEMUM SOCIETY.—We are requested to remind members and friends of the National Chrysanthemum Society that the annual outing will take place on Monday, August 9, when a visit will be paid to Sir FRANK CRISP's residence at Friar Park, Henley-on-Thames. Tickets will be half a guinea each, and application for these must be made to the secretary before August 4. The party will assemble at Paddington at 9 o'clock in the morning, and will leave Henley Station on the homeward journey at 8.20 p.m.

DESTRUCTION OF CHARLOCK BY CALCIUM CYANAMIDE.—Calcium cyanamide, one of the most recently-introduced nitrogenous fertilisers, appears, according to experiments carried out at the Agricultural School at Arenenberg, Switzerland, to be of considerable value as a specific against Charlock. The experiments were started in consequence of observations made on grass land manured with calcium cyanamide, it having been observed that on such land, though the weeds

FIG. 32.—MALE FLOWERS OF ACTINIDIA CHINENSIS: FLORAL DETAILS (MAGN.).
(See pp. 78 and 79, and Supplementary Illustration.)

"The Royal Horticultural Society will, in due course, call a meeting of horticulturists and others to consider the matter, and if the suggestion be adopted, and an influential general committee be appointed to carry it out on these lines, the Council are prepared to guarantee £5,000 on condition that all the Fellows of the Society receive admission tickets (not necessarily on the first day), one ticket for £1 1s. Fellows, two tickets for £2 2s. Fellows, and four tickets for £4 4s. Fellows."

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees will take place in the Society's Hall, Vincent Square, Westminster, on Tuesday next, August 3, at 3 o'clock. A lecture on "Water Plants" will be given by Mr. F. W. MOORE, V.M.H.

were burnt badly, the grass was acted on favourably. In the following year, therefore, a quarter of an acre plot of Barley was dressed on June 5 with 22 lbs. of calcium cyanamide. The results observed a month afterwards proved extremely satisfactory. On the treated plot scarcely a trace of Charlock was to be seen, and the Barley was 4 inches taller than on the untreated plots. Other weeds had also suffered. There is evidently room for further experiment in the use of calcium cyanamide as a weed destroyer for use on cultivated land.

PHENIX CANARIENSIS AT HYERES.—The *Revue de l'Horticulture Belge et Etrangere* (No. 13) contains an account of the culture of this Palm on a large scale at Hyères, as well as descriptions of some of the more interesting trees and shrubs, which are cultivated in the neighbourhood of Marseilles and Hyères.

VARIETIES OF SCAB IN POTATOS.—The irregular, more or less corrugated patches so frequently met with on Potato tubers are generally described as scabs; but it is useful to point out, as is done in the *Journal* of the Board of Agriculture, Vol. XV., No 10, that scab of Potatoes is not merely one form of disease, but that the different types of scabbing are due to distinct causes. Thus a very prevalent form of scab consists of rough patches of very variable size, often covering the greater part of the surface. This type of scab is due to mechanical injury, and is not infectious, hence, Potatoes showing it may be used for "sets." Black scab, or warty disease (see p. 79), is recognisable by reason of irregular, corrugated warts, pale in the young, but turning blackish in the old tuber. When such scabbed Potatoes are used for "seed," the young sheets which they produce grow abnormally, and become, together with the old tuber, covered with irregular, Cauliflower-like masses. Tubers infested with this fungus disease must be burned or otherwise destroyed. Another type of scab consists of narrow patches of a pinkish-white colour, with rows of purple spots, and is caused by the millepede *Julus pulchellus*. In a severe attack, the substance of the Potato may be so destroyed as to leave a large hollow space. A fourth form of scab is due to the fungus *Pospora scabies*, Thaxter. In appearance, it resembles that due to mechanical injury, but it may be distinguished from this latter form by the delicate greyish bloom which may be seen on the wounded parts. Lastly, another scab, due to an organism called *Spongespora scabies*, Mass., may be recognised by the snuff-coloured mass of spores which occur on the surface of the wound.

THE "GARDEN" FLOWER SHOW.—Our contemporary held its second annual show on Wednesday last in the Royal Horticultural Hall, Westminster, when the readers of that journal contributed a very fine show. So many exhibits were received that, in addition to both annexes and the large hall, the lecture-room and one of the committee rooms also had to be filled with the produce. About 2,000 bunches of Sweet Peas were shown, the best collection coming from Mr. T. STEVENSON, Woburn Place Gardens, Addlestone. Fruit was well represented. There were Peaches, Gooseberries, Currants and Raspberries. Some of the collections of vegetables were of high-class quality. The Gold Medal for the best exhibit in the whole show was awarded to H. J. TATHAM, Esq., Kendall Hall, Elstree, Herts. (gr. Mr. W. Gaiger), for a splendid collection of 12 kinds. There were 47 decorated tablos, Sweet Peas, Roses, and other flowers being those chiefly employed for this purpose.

THE PROTECTION OF SEED.—According to trials made recently at the Kansas State Experiment Station, seed, e.g., of Corn, may be protected from burrowing animals, such as mice, by coating it with an offensive-smelling substance, such as coal-tar. The procedure recommended for Corn is as follows:—The Corn is slightly wetted with warm water, and then stirred in the tar; one teaspoonful of tar is to be used for each quarter-bushel of Corn. The seed is stirred thoroughly till each grain is covered with tar. Afterwards the seeds are dried and planted.

TO EXTERMINATE COCKROACHES FROM ROOMS.—Where it is possible to leave a room unoccupied for a day or two, cockroaches infesting it may be destroyed by fumigating with bisulphide of carbon. A note in the *Journal* of the Board of Agriculture, Vol. XV., No. 10, gives the method to be adopted. Saucers containing the carbon bisulphide are placed about the room, which is made as air-tight as possible. They are left for 24 to 48 hours, and then, after ventilating for an hour or two, the room may be used.

GRAFTING OF HERBACEOUS PLANTS.—M. GRIFFIN contributes to the current number of the *Pulletin de la Société Botanique de France* an illustrated article recording his experiments in grafting herbaceous plants. Besides repeating his earlier experiments on Potatoes and Tomatoes, and comparing the results with those previously obtained, he describes, among others, the following instances:—*Solanum nigrum* grafts very readily on *S. Lycopersicum* and remains perfectly distinct. M. GRIFFIN did not observe in his experiments the slight modifications in foliage observed by WINKLER in Germany. Several varieties of Haricot Beans, distinct in foliage, flower, and fruit, were grafted together. No modification of stock or scion was observed, either in habit or constitution. In the case of *Helianthus annuus* grafted on *H. latifolius*, the specific characters are preserved in both stock and scion. Small variations in the shape of leaves, &c., occurred in a few cases, but these were as frequently observed in control plants which were not grafted. M. GRIFFIN summarises the results of his experiments on Solanaceae, Leguminosae, and Compositae by stating that in none of his very numerous experiments has he observed the slightest indication of the production of a graft hybrid. Slight unimportant variations occur occasionally with regard to nutrition, but all his experiments support the views as to the complete independence of stock and scion.

FLOWERS FROM THE MARITIME ALPS.—Several interesting species have been forwarded by Mr. EDWIN AVERY, who writes from the Villa Victoria, Grasse, Alpes Maritimes, France:—"I am posting a small box of wild flowers gathered in the district. The *Lilium* grows abundantly on the wooded slopes of the mountains above Grasse at 3,000 feet altitude. The *Statice* I found on the seaside rocks of the Isle St. Marguerite off Cannes. The enclosed *Ranunculus*, which I take to be *R. gramineus*, I found at an altitude of about 5,000 feet, where, on a little grassy plateau, it blended charmingly with *Orchis Morio* and *Orchis militaris*. *Aristolochia pistilochia* is frequently found nearer Grasse; also *Nigella damascena*. *Cineraria maritima* grows everywhere; also *Rhus Cotinus* and *Pistacia Terebinthus*. Among many interesting plants I have been able to recognise at various altitudes are *Paeonia peregrina*, *Cistus*, *Daphne Gnidium*, *Anehus italica*, *Cibola perfoliata*, *Primula Auricula*, *Anemone Hepatica*, *Saxifraga lingulata*, *Androsace maxima*, *Anthyllus montana*, *Orchises* in variety, *Ophrys apifera*, *O. Scopolax*, *O. Bertolina*, *Cephalanthera grandiflora*, *Epipactis latifolia*, and *Limodorum abortivum*. I enclose in the box what I think is probably *Cephalanthera rubra*." Those sent for identification were as follow:—1, *Echinops Ritro*; 2, *Cirsium* sp.; 3, *Centaurea collina*; 4, *Rhododendron ferrugineum*; 5, *Osyris alba*; 6, *Cephalanthera rubra*; 7, *Clematis flammula*; 8, *Filago spathulata*; 9, *Dianthus* (probably *D. Caryophyllus*); 10, *Linum strictum*; 11, *Arenaria capitata*; 12, *Phagnalon sordidum*; also *Lilium pomponium*, *Aristolochia pistilochia*, *Ranunculus gramineus*, *Bupleurum protractum*, *Nigella damascena*, *Statice cordata*, *Campanula* (probably *C. Scheuchzeri*), *Leuzea confira*, *Helichrysum serotinum*, *Nepeta Nepetella*, *Dianthus Balbisii*, and *Armeria bupleuroides*.

BOARD OF AGRICULTURE AND FISHERIES' REPORT ON CROP PROSPECTS.—The Crop Estimators of the Board in reporting on the condition and prospects of the principal crops on July 15, generally comment on the backwardness of the season as compared with former years, caused more particularly by the cold and dry spell of weather during May and the first two or three weeks of June, which has retarded the growth of late-sown corn and early root crops.

and has especially resulted in a deficient growth of grass. The abundant rains which fell from the third week of June onward appear to have had beneficial effects on the growth of the crops generally, though their continuance has been detrimental in some respects and especially in regard to the Hay harvest. General reference is made to the suitability of the season, from the autumn seed-time onwards, to the growth of Wheat, the acreage of which is said to have been increased. An over-average crop is anticipated throughout Great Britain, but particularly in England. Barley also has been favoured by the seasonal conditions, and appears to give good promise throughout the country, except in Wales. The Oat crop on the other hand is unsatisfactory throughout England and Wales, the wide prevalence of insect attacks having materially reduced the prospects of an average yield. In Scotland, however, the yield may slightly exceed the average. Roots and Potatoes promise well, though the season has not hitherto been favourable to the growth of Mangolds. As already indicated the yield of Hay is low, on account of the unfavourable spring and early summer. The yield in Scotland though not up to the average seems to be better than in England. Hops compare unfavourably with last year, and are stated to be seriously affected by vermin and blight. Summarising the reports, and representing an average crop by 100, the appearance of the crops in mid-July indicates yields for Great Britain which may be represented by the following percentages:—Wheat, 104; Barley, 103; Oats, 96; Potatoes, 104; Roots, 104; Hay, 92.

SAGO.—The method employed in the Malay Straits for producing Sago starch is, according to an article in the *Journal* of the New York Botanic Garden, extremely simple. A full-grown plant of the true Sago Palm, *Metroxylon Sagus*, is felled and cut up into lengths of 3 or 4 feet. The chunks are immersed in water for several days, and then the outer fibrous layers are removed. The remainder is ground to sawdust, which is put into a receptacle made of coarse sacking. A native then enters the receptacle, into which water is poured. The native tramps up and down, and the starch, liberated from the tissues of the Palm stem, sinks, and is drawn off through a Bamboo trough into a vessel placed below the sacking. After some days the water is drained off from the Sago meal, which is dried and put into bags for shipment.

ACTINIDIA CHINENSIS.—In reference to this Chinese species now figured, we believe, for the first time from natural specimens, it may be said that the first flowers that came before our notice were sent us by Mr. J. COMBER, gardener at Nymans, near Crawley, in Sussex, where a plant bloomed very early this season. These flowers were partly withered on receipt. Since Mr. WOODALL very kindly sent us the flowering spray now figured in the Supplementary Illustration, information has reached us that plants have flowered in Messrs. JAS. VEITCH & Sons' nursery at Coombe Wood. The existence of the species in China has long been known, for ROBERT FORTUNE sent dried specimens to this country, and PLANCHON's first description was published in Hooker's *London Journal of Botany*, vol. vi. (1847), p. 302. There is a figure in the *Journal* of the Royal Horticultural Society, vol. xxviii., pt. i., doubtless prepared from dried specimens. *Actinidia chinensis* was introduced to cultivation by Mr. E. H. WILSON whilst travelling in China for Messrs. JAS. VEITCH & Sons.

PUBLICATIONS RECEIVED.—*Small Estate Management*, by Albert C. Freeman, M.S.A. (London: Rebman, Ltd.). Price 2s. 6d. net.—*Successful Jam Making and Fruit Bottling*, by Lucy H. Yates (London: Rebman, Ltd.). Price 2s. 6d. net.—*Successful Dairy Work*, by A. T. Matthews (London: Rebman, Ltd.). Price 2s. 6d. net.

ACTINIDIA CHINENSIS.

(See Supplementary Illustration.)

ACTINIDIA CHINENSIS, the subject of the accompanying illustration, flowered for the first time in Europe this spring. The specimen, here so faithfully delineated, came from Nice, where it was grown on a pole in the open air in my garden. Owing to the distance it had to travel, the cut blooms are decidedly smaller than specimens which expand on the plant as it grows in the open. Hitherto all the plants that have flowered have proved males or "pollen bearing," so since the plant is dioecious we may have to wait some considerable time before we see the fruit, which is said to be highly esteemed by the Chinese in its native mountain district.

The plant is a handsome and hardy climber, with rounded, rather heart-shaped leaves, and the rose-red petioles or leaf-stalks contrast well with the fresh green of the summer foliage. At Nice it has grown most luxuriantly in very poor, calcareous soil in a sheltered and sunny valley, where a little infiltration of moisture keeps the ground somewhat moist during the trying drought and heat of summer. It is evident, therefore, that its requirements are few. The male flowers, though numerous, are not effective, as they are generally hidden by the leaves. They appear in irregular clusters in the axils of the young growths, and are at first pure white with orange stamens, but in a few hours the colour turns to a dirty white or pinky buff, according to the temperature, and the flower withers on the second day. As the female flowers have not yet been seen, let us hope they are more ornamental and of a clear yellow colour, as reported by the discoverer of the species. This handsome deciduous climber may yet prove a considerable gain to our fruit and flower gardens. From the altitude at which it grows, it must be hardy in England, but it remains to be proved whether our summers are long enough or our suns hot enough to ripen the vigorous growths sufficiently to bear fruits, even when we have the female form in our gardens. It is a tiresome job to wait for the "pairing plant" when one remembers that it was quite 50 years after the introduction of the common Aucuba before the pollen-bearing plants were brought to Europe and the first fruits were produced! The fruit of *Actinidia chinensis* is said to be of the shape of a small Plum, but in structure like the Gooseberry, with internal seeds in the juicy pulp. It will be interesting when we can taste it to compare our sensations with those of the Chinese, who like it so well. If it fulfils expectations, it will be a delightful thing to welcome a successor to the early and hardy Gooseberry, now so threatened by new and fell diseases. *Edward H. Woodall, La Selva, Brancolar, Nicc.*

season I have been able to carry out some experiments which have made clear the main facts of the development of the parasite.

When a cross section is made in late summer or autumn of the warty or Cauliflower-like exerescence of a diseased tuber, large brown, thick-walled spores are seen embedded in the tissues beneath the surface. Usually only one spore is present in each infected cell, but some of the latter occasionally contain two. The diseased portion of the tuber left in the ground becomes disorganised and the spores are set free into the soil. In spring, the thick outer coat of the spore bursts, and from the opening is produced a thin bladder-like case or sporangium containing a large number of zoospores. These make their way out of a slit or pore in the wall of the sporangium, and for a time swim about in water in the soil by means of a single cilium. I have frequently observed that the zoospores just after emerging remain crowded together and quiescent for a short time, before becoming motile. Motion by means of the lashing cilium ceases in 20 minutes or less; the zoospores then

The parts attacked by the parasite are stimulated in a remarkable manner, rapid division occurs in cells near those which are infested, and extraordinary proliferation of tissue goes on, the new growth often resembling a piece of Cauliflower.

The pest is a fungus belonging to the Chytridiaceæ, and in its life-history very closely resembles the simpler representatives of the genus *Synchytrium*. Potato wart has already become a serious trouble in many districts in this country, and it is likely to develop into the worst pest with which the grower will have to deal unless vigorous measures are adopted to stamp it out. Much credit is due to the Board of Agriculture in making it a notifiable disease under the Destructive Insects and Pests Act. All interested in the Potato should read and carry out the suggestions regarding the treatment of this fungus given in the Board's Leaflet No. 105. *John Percival.*

NURSERY NOTES.

MESSRS. JAMES CYPHER & SONS.

RECENT additions at this Cheltenham nursery have completed the joining of the two ranges of glasshouses, so that now they form an uninterrupted line of glass structures abutting on the Queen's Road.

Cattleyas are especially well cultivated, and at the present time there is a good display of flowers on the various specimens, especially fine being *C. Warszewiczii Sanderiana*, even small plants bearing from four to six large and richly-coloured flowers. Many varieties of *C. Mossiæ* are in bloom, including several white varieties, also plants of *C. Mendelii*, a few of *C. Gaskelliana*, one having white sepals and petals; several examples of the true *C. Warneri*; *C. intermedia*, with its white variety; and other species. Arranged with them are three fine species of *Oncidium*, viz., *O. divaricatum*, with cream-white flowers spotted with red-brown; the graceful bright-yellow-flowered *O. flexuosum*, and the profuse-flowering *O. sphacelatum*.

In another intermediate house are some good examples of *Lælia purpurata*, the plants being still in bloom. The white-petalled forms are the most showy, by reason of the contrast of the white and the rich ruby-claret of their labellums. A still greater number of *L. tenebrosa* are in flower, the blooms being good and very freely produced. These *Lælias* and other Brazilian Orchids are shaded during strong sunlight only, the result being freer flowering than in the case of plants which are grown in too dense shade. In the same house is a collection of hybrid *Lælio-Cattleyas*, also *Brasso-Cattleyas* and *Cattleyas*, a large number of the best kinds being suspended from the roof. The varieties of *Lælio-Cattleya Canhamiana* are in flower, the specimens bearing from four to ten blooms. Amongst other *Lælio-Cattleyas* is a new, dwarf-habited variety—believed to be a cross with *L. C. Ingramii*—having purplish-bronze sepals and petals and a dark, velvety, maroon lip with a white base. *Brasso-Cattleya Digbyano-Mossiæ*, *B.-C. Digbyano Mendelii*, as well as the parent *Brassavola Digbyana*, are also in bloom.

Dendrobiums are a speciality with Messrs. Cypher, and although not so much in request as formerly, it must be put to their credit that they will furnish a display of flowers from January until July. The varieties of *D. nobile* and its hybrids alone supply a wide assortment, and, when well grown, few plants give a better show of flowers. At Cheltenham they are accommodated in a warm, moist house, that becomes very hot with sun heat, but immediately the growths are developed the plants are removed to cooler quarters, where they are kept dry until the time for again starting them into growth. *Dendrobium Dalhousianum*, *D. chrysotoxum*, *D. suavisimum*, and other Burmese species are also in bloom.

FIG. 33.—CHRYSOCHLYCTIS ENDOBIOtica IN POTATO TUBER.

(1) Section of warty growth showing spores embedded in the tissue (x 90). (2) Section of "spore" showing zoospores within (x 500). (3) a, Free zoospores just after emerging from sporangium; b, the same in amoeboid condition (x 1,000).

NEW FACTS CONCERNING WARTY DISEASE OF POTATO.

In 1896 Schilberszky gave an account of a new disease of Potatos which had been sent to him for investigation from a certain district of Upper Hungary. Although the description he gave was brief and in many respects incomplete, it is clear that the disease was the same as that which is now sometimes spoken of as black scab. Since the term scab does not adequately indicate the character of the disease and it is not black, the name "black scab" should be abandoned in favour of "Potato wart."

In the autumn of 1900 several tubers exhibiting this peculiar disease were sent to me for examination from the district round Burton-on-Trent, but owing to other duties I was unable to do more than note in the diseased tissues of the Potato the presence of the resting spores of the parasite which was named *Chrysochlyctis endobiotica* by Schilberszky. During the present

young amoeboid and enter into the cells of any young Potato plant with which they come in contact. After gaining access into their host they grow very rapidly and consume the protoplasmic contents of the cells which they infect. Ultimately each organism surrounds itself with a cell wall, but soon afterwards breaks up into a number of zoospores, which escape and extend the disease to other parts of the tubers and stems of the Potato below or on the surface of the soil. The formation of zoosporangia and the setting free of the zoospores go on repeatedly during the early summer, but later resting cells are produced, the contents of which do not appear as zoospores until the following spring and summer.

Another cool plant-house is gay with plants of *Miltenia vexillaria*. Most of the specimens were in small pots, and bearing from three to six inflorescences with rose and white flowers.

Several specimens of the handsome *Epidendrum prismatocarpum* had developed many flower-spikes, whilst a batch of the orange-scarlet-flowered *E. vitellinum majus* and a number of the scarlet *Cochlioda Noezliana* give a bright display of colours. *Vanda cœrulea* also thrives well in this nursery, and several plants with the large, white, and sky-blue flowers were noticed, one variety being veined with violet and having a dark, violet-coloured labellum.

In the next cool house the variously-coloured varieties of *Masdevallia coccinea* (Harryana) had produced a profusion of their purple and scarlet flowers; *M. Veitchiana*, still one of the showiest of *Masdevallias*; *M. ignea*, *M. Schroderiana*, some varieties of *M. chimera*, an interesting selection of the small-growing *Masdevallias*, and several hybrids, including *M. Leda* and *M. Courtauldiana*, being in bloom.

The collection of *Cyripediums* includes a large number of the finest varieties of *C. insigne* and a choice selection of hybrids, among which the varieties of *C. aureum* are especially fine. Good specimens of *C. grande* and its darker variety *atratum* are in bloom in large specimens,

flower, and, in a warm, moist corner, is *Coelogyne pandurata*, bearing a spray of its large pale green flowers, with blackish markings on the labellum.

In other houses there is a fine collection of flowering and foliage stove and greenhouse plants, the large specimen plants being on the whole the finest in the country. *Bougainvillea Cypheri* is apparently the best decorative *Bougainvillea*. Well-grown plants bearing large, rosy-mauve inflorescences were seen both as small plants and large specimens. The house of *Anthuriums* is bright with the scarlet spathes. Showy florists' flowers are another pleasing feature in the plant-houses. On the rising ground opposite the range of glasshouses is a fine show of herbaceous perennials, Carnations, Roses, etc., with bright tints of variegated-leaved shrubs. A rock-garden is specially interesting at the present time, whilst the many *Wichuriana* Roses trained on pillars and arches are a gay scene. J. B.

NOTES FROM A "FRENCH" GARDEN.

OWING to the unfavourable weather, Melon fruits are only slowly ripening. In the event of a few days of fine weather, all the fruits will be

watered twice a day. Thin out the young plants as soon as needed. This crop is generally cleared late in September or early in October.

Celery has grown well, and, for the time of the year, the crop is very forward.

Owing to maggots being found on the leaves of *Celeriac*, we have had to remove the young shoots growing round the main root.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

STENANTHIUM ROBUSTUM.—It is a difficult matter to anticipate Mr. S. Arnott in acquaintance with ornamental plants, but he writes (*Gardeners' Chronicle*, July 24, p. 54) that he has no knowledge of how *Stenanthium* will stand our average winter. Whilst confirming all that he says about the beauty of this fine plant, I am happy to report that it has stood unprotected here during the two last winters, and is now coming into abundant flower. It is growing in a deep soil of loam and peat, in a north and shady aspect. Like *Roscoea purpurea*, *Gaura Lindheimeri* and some other plants reputed to be tender, it is saved from spring frosts (more destructive than the severest winter) by starting late into growth. *Herbert Maxwell, Monreith.*

THE CARROT FLY.—Although the damage in this district has not been so great as that described last week (see p. 60) by a correspondent from Hampshire, yet the loss in many gardens through the ravages of the grub of the Carrot fly is serious. The fly usually puts in an appearance every season in these gardens. I keep a watchful eye on the beds, and at once pull up and burn any suspected root. But "prevention is better than cure," and much may be done on the lines indicated in the Editorial footnote on p. 60 to lessen the effects of a threatened attack. After the crop has been cleared from the ground, it is well, if the grub has been present, to give the land a good dressing with fresh gas-lime to kill the pupæ, in which form the Carrot fly passes the winter. It emerges in the spring as a shining, black fly, slightly tinged with a greenish lustre. It has yellowish legs, white "balancers," and hyaline transparent wings. This is the fly which, in the spring, lays its eggs in the young Carrots. The eggs quickly hatch into grubs, which live on the roots of the Carrots. When mature, the grubs leave the Carrots and burrow into the earth to become pupæ. I feel sure that the unusual prevalence of the Carrot grub this year is the outcome of the extremely dry spring. The surface soil being dry, it exposed the tops of the roots to the attacks of the fly. To prevent these attacks, immediately the rows have been thinned or weeded the soil should be drawn around the plants with a hoe. A watering with diluted manure water at the time of thinning will assist the young Carrots to grow away freely, and will also make them distasteful to the fly. *A. C. Bartlett, Pencarrow Gardens, Cornwall.*

VITALITY OF SEEDS.—Your leading article (p. 40) brings to my mind an incident bearing upon the subject which may be worth putting on record. It happened at Wortley Hall Gardens, in this county, about the years 1858 or 1859. I began my gardening career there in 1856 under a gardener named Edward Law, who died in 1860. One wet day I was set to clear out a wooden loft over the stoekholes situated in the enclosed shed behind the vineries, at that time heated with brick flues. I came across a box with a number of old seeds in various papers and packets. Amongst them were some of Melons, named, if my memory serves me right, Orion, Cantaloupe, and Egyptian Green Flesh, dated 1836 or 1837. At any rate, I am clear upon this—it was before Mr. Law went as gardener, and he was there 23 years. A lad's curiosity prompted me to sow some of them and to put the pots in the Cucumber pit when they germinated. I well recollect showing them to Mr. Law, and have mentioned the fact several times to others when this subject has cropped up. The seeds were more or less stuck together in the packet, no doubt through the glutinous substance present on many seeds, and especially those of the Cucurbitaceæ family. This natural coating had probably helped the seeds in retaining their

FIG. 34.—POTATO TUBERS AFFECTED WITH WARTY DISEASE.
(see p. 79.)

also the pale green and white-flowered *C. callosum Sanderæ*, *C. Mandiæ*, and a number of others. In the *Odontoglossum* houses *O. crispum* gives a fine show of bloom, with varieties of *O. luteo-purpureum*, *O. cordatum*, *O. nebulosum*, *O. Andersonianum*, and other species.

Amongst older well-known species, specially finely flowered, are *Thunia Marshalliana*, with nodding sprays of white flowers with yellow labellums, and *Thunia Bensoniæ superba*, with still larger, deep, rosy-mauve blooms developed from the tips of the stout Bamboo-like growths. These are excellent plants for ordinary decorative purposes; they grow freely, and can be propagated with ease. *Anguloa Clowesii* was noticed with its large pale yellow flowers. *Epidendrum O'Brienianum*, the flowers being scarlet to rose-purple, and *E. Boundii*, orange-scarlet, are largely grown by Messrs. Cypher for arranging in the houses. Mention must also be made of *Brassia verrucosa*, *Oncidium phymatocilum*, *O. macranthum*, and a good batch of *Lycaste Skinneri*.

The collection of varieties of *Vanda tricolor* and *V. suavis* includes several good forms in

ready for use at the same time, and thus there will be a glut on the market.

We are finishing the planting of Cauliflowers among the Melons, which work has had to be delayed this year because we could not leave the lights open at night-time. This ventilation is most necessary for Cauliflowers as soon as they are properly established in their new quarters.

Endives planted early this month on the old manure beds are growing well, and we have planted a batch of Cauliflowers "Driancourt" as an inter-crop, putting one row of Cauliflowers to every three rows of Endives. The young seedlings of Endive and Batavian Green are also doing well, and we are preparing the ground ready for their transplantation in the middle of August.

The Cauliflowers grown as an inter-crop following the Cos Lettuces under the cloches have been cleared, and, as stated in a previous "Note," the beds have been prepared for sowing broadcast a batch of the "Bellot" Carrot. As a rule, this crop is very profitable, but in hot, summer weather the seed does not always germinate freely, and the first growth afterwards is a critical stage. The beds should be

vitality so long. Ever since, when I wished to keep Melon, Cucumber, or Tomato seeds for some time, I have had them sun-dried as taken from the fruits, and not washed, as is often done. *Yorkshire Gardener.*

THE RAINFALL, 1909 (see pp. 5, 19).—Mr. J. S. Higgins, Rig Gardens, Corwen, records 14.3 inches of rain for the first six months of the year, and as Rig is only 30 miles from Dolgelly, it will no doubt interest many to learn that in the same period we registered 22.42 inches, which is considerably less than for the corresponding period of last year, viz., 30.73. For the whole of 1908 the rainfall was 60.4 inches. *F. G. Brewer, The Gardens, Bryntirion, Dolgelly, N. Wales.*

—The rainfall recorded here for the first half of the year 1909 was 13.87 inches, against 16.73 inches in 1908. After a partial drought of 23 days during May our heaviest fall in June was .56 inch on June 25. In May, 1908, we had 1 inch more rain, followed by a fall of 1.62 inch on June 4. The gauge is 1 foot above the ground level and about 650 feet above sea level. *J. Edwards, Sylfaen Gardens, Welshpool.*

SEVERE HAILSTORM IN KENT.—Soon after two o'clock p.m. on the 26th inst. and following upon many showers, there occurred a heavy thunderstorm directly over this place. The results are to be seen everywhere in the devastated vegetation. Most crops are damaged, and many of them are ruined for the season. The flower-beds, which, after nearly two months' unseasonable weather, had begun to look a little brighter under the influence of a few days' sunshine, are now in a hopeless condition, the plants being battered almost beyond recognition, Begonias, Pelargoniums, Heliotropes, &c., being completely smashed. No one in this immediate locality seems ever to have seen anything like it. The storm spent itself in a very small radius, for a mile or two away no hail was seen. *J. G. Weston, Eastwell Park Gardens.* [Specimens of various out-door plants sent us with the above letter only too well bear out our correspondent's description of the injuries inflicted by the storm.—Eps.]

SOCIETIES.

BIRMINGHAM BOTANICAL AND HORTICULTURAL.

JULY 21.—The annual show of Roses and mid-summer flowers was held at the Botanical Gardens, Edgbaston, on the above date. The principal features included Carnations, hardy flowers, and a neatly-constructed water-garden. Considering the cold, late season, Roses were well shown. The weather was fine and pleasant, and the show was visited by a record number of visitors. Two Gold, one Silver-gilt, three Silver and four Bronze Medals, two Awards of Merit and one Cultural Commendation were awarded.

The Right Hon. JOSEPH CHAMBERLAIN, M.P. (gr. Mr. John Deacon), sent a large group of Souvenir de la Malmaison, tree, and border Carnations, showing excellent culture. The plants were sturdy, the "grass" broad and leathery, and the flowers large, shapely and of good colour. The "Malmaison" varieties occupied the front part of the group, and were arranged in three bold semi-circles, the centre one composed of the Old Blush, the other two consisting of the pretty pink Princess of Wales variety. On either side of the "Malmaisons" two dark-flowered varieties—H. J. Jones and Maggie Hodgson—were seen to advantage, and interspersed in the exhibit were good examples of Nautilus (very pale pink) and Draycott (cherry red). Behind these a high broad band was formed of tree and border varieties, backed by Palms, which gave relief. Of Border Carnations Lady Hermione (flesh), Lord Roberts (yellow), Lady Hinton (buff), Sam Weller (yellow ground), Helene Countess of Radnor (dark crimson), Helmsman (white), and King Arthur, an unusually large scarlet flower, were well shown. The tree section was represented by many of the leading varieties. (Gold Medal.)

Mr. A. R. BROWN, Wychell Lane, King's Norton, exhibited a handsome group of Roses arranged in bamboo stands and show boxes. Richmond, Mrs. W. J. Grant, Earl of Warwick, Ulrich Brunner and Queen of Spain were the most meritorious varieties. (Silver Medal.)

Messrs. J. H. WHITE & Co., Worcester, had an assortment of hardy cut flowers and sprays of flowering trees and shrubs. (Bronze Medal.)

W. BYNG KENRICK, Esq., Somerset Road, Edgbaston (gr. Mr. James Webb), exhibited a group of foliage and flowering plants, which included a pretty strain of well-flowered Gloxinias; also double and single-flowered tuberous-rooted Begonias, Hydrangeas, Liliums, Caladiums, and Coleuses, together with a number of bunches of species and varieties of hardy cut flowers. (Bronze Medal.)

From Messrs. GUNN & SONS, Brookfield Nurseries, Olton, Birmingham, came an extensive collection of Roses, Phloxes, and a beautifully-arranged and carefully-planted water-garden. In the water-garden Nymphaea flowers and leaves were to be seen floating on the water, and near the sides such plants as Sarracenias, Rushes, Spirea, Tritonias, Funkias, Grasses, and Foxgloves were grouped with great taste. A rock-work edging along the lower sides was nicely clothed with Campanulas, Ericas, and Ferns. At one corner a clump of plants of Spiraea Queen Alexandra was effective. Of Roses the following varieties were noteworthy: Moss. Joseph Hill, La Tosca, Fran Karl Druschki, Dean Hole, and Tausendschon. A large arch clothed with the variety Dorothy Perkins was much admired. Phloxes bearing huge trusses of fragrant flowers were represented by such excellent varieties as Mrs. Oliver (pink), General Van Hentsz (bright salmon-scarlet), Ironie (pink), Le Mahdi (purplish-blue), Fraulein Von Lassberg (pure white, large, exceptionally good), Tapis Blanc (dwarf, white), and Antoine Mercie (delicate lavender). (Gold Medal.)

THE LAPWORTH NURSERIES, Hockley Heath, Birmingham, contributed 18 varieties of beautifully fresh, but rather small Sweet Pea flowers. (Bronze Medal.)

The best and most effectively-arranged group of hardy cut flowers came from Mr. C. H. HERBERT, Hazelwood Road, Acocks Green, whose flowers were displayed in tall stands and vases. Delphiniums, Coreopsis grandiflora, Chrysanthemum maximum W. H. Gabb, Erigeron speciosus, and Pink "Progress" were shown in large masses. (Silver-gilt Medal.)

W. P. WILCOX, Esq., Park Hill, Moseley (gr. Mr. A. E. Hartwell), exhibited plants of a very good strain of double and single-flowered tuberous-rooted Begonias. (Bronze Medal.)

ROBERT SYDENHAM, LTD., Tenby Street, Birmingham, sent a collection of Sweet Peas containing excellent vases of Saint George, Constance Oliver, George Herbert, Evelyn Hemus, Tuckwood, Helen Lewis, Anna Lumley, Paradise Opal, Mrs. A. Ireland, and Etta Dyke. (Silver Medal.)

Messrs. DICKSONS, LTD., Chester, exhibited hardy herbaceous flowers and Roses. Of the latter we noted good examples of Lady Roberts, Liberty, Killarney, Corallina, Lady Battersea, Mrs. W. J. Grant, and Mme. Ravary. The border flowers included Delphiniums, Pentstemons, Henecheras, English Irises, and Gladiolus. (Silver Medal.)

AWARDS OF MERIT.

Lalio-Cattleya callistoglossa superba.—A large, shapely form of the type, with a very rich, deep purple lip. Shown by the Right Hon. JOSEPH CHAMBERLAIN, Highbury (gr. Mr. John Mackay).

Sweet Pea S. Lee.—Flowers large, salmon-pink over a buff ground. Shown by ROBERT SYDENHAM, LTD., Birmingham.

CULTURAL COMMENTATION.

To Mr. JOHN MACKAY, grower to the Right Hon. Joseph Chamberlain, M.P., for two well-flowered plants of *Cattleya atalanta superba* and *Lalio-Cattleya callistoglossa superba*.

LIVERPOOL HORTICULTURAL.

JULY 21.—This Society held an exhibition of popular flowers in the Corn Hall on the above date. This hall is a very suitable one for the purpose. It is a light building, and is situated in the midst of the business quarters of the city. Unfortunately the weather was detrimental to the holding of a good show. Many growers failed to exhibit owing to the heavy storms of wind and rain just previous to the show day.

In an open class for 18 vases of Sweet Peas, distinct varieties, Mr. R. WRIGHT, Formby, won the 1st prize, staging a capital lot of flowers, including Helen Lewis, Marjorie Willis, St. George, and George Herbert. 2nd, G. H. T. ROBERTSON, Esq., Gresford (gr. Mr. Ernest Jones). For 12 distinct varieties, G. H. T. ROBERTSON, Esq., J. E. PHILLIPS, Esq., Malpas (gr. Mr. W. Davies), and Messrs. S. SALISBURY & SONS were awarded the prizes. Mr. W. DAVIES had the best exhibit of 12 varieties with waved standards.

ROSES.—For 18 single blooms, distinct, J. U. HODGSON, Esq., Bebington (gr. Mr. S. Bell), won the 1st prize, G. H. T. CUTHBERTSON, Esq., being 2nd. This exhibitor had the best collection of 12 blooms of hybrid perpetual varieties. For 12 Hybrid Teas the prize-winners were Messrs. S. BELL, CUTHBERTSON and W. DAVIES.

CARNATIONS.—The best collection of 12 single blooms was shown by Mr. P. CORNELIUS, 2nd, C. ALCOCK, Esq. (gr. Mr. C. Russell). These exhibitors were placed in the same position for six varieties. Sir W. H. TATE, Bart. (gr. Mr. G. Haigh), had the best collection of 12 blooms of Souvenir de la Malmaison varieties.

The best arrangement of Sweet Peas, suitable for a dinner table, was shown by Miss S. PARLOW, Formby.

There were classes for amateurs, in which the exhibits were praiseworthy.

Many noteworthy exhibits were staged "not for competition." The following received Awards of Merit:—Mr. H. MIDDLEHURST, Liverpool (Sweet Peas); Mr. J. LEE (collection of Gooseberries); Mr. W. ROWLANDS, Childwall Nurseries (Roses); Mr. THOS. DAVIES, Wavertree (Liliums and herbaceous cut flowers); Mr. H. ECKFORD, Wem (Sweet Peas); Messrs. W. CONWAY & SON, Halifax (herbaceous cut flowers); Mr. R. WRIGHT, Formby (Sweet Peas); Messrs. YOUNG (Carnations); and Messrs. R. P. KER & SONS (herbaceous cut flowers).

Mr. Harold Sadler carried out the duties of secretary to the satisfaction of all.

MANCHESTER ROSE SHOW.

JULY 21.—This exhibition was held under the auspices of the White City, and Mr. J. Calvin Brown acted as manager. A highly creditable display of blooms was staged, although in many cases they showed the effects of heavy rains.

For 60 distinct single blooms, Messrs. D. PRIOR & SON, Colchester, easily won the 1st prize. Their best blooms were J. B. Clarke, Captain Hayward, Hugh Dickson, Horace Vermet, Bessie Brown, Charles Graham and Maman Cochet. Messrs. G. & W. H. BURCH, Peterborough, were 2nd with smaller but bright blooms.

For 36 distinct single trusses, Messrs. PRIOR & SON again won the 1st prize, Messrs. G. & W. H. BURCH obtaining the 2nd prize.

Mr. G. PRINCE, Longworth, Berks., had the best collection of 24 blooms of Tea or Noisette varieties, showing beautiful blooms of Ernest Metz, Bridesmaid, Mme. H. Berger, Comtesse de Nadaillac, Golden Gate, The Bride, Cleopatra, &c. Messrs. PRIOR & SON were 2nd.

The best collection of 12 blooms of any white or yellow Rose was shown by Messrs. W. & J. BROWN, Peterborough, Messrs. D. PRIOR & SON and THE KING'S ACRE NURSERY Co. obtaining 2nd and 3rd prizes. All three exhibitors staged the variety Frau Karl Druschki.

A similar collection of any other light Rose was shown best by Mr. PRINCE, who staged Dean Hole. Messrs. BURCH were 2nd with Lalie Ashton, and Messrs. PRIOR & SON 3rd with Mrs. J. Laing.

Messrs. PRIOR & SON had the best crimson variety, and Messrs. W. & J. BROWN were 2nd. Both exhibitors showed well-coloured blooms of Horace Vermet.

In the amateurs' classes, exhibits were numerous and good. As many as eight collections were staged in the class for 24 blooms. Mr. E. B. LINDSELL, Hitchin, won the 1st prize with highly-creditable blooms of Horace Vermet, Duchess of Bedford, Bessie Brown, &c. Mr. TOM PARK, Bodale, and Mr. H. W. MACHIN, Workson, won the 2nd and 3rd prizes respectively.

For 12 distinct trusses the prize-winners were Messrs. CONWAY JONES, Gloucester, T. PARK, and R. FOLEY HOBBS.

The best collection of 12 blooms of Tea or Noisette varieties was shown by the Rev. JOHN A. L. FELLOWS.

For 12 blooms of any white or yellow Rose, the Rev. J. H. PEMBERTON, Havering-atte-Bower, Essex, won the 1st prize, and Mr. HOBBS the 2nd prize. Both exhibitors showed the variety Mme. Jules Graveraux.

The best dozen blooms of any light Rose were shown by Mr. R. FOLEY HOBBS, and Mr. H. V. MACHIN was 2nd. The variety Bessie Brown was shown in both cases.

Mr. G. PRINCE had the best 12 bunches of buttonhole Roses.

Silver Medals were given to Messrs PRIOR & SON and Messrs. W. & J. BROWN for the best H.P. or H.T., and the best Tea or Noisette, Messrs. PRIOR & SON staging C. J. Graham, and Messrs. W. & J. BROWN Mme. Jules Graveraux. Sweet Peas were well shown. Mr. J. L. WELCH, Timperley, Mr. C. BURGESS and Mr. G. A. ASHCROFT won the prizes offered for the best collection of flowers arranged in 12 vases.

CARDIFF AND COUNTY HORTICULTURAL COMING-OF-AGE SHOW.

JULY 21, 22.—As we stated last week, the 21st annual show under the auspices of this society took place in the Sophia Gardens, Cardiff. The committee marked its appreciation of the fact that the society had this year attained its majority by increasing the number and value of the prizes, and by making the show generally more attractive to both exhibitors and visitors alike. That this object was fully attained was evident to all those who are acquainted with the society, for never before in its history have so many and so varied exhibits been brought together as on this occasion. The deputation from the R.H.S. alluded to in our previous note consisted of the President (Sir Trevor Lawrence, Bart.), the Secretary (the Rev. W. Wilks, M.A.), and Messrs. Harry J. Veitch, J. Hudson, and H. B. May.

Notwithstanding the cold, sunless season experienced this year, the exhibits hardly showed any sign of it, for on every hand were to be seen flowers, fruits and vegetables which were examples of the best culture, and a credit to those who grew them. At the luncheon, presided over by the Marquis of Bute, Sir Trevor Lawrence congratulated the committee on the excellence of the display, which, together with the reception accorded to the deputation, had so impressed him that he expressed a hope that he would live to visit the city again at some future date, a hope shared by the Rev. W. Wilks.

PLANTS.

For a group of miscellaneous plants in or out of bloom, arranged in a space of 150 square feet, to produce the best effect, excellence of culture as well as taste in arrangement being taken into consideration, Messrs. J. CYPHER & SONS, Cheltenham, were awarded the 1st prize for a well-arranged lot of plants, among which Codæums (Crotons), Aralias, Cocos, and a Kentia Fosteriana (centre-piece) were used as foliage plants, while the requisite amount of colour was imparted by the use of a number of Liliums and a great variety of choice Orchids. Lady HILL, Llandaff (gr. Mr. D. Macintyre), was awarded the 2nd prize. This group was light and pleasing, the main features being composed of Humæas, Crotons and Caladiums, interspersed with Orchids and Maidenhair Ferns. HENRY OAKLEY, Esq., Newport, Mon., was 3rd with a very neat group.

Under identical conditions, excepting that the entries were restricted to amateurs, L. MORGAN, Esq., Llandaff (gr. Mr. G. Wall), showed a group arranged on a space of 50 square feet, for which he received the 1st prize. Crotons, Humæas, Francoas, Celosias, Schizanthus and Streptocarpus were among the principal plants used in this group. The same gentleman was awarded the 1st prize for a group (from which Orchids were excluded) occupying a space of 25 square feet. The plants used were very similar to those in the previous class. Dr. REES, Penarth (gr. Mr. W. Thurston), was 2nd, Liliun Harrisii being the outstanding plant used in this arrangement.

For a collection of six distinct varieties of

tuberous-rooted Begonias there was but little competition, and the quality of the plants staged was not good. 1st, W. GEEN, Esq., Penylan (gr. Mr. W. Metford). Far different from the foregoing was a collection—non-competitive—set up by Messrs. BLACKMORE & LANGDON, Bath. Some of the varieties most admired in this lot were Mrs. W. L. Ainslie, Mrs. G. F. Fry and Col. Turner.

The class for six distinct kinds of table plants growing in 6-inch pots did not cause much competition, and those shown consisted principally of the finer-leaved Crotons, Aralias, Dracænas, and Cocos Weddelliana. 1st, Mr. W. GARNER, Hale; 2nd, Lady HILL; 3rd, J. L. MORGAN.

CUT FLOWERS.

The competition in the class for a collection of Roses arranged for artistic effect, set out in a space 9 feet by 4 feet 6 inches, and limited to a height of 6 feet, resulted in an extremely fine display. Mr. J. MATTOCK, Oxford, won the premier prize in this class and was further the recipient of the R.H.S. Silver Flora Medal. The outstanding varieties in this collection were Gottfried Keller, Irish Elegans, Mme. Abel Chatenay, Countess of Gosford, Marie van Houtte, and Blush Rambler. Mr. JOHN CROSSING, Penarth, was placed 2nd with a collection among which there were several very fine examples of Victor Hugo, Dean Hole, Gustave Regius, and Mrs. J. Laing. 3rd, Messrs. S. TRESEDER & SON, Cardiff. The firm last mentioned was awarded the 1st prize for a collection of 12 distinct varieties of Roses, three blooms of each. Fine examples of Earl of Warwick, White Lady, Duke of Wellington, and Frau Karl Druschki were noticed in this exhibit. THE KING'S ACRE NURSERY CO., LTD., Hereford, were placed 2nd; whilst Mr. H. DREW, Bath, was 3rd. THE KING'S ACRE NURSERY CO. secured 1st position for a collection of Teas or Noisettes, 12 distinct varieties, three blooms of each. Mme. Jules Graveraux, Maman Cochet, Golden Gate, and Mrs. E. Mawley were amongst the best varieties. Messrs. H. DREW and J. TOWNSEND & SONS, Worcester, were placed 2nd and 3rd respectively. Messrs. S. TRESEDER & SON were again placed 1st for a collection of 24 blooms, distinct varieties, out of which J. S. Mills, Dupre Jamain, Horace Vernier, and Earl of Warwick were the most noticeable. In Mr. MATTOCK'S stand—which was awarded the 2nd prize—Lyon Rose and Capt. Hayward were good. Mr. H. DREW received the 1st prize for a stand of 18 blooms of Teas or Noisettes, the most noteworthy varieties being Medea, Muriel Graham, Auguste Comte, and Mrs. E. Mawley. 2nd, THE KING'S ACRE NURSERY CO. 3rd, Mr. J. MATTOCK.

With 12 blooms of the variety Fisher Holmes, THE KING'S ACRE NURSERY CO. took 1st place for the collection of any one variety other than Teas or Noisettes. Messrs. J. JEFFRIES & SON, Cirencester, were 2nd with a box of Her Majesty. THE KING'S ACRE NURSERY CO. showed 12 extra fine blooms of Mrs. E. Mawley, for which they were awarded the 1st prize in the class restricted to one Tea or Noisette variety.

Several beautifully arranged groups of Carnations and Picotees added considerable brightness and interest to the floral displays, and it is pleasing to note the disappearance of the old-fashioned method of exhibiting this lovely flower on a board with each bloom surrounded by a paper collar.

Mr. C. F. WALTERS, Balcombe, staged two fine collections—one of Border Carnations and Picotees and the other of tree or "Malmesion" Carnations—for which in both instances he was awarded the 1st prize. Among the former the most striking were Agnes Soral, Cecilia, Hon. C. Bathurst, and F. Samuelson; whilst in the latter collection Calypso, Mrs. T. W. Lawson, Enchantress, and Britannia were remarkably fine.

The Sweet Peas shown in the various classes were of such quality as to call forth the praises of all who saw them. The substance of the flowers and the robustness of stems and foliage were indications of the great attention which must have been brought to bear upon them by exhibitors.

Mr. T. JONES, Ruabon, displayed a collection of 19 distinct varieties, tastefully arranged with their own foliage (each variety in a separate vase), with which he secured the 1st prize. The King, Marquis of Wilts, John Ingman, Olive Bolton, and Nancy Perkins were well shown.

H. PITT, Esq., Abergavenny (gr. Mr. Townsend), was placed 2nd with a fine lot of blooms.

For 12 distinct varieties, arranged in bunches of 20 to 30 stems, the former competitor was again well to the front; whilst Mrs. JENNER, Wenvoe (gr. Mr. Wheeler), was 2nd.

The suitability of the Sweet Pea for table decoration was demonstrated by Mrs. PHILLIPS, to whom the N.S.P.S. Silver Medal, together with a piece of silver plate, were awarded for the decoration of a dinner table 8 feet by 4 feet. The arrangement was graceful and light, only two varieties—Mrs. H. Bell and Mrs. H. Sykes—being used.

Hardy flowers were a feature of the show. The competition in these classes was keen, and resulted in a very fine display being made. Mr. G. GIBSON, Bedale, Yorks., carried off the first prize for a highly interesting collection. The flowers used were of such great merit that it is difficult to select any for special mention, but undoubtedly the Oriental Poppy Mrs. Perry, the Delphiniums Mrs. Creighton and Ustane, and Gaillardia Meteor were among the best shown. Messrs. WM. ARTINDALE & SON, Sheffield, were placed 2nd; and Messrs. H. & W. EVANS, Llanishen, 3rd.

FRUIT AND VEGETABLES.

Fruit was better represented at the present show than has been the case for a number of years past. The Marquis of NORTHAMPTON, K.G. (gr. Mr. A. R. Searle), staged a fine collection of fruit, for which he obtained the 1st prize. This consisted of dishes of Grape Muscat of Alexandria, Nectarine Downton (extra good), Peach Grosse Mignonne, and Figs, Cherries and Strawberries. The 2nd prize was awarded to GEO. GIBBS, Esq., M.P., Bourton (gr. Mr. T. Wilkinson), who was placed 1st for six bunches of black and white Grapes, the latter being Muscat of Alexandria. D. C. LYSAGHT, Esq., Chepstow (gr. Mr. H. Perry), was placed 1st for two bunches of Black Hamburg and 1st for one bunch of Madresfield Court.

The Hon. VICARY GIBBS, Elstree (gr. Mr. E. Beckett), won the 1st prize for a collection of nine vegetables and 1st for a collection of six varieties. In the former the most important were Cauliflowers, Peas, Carrots, French Beans, and Potatoes, all of which were fine examples of culture.

NON-COMPETITIVE AND TRADE EXHIBITS.

Had no prizes been offered at the Cardiff Show on the present occasion, it would even then have been horticulturally a success, for the great number of non-competitive and trade exhibits were such as to have made an excellent display in themselves.

Two of the most admired exhibits of this character were those set up by the Marquis of BUTE (gr. Mr. H. Farmer)—one a group of flowering and foliage plants and the other a collection of fruit—and were each awarded a Gold Medal.

Awards made by the Royal Horticultural Society.

The deputation from the R.H.S. made the following Awards:—

GOLD MEDALS.—The Marquis of Bute (display of fruit), Mr. W. Treseder (exhibit of floral designs, florists' plants and hardy plants), Messrs. James Veitch & Sons (group of stove plants).

SILVER CUT.—The Marquis of Bute (a group of stove and greenhouse plants).

SILVER-GILT FLORA MEDALS.—Messrs. Blackmore & Langdon (Begonias), Lady Hill (group of plants), Messrs. Cypher & Sons (group of plants), Messrs. Wallace & Co. (rockwork, &c.).

SILVER-GILT BANKSIAN MEDALS.—Mr. T. Jones, Ruabon (collection of Sweet Peas), Mr. Fames (hardy herbaceous plants), Mr. G. Gibson (hardy flowers).

SILVER KNIGHTIAN MEDAL.—The King's Acre Nursery Co. (fruit trees in pots).

SILVER BANKSIAN MEDALS.—Mr. Ellison (Ferns), Mr. E. E. Hole (vegetables), Messrs. W. & H. Evans (rockwork, &c.), Mr. J. Crossling (Roses), Messrs. Bell & Sheldon (Carnations), Mr. R. Went (hardy flowers).

SILVER FLORA MEDALS.—Messrs. Breamore (Sweet Peas), Mr. J. J. Neal, Cardiff (insectivorous plants and Orchids), Mr. L. R. Russell,

Richmond (shrubs), Mr. J. Mattock (Roses), Messrs. Dickson's, Chester (hardy flowers), Messrs. Dobbie (Sweet Peas), Mr. Waters (Carnations).

The Gold Medal of the National Sweet Pea Society was awarded to Mr. Jones for his collection of 19 vases of Sweet Peas.

NON-COMPETITIVE EXHIBITS.

The Cardiff Society made the following awards to non-competitive exhibits:—

GOLD MEDALS.—The King's Acre Nursery Co. (fruit trees in pots), Messrs. Webb & Sons (flowers and vegetables), Mr. Basham, Bassaleg (fruit trees in pots), Messrs. Sutton & Sons, Reading (vegetables), the Marquis of Bute (group of plants).

Messrs. Stephen Treseder & Sons were awarded a R.H.S. Silver Medal for the best exhibit in the various classes for cut Roses displayed in boxes.

ROSE SHOW AT DUNFERMLINE.

JULY 22, 23.—The sixth Rose show under the auspices of the Carnegie Trust was held in the grounds at Pittencrieff Park, Dunfermline, on the above dates. The entries numbered 650, being 20 fewer than last year. This was accounted for mainly in the local classes for Pansies and Violas. The quality of the Roses was better than last year. The late season suiting the English and Irish growers, Scottish cultivators were unable to repeat their triumph of last year. The prize money offered was £200. Competition was keen, especially in the open Rose classes.

The Carnegie Championship.—The prize for 72 cut Roses in not fewer than 36 distinct varieties was won by Mr. HUGH DICKSON, Belfast; Messrs. R. HARKNESS & Co., Hitchin, being 2nd.

Mr. HUGH DICKSON again led for 36 cut Roses in not fewer than 24 distinct varieties; Messrs. R. HARKNESS & Co. winning the 2nd prize.

For 24 cut Roses, distinct, Messrs. R. HARKNESS & Co. were the most successful exhibitors, being followed by Messrs. G. & W. H. BURCH, Peterborough.

Mr. HUGH DICKSON secured the 1st place for 12 distinct blooms.

For 24 Tea or Noisette Roses, distinct, Messrs HARKNESS & Co. won the first prize; and Messrs D. & W. CROLL, Dundee, were 2nd.

The 1st prize for 12 Tea or Noisette Roses was won by Messrs. G. & W. H. BURCH; J. McARA, Crieff, was 2nd.

In the classes open only to gardeners and amateurs, Mr. TOM PARK, Bedale, won the 1st prize for 24 Roses.

Mr. CONWAY JONES, Gloucester, was 1st for 12 blooms, and for 12 Teas or Noisettes.

Messrs. COCKER & Co., Aberdeen, and Messrs. GIBSON, Bedale, won 1st and 2nd prizes respectively for a display of herbaceous flowers.

Sweet Peas were a great show. Messrs. GEO. REID, Dundee, led in three classes; Messrs. SHAW, WATSON (both of Kippen), and YOUNG, Falkland Palace, being seconds.

Messrs. KIDD, Carbery Tower Gardens, and CAMPBELL, Meldrum Gardens, both of Dunfermline, had the best bouquets, baskets and floral devices.

NATIONAL SWEET PEA.

JULY 23.—The ninth annual exhibition of this Society was held in the Royal Horticultural Hall, Vincent Square, Westminster. Despite the fact that Sweet Peas, generally speaking, are not good this year, the exhibition was the finest yet held. The entire hall, with both annexes, were quite filled, whilst the overflow extended to two rooms upstairs.

SPECIAL AUDIT CLASS.

This was for 15 bunches of varieties enumerated in the schedule. The 1st prize included the Sutton Silver Challenge Cup and the Society's Gold Medal. There were eight contestants. Mr. THOS. JONES, Ruabon, was awarded the 1st prize for a fine display, pleasingly arranged. The varieties were Countess Spencer, Helen Pierce, Mrs. Harcastle Sykes, Clara Curtis, Black Knight, Helen Lewis, Constance Oliver, Frank Dolby, Sybil Eckford, Lord Nelson, Evelyn Hemus, John Ingman, Etta Dyke, King Edward VII. and Prince Olaf—not a weak variety

amongst them. Sir R. BAKER, Bart., Rauston, Blandford (gr. Mr. A. E. Usher), was 2nd, having good bunches of John Ingman, Helen Lewis, Mrs. W. Wright, Mrs. Harcastle Sykes, and Evelyn Hemus. CHAS. H. WILD, Esq., The Grange, New Eltham (gr. Mr. E. T. Usher), was 3rd; and Mrs. A. TIGWELL, Harrow View, Greenford, 4th.

In the class for 24 bunches, distinct, W. H. RAWNSLEY, Esq., Well Vale, Alford (gr. Mr. T. Vickers), won the 1st prize in a strong competition. His varieties were Evelyn Hemus, Betty, Helen Pierce, Helen Lewis, Emperor, King Edward VII., A. J. Cook, Mrs. Routzahn, Rosie Adams, Miss Audrey Crier, Alice Godman, Jeanne Gordon, Marbled Blue, Queen Alexandra, White Spencer, John Ingman, White Wings, Jas. Grieve, Sir J. Franklin, St. George, Nelson, Countess Spencer, Minnie Christie and Mrs. A. Ireland. Mrs. A. TIGWELL was 2nd with a good display; whilst Mr. J. T. TUBB, The Gardens, Oakbank, Seal, Sevenoaks, was 3rd.

HENRY ECKFORD MEMORIAL CLASS.

There was a keen fight for the Henry Eckford Memorial Challenge Cup, in which no fewer than 12 exhibitors took part. E. E. MOCATTA, Esq., Woburn Place, Addlestone (gr. Mr. T. Stevenson), was awarded the cup. His flowers were large, fresh, grand in colour, and had good, long stems. The varieties were Elsie Herbert, Countess Spencer, The Marquis, Lavender, George Herbert, Helen Lewis, Clara Curtis, Evelyn Hemus, Rosie Adams, Miss Audrey Crier, John Ingman, Mrs. Henry Bell and Prince of Asturias. Mr. T. JONES followed with some fine specimens, carrying extraordinary foliage. Mr. A. E. USHER won the 3rd prize.

For 12 distinct bunches, Mr. J. HAYCOCK, Waggoners Inn, Wrexham, secured the premier award; and Lady HESKETH, Neston, Towcester (gr. Mr. G. F. Hallett), the 2nd prize.

Class 5 was for 12 bunches, distinct, to include varieties specified in the schedule. This class attracted 18 entries. The 1st prize was well won by Mr. GEO. STEVENSON, who staged splendid flowers of Constance Oliver, Helen Lewis, Nora Unwin, Black Knight (Spencer), Mrs. Collier, The King, John Ingman, The Marquis, Mrs. A. Ireland, Prince Olaf, Princess Victoria and St. George. Mr. T. JONES was 2nd and Mr. A. E. USHER, 3rd.

"HORACE WRIGHT" CHALLENGE BOWL.

This class was for nine bunches of Sweet Peas, distinct varieties, and the exhibits made a very fine display. The Rev. J. McMURDIE, Woburn Park, Weybridge (gr. Mr. A. Basile), was awarded the 1st prize. He staged fine flowers of Jeanne Gordon, Countess Spencer, Helen Pierce, Dora Bredmore, King Edward (Spencer), Nora Unwin, John Ingman, Helen Lewis and Frank Dolby. Mr. G. F. HALLETT was 2nd (losing a little in staging); and Mrs. F. WALLIS, Avondale, West Byfleet, 3rd. There were nine entries.

THE "BREADMORE" CHALLENGE CLASS

provided another keen contest, no fewer than 17 collections being staged. E. A. P. BROAD, Esq., Rosehill, Par Station, Cornwall (gr. Mr. W. H. Prophet), won the 1st prize with some very fine flowers. The varieties were Black Knight, Paradise Red Flake, Etta Dyke, Paradise Carmine, Dora Bredmore, A. J. Cook, Primrose Spencer, M. Christie, Queen Alexandra, Miss Audrey Crier and Henry Eckford. Mr. E. COWDY, Greenhall Mills, Longhall, and Mr. R. HALLAM, Chestnut Grove, Radcliffe-on-Trent, were 2nd and 3rd in the order named.

For six bunches, distinct, Mr. JOHN HAYCOCK obtained the 1st prize for a capital collection with well-arranged bunches. The varieties were Mrs. Wilcox, Nora Unwin, Sunrise, Jas. Grieve, George Herbert and Paradise. Mr. A. E. USHER showed very well for the 2nd prize; whilst Mr. A. LAMBERT was 3rd.

The following class, for six bunches without any restriction as to varieties, proved popular with 30 competitors. Mrs. E. OTTER, Stanhope Park, Greenford (gr. Mr. F. Fairbairn), won the 1st prize with M. Christie, George Herbert, A. J. Cook, Mrs. Harcastle Sykes, Fred. Fairbairn and Frank Dolby; all were very fine flowers and well staged. Mr. A. LAMBERT was 2nd, and Mr. G. BALDWIN 3rd.

The prizes in the competition for the best flowers of the varieties Herbert Smith, Jet, Mother of Pearl and Miss Millie Maslin were won by Messrs. C. KEITH, A. E. USHER, and W. C. WHITE respectively.

For one bunch of the variety Sutton's Queen, E. J. JOHNSTONE, Esq., Groombridge (gr. Mr. A. T. Pockett), won the 1st prize with well-coloured flowers.

THE CLASSIFICATION CLASS (OPEN).

This class is intended to illustrate the colour distinctions in the Society's classification. The premier award was won by Mr. E. KEITH with the following 18 varieties:—George Herbert, Etta Dyke, The Marquis, Queen Alexandra, Jas. Grieve, Frank Dolby, Paradise, Mrs. H. Sykes, Minnie Christie, St. George, Rosie Adams, Hannah Dale, Evelyn Hemus, Jeanne Gordon, Marbled Blue, Sybil Eckford, Helen Pierce and Constance Oliver. Mr. A. E. USHER won the 2nd prize with a good collection; and Messrs. S. BIDE & SONS, Farnham, were 3rd.

For 16 bunches of Sweet Peas in eight varieties, Messrs. JONES & SONS, Cotton Hill Nursery, Shrewsbury, were placed 1st, Mr. A. E. USHER 2nd, and Mrs. A. TIGWELL 3rd.

Class 14 was for 24 varieties, distinct. Mr. C. W. BREADMORE, 120, High Street, Winchester, led with fine examples of Constance Oliver, Mrs. Collier, Dusky Monarch, Elsie Herbert, Apple Blossom Spencer, Queen Alexandra, Paradise Ivory, Mrs. H. Bell, Lavender George Herbert, Mrs. C. W. Bredmore, Snowflake, Mrs. A. Ireland and King Alfonso. Mr. GEO. HUMPHRIES, Langley Nurseries, Chippenham, was a close 2nd, with Mr. W. MARPLE, Summer House, Penkridge, Staffs., 3rd.

The 1st prize in the smaller class for 12 bunches, distinct, was awarded to Mr. W. HOPKINS, who staged fine examples of Miss A. Crier, Prince of Asturias, Nora Unwin and Mrs. Routzahn. Messrs. JONES & SONS were 2nd, and Mr. A. J. PASKETT 3rd.

FLOWERS WITH WAVED STANDARDS.

The classes devoted to varieties with waved standards were very attractive. In that for 12 bunches, distinct, Mr. T. STEVENSON was irresistible. His varieties were Countess Spencer, Paradise Ivory, Black Knight (Spencer), Frank Dolby, Mrs. C. W. Bredmore, Helen Lewis, Mrs. H. Bell, America Spencer, Etta Dyke, Marjorie Willis, Kathleen McGowan and Mrs. Hardcastle Sykes. Mr. A. J. PASKETT was 2nd.

For six bunches of the same type, distinct, there were 50 entrants. Here Mr. F. FAIRBAIRN scored with Asta Ohn, Helen Lewis, Mrs. H. Sykes, Mrs. C. W. Bredmore, Fred. Fairbairn and Nora Unwin in capital condition. Mr. W. H. PROPHET was 2nd, having large flowers though not so fresh as in the 1st prize group.

There were prizes offered for the best three bunches of Paradise, Lavender George Herbert, King Alfonso and Yellowhammer, and excellent specimens of these varieties were exhibited.

E. W. KING CHALLENGE CUP.

This was offered for 12 bunches of the new Unwin and Spencer types. There were 17 entries. Mr. W. H. PROPHET won the 1st prize with splendid flowers, the varieties being The Marquis, Nora Unwin, Mrs. A. Ireland, Paradise Ivory, Helen Lewis, Frank Dolby, George Herbert, Mrs. H. Sykes, St. George, Elsie Herbert, Prince of Asturias and Mrs. H. Bell.

BURPEE CHALLENGE TROPHY.

This was offered for a display of Sweet Peas arranged on a table 4 feet by 3 feet. Mr. R. BOLTON, Warton, Carniforth, secured the premier award. The varieties were Zephyr, Fire King, Prince of Asturias, Chas. Foster, Clara Curtis, Nancy Perkins, Mrs. Chas. Foster, Tom Bolton, President, Mrs. H. Sykes, John Ingman, Mrs. H. Bell, White Spencer, Lancashire, Elsie Herbert, Maggie Stark, and some seedlings—Earl SPENCER, K.G., Althorp Park, Northampton (gr. Mr. Silas Cole), was 2nd; and Messrs. J. LAMB & SONS, The Nursery, Bingham, 3rd.

Mr. A. E. USHER was awarded the 1st prize for 12 bunches of American varieties, staging some very fine flowers. The varieties were Othello Spencer, Queen Victoria Spencer, Asta Ohn Spencer, King Edward Spencer, F. Moro Spencer, Tennant Spencer, White Spencer, Flora

Norton Spencer and Mrs. Rontzahn. Messrs. J. Box and Bolton Bros. were the other winners in the order named.

The division for small growers was very popular, many of the classes having more than 30 entries, whilst the decorative classes were a good feature. The class for dinner tables secured an entry of 21 tables, most of these representing a very high order of merit. Mrs. A. ROBINSON, Northurst, Park Hill, Carshalton, was awarded the 1st prize for a light arrangement of the creamy varieties, and Miss JESSIE G. CUTHBERTSON, Mark's Tey, 2nd. Miss CUTHBERTSON and Messrs. J. LAMB & SONS were made equal 1sts in the class for epergnes; but Miss CUTHBERTSON was awarded the 1st prize for Sweet Peas arranged in a vase.

NON-COMPETITIVE EXHIBITS.

A fine feature of the show was the decoration of the balcony at the end of the hall. Huge Palms, towering high, formed a fine background, whilst stands and vases were filled with Sweet Peas, the front fringed with Asparagus Sprengeri. Great credit is due to Messrs. H. D. TIGWELL & C. H. CURTIS. (Gold Medal.)

The trade were well represented, their exhibits being arranged beside the walls of the building. The following firms made good displays:—Messrs. R. SYDENHAM, LTD., Birmingham; Messrs. DOBBIE & Co., Rothesay (Large Gold Medal); Mr. W. J. UNWIN, Histon (Gold Medal); Messrs. J. HOUSE & SON, Westbury-on-Trym; Mr. ROBERT BOLTON, Watton, Carnforth (Gold Medal); Messrs. W. ATLEE BURPEE & Co., Philadelphia (Gold Medal); Messrs. E. W. KING & Co., Coggeshall (Large Gold Medal); Messrs. G. STARK & SON, Great Ryburgh (Silver Medal); Messrs. GILBERT & SON, Bourne; Messrs. KELWAY & SON, Langport; Miss HEMUS, Upton-on-Severn; Mr. HENRY ECKFORD, Wem (Silver Medal); Messrs. JAS. CARTER & Co., High Holborn, London (Large Gold Medal); Messrs. HOBBIES, LTD., Dereham (Silver-gilt Medal); Mr. CHAS. BREADMORE, Winchester (Large Silver Medal); Messrs. BAKERS, Wolverhampton (Large Silver Medal); Messrs. J. W. KING & SONS, Coggeshall; Messrs. JONES & SONS, Shrewsbury (Large Silver Medal); Messrs. JARMAN & SON, Chard; Mr. W. O. CAUTLEY, Bury St. Edmunds; Messrs. BIDE & SONS, Farnham; Messrs. H. CANNELL & SONS, Swanley (Large Silver Medal); Messrs. G. & A. CLARK, Dover; Messrs. R. H. BATH, LTD., Wisbech; and Mr. W. DEAL, Kelvedon (Silver Medal).

SOUTHERN COUNTIES CARNATION.

JULY 23.—The annual exhibition of the Southern Counties Carnation Show was held on the Royal Pier, Southampton, on the above date. There was plenty of competition to make a representative and good display.

CARNATIONS.

FLAKES AND BIZARRES.—In the class for 12 blooms, distinct, five competed. Mr. H. R. TAYLOR, Oakleigh, Cheam, won the 1st prize with thoroughly good specimens of Mentor, Fireman, Joe Edwards, Torchlight, Murillo, Tom Attrill, Crusader, Gordon Lewis, Admiral Curzon, Bedouin and two unnamed seedlings. Mr. J. DOUGLAS, Edenside Nurseries, Great Bookham, Surrey, was a close 2nd, with Master Fred, Recorder and G. Melville as noteworthy sorts.

Mr. C. H. LINZEE, Bramdean Lodge, Alresford, was the only exhibitor of a collection of six flowers, staging Thalia, G. Melville, Robert Haulgrave and Sportsman.

FANCY VARIETIES.—Mr. DOUGLAS won the 1st prize for 12 blooms, distinct, with desirable blooms of Mrs. Penton, Hidalgo, Liberté, Sam Weller, Mrs. Gardiner, Lord Steyne, and seedlings possessing much merit; 2nd, Mr. HAYWARD MATHIAS, Alresford.

Mr. LINZEE had the best exhibit of six blooms, distinct, and was closely followed by Mr. J. A. FORT, Kingsgate Street, Winchester.

SELF-COLOURED FLOWERS.—Mr. TAYLOR was successful amongst five exhibitors for 12 blooms, distinct, showing commendable examples of Caruso, Snowflight, Maud Allen, Daffodil, W. H. Parton, Cardinal, Sultana and Miss Willmott. Mr. HAYWARD MATHIAS was again 2nd.

Mr. LINZEE and Mr. FORT won the 1st and 2nd prizes for six varieties, both showing creditably

Mr. ARTHUR R. BROWN, Wyehall Lane, King's Norton, Birmingham, won the 1st prize for three blooms of a white variety with Snowdrop; Mr. E. C. GOBLE, The Nurseries, Ryde, won in the similar class for blush or pink, with Blushing Bride; and Mr. H. R. TAYLOR for a salmon self and for terra-cotta and a dark self. Messrs. PHILLIPS & TAYLOR, Lily Hall, Bracknell, won the 1st prize in the class for "yellow" flowers.

Mr. A. F. DUTTON, Iver, Bucks., offered prizes for three American tree varieties. W. H. MYERS, Esq., Swanmore Park, Bishop's Waltham (gr. Mr. G. Ellwood), won the 1st prize with Fair Maid, Mrs. Lawson, and Beacon.

PICOTEES.—For 12 white-ground varieties, Mr. A. R. BROWN won 1st place with Hon. Mrs. Kenyon, Favourite, Queen of Spain, Mrs. Halden, John Smith, and Myra. For 12 yellow-ground Picotees in not fewer than six varieties, Mr. DOUGLAS won the 1st prize with capital blooms of Exquisite, Solomon Giles, Oberon, Santa Claus, Cymbeline, Lady Freemantle, and Burgomaster. Mr. HAYWARD MATHIAS was 2nd.

Encouragement was given to undressed blooms of border varieties, to illustrate their value for

won Messrs. Eckford's prize for nine varieties. For the best table decorated with Sweet Peas there were seven entrants. Mr. F. G. BEALING won the 1st prize quite easily.

TRADE EXHIBITS.

Messrs. B. LADHAMS & SON, Shirley, Southampton, exhibited hardy flowers (Gold Medal), Messrs. W. H. ROGERS & SON, Red Lodge Nurseries, Southampton, Roses in pots and cut blooms of Roses (Gold Medal); Mr. BURNETT, Guernsey, Carnations (Gold Medal); and Mr. J. DOUGLAS, Edenside Nurseries, Great Bookham, Surrey, Carnations.

DEBATING SOCIETIES.

DEVON AND EXETER GARDENERS'.—The annual summer outing was held on the 21st inst. The members proceeded to Plymouth and thence up the river Tamar by special steamer to Pentilite Castle, the seat of Col. Coryton. At Pentilite are many fine specimens of the rarer Rhododendrons, including R. Falconeri, R. Fortunei, R. Aucklandii, R. campylocarpum, and R. campomlatum. Benthania fragifera was represented by some fine trees in full bloom. A specimen of Magnolia

FIG. 35.—ROSE MRS. TAFT; A DWARF POLYANTHA VARIETY WITH ROSE-COLOURED FLOWERS.

This variety has received an Award of Merit from the Royal Horticultural Society. (See p. 345, Vol. XLV.)

out-of-door flowering, but there were not many entries. For 12 blooms Mr. HAYWARD MATHIAS won the 1st prize, showing Sam Weller, Lord Steyne, Viola, Douce Davie, and Mrs. F. Wellesley. Mr. E. GOBLE, Ryde, was 2nd.

Decorated dinner tables with Carnations and Picotees were numerous. Mrs. E. LADHAMS, Alresford House, Southampton, had the best arrangement.

SWEET PEAS.

For 12 bunches, distinct (Mr. Sydenham's prize), A. P. RALLI, Esq., Twyford Lodge, Winchester (gr. Mr. J. Hughes), won the 1st prize with fine blooms of Audrey Crier, Evelyn Hemus, Mrs. Hardeastle Sykes, Mrs. C. Foster, and Helen Lewis as the best. Admiral Sir J. HOOKINS, Greatbridge House, Romsey (gr. Mr. Mattingley), was 2nd. Eight exhibitors competed for Messrs. Toogood's prizes for nine bunches, Mr. F. GREEN, Inverary, The Polygon, Southampton, winning with a capital set. G. H. KITCHIN, Esq., Compton End, Winchester (gr. Mr. D. Grant),

glanca, 12 feet in height, was much admired. Against the buttresses of the terrace, Pomegranates, Lapagerias, Berberidopsis corallina, and Edwardsia Macnabiana seemed quite at home. In a dell were British ferns, Lomarias growing as robustly as Bracken, L. Magelliana was particularly noticeable. A pleasant afternoon was spent in seeing the beauties of the villages abutting on Plymouth Sound and the warships. A. H.

ALTON HORTICULTURAL.—The members visited Aldenham House Gardens, Elstree, on July 21. Mr. Edwin Beckett conducted the party through the grounds. The scenery was much admired. The collection of flowering shrubs and trees afforded much that was of interest. After lunch the kitchen gardens and fruit quarters were inspected.

GUILDFORD AND DISTRICT GARDENERS'.—About 50 of the members visited the Royal Gardens, Frogmore, on Wednesday, July 21. A tour of inspection was made under the guidance of Mr. T. Edwards. The State Apartments were first visited and afterwards the terrace with its flower-beds, the pleasure grounds, and glass department. Next were visited the vineries, Peach and other plant houses. In the kitchen garden also the visitors saw much of interest. Returning to the castle some of the members ascended the Round Tower, whilst others inspected the interesting Alpine garden belonging to Sir Dighton Probyn, Bt. J. G.

MARKETS.

COVENT GARDEN, July 28.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

REMARKS.—English Cherries are arriving in a sounder condition, but there is not much improvement in the demand for them. Bigarreau Napoleon and Waterloo are the most saleable varieties. There is still a few Strawberries arriving, but the bulk of the crop is over. Gooseberries remain very cheap. French Plums, including Gages, are received in larger quantities and are selling freely. Apricots from France are very cheap. Peaches and Nectarines are slightly cheaper. Tomatoes are firm at 3s. to 3s. 6d. per 12 lbs. The demand for vegetables is moderate. E. H. R., Covent Garden, Wednesday, July 28, 1909.

— May Queen	4 0-4 9

REMARKS.—There is no alteration in prices, and conditions remain the same as last week. Edward J. Neuborn, Covent Garden and St. Pancras, July 28, 1909.

COVENT GARDEN FLOWER MARKET.

After this week, until next April, the Flower Market will not be open for the sale of pot plants except on Tuesdays, Thursdays, and Saturdays. For cut flowers the market will be open every morning, but on Mondays, Wednesdays, and Fridays the sales will not commence before 7 a.m., and they will continue for two hours. At the many wholesale stores about the vicinity of the market cut flowers can be purchased up to mid-day, and often later. I have recently visited several nurseries, and I find the growers complain that their secondary crops are all backward.

POT PLANTS.

Supplies of good flowering plants are abundant. Large quantities of white-flowered Marguerites of good quality failed to find purchasers this morning. Hydrangeas also are over plentiful. Fuchsias are seen in large quantities. These plants are well grown. The supply of Rambler Roses is not exhausted, but it will not last much longer. The dwarf Polyantha varieties are later. Campanula isophylla alba and C. i. Mayi are both very finely flowered. Pelargoniums in all sections are remarkably good. Best plants of Lobelia in 4-inch pots are much scarcer. One salesman informed me that he has sold all his stock and has since had several enquiries for more stock. Verbenas are good, and supplies will last for some time to come. The pink-flowered Spiraeas are not much in demand. Rhodanthes is nearly finished for the season. Stocks of Mignonette hold out well. The plants are much better than those usually seen so late in the season. Musk is also good. Well-flowered plants of Coreopsis are plentiful. In Ferns, the plumose fronded Nephrolepis are very good. They may be purchased at reasonable prices. A few Chrysanthemums are seen.

CUT FLOWERS.

Supplies all round are over abundant. Good Roses may be bought for about 6s. per dozen bunches, but this does not apply to extra special blooms on long stems. Carnations also are very cheap. Much better blooms of white varieties are seen than was the case a few years ago. Eucharistia is the most plentiful. Good crimson Carnations are scarcer. Lilliums were making slightly advanced prices this morning, but these may not be maintained. Blooms of L. auratum are of much better quality, and there are some very well-coloured examples of L. speciosum rubrum. Double white Stocks are remarkably fine. I measured some bunches this morning which, including stems, were fully 3 feet long; the flower-spikes were proportionately massive. Asters are of fairly good quality, but they are not selling freely. Sweet Peas are considerably over done, and many of the flowers are wasted. Gypsophila paniculata is marketed in large quantities, but it is not yet at its best. Gladioli, of several types, are good. I noted a very pretty pink-flowered variety of the gandavensis section. The only flowers that are scarce are best Orchids. Hardy flowers are seen in huge quantities.—A. H., Covent Garden, July 28, 1909.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending July 24, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The temperature was equal to the average in England N.E., slightly above it in England E., and below it elsewhere, in Scotland N. and W. The departure from the normal was nearly 2°. The highest of the maxima occurred during the earlier half of the week, and ranged from 76° in England E. and 75° in England S.E. and S.W. and the Midland Counties to 68° in Ireland N. and to 64° in Scotland N. The lowest of the minima were registered at most stations on the 20th, where they varied from 40° in Scotland N. and England S.E. to 46° in England E. and N.W. and to 53° in the English Channel. The lowest grass readings reported were 31° at Llanquar-march Wells, 34° at Birmingham, and 36° at Crathes, Hereford and Greenwick.

The rainfall was considerably more than the average in Scotland N. and W. and England N.W., and about normal in Ireland, but less in all other districts, the fall being much below the normal in England E., S.E. and the English Channel. Douglas and some Scottish localities experienced more than an inch on one of the later days of the week. Holyhead 1.5 inch. The bright sunshine somewhat exceeded the average except in Scotland W., England N.W., and the English Channel. The percentage of the possible duration ranged from 55 in England S.E. and 54 in England E. to 29 in Scotland N. and Ireland N. and 28 in England N.W.

THE WEATHER IN WEST HERTS.

Week ending July 28.

A cold and wet week.—All the days of the past week were cold for the time of year, and also most of the nights. The ground is now very cold for July, being 9° colder at 2 feet deep, and 4° colder at 1 foot deep, than is reasonable. Rain fell on all but the first day of the week, and to the total depth of nearly an inch—by far the greater part of that amount was, however, deposited on one day, the 27th inst. For the first time since the beginning of the month a few drops of rain-water came to-day through the soil gauge on which short grass is growing. On the same day 14 gallons passed through the bare soil gauge. The sun shone on an average for six hours a day, which is about a quarter of an hour a day short of the average duration at this period of July. The winds have been as a rule moderately high, and in the windiest hour the mean velocity amounted to 16 miles in direction W.S.W. For the third week in succession the direction of the wind has been almost exclusively some westerly point of the compass. The mean amount of moisture in the air at three o'clock in the afternoon exceeded a seasonable quantity for that hour by 8 per cent.—E. M., Bockhamsted, July 28, 1909.

GARDENING APPOINTMENTS.

[Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting Box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.]

Mr. WALTER WAINWRIGHT, for 7½ years Gardener to the late RICHARD HOBSON, Esq., J.P., D.L., The Marfords, Bromborough, as Gardener to Mrs. STEPHEN WILLIAMSON, Copley House, Thornton Hough, Cheshire.

Mr. W. PHILLIPS, for the past 11½ years Gardener and Bailiff to J. H. BUXTON, Esq., as Gardener to W. INGLIS-JONES, Esq., Derry Ormond, Llangybi, Cardiganshire. (Thanks for 1s. contribution to the K.G.O. Fund.)

Mr. GEORGE A. RIPLEY, for the last 10 years Gardener to Viscount DEERHURST, as Gardener to JOSEPH PIKE, Esq., Dunsland, Glaninire, co. Cork.

Mr. G. BOOTH, previously Foreman at Poltimore Gardens, Devon, and Canwell Hall, Staffordshire, also at Aske Hall, Yorkshire, as Gardener to Lady PAYNE GALLWEY, Thirskley Park, Thirsk, Yorkshire.

Mr. W. RICH, for 2½ years Gardener to C. E. LACY-HULBERT, Esq., Mayfield, Cheam, and previously for many years Gardener to the late General G. B. FISHER, Paignton, Devon, as Gardener to FRANK REE, Esq., Antonsy, Pinner, Middlesex.

Mr. GEORGE BAILEY, for the past 5 years Foreman at Studley Royal Gardens, Ripon, as Gardener to A. J. MURRAY, Esq., The Hall, Thornton-le-Street, Thirsk, Yorks.

CATALOGUES RECEIVED.

JAMES VEITCH & SONS, LTD., Royal Exotic Nursery, Chelsea, London—Strawberry plants.
GEORGE BUNYARD & CO., LTD., The Royal Nurseries, Maidstone—Strawberry plants.
WILLIAM BULL & SONS, King's Road, Chelsea, London, S.W.—Orchids.
F. HERBERT CHAPMAN, Rye—Daffodils.
LITTLE & BALLANTYNE, Carlisle—Bulbs.

Obituary.

EUGENE-EMERY TRANSON.—A well-known French horticulturist has passed away in the person of Mons. Eugène Emery Transon, whose death occurred last week at his residence, 1, Route d'Olivet, Orleans. The deceased nurseryman was 72 years of age. The funeral took place on the 23rd inst.

JOHN THORPE—On July 15, at Chicago, Mr. John Thorpe died in his 70th year, after a long illness. Mr. Thorpe had been for many years a prominent figure in American horticulture. "Uncle John," as he was familiarly known, will be remembered by British visitors to the Chicago World's Fair as the superintendent of the horticultural department. He had come to Chicago in 1892 for the purpose of laying out the exhibition grounds there. Thorpe was born at Keyham, in Leicestershire, England, in 1842. He was a member of the firm of Bell & Thorpe, nurserymen and florists, of Stratford-on-Avon. On the break up of the business in 1874, Mr. Thorpe went to the United States, joined the well-known firm of Hallock & Son, and became exceedingly popular in the American horticultural trade. He raised many seedling Pelargoniums and is credited with having raised the variety known as "Happy Thought." Having a natural liking for cross-fertilisation, he also raised many good Chrysanthemums and other plants. He was very fond of flowers of all kinds, and had a good knowledge of their culture and nomenclature. The Society of American Florists owes its inception to John Thorpe, and he was its first president in 1884-5. Had he lived he would have been an interested and interesting visitor at the 25th annual convention of this organisation, which is to be held at Cincinnati next month. The Ohio City was the venue of the first convention in 1895. Thorpe's memory will be kept green in America by the Rose Uncle John, which is a popular market variety here. Genial, kindly, and companionable, the personality of John Thorpe will be missed by a large circle of friends. *H. R. Richards, Chicago.*

ENQUIRY.

PRIMULA.—Are there other species of Primula besides *P. japonica* and *P. denticulata* which would grow easily and seed themselves in the damper parts of the wild garden? I am told by friends that *P. sikimensis* does not really do well, as it has constantly to be replanted. But of recent years this genus has been enriched by discoveries in China. Concerning many of these species I have no experience. *B. L.*

BOOKS: *E. M. W.* We do not know a book of the description required.

CARNATION: *Waltham and G. J. II.* The plants are affected with Sclerotinia disease. Those already attacked cannot be saved, and should not be used for layering. Treat the soil with quicklime.

CUCUMBER: *H. C., W. W. C. and F. E. S. & Co.* The plants are subjected to an excess of humidity in the atmosphere, no less than in the soil. Give increased ventilation, especially in the early hours of the day.

GRAPES: *W. Gower.* The fungus *Gloeosporium ampelophagum* is undoubtedly present on some of the shoots. All such spotted shoots should be cut out and removed to the fire heap.—*J. C.* See reply to *W. C.* under "Nectarine."

INJURY TO THE SKIN CAUSED BY CONTACT WITH CERTAIN LIVING PLANTS: *J. W., Horsham.* If you refer to the issue of *Gardeners' Chronicle* for August 8, 1903, p. 110, you will find an article on the subject of plants and skin irritation. The statement made by your friend rests on a basis of truth, although in its baldness it may exaggerate the facts of the case.

LINNEAN: *Instructor.* Candidates for Fellowship are admitted by election. Write to the secretary of the Linnean Society, Burlington House, Piccadilly, London, W.

MARROWS: *W. C.* Your specimens present no appearance of disease. The failure is due to something unsuitable in the cultivation afforded the plants.

MELON: *S. O. J.* See above reply to *H. C., W. W. C.* and *F. E. S. & Co.* under "Cucumber."

NAMES OF FRUITS: *J. Nicol.* The cardboard box in which you packed the Peach fruit was so damaged in the post that the fruit itself was smashed before delivery here.

NAMES OF PLANTS: *W. D.* A species of *Linaria*, probably *L. reticulata*.—*G. H. S.*: 1, *Actea spicata*; 2, *Valeriana Phu*; 3, *Erythrochate palmatifida* (syn. *Senecio japonicus*); 4, Not recognised; 5, *Lysimachia vulgaris*; 6, *Lychnis chaledonica*; 7, specimen withered; 8, *Lilium Martagon*. (Thanks for 1s. received for R.G.O.F.)—*H. B.* 1, Crown or Mummy Pea; 2, *Lathyrus rotundifolius*; 3, *Typha angustifolia*.—*A. E. S.* 1 and 2, *Sedum Sieboldii* probably, send when in flower; 3, *S. spectabile*.—*G. H.* 1, *Thalictrum flavum*; 2, *Lysimachia vulgaris*; 3, *Polemonium reptans*; 4, *Orobanchis lathyroides*; 5, *Lychnis chaledonica*.—*A. P.* 1, The specimen was withered; 2, *Inula salicifolia*; 3, *Platyodon grandiflorum*; 4, *Gaultheria Shallon*; 5, *Ajuga reptans*; 6, *Lysimachia vulgaris*.—*T. T.* 1, *Scabiosa ochroleuca*; 2, *Astrantia carniolica*; 3, *Sidaelea malvaeflora*; 4, *Eriogonum fruticosum* Youngii; 5, *Veronica virginica* var.; 6, *Anthemis tinctoria*.—*B. R. D. & S.* *Abies cephalonica*.—*J. D. W.* 1, *Lonicera tatarica*; 2, *Ozothamnus rosmarinifolius*; 3, *Spiraea Thunbergii*; 4, *Cotoneaster microphylla* var. *glacialis*; 5, *C. Simonsii*; 6, *Ligustrum japonicum*.—*Legem.* 1, *Strobilanthes* sp.; 2 and 3, *Philadelphus* sp. (not recognisable); 4, probably *Rhus Toxicodendron* (Poison Ivy); 5, *Halesia hispida*; 6, *Cotoneaster Simonsii*; 7, *Spiraea canescens*; 8, *S. japonica*; 9, *Clematis* species.—*W. J.* 1, *Rebmannia angulata*; 2, *Adiantum cuneatum*, strong-

growing var.; 3, *Tilia platyphyllos asplenifolia*; 4, *Berberis vulgaris purpurea*; 5, *Rhus Cotinus*; 6, *Spiraea discolor*.—*C. A.* 1, *Pteris arguta*; 2, *Selaginella caulescens*; 3, *Lygodium japonicum*; 4, *Davallia bullata*; 5, *Asplenium alatum*; 6, *Blechnum orientale*.—*H. E. T.* 1, *Abutilon Golden Gem*; 2, *Abutilon Princess of Wales*; 3, *Adiantum formosum*; 4, *Magnolia acuminata*; 5, *Asclepias curassavica*.—*Urgent.* *Adiantum Capillus-veneris*.—*N. H. P.* *Digitalis lutea*.—*A. W. A.* We cannot undertake to name garden Roses; 9, *Spiraea japonica callosum*; 10, *Bambusa gracilis*; 11, *Spiraea media*; 12, *Hedera Helix glomerata*; 13, *Hedera canariensis aurea*, arborescent form.—*F. H. J.* 1, *Adiantum excisum*; 2, *Adiantum cuneatum Pacotii*; 3, *Cyrtomium Fortunei*; 4, *Panicum plicatum*; 5, *Bambusa Fortunei*; 6, *Abutilon Savitzii*; 7, *Begonia Madame Anna Low*.—*R. O. Y.* 1, *Oncidium obryzatum*; 2, *Oncidium prætexatum*; 3, *Odontoglossum Coradinei*; 4, *Brassia verrucosa*; 5, *Maxillaria pieta*.—*J. C. Knowle.* Crown or Mummy Pea. *Pisum elatius*, known in gardens as *Pisum sativum* var. *umbellatum*.—*E. B.* 1, *Helenium pumilum*; 2, *Rudbeckia laevigata*; 3, *Lychnis chaledonica*; 4, *Galega officinalis*; 5, *Alströméria aurea*.—*Fencote.* *Dictamnus fraxinella*.—*T. B. G. & Son.* The specimen was sent without foliage: it is probably *Lychnis grandiflora*.—*E. T.* *Phalaris arundinacea* variegated variety.—*R. G.* 1, *Achillea Patrnica*; 2, *Pulmonaria mollis*.—*A. W. C.* Probably *Ptelea trifoliata*; send again when in flower or fruit.—*H. H. R.* *Olearia macrodonta*.

NECTARINE FRUIT: *W. C.* Soft fruits such as Nectarines, Peaches, Cherries, and Gooseberries, frequently split their fruits owing to an excess of moisture in the soil or atmosphere or both. You have probably noticed that the number of split Cherries this year is quite extraordinary, whereas in a dry, hot season such a thing is scarcely known on out-of-doors trees. As your Nectarines have been cultivated indoors, it may be useful to say that a tendency to splitting is caused by extreme conditions following quickly upon each other. For instance, if the borders are allowed to become very dry, and then for a time they are flooded with water, a set of conditions is produced which frequently results in splitting. Steady, rather than fitful, growth is to be encouraged. You should not apply any artificial or other kind of manure to a tree exhibiting the condition of which you complain.

PEAR FRUITS: *Jno. McC.* The fruits have been checked in growth at an early stage, causing the rupture of the skin and subsequent out-growths. There is no fungus disease present.

PLANE TREES: *J. L. R.* The trouble is caused by the fungus known as the Plane leaf scorch (*Gloeosporium nervisequum*). It is too late to employ remedies this season. Carefully collect and burn all fallen leaves. Spray the trees with dilute Bordeaux mixture next spring when the leaves are unfolding.

POLYGONUM BALDSCHUANICUM: *F. A. E.* The specimens are not affected by any fungus disease. There is something unsuitable to the plant in the soil or surroundings.

TOMATO DISEASED: *F. E. G.* The plants are attacked by "black rot." The fungus causing the disease enters by means of the style or through minute cracks in the skin. Remove and burn the affected Tomatos, and spray the plants—especially the flowers just before they set—with potassium sulphide, using ½ ounce in two gallons of water. Be careful not to spray the woodwork, as this chemical turns paint black.

WEED ON LAWN: *C. W.* The specimen was small and shrivelled. It is probably *Prunella vulgaris* (Self-Heal). Apply some nitrogenous manure, such as sulphate of ammonia, in small doses. This will cause the grass to grow vigorously, and in time crowd out the weeds.

***THE RATTANS OR ROTANGS.**

THE eleventh issue of the *Annals of the Royal Botanic Garden, Calcutta*, consists of an illustrated monograph of the genus *Calamus* by the eminent botanist and traveller, Dr. O. Beccari. Like most of its predecessors, it comprises more than one volume. In this instance there is a quarto volume of letterpress of 518 pages, and a folio volume, 22 inches by 15 inches, containing 238 plates. To say that it is a monumental work, apart from size, is to give no idea of the immense amount of labour and skill expended on it. During a long and very active life the author has made a special study of the Asiatic Palms, both in the forest and in the herbarium, and it may be safely asserted that there is no person, either of the past or present, with whom to compare him for knowledge of this family, at least as represented in the old world. Indeed, we feel that a critical review of this work which is the result of so many years of observation and investigation is impracticable. But an appreciation may be useful, especially as the book, from its size and cost, will be accessible to most persons only in the larger botanical libraries.

* *Asiatic Palms—Lepidocarpeae*, by Dr. Odoardo Beccari. Part I. *The Species of Calamus*, with 238 plates. *Annals of the Royal Botanic Garden of Calcutta*. Vol. XI. Calcutta: Printed at the Bengal Secretariat Press, 1908. Price Rs. 100, or £7.

The monograph is appropriately dedicated to the "illustrious memory" of William Griffith, author of the *Palms of British East India*, whose premature death in 1845, at the early age of thirty-five, was a great loss to botanical science. This dedication, preceded by the quotation, "In palmis semper-juvenis; in palmis resurgo," is followed by a preface, in which the author relates that he had prepared a monograph of the genera *Calamus* and *Dæmonorops* many years ago, with the intention of publishing it in his *Malesia*, but funds failing "the present monograph would probably never have seen light had it not been my good fortune, in 1899, to meet in Florence Sir George King, who most courteously and generously offered to arrange for the publication of the work in the *Annals of the Royal Botanic Garden of Calcutta*."

We learn also from this preface that the author had the advantage of examining and comparing the specimens of *Calami* belonging to all the principal herbaria of the world, including that of Kew, "which has been my main source of information regarding the *Palms* that form the subject of the present study."

The preface, dated 1905, is succeeded by a comprehensive "Introductory Essay" treating of the biological and organological characters of the genus *Calamus*; of its economic products; of its position in cultivation, and of the genus from a variety of other aspects.

Concerning *Calami* under cultivation, Beccari's remarks are disconcerting and inconclusive, for these show that the nomenclature employed is beyond correction in most cases. In his own words "the names by which cultivated *Calami* are known to horticulturists are, with hardly an exception, incorrect; and since, on the other hand, horticulturists are in the habit of putting on the market small seedlings or very young non-characterised plants, the foliage of which usually exhibits much uniformity in the various species and always differs considerably from that of the adult plant, it becomes very difficult for a botanist to reduce the species, rashly proposed by horticulturists as new, to their true position in scientific nomenclature." Further: "In the French edition of Nicholson and Mottet's *Dictionnaire d'Horticulture*, twenty-one cultivated species of *Calamus* are enumerated, and many of them bear the names of very well-known species, but, as it appears to me, in almost every instance misapplied."

The only species known to Dr. Beccari as having produced flowers in Europe are *C. ciliaris* and *C. javensis*, the latter cultivated at Kew under the name of *C. trinervis*. Some account of the former is given in the *Gardeners' Chronicle* for February 6, 1897, p. 86, f. 23. To these may be added *Dæmonorops Jenkinsianus*, which has flowered at Kew. Dr. Beccari, it may be mentioned, distinguishes *Dæmonorops* from *Calamus*, with which it is united by some authors, though not by any character easily explained, but by combinations of characters not repeated in the two genera.

The following notes may be useful to the cultivators of *Calami*: "The plants of *Calami* never have deep roots, and they acquire a luxuriant habit in the superficial layer of humus of the tropical forests, when

this overlies a siliceous subsoil, because *Calami*, like almost all other kinds of *Palms*, avoid a calcareous subsoil.

"In cultivation *Calami* thrive best in a compost of equal parts of sandy loam and vegetable soil formed by decomposed leaves. They require a warm, moist atmosphere and copious watering. I have, however, to observe that *Calami* grow in very different situations, from marshy plains at the level of the sea up to an elevation of 2,000 metres (about 7,000 feet), so that in the cultivation of *Calami*, as in that of any other plants, it is necessary to know beforehand the natural conditions of their existence and to modify their cultural conditions accordingly. If this be borne in mind, it may be found that probably not a few of the mountain species of *Calamus*, as for instance those of the Himalaya and Assam, will thrive better in the temperate, than in the hothouse, while others should receive the treatment of aquatic plants in warm water."

Respecting the uses of the stems, canes or rattans of the *Calami*, we learn that *C. javensis* and allied species have the most slender canes. They are employed entire for binding purposes and for making chairs, blinds, mats, baskets, fishing tackle, and a variety of other purposes. The larger and stronger canes of *C. rudentum*, *C. ornatus*, *C. palustris*, *C. albus* and others, are used entire as cables, &c. Particulars are given of the preparation of the various kinds of cane for different purposes. So far as the author is aware, no attempt has been made to cultivate *Calami* for economic purposes either in their native countries, or in countries having a similar climate.

Dr. Beccari describes 200 species of *Calamus*, which he considers as about two-thirds of those actually existing. They are generally spread, and most abundant in the warm regions of Asia, one species extending as far north as Kumaon in the west, and one to North Formosa in the east. Five species are known to occur in Australia, one extending southwards to the Clarence River, in lat. 29° 30', and eight species have been found in tropical Africa. Most of the species are endemic in somewhat restricted areas. Contrary to one's preconceived ideas, the *Rotangs*, we are told, are never gregarious, but always grow isolated in the forest, and none of the species is ever so abundant as to give a special character to the forest vegetation; and they are never met with in the secondary forest, or in that which springs up after the primary forest has been destroyed. A few species are of erect habit, and the rest climb over trees by means of hooked spines. The stems are always slender, sometimes very slender, not more than a quarter to a third of an inch in diameter, as in *C. javensis*, attaining in this species a length of 10 feet to 30 feet. The total length of the stems of *Calami* has, according to our author, been greatly exaggerated. Roxburgh describes his *C. extensus* as having stems 200 yards to 300 yards in length, and Loureiro assigns to his *C. rudentum* a length of 500 feet; whereas of all those measured by Beccari none exceeded 150 feet.

Dr. Beccari classifies the species of *Calamus* in sixteen defined groups. Diagnoses of eight to ten lines upon each species follow, and these are succeeded by full detailed descriptions and

details of distribution, which, including observations, occupy, on the average, nearly two pages for each species.

A list of names of unknown and excluded species includes no fewer than twenty-three names applied to cultivated plants which the author has not been able to identify. Some of them have been given to species of *Demonorops*, whilst others were given to plants which have entirely disappeared from cultivation.

The volume of magnificent plates illustrating this monograph calls for something more than mere mention. Apart from two quarto lithographed plates showing the general structure of the inflorescence and flowers, and a few folios, they are prints of Dr. Beccari's own photographs, admirably reproduced by a firm of printers in Florence. It is no detraction from the merits of other illustrations of herbarium specimens of Palms to say that the present series surpasses by a long way all previous productions. We are not acquainted with all the details of Dr. Beccari's mode of procedure, but we know that the specimens were detached from the sheets of paper and photographed in space with a near background without the labels. The effect is perfect. Exclusive of margin, the plates are 17 inches by 11 inches, and the figures, so far as we can judge, are uniformly of natural size. The absence of floral analyses is fully compensated by the detailed descriptions. Besides, the distinctive characters are derived mostly from the armature, leaves, inflorescences and fruits. The value of these plates is greatly enhanced by the fact that no one establishment possesses specimens of a large percentage of the species. In each instance the source of the specimen represented is recorded.

We congratulate the author and the botanical world on the appearance of this great work, due to the energy of the late Sir George King, the hearty co-operation of Lieut.-Colonel Prain and Captain Gage, his successor at Calcutta, and the munificence of the Government of Bengal. *W. Botting Hemsley.*

NOTES FROM THE BOTANIC GARDENS, CAMBRIDGE.

A good collection of hybrid Roses is now in flower. The following are hybrids of *Rosa rugosa*:—*Fimbriata* is a charming Rose with light green foliage and delicate salmon-tinted flowers, its distinctive quality being the prettily fimbriated petals; *Mme. Georges Bruant* is a white variety, with reddish stems and deep green foliage; *Rose Apples* is an extremely fine pink Rose, very profuse in flowering; *Mrs. Anthony Waterer* is one of the finest red varieties of this section; *Mercédès* has beautiful, pale pink flowers of large size; and *R. rugosa repens alba* is a creeping plant that produces large, single, pure white flowers, the petals of which curve in all directions, giving a delightfully informal effect. This last is one of the best for covering large spaces quickly, and is most distinct in flowering freely about 8 or 9 inches from the ground.

The *Wichuraiana* hybrids include a number of popular kinds, but I will mention only two. *René André* is without doubt one of the most charming. The buds are of a delicate salmon tint, and the open flowers are inclined to pink. *Ruby Queen* forms a low bush and produces large numbers of bright pink flowers.

Among *Polyantha* Roses I may specially mention *Helene*, a strong grower, producing trusses of delicate semi-double pink flowers, associated with beautiful green foliage; *The Lion* is an extremely large, single, red flower, measuring 4 to 4½ inches across; *The Dawson Rose* is particularly free in flowering, the blooms being semi-double and pink.

The principal parents in each group are also in flower, namely, *R. rugosa*, *R. Wichuraiana*, and the typical *R. polyantha*, more correctly known as *R. multiflora*. It is worth remark that they are all Japanese species.

HYDRANGEA PETIOLARIS.

This plant has made a fine show this season, growing on the east side of a wall. The main growth bearing the flower-heads has reached the top of the wall, and is extending upon an adjoining roof. The leaves are broadly ovate cordate, and are borne upon petioles 2 to 3 inches long. The plant makes a very handsome climber, and attaches itself by its own roots. It is sometimes confounded with *Schizophragma hydrangeoides*, but differs in having four or five styles, whilst *S. hydrangeoides* has but one, and flowers in autumn instead of June. It is a native of Japan.

HALESIA HISPIDA.

This plant is greatly admired on account of its gracefully drooping inflorescences. It is a hardy, deciduous tree, 20 feet in height, and bears charming white flowers in panicles. The leaves are large and very attractive, ovate in outline and of light green colour (see fig. 37).

[Photograph by R. S. Lynch.]

FIG. 36.—*VACCINIUM SERRULATUM* VAR. *LEUCOBOTRYS*.

VACCINIUM SERRULATUM VAR. *LEUCOBOTRYS*.

This species is very attractive in the temperate house on account of its wax-like, pure white berries, which hang in numerous racemes 2 to 3 inches long. Each berry is produced upon a tapering white stalk, at its apex is a black spot which is surrounded by five black points, the remains of the calyx limb. It is a most attractive plant, as will be seen by the accompanying illustration (fig. 36), and quite uncommon.

LONICERA GRATA

is now the most ornamental shrub in flower. In the *Kew Handlist* it appears to be referred to *L. Caprifolium*, but it differs from the latter in not being a climber. In Rehder's synopsis of the genus in the *Missouri Botanic Garden Report* (1903) it is placed under *L. Caprifolium* f. *parvifolia* as a hybrid with *L. italica*. At Cambridge it forms a round, spreading bush, requiring no support, and is 4 to 5 feet high. The buds are reddish-pink, whilst the interior of the open flower is of a delicate cream colour, the external colour remaining the same as in the bud. The flowers are very fragrant, and are borne in clusters of about four whorls at the end of all the very numerous branches. The leaves are about

2 inches long, ovate, glabrous, and slightly glaucous beneath, the upper ones being connate. According to Rehder, this hybrid is found near Lyons, and at Istria, near Trieste, and is very rare even in regions where the two parents grow together. The plant here referred to, with its obovate lower leaves, appears to answer the description of *Lonicera grata* of Aiton in *Hort. Kew*, ed. I, i. 251. It is always referred to as North American, but this appears to be wrong. Rehder says in his synopsis, "There has never been found in North America a plant undoubtedly native which could be referred to *L. grata*, Ait." Apparently, Rehder has seen specimens from the localities above mentioned to which he attributes the plant. *R. Stewart Lynch.*

NURSERY NOTES.

STUART LOW & CO., ENFIELD.

NOTWITHSTANDING the deluge of rain during these last few weeks, the Roses at the Bush Hill Park Nurseries, if not looking at their best, gave me the opportunity of noting the weatherproof varieties—those which were the least affected by wet. The stock of dwarfs, ramblers, and climbers seem to have revelled in the moist conditions, and growth was in almost every case most cheering in robustness, height, general healthiness, and profusion of flowers and flower-buds. Surprisingly fine were General McArthur, of rare fragrance, one of the best H.T.s; Betty, H.T., of a coppery tint, with large, long petals; Antoine Revoire, H.T., a splendid grower; *Mme. Segond Weber*, a fine H.P. variety of a pink colour, of American origin; W. Shean, H.T., also of a pink colour, very large, of fine form and great substance, the plant growing well in the heavy loam of this nursery; and Mrs. W. J. Grant, H.T., of a true pink colour, a large and full flower. The climbing variety of this Rose has striking foliage, large and bronzy, as are the shoots. *Lady Faire*, a sport from Mrs. W. J. Grant, is a very beautiful flower. *Dean Hole* seemed to be late in flowering and the growth of the plants was weak and short—only here and there were flowers visible. One of the finest novelties is *Paul Lede*, a white flower with a yellow suffusion at the base of the petals; *Killarney*, a big, filbert-shaped flower of pale pink, shaded blush and white, a hardy, free-flowering H.T.; *Richmond*, H.T., too well known to need a description; *Reine Olga von Wurtemberg*, H.T., a bright crimson; and *Flora Fairfield*, a pink-flowered Rambler, and profuse bloomer. Every side shoot of *Flora Fairfield* bears many blooms, consequently its flowering season is more prolonged than that of any other of its class. Of *Minnehaha* and *Hiawatha*, fine ramblers, a large number was observed.

In the Carnation houses were the following perpetual-flowering varieties, growing in about 9 inches of soil deposited on "benches," as the Americans term these contrivances for dispensing with flower pots:—*Red Lawson*; *Victory*, a true scarlet; *Black Chief*, a much better flower than *Harlowarden*, its nearest relative as regards colour; some of the *Enchantress* race in variety; *Sarah Hill*, a large, pure white flower; and *Beacon*. The *Souvenir de la Malmaison* varieties were still showing a few blooms, but the season is practically at an end as regards these and the other Carnations. It may be of interest to some cultivators to learn that the propagation of the perpetual-flowering varieties is carried out on beds of clean sand in a comparatively cool house. There are hot-water pipes under the beds, but the warmth applied is only sufficient to raise the sand beds to 50° or 55°. Under this kind of treatment the growth is always strong. *F. M.*

(See "Notes from the Botanic Garden, Cambridge," on p. 88.)

NEW OR NOTEWORTHY PLANTS.

ELISENA LONGIPETALA.

(See Supplementary Illustration.)

THIS interesting and beautiful Amaryllid has a singular history, but much yet remains to be discovered respecting its real home and its supposed congeners. Ruiz and Pavon described and figured this, or a very closely-allied species (*Fl. Per. et Chil.*, vol. iii., t. 265, f.b.), under the name of *Pancratium ringens*. Dean Herbert, recognising in it a genus distinct from *Pancratium*, described it more fully (*Amaryllidaceæ*,

The original species described by Ruiz and Pavon was cultivated in the gardens of Lima, and supposed by (or known to) the authors to be a native of the Andes, which is most probable; yet, so far as my researches go, it has not been actually verified, and there are no wild specimens either in the Kew Herbarium or the Herbarium of the British Museum.

Following Herbert's foundation of the genus *Elisena*, we find Lindley (*Botanical Register*, vol. xxiv., 1858, *Miscellanea*, p. 45, n. 79), describing *E. longipetala* from specimens cultivated by R. Harrison at Aigburth, near Liverpool, in 1837. In 1841, a coloured figure of the same appeared in the *Botanical Magazine*,

species as Miss Willmott's plant, represented in the accompanying plate.

In floral structure *Elisena* is most nearly related to *Pancratium* and *Hymenocallis*, from which it is distinguished by the very short tube of the perianth and by having only two ovules in each cell of the ovary.

Perhaps some readers of the *Gardeners' Chronicle* may know of the existence of wild specimens of a species of *Elisena*? W. Botting Hemsley.

TREES AND SHRUBS.

DIERVILLA (WEIGELA) EVA RATHKE.

Most of the garden varieties of *Weigela* flower in the spring and produce a few intermittent blooms later. The variety *Eva Rathke* forms an exception to this rule, for though somewhat later in expanding than most other varieties, it keeps up a succession of its brightly-coloured blossoms till summer is well advanced. A bed or group of this variety, with its bright claret-crimson-coloured blossoms, forms a pleasing summer feature in the garden, especially in July, when comparatively few shrubs are in flower. It is by no means a novelty, for it was given a First-class Certificate by the Royal Horticultural Society as long ago as August 29, 1893. The fact that it could be shown sufficiently well to gain such an award as late as the end of August proves the length of time over which its flowering season extends. Though they are by no means the equal of *Eva Rathke* in persistent blooming qualities, two other garden forms are to be recommended, viz., *Abel Carrière* (deep pink) and *candida* (white). The readiness with which these *Diervillas* can be propagated from cuttings of the young growing shoots and the short time necessary in order to ensure flowering examples are all points in their favour, whilst as to soil and situation their requirements are not exacting. A fairly good loam and an open situation suit them best.

SPIRÆA JAPONICA AND ITS VARIETIES.

OF the many shrubby *Spiræas* one of the best is *S. japonica*, more generally known in gardens as *S. callosa*. It is also noteworthy from the fact that it is one of the most variable members of the genus, as the several forms differ from each other, and from the type, in stature, colour of the flower, and other details.

The typical form of *S. japonica* is of free growth, and assumes the character of a rather upright bush from 4 feet to 5 feet in height. The flowers, borne in flattened corymbs, are bright red in colour, and a succession is produced from July to September. Given a sunny spot, the young leaves become deeply suffused with crimson, thus imparting a very pretty effect to a specimen. Of the several varieties, the most marked are *alba*, a compact bush about 2 feet in height, whose clusters of white flowers are borne to the end of October in mild seasons; *Anthony Waterer*, a dwarf form with bright crimson flowers; *Bumalda*, a somewhat taller and more lax-growing plant than the preceding, with a profusion of pink flowers; *glabrata*, a particularly sturdy form, whose stout branches reach to a height of about 3 feet, being terminated by very large heads of pink blossoms; and *superba*, a richly-coloured form of the type.

Similar to nearly all the shrubby *Spiræas*, this species is most effective when planted in fairly good soil that is not affected with drought at any time. A feature to which more attention than usual might well be paid is the removal of all flower-heads as soon as their beauty is over. This particularly applies to the dwarf-growing variety *Anthony Waterer*, which, if attended to in this respect, develops secondary clusters, and thus keeps up a display of flowers well into the autumn. W.

FIG. 38.—MECONOPSIS ACULEATA: FLOWERS BLUE WITH ORANGE-COLOURED STAMENS.
(See p. 91.)

p. 201), and named it *Elisena ringens*, without giving any explanation of the derivation of the new generic name. The gardeners' dictionaries and other works treating of plant-names had to supply this deficiency, and Paxton and Johnson give it as "an ancient name of romance," which is probable, as Herbert adopted many obviously classical names; but I am unable to confirm or disprove this origin. Other authorities, such as Wettstein, Nicholson, and Mottet, state that the genus was named after Elise, sister of Napoleon and Princess of Lucca and Piombino. It seems hardly likely, however, that Dean Herbert would have made such a dedication without putting it on record. Possibly a reliable record is somewhere in existence, though I have failed to find it.

t 3873; and much more recently another in the *Refugium Botanicum*, t. 264.

Dean Herbert contributed the letterpress accompanying the plate in the *Botanical Magazine*, and he there describes what he took to be a third species, his *E. sublimis*. It is not clear whether he had specimens or drawings before him, but he formed no herbarium, and I believe, there is no drawing in the Herbert collection in the Lindley Library of the Horticultural Society corresponding to his description. All the available evidence points to the existence of only one species, of which there are cultivated specimens in the Kew Herbarium from the gardens of Wilson Saunders, 1870; Mr. Elwes, 1875; and Colonel Trevor Clarke and Messrs. Henderson, 1877. All of these are evidently of the same

MECONOPSIS IN AN EAST-COAST GARDEN.

CONTRASTING unfavourably with the true Poppies in vegetative vigour, the species of *Meconopsis* are most charming in their flowers. In some, the colouring pigment is so delicately developed that the flowers have not inaptly been likened to some exquisite silken fabric. The stamens are usually of another colour to the petals, and thus form in some species pleasing harmonies, and in others distinct contrasts. It is interesting to note that in *Meconopsis aculeata* and *M. racemosa* there are colours unrepresented in the Papavers, nor is the particular shade of *M. integrifolia* common in Poppies, whilst the rich shade of orange found in *M. heterophylla* marks this species as distinct.

Few of the *Meconopsis* are perennial, the best known exception being the Welsh Poppy, *M. cambrica*. The type bears single flowers of a bright yellow, but it is also represented by double forms, having yellow and orange flowers respectively. This species and its varieties succeed in most soils, provided they are well drained in winter. With the exotic species, the cultural difficulties are encountered in the seedling stage, and they continue to the end. Seeds, under normal conditions, ripen in autumn, and may be sown then or even early in spring. They should be sown in well-drained pans or boxes, filled with light peaty soil, which latter should be placed in a moderately warm house, such as an early vinery in spring, or an intermediate house in autumn. The plants require a light shade during all stages of growth. Seedlings may be transplanted readily as soon as they have formed two or more true leaves. Slightly rougher soil should be used at each successive potting. A suitable compost is one formed of fibrous loam, sandy peat and decayed Oak leaves in equal parts. Plants raised from seed in autumn or spring and gradually hardened are grown in unheated frames from May onward. Planting out may be performed early in August, thereby ensuring the plants becoming established before winter. *M. heterophylla*, being an annual species, is planted out in May, and the plants flower in July of the same year.

The ideal position for species of *Meconopsis* is a deep "bay" among choice shrubs, or a woodland clearing. The position should be comparatively flat, and have enough protection from shrubs to break all rough winds and furnish a fair amount of overhead shade. The soil must be free from calcareous matter, and, in bulk, should approximate to that recommended for potting. Rich sandy loam, moss litter and decayed leaves, in default of anything better, have given excellent results here. Four parts of loam are used to one part each of the other ingredients.

I have secured the best results from the most porous bed. The natural subsoil here is chalk, upon this rests the fresh soil forming the bed, which never exceeds 2 feet in depth, therefore the surplus moisture passes away speedily. Overhead spraying of the plants with clean water in the evening is beneficial, but artificial waterings to the roots are rarely practised, and then only during periods of drought. Dwarf shrubs, like *Pernettya*, *Kalmia* and tree Heaths, are sparingly planted over the bed. These break up undercurrents of wind, and lend sufficient support to render much staking of the *Meconopsis* unnecessary.

The following species are given in the order in which they succeed in these gardens.

M. CAMBRICA (perennial) is the only European species. The flowers are yellow or a shade of orange. They are produced on stems 2 feet in height from May till autumn. The double flowers last well in a cut state. (See fig. in *Gard. Chron.*, May 30, 1896, p. 671.)

M. HETEROPHYLLA (annual).—The only American species. The flowers are a deep shade of orange, with a maroon blotch at the base of petals. The stamens are yellow. The plant forms a rounded bush and its branches freely. The flowers are produced on wiry stems; they are sweetly scented and last over a week when cut. This plant attains a height of 30 inches in the open.

M. WALLICHII (biennial).—This species will sometimes miss flowering until the third and fourth year. The flowers are blue, or tinted with purple. The inflorescence is erect, much branched, and carries great numbers of flowers, which always open early in the morning, hence it is seen at its best from sunrise till before mid-day. The foliage of this species is most beautiful, and

FIG. 39.—MECONOPSIS ACULEATA.

Photograph taken one month later than that of same plant shown in fig. 38.

forming rosettes that, under favourable conditions, measure 4 feet across. The pinnatifid leaves are densely clothed with golden-russet hairs, among which the raindrops occasionally stand like pearls. The tallest stems produced by this species here were just over 7 feet 6 inches in height. A native of the Sikkim Himalayas, *M. Wallichii* is one of the most distinct and easy to grow; its only disadvantage lies in the ephemeral character of the flowers.

M. INTEGRIFOLIA (biennial) (see Supplementary Illustration in *Gardeners' Chronicle*, October 1, 1904).—This Chinese species has largely increased the interest taken in this genus. Occasionally the plants do not flower till the third year. In this species the rosettes often measure 30 inches

across. The stem is simple, branching at the top, the flowers being carried upon long peduncles. All parts of the plant are clothed with fine, tawny hairs. The flowers are globe shape, lemon-yellow in colour: well-grown specimens carry 12 to 15 flowers. The stamens are bright orange. This species is deciduous in winter, but the rudimentary leaves are always plainly visible, and form a projecting rampart around the central axis.

M. ACULEATA (biennial) (see figs. 38 and 39).—The entire plant, including leaves, stem and sepals, is densely clothed with long, white, rigid bristles or spines. The leaves are cordate in outline, somewhat five-lobed, the blunt point of each leaf forming the largest lobe. The stem is erect, producing 50 or more flowers, which are carried upon short peduncles, springing singly from the stem. The floral segments are empyrean blue, enclosing bright orange-coloured stamens. Individual flowers remain effective from five to seven days. The plant grows to a height of 2 feet. When in flower this species is a most beautiful plant.

M. RACEMOSA (biennial) (see fig. 40).—The rosettes consist of long, narrow leaves, with unbroken margins. Like *M. aculeata*, the whole plant is densely clothed with white spines, imparting to this species a thistle-like appearance. The petals of *M. aculeata* and *M. racemosa*, more than any of the others, are strikingly suggestive of fine woven silk. In *M. racemosa*, the flowers are variable; in some the floral segments are light chocolate colour, quite devoid of purple; in others purple alternates in irregular bands with the deepest indigo-blue. The stamens are white. The stem is erect, each bearing 12 or more flowers, which are carried singly upon short peduncles. *M. racemosa* attains a height of 18 inches, and flowers during June and July. This species and *M. aculeata* are deciduous in winter, no visible trace of them being left above ground at that season.

M. PANICULATA (biennial).—This species has foliage almost as beautiful as *M. Wallichii*. The presence of innumerable fine hairs gives the leaves a hoary, grey appearance. The plants are very susceptible to moisture in winter, and therefore they should be protected from rain and snow by placing pieces of glass above the crowns and tilting them to one edge. *M. paniculata* grows to a height of 3 feet or more, and forms slender, sparingly-branched stems. The flowers are somewhat of the colour of *M. integrifolia*, but singularly lacking in any attractive or pleasing feature. The beauty of this plant is in its leaves. *Thomas Smith, Walmsgate Gardens, Lincolnshire.*

THE ALPINE GARDEN.

ANEMONE SULPHUREA.

At a recent meeting of the Royal Horticultural Society some splendid flowers of this beautiful plant were exhibited by Messrs. W. Cutbush & Sons. Formerly the plant was known as *A. alpina* var. *sulphurea*, the type being of a variable character. I never remember seeing better examples, and on enquiry I found the flowers had been gathered from four-year-old, home-raised seedlings. In the text books the reader is informed that Alpine wild flowers are easily raised from seeds, and that the plants succeed in ordinary garden soil, but the evidences of this are rare. The examples referred to were about 18 inches in height, and the soft, yellow colour of the cupped or saucer-shaped blossoms was delightful. The excellence of Messrs. Cutbush's flowers and the vigour of their plants were in marked contrast with the poorly coloured, diminutive scraps from collected specimens usually seen in pots. By raising seedlings freely from fresh seeds, it is obvious that a greater measure of success can be assured. *E. H. J.*

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, ante, pp. 70-76.)

0, SCOTLAND, N.

ORKNEYS.—The fruit crops in Orkney this season are above the average in quantity. We had a long spell of cold, dry weather in April, May and part of June, which retarded the crops. Since the middle of June, when rain began to fall, the prospects have been good. The soil here is heavy and cold, but strong. It yields good but late crops. *Wm. Liddell, Balfour Castle Gardens, via Kirkwall.*

SUTHERLANDSHIRE.—The fruit crops generally are very good this season, both as to quantity and quality, although up to now the weather has been rather sunless. Owing to the little sunshine and lack of warmth at nights, fruit will be later in ripening than usual. The soil here is a black, sandy loam, resting on gravel and sand. *D. Melville, Dunrobin Castle Gardens, Golspie.*

FIG. 40.—*MECONOPSIS RACEMOSA*: FLOWERS PURPLE WITH WHITE STAMENS.
(See p. 91.)

1, SCOTLAND, E.

BANFFSHIRE.—Fruit trees of all sorts had an exceptional show of blossom, and they now bear abundant crops, if we except Apples, which are partial. Insect and fungal diseases have been more prevalent than usual. There has been extra work in spraying the trees. The crops are fully a fortnight later than usual. More genial weather is very necessary. *Chas. Webster, Gordon Castle Gardens.*

—The crops in this district are looking remarkably well, but they are three weeks later than last season. March frosts damaged the blossom on some of the more exposed trees. *George Edwards, Ballindalloch Castle Gardens.*

BERWICKSHIRE.—The fruit crops here are all above the average. The garden is well sheltered, and did not suffer to any extent from the cold weather in May. It is situated 500 feet above sea-level and 15 miles east from the sea. The soil is light red and gravelly, needing much

manure. *James R. Redpath, Duns Castle Gardens, Duns.*

EAST LoTHIAN.—Without exception, every fruit crop is good, a few bushes of Victoria Black Currant only being below the average. I hear that Plums in some gardens are deficient, but the rule is a heavy crop all round. The foliage is large and healthy, though Gooseberries are suffering from attacks of red spider, owing, perhaps, to the too abundant crop of fruits. *R. P. Brotherston, Tynninghame Gardens, Prestonkirk.*

KINCARDINESHIRE.—The blossom on all kinds of fruit trees was very plentiful, and, with the exception of some early Pears and Plums, which were damaged by frost, they have set well, and promise to be heavy crops. Especially is this the case with Apples and Gooseberries. We are getting plenty of rain; but as yet the weather has been unseasonably cold since March. *John Brown, The Gardens, Blackhall Castle, Banchory.*

MIDLoTHIAN.—Plums promised well both on standard trees and on trained trees on walls; but

when in bloom. Strawberries are a heavy crop, but owing to the cold, sunless weather, they are slow in ripening and deficient in flavour. We are 14 days later in gathering this season than last year. The soil here is a light sandy loam, with a gravelly subsoil. *Geo. Haig, Garvald House Gardens, Dolphinton.*

6, SCOTLAND, W.

ARGYLLSHIRE.—For the west coast of Argyll there was a fine display of healthy blossom on the Apple trees, but severe frosts and N. and N.E. winds destroyed the good prospects. The crop will be a meagre one. Gooseberries, Black and Red Currants are heavily laden, and the crops of Sweet and Morello Cherries are good. *D. S. Melville, Pottaloch, Lochgilphead.*

AYRSHIRE.—We never had a better show of bloom on all fruit trees than this season; but late frosts and dry, cold winds destroyed many of the flowers. What fruits there are left are looking well, but they are late. The soil is a stiff, retentive loam. *W. Priest, Eglinton Gardens.*

—Owing to the almost entire absence of frost in April (a very unusual experience here), heavy crops of fruit set in nearly all cases. Apples and Plums had to be liberally thinned, whilst Pears look better at this date than they have done for years past. Dry, hot weather in June and the want of sufficient sunshine and heat at the present time are, however, retarding the proper development of all kinds of fruits. *D. Buchanan, Bargany Gardens, Dailly.*

DUMFRIESHIRE.—Strawberries have been firm in the flesh and of good flavour on young plants. They do remarkably well here on our light loam for two years after they are planted; but afterwards the fruits are so small the plants are not worth cultivation. We trench in half the number of plants every year. *James McDonald, Dryfeholm, Lockerbie.*

MORAYSHIRE.—As to quantity, the Apple crop here has the appearance of being the largest for 10 years past. *Wm. Ogg, Duffus House Gardens, Nr. Elgin.*

STIRLINGSHIRE.—The fruit crops as a whole are rather below the average, but Strawberries, Raspberries and Red Currants are very good. The Apple and Pear blossom was plentiful, but a frost of 11° which occurred on May 15 did a great amount of damage. Our soil is very heavy, having been reclaimed from the seashore. It is 13 feet above the sea-level. The subsoil is heavy clay to the depth of 30 feet or so. Our best Strawberries are Dr. Hogg, Dumbarton Castle, Leader and Garibaldi. Owing to the heavy clay, it is not every variety that is suitable. *Peter Brown, Kersc Gardens, by Falkirk.*

WIGTOWNSHIRE.—Small fruits of all kinds are abundant and promise to mature well. Currants during the dry weather were badly affected with aphids, which the recent heavy rains and hand-washings have cleared away. Apple trees flowered profusely, and some kinds have set well, whilst others are almost fruitless. Cherries are a better crop than for some years past. Pears and Plums are fair average crops. *James Day, Galloway House, Gartleston.*

2, ENGLAND, N.E.

DURHAM.—Hardy fruits of all kinds in the flowering stage gave great promise of full crops. Plums, Cherries and Pears suffered badly from the sharp frosts and low night temperatures during May, causing lots of fruits to drop prematurely. Gooseberries, Currants and small fruits are generally plentiful. Strawberries were very good, though late. *James Machar, Smelt House Gardens, Howden-le-Wear, R.S.O.*

YORKSHIRE.—The fruits generally in this district are better than might have been expected, considering the untoward season. Strawberries were our heaviest crop, but they suffered severely from the excessive wet and cold weather. Raspberries, Currants and Gooseberries are plentiful and of fair average quality. Pears are scarce and of poor quality. Apples are a fair average crop and promise to be good. All vegetation here is very late and more or less unhealthy, the result of the cold and wet season. The foliage of Currant, Apple and other trees has withered prematurely, owing to bad attacks of aphids. The soil is of a stiff nature, and it rests on a subsoil of marl, clay and chalk. *F. Jordan, Warton Priory, York.*

—There is a better crop of Apples than in 1908, and Pears on wall trees are equal to the average. There is a good crop of Plums locally, except in these gardens. All small fruits are heavy crops. Royal Sovereign Strawberry was spoiled by rain. The fall in 10 days amounted to 3.07 inches. This occurred after the fruits commenced to colour. The dry weather in June caused attacks of green fly, which injured the leaves of the Currant bushes. The variety Boskoop Giant resisted well, and bids even now to give good returns. If the weather becomes warm we shall have good results from the needed rainfall. Our soil is a hungry, sandy loam on sandstone. *J. G. Wilson, Chevet Park Gardens, Wakefield.*

—The fruit crops in this district are fairly good, but the drought in the early part of the year caused Apples to drop, otherwise the crop would have been plentiful. Pears are a heavy crop, and Plums a fair crop. Small fruits are very good; but Black Currants were ruined by fly in the spring, otherwise they would have been good. *James E. Hathaway, Baldersby Park, Thirsk.*

—There was a good show of blossom on fruit trees in general, with the exception of those that fruited heavily in 1908. Apples of the choicer kinds have not set so well as could be wished, though there are good crops on the hardier varieties, such as Keswick Codlin and Cockpit. The same remarks apply to Pears and Plums on standard and bush-grown trees. Up to now the

loam, with a composition of gait. *T. W. Birkinshaw, Hatley Park Gardens, Gomlingay.*

—Our best crops of Apples are on standard trees. Tower of Glannis, Blenheim Pippin, Early Rivers, Dumelow's Seedling, and Flower of Kent are all carrying heavy crops. The profuse flowering of Pears has not been followed by good crops; in some cases the whole of the fruits fell, owing to the attack of the Pear midge. Peaches and Nectarines are abundant crops, and the trees are clean and healthy, but, owing to lack of sunshine, the fruits will be late in ripening; Early Alexander and Waterloo are about 10 days later than usual. Gooseberries and Red and Black Currants all set grand crops, but about a month ago the sparrows devoured the greater number of the Currants whilst still in a green state. Continuous rains have spoiled the flavour of the Strawberries, and a great many of the berries decayed on the plants. Our soil is a heavy loam overlying clay. *W. J. Snell, Wimpole Hall Gardens, near Royston.*

—The fruit crops generally are about the average. With the exception of small fruits, they are very clean and healthy. Currants are badly attacked with blight. The soil here is light, sandy loam with a subsoil of chalk. *B. Goodacre, Moulton Paddocks Gardens, Newmarket.*

ESSEX.—Up to within the last week in May the promise of abundant crops of Apples, Pears, and Plums was everything that could be desired, the trees being most profusely furnished

Beauty of Bath, Lord Grosvenor, and Bramley's Seedling are carrying heavy crops. Pears are only scarce, Louise Bonne of Jersey being the only variety carrying a good crop. The season is a fortnight late. *F. J. Fleming, Weelsby Old Hall Gardens, Grimsby.*

—With regard to Strawberries, the only variety we can depend upon here is Royal Sovereign. By growing this sort in various aspects, we have out-door fruit from the beginning of June to the first week in August. It is the only reliable one for forcing. Waterloo is appreciated during August, and is grown on a north border. We were greatly troubled with the Apple blossom weevil and Pear midge in the early part of the season, and were only able to keep these pests in check by frequent sprayings of quassia and Nico soap, finding the latter the more effective remedy. The Black Currant crop was practically destroyed by blight and aphid, which no sprayings would seem to hold in check. Our soil is strong loam; but for the cultivation of Pears, and stone fruits the borders are specially prepared. *F. C. Stainsby, Brocklesby Park Gardens, Brocklesby.*

(To be continued.)

PINUS PUMILA REGEL.

THE curious pigmy Conifer represented in fig. 41 has been recently reintroduced into cultivation at Bayfordbury, Hertfordshire, by Mr. H. Clinton-Baker, who obtained native specimens from the summit of Nyoho-san, near Nikko, through his brother, Capt. L. Clinton Baker, R.N.

Its nearest ally seems to be the common Pinus Cembra, of which many botanists consider it a variety, and Pallas, as long ago as 1784, called it Pinus Cembra var. pumila. It is probably the representative of the Swiss Stone Pine in north-eastern Asia. In eastern Siberia and Kamtschatka it occupies large tracts of barren country, always maintaining its prostrate, shrubby habit and never exceeding 10 feet in height. The leaves, which are five in a bundle, resemble those of Pinus Cembra, but they are much shorter, and have often entire and not serrate margins. The cones are much smaller than in P. Cembra, about 1½ inch long, orange-brown when ripe, the scales few, with a dark-coloured terminal umbo, which has a minute reflexed tip.

Dr. Regel, who was the first to describe this creeping Pine as a distinct species, says that it may always be distinguished from P. Cembra by its smooth-margined leaves, but this character breaks down in Japanese specimens which have the leaves distinctly toothed.

Pinus pumila also occurs in Amurland, Saghalien, and the Kurile Isles, growing in the coldest situations. In south and central Japan it is only known on mountain peaks at 7,000 feet to 8,000 feet elevation. Further north it is often spread as a dense scrub over a large area of wind-swept plateaux.

This Pine is remarkable for its slow growth. There used to be a single specimen in cultivation at Dropmore, and Loudon, in alluding to this, states that when he saw it in 1837 it had been 20 years planted and was only 6 inches high. In 1866 the same plant was 8½ inches in height. Mr. Frost, the then gardener, is said to have known the plant for 40 years, and during that time noticed very little increase in its stature. Unfortunately, there is now no trace of this remarkable specimen at Dropmore.

Pinus pumila was mentioned by the Abbé Chappé d'Anteroche, who, in the *Voyage en Sibirie*, vol. i., p. 360, published in 1768, says that "little Cedars, creeping on the ground and never growing upright are found on the mountains and moss-covered plains of Kamtschatka. The inhabitants gather large quantities of the seed for food, and make a drink something like kwas by boiling and fermenting the young shoots—considered to be a cure for scurvy."

The Japanese name for this species is "Haimatzi." The photograph kindly sent me by Mr. Clinton-Baker is from a negative by Mr. A. Elsdon, of Hertford. It represents one of the trees sent home by Capt. Clinton-Baker from Japan.

Pinus pumila was elaborately described by Mr. A. Murray in Ravenscroft's *Pinetum Britannicum* under the name Pinus manschurica. *A. Bruce Jackson.*

FIG. 41.—PINUS PUMILA AT BAYFORDBURY, HERTFORDSHIRE.

season has been an ungenial one, yet vegetation is fairly healthy. Given more sunshine from now onwards, a good foundation for next year's crops will be laid. Raspberries promise well. Black Currants in particular have been infested with fly and are very scarce. The variety Boskoop Giant promises well for the future. Gooseberries are an abundant crop. We are situated on the southern side of the great plain of York, hence the soil is mostly of an alluvial character. *Henry J. Clayton, Wharfe Bank, Ulleskelf, York.*

—Apples are promising, but Pears are only moderate. Apricots, Plums, Peaches, and Cherries are heavy crops. All bush fruits, with the exception of Black Currants, are good. Strawberries were a heavy crop, but, owing to the cold rains, were deficient in flavour, and a large quantity of the best fruits rotted on the ground. *A. E. Sutton, Castle Howard Gardens, Welburn, Yorks.*

3, ENGLAND, E.

CAMBRIDGESHIRE.—Apple, Pear, Peach, Nectarine, and Cherry trees were covered with bloom, but severe frosts in May caused many fruits of Apple and Pear to drop. Caterpillars were very troublesome on Apple trees, and thus caused extra labour in hand picking, this being the best remedy for the pest. Black fly has been prevalent on Cherry trees this season, but spraying with paraffin soap soon eradicated the pest. The soil here is strong

with strong, healthy blossoms, which, owing to the dry weather experienced up to the time indicated, escaped injury from the frosts which were registered every night pretty well in the month of May. In the last week of the same month (May) the much-needed rains experienced in the daytime were followed by frosts at night, and these reduced the promise of a bountiful, good all-round fruit year. However, there will be a fair crop of some varieties of Apples, Pears, and Plums. Some trees are heavily laden with fruit, whilst others of the same varieties are almost bare within a dozen or two yards of each other. The trees generally are suffering from blight. *H. W. Ward, Lime House Nurseries, Rayleigh.*

LINCOLNSHIRE.—Although I think there will be average crops of fruit, the quality will be only moderate, owing to dry and cold weather. Plums, for the third year in succession, have an average crop. Currants would have been a good crop but for blight. I have seen a quantity of Black Currant bushes almost denuded of leaves. A spraying of quassia partially saved the crop in these gardens. Gooseberries and Raspberries are good crops, and will benefit greatly by recent rains. Apples are slightly under an average crop. *H. Vinden, Harlorton Manor, Grantham.*

—Some varieties of Apples give promise of good crops; others are scarce. Cox's Orange Pippin, King of the Pippins, Blenheim Pippin, Sturmer Pippin, Cellini, Ecklinville Seedling,

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Calanthes.—The deciduous *Calanthes* of the *vestita* and *Veitchii* sections are now growing vigorously. Well-rooted plants require abundance of water at the root, but more care will be necessary as regards those of the *C. Regnieri* section, which have not yet filled their pots with roots, otherwise spot and disease will result. Where a number of these plants is cultivated, it is a good plan to arrange all the best-rooted plants together, so that they may be treated with alternate waterings of liquid cow manure, for when well rooted this stimulant is very beneficial to them. For the first fortnight, at least, one part manure water to three parts of water will be sufficient, but afterwards it need not be so much diluted. At this season many young roots will appear on the surface of the compost, and if a thin layer of good fibrous, yellow loam be laid lightly over them, they will quickly enter and appreciate it. These plants will now need plenty of heat, moisture, light and air, keeping them as near to the roof glass as convenient. The evergreen *Calanthes* as *C. veratrifolia*, *C. Masuca*, *C. Sanderiana*, &c., which are now making their growth, will need to be kept thoroughly moist at the root, and an occasional watering with liquid manure as advised for the deciduous kinds will do them good. They are intermediate house plants, and do not thrive so well with their foliage very near to the roof glass. The cooler-growing sorts such as *C. japonica*, *C. j. alba*, *C. Cecilæ*, *C. discolor*, and *C. citrina* require the same cultural treatment.

The cool house.—At this time of the year it is often a difficult matter, owing to the hot and dry atmosphere out-of-doors, to keep the temperature of this house as cool and moist as desirable, but with a little discretion and care it can be made suitable for the plants. With an outside temperature of from 55° to 65°, and heavy showers of rain such as we have lately experienced, little fear need be entertained of affording too much ventilation during periods when there are no high winds. At such times we have all the ventilators wide open and also the doors, if the air is mild. But when there is an external day temperature ranging from 70° to 80°, and a hot, bright sun drying the ground more and more every day, it is a mistake to open the windows, and thus admit more air than can be kept sufficiently moist. Should the grower endeavour to counteract the dry air thus admitted to the house by frequently damping the floors and syringing the plants overhead, the plants will soon show by loss of foliage that they do not appreciate such treatment. The best practice, therefore, is to admit only as much air as can be kept well charged with moisture. By day, no matter how hot the outside temperature may be, keep all the top ventilators closed, leaving the bottom ventilators always wide open, but at sunset the top lights should be raised 2 or 3 inches, and on mild, dewy nights they may be left wide open. Early in the morning, when the sun begins to shine on the roof of the house, the top ventilators must again be closed and the shading employed. Thoroughly damp down the house, syringing well between the pots and under the stages, and, if the sun is bright, slightly spray the plants overhead, but take care that the water does not run along the leaves and down into the axils. Under such treatment, it is possible to maintain a temperature several degrees lower than that of the outside air in the shade. Taking the cool-house plants as a whole, they are, at this particular season, more or less inactive. The young growths of many have only just started from the base of the last-made pseudo-bulb, so that for several weeks to come no more water must be afforded than is sufficient to keep the pseudo-bulbs in a fairly plump condition. Where the house is stippled, as recommended in a former Calendar, the blinds may be removed about half an hour before the sun ceases to shine on the roof, but in cases where the plants are under clear glass, the shading material should be kept down as long as the sun shines on the house. Yellow thrips are apt to make their appearance in the young growths at this season, causing disfigurement to the plants. In such circumstances, vaporise the house once,

or even twice, a week with a nicotine compound or other safe insecticide, continuing this treatment for two or three consecutive weeks. This operation should be carried out in the evening just before the usual time for removing the shading, but leave the blinds down for about an hour after the sun ceases to shine on the roof, and afford ventilation according to the condition of the weather outside.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

Freesia.—To obtain early flowers it is necessary to pot a batch of bulbs in good time; it is only well-rooted plants that will bear even the mild forcing to which these bulbs may be subjected with safety. Whether imported or home-grown bulbs are used, they should be graded so as to ensure having plants of fairly even size in each pot. For general purposes 5-inch or 6-inch pots will be found the most convenient size. The potting soil should be of a rather light, sandy nature, containing a good proportion of sifted leaf-mould. About eight of the largest size bulbs should be placed in a 5-inch pot, covering them with an inch deep of soil. Place the pots in an unheated frame, and either cover them with ashes or shade the frames by day to keep the soil moist without watering, until growth commences. A good watch must be kept for mice and moles, which are very fond of *Freesia* bulbs.

Schizanthus.—Seeds should be sown now for raising plants to flower early in spring, sowing them in pans containing light, sandy soil. Place the pans in a warm house and shade them from bright sunshine. As soon as the seedlings appear, remove the shading and gradually inure them to exposure, light and air; this will prevent them becoming drawn and weakly. As the seedlings are somewhat brittle, care must be exercised in handling them. *Schizanthi* need a rich soil when they are being potted for the last time.

Rhomania angulata.—If a small sowing of the "Pink Perfection" variety of this half-hardy perennial is made now it will furnish plants that may be expected to commence flowering at the beginning of May. When potting the plants into their flowering pots, do not use too rich a soil, but pot firmly so that the plants will produce compact flower-spikes.

Nerines.—The argument often advanced against the annual repotting of these bulbous plants is, that to do so tends to induce them to form foliage instead of flower-spikes, the latter being the outcome of restricted root room. But the amount of root space can be easily regulated when repotting the bulbs in fresh soil, and the tree flowering, or otherwise, of most bulbous plants depends largely on the amount of growth made and its degree of ripening during the previous season. So that when we consider the condition of the soil that, since last May, has been baked, as it were, in small pots, there is something to be said for annual repotting. If this practice is followed the whole of the soil should now be shaken from the bulbs, carefully cutting away the dead roots but preserving those which are alive. A suitable potting soil is one composed of loam four parts and leaf-mould one part, adding a good sprinkling of sand. Proper attention should be paid to the drainage of the pots, as these plants require a plentiful supply of water during their growing season. As far as possible bulbs of similar size should be potted together, but unless the stock of each kind is fairly large this is difficult. Comparatively small pots should be used, and in each pot should be put as many bulbs as can be conveniently placed in it, potting as firmly as possible without injuring the roots. The soil will not require watering until the flower-spikes or the foliage appears, when they should be given a good soaking. Although the plants must not be subjected to more heat than is usual in a warm greenhouse, a mild bottom heat is often beneficial, and for this reason frame culture, at the present time, has much to recommend it.

Calcolaria, *Cineraria*, and *Primula*.—Where these spring-flowering plants are in great request it is well to make a last sowing of seed at the present time to provide plants for flowering late in spring.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Strawberries.—In some gardens a portion of the Strawberry plantation is reserved for the production of runners. In such cases the young plants that have been layered early will now be ready for severance. After cutting them off from the parent plants, let them be placed in a shady situation for a few days to recover from the check, and afterwards plant them in their permanent quarters without further delay. If a warm border can be given them, the plants will produce fine fruits a week or two in advance of the general batch planted in the open garden. Where much Strawberry forcing is done, there is usually great congestion in the houses in the spring-time. In order to relieve this, there is no better plan than to have a small plantation in a warm corner out-of-doors. The first outdoor fruit is always welcome. To obtain an extra early crop it is necessary to plant annually, and for two reasons: first, young plants always produce the earliest fruits; and, secondly, the useful warm borders are not monopolised by Strawberries, as would be the case in a large measure if a portion were planted up for succession each year. As the bed will only be required for one season, the plants may be placed much closer together than is usual in the main crop plantation. When the border has been prepared as advised in previous Calendars, the plants may be placed at from 12 to 15 inches apart; thus a considerable number can be planted on a small border. In the main plantation, however, it will be necessary to leave a space of 2½ feet between the rows, and 2 to 2½ feet from plant to plant (according to the variety). A capital place for Strawberries is a piece of ground which was trenched and manured last winter, and from which a crop of early Potatoes has been taken. After levelling the soil, the only preparation needed will be to work in a dressing of soot and wood-ashes, and to make the ground firm again. In the act of planting be careful to keep the crown of the plant just above the soil; spread out the roots evenly, and apply a thorough watering. The subsequent treatment will consist in cutting off all runners as they appear, and keeping the ground clean by constant hoeing. Plant early, and encourage the plants to continue growing until the end of the season; they will then be sure to make extra fine growth in the following season.

Old plantations.—Strawberry plants which it is intended to clear out should be burned immediately the fruits are gathered. If the nets which have been used for the Strawberry beds are not required for other crops, let them be labelled and stored away, choosing a day when they are thoroughly dry. Nets should never be allowed to remain in a heap on the floor, as mice are apt to greatly damage them during the winter months. They should be suspended by a strong cord to a beam in a dry loft or shed.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardslee, Sussex.

Water Lilies and other aquatics.—Remove any shabby leaves in order that the newer leaves and flowers may be the better displayed. The beautiful and fragrant *Aponogeton distachyon* is grand this season. For the purpose of increasing the stock of this plant as quickly as possible, take a few seeds and place them in a tank of warm water. They will soon germinate and supply plants in a short time. *Richardia africana* appears to good effect with its white flowers showing in dark water. Keep the banks free from weeds, and do not allow any plant to overgrow its neighbour. The species and varieties of *Carex* and *Cyperus* are very effective. *Bombus umbellatus*, with its pretty pink flowers, looks well growing along the margins of lakes, likewise the different forms of *Spiræa*. *Primula sikkimensis* succeeds very well around a pool or lake. Seeds of this *Primula* should be sown as soon as ripe, cultivating the plants through the autumn in pans or pots until they are large enough to plant out. *Zizania latifolia*, the Water Rice, grows 7 to 10 feet in height and is very effective at this season. *Mentha trifoliata* will now need cutting back to prevent its spreading. *Rumex hydrolopathum*, Giant Water Dock, is very effective throughout the autumn. Its large *Musa*-like leaves turn a

beautiful red colour. *Osmunda regalis*, the Royal Fern, grows about 6 feet in height here on the edge of the lake.

Pelargonium.—Zonal varieties of *Pelargonium* may now be propagated from cuttings selected from well-ripened shoots. It is a good plan to put out in spring some plants into a spare piece of ground merely for supplying cuttings in autumn. When this is done, a great quantity of cuttings can be obtained at one time, but in other cases it will be necessary to take them gradually from the flower-beds, selecting the shoots carefully so as not to disfigure the bedding arrangements more than necessary. The cuttings may either be planted in boxes or in open borders. In the latter case they should be taken up and potted into small pots directly they have formed roots. Or, again, the cuttings may be inserted around the sides of a 6-inch pot, putting 8 or 10 cuttings into each. The pots should be placed out-of-doors on a hard base, one composed of ashes being most suitable. A little later in the month other subjects may be propagated, as *Gazania*, *Mesembryanthemum*, *Lobelia*, and *Fresia*.

Begonia.—*Begonias* are doing well this season, being better wet-weather plants than the *Pelargonium*. Do not allow the seed pods to remain on the plants after the flowers have fallen, or any yellow or decaying leaves which would be likely to disfigure the beds. In the case of extra good varieties that appear amongst seedling *Begonias*, these should be marked, in order that they may be cultivated another season. A variety called *Dr. Farrant* is very free-blooming and more hardy than some others. It is just now a mass of flowers. The tubers keep well through the winter, and although they are cut into pieces for propagating purposes as one would cut a *Potato* tuber, each piece develops into a fine plant.

Gladiolus.—Plants of *Gladiolus* should be staked very carefully. They are now commencing to make a good show, associated with *Dahlias*, *Hollyhocks*, and *Phloxes*. If the *Gladioli* are grown in considerable quantities in rows, a strong stake may be placed at either end of the row and another in the centre. By stretching several strands of strong string from end to end, these will afford sufficient support. In the event of dry weather, an abundance of water should be given *Gladioli*, and a mulch of cow manure. An important matter in connection with the development of a long spike is the provision of shade from direct sunshine. The material used for effecting this shade must be secured in such a way that it will not rub the flowers. To have *Gladioli* at their best, they need to be as carefully tended as *Cattleyas*.

Agapanthus.—These plants, growing in tubs or boxes, will be much benefited by occasional waterings with liquid manure at this season.

Astilbe (*Spiraea*).—The *Spiraeas* have been extra good this season. A *palmata* is a glorious blaze by the side of the water and in the bog-garden. A *Davidii* should be supported with stakes if exposed to winds; the inflorescences of this species reach a height of 6 feet or 7 feet if the plants are cultivated in a moist situation by the side of water and the roots are provided with a liberal mulch.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

The orchard house.—When the trees growing in pots have been divested of all fruits, they should be removed to a site out-of-doors where they will be exposed to the sun during the greater part of the day. Plunge the pots in ashes. The trees must be given water at the roots as often as they become dry, and liquid manure should be afforded them twice a week until they are repotted. Keep the laterals pinched, and cut out any superfluous shoots which may be merely obstructing sunlight and air, as the fruiting wood needs full exposure to become thoroughly ripened by the end of autumn. Syringe the trees late in the afternoon on every day during hot weather, and occasionally they may be syringed with an insecticide. Later trees, now swelling their fruits, must be liberally fed with stimulants until the ripening has actually commenced, when clear water alone must be given. Let there be a free circulation of air in the house and a discontinuance of syringing during that period. In dull, wet weather, a

little heat should be allowed in the water-pipes to encourage a more buoyant atmosphere, or the flavour of the fruits will not be good.

Early Muscat Grapes.—Do not let the ripe bunches in the early house be exposed to the direct influence of the sun, or the berries will become brown. A piece of tissue paper should be placed over each bunch as a preventive. If only a few bunches are now hanging, it is better to cut these and place them in bottles in a cool room, where they will keep in good condition for several weeks. The house should then be thrown wide open and the borders soaked with water. Give the foliage a thorough spraying with a strong solution of soft soap and sulphur late in the afternoon to destroy red spider. Afterwards syringe the trees every day with clear water.

Late Muscat Grapes.—So far, the present season has not been favourable for *Muscat Grapes* in late houses, therefore, in some districts difficulty will be experienced in getting the berries well ripened by the end of the season. Where the roots are confined to the inside of the house the trouble will be greatly lessened, as in this case the roots will be under control. But some means must be taken to protect outside borders from heavy rains, especially if the subsoil is of a heavy and retentive nature. The bunches must be exposed fully to the light; therefore, if there is a thick covering of foliage, this should be drawn aside to allow the sun's rays to penetrate amongst the branches. Laterals also must be removed before they become large. Keep a brisk heat in the pipes, excepting when the weather is hot, and do not allow the temperature to drop below 70° until the *Grapes* are quite ripe.

Late Black Grapes.—Like the *Muscats*, these will need plenty of encouragement in order that they may ripen perfectly. *Lady Downe's* especially is very difficult to ripen unless the season is favourable. In regard to temperature, it needs almost as much heat as *Muscat of Alexandria*. If a house cannot wholly be devoted to its culture, this variety should be planted in the warmer end of the house. The remarks in regard to outside borders may also be applied in this case. Remove laterals regularly, and never allow the atmosphere to become stagnant through lack of artificial heat.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Herbs.—Where these are in large demand during the winter months, a good quantity of most of the varieties, such as *Mint*, *Sage*, *Marjoram*, and *Thyme*, should be cut and carefully laid out to dry in a sunny position, being afterwards tied in small bunches and suspended in an open shed or in one that is freely ventilated. Sow a good batch of *Chervil* on a south border.

Runner Beans.—These promise to be good, although like many other crops they are very late. See that the leading growths are kept trained to the supports, cutting away any surplus laterals. The roots must be well supplied with water. Syringe the growths early in the evening after a fine day.

Vegetable Marrows.—*Marrows* which were started early on hot-beds, as previously advised, and from which the lights were removed during June, have done well. Being on a high elevation, and the plants strong and vigorous, they have yielded a good return; but small plants put out in the beginning of June have scarcely made any growth. In many places foliage and growth are badly infested with black aphid, and it will be necessary to make strenuous efforts to rid them of this by using reliable insecticides. *Gourds* and *Pumpkins* are, in most cases, in the same condition. Every means should be taken to expose the young fruits to all the light and sun possible to ensure their ripening; especially does this refer to the large fruiting kinds. If the plants are growing on flat trellis, the fruit should be elevated above the foliage, and if on pergolas or screens, the large fruits should be exposed and some supports provided.

Celery.—*Celery* in its various stages is looking remarkably well. Continue to blanch the earlier plants as occasion demands. Keep the roots well supplied with moisture. Towards the end of the present month, when the *Celery* fly may be expected, frequent dustings of fresh soot

should be applied. Remove all side growths and decaying leaves.

General work.—At this season the principal work in connection with the vegetable garden will be to frequently hoe, mulch, and water the ground between the crops. Extreme tidiness should be observed in the kitchen garden, as in other departments. Above everything, weeds should not be tolerated. In late summer and autumn the refuse in any fairly sized garden will keep going a rubbish or smother fire. Weeds and all other rubbish should be burnt on such a fire. The ashes will be most useful material for placing on the land in winter.

The weather.—So far, the present season has been one of the most smiless experienced for some time past. In consequence of this, many of the crops are not nearly so satisfactory as they once promised to be, this being particularly noticeable in low-lying districts and on cold, retentive soils. Amongst those crops which have made but little progress since they were planted are *Rummer* and *French Beans*, *Vegetable Marrows*, *Gourds*, *Pumpkins*, and *Tomatos*. However, before long there may be a welcome change in the weather, and we may yet have a fine autumn.

PUBLIC PARKS AND GARDENS.

By W. W. PETTIGREW, Superintendent of City Parks, Cardiff.

Picnic parties in parks.—It can hardly be claimed that the general conduct of picnic parties is such that they are regarded with favour or treated with much consideration in either public or private parks. Unfortunately, from past experience, park officials invariably associate "picnickers" with an aftermath of broken bottles, paper and other rubbish, and numerous more or less damaged trees and shrubs. Hence the natural dislike to such parties which is to be found among those who have to deal with them. Many places which were at one time accessible to them have now been closed by their owners.

A necessary evil.—In spite, however, of all the annoyance and trouble given by these gatherings, it is quite as well for those in charge of public parks to realise that picnicking takes such an important place among the social institutions of this country that provision ought to be made for it, as far as possible, in the suitable portions of large parks. Needless to say, no part of the "kept" grounds could possibly be devoted to this purpose, but picnic gatherings can be relegated to the rougher portions of a large park, where a good deal of liberty can be given to visitors at a minimum of risk or expense in the upkeep of the ground. In one of the larger parks in this city we have recently introduced an American idea on this subject, which has become very popular among a certain section of the residents in and around the town. This is the provision of a large gas stove, having several burners, kettles, a water supply, and a number of rough tables and seats, placed under the shade of a plantation of trees. Here, by the aid of the gas stove, visitors can easily get boiling water, or even cook plain food, and this is served on the adjoining tables. Those desirous of using the stove may obtain the requisite amount of gas by inserting a penny into a slot meter (placed under cover close by), which will set free more than sufficient gas to boil a gallon of water. Since the introduction of this scheme numbers of families in the neighbourhood—many of whom could not afford to go into the country for a day—bring provisions and the necessary utensils to the park during holiday times, and spend the greater part of the day in the open air—no doubt to the improved health of all concerned. A scheme of this description is only possible where a gas main passes in close proximity to a park, and in this respect we are fortunate. Instead of allowing the gas company to reap the full benefit of this gas installation, we hire the penny-in-the-slot meter and take the pennies from it ourselves. We only pay for the actual amount of gas registered through an ordinary meter placed close to the main. It will be understood that this "American idea" is not carried out altogether on philanthropic lines when it is explained that we make a profit of from 53 to 40 per cent. on the amount of gas consumed by visitors.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, AUGUST 7—
Soc. Franc. d'Hort. de Londres meet.
MONDAY, AUGUST 9—
United Hort. Ben. and Prov. Soc. Com. meet.
WEDNESDAY, AUGUST 11—
Taunton Fl. Sh. (2 days). Kingstow Fl. Sh.
THURSDAY, AUGUST 12—
Malmesbury Fl. Sh. Hylport Fl. Sh.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—62.3°.

ACTUAL TEMPERATURES:—
LONDON.—Wednesday, August 4 (6 P.M.): Max. 70°; Min. 56°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, August 5 (10 A.M.): Bar. 30.3; Temp. 69°; Weather—Bright sunshine.

PROVINCES.—Wednesday, August 4: Max. 70° Guildford; Min. 66° Newcastle-on-Tyne.

Ants and Plants. In many parts of the world, especially in tropical and sub-tropical countries, plants suffer very considerably from the ravages of ants. Bates, for instance, has described in the fascinating accounts of his travels, the extraordinary foraging expeditions of the leaf-cutting ants of South America. How they mark down a tree for attack, swarm up it, and, cutting out sections of the leaves and falling therewith like parachutists to the ground, the enemy marches off, carrying its plunder of foliage with it. He gave long ago a description, which recent observation confirms, of the use to which the leaves, gathered by the leaf-cutter ants, is put.

Incredible as it sounds, there seems to be no doubt that the leaves are made by the ant community into a hot-bed for the cultivation of fungi; the fungi, grown on this intensive system, serving as fresh vegetables for the ants. Now, as Bates, Fritz Müller, Schimper, and other naturalists have observed, various of the trees in these ant-infested districts, both of the old world and the new, have other non-leaf cutting species of ants living regularly upon them. Among such myrmecophilous trees are *Cecropia peltata* and various species of *Acacia*, such as *A. caverna*. Trees such as these have been observed to escape the devastating attacks of the marauding leaf-cutters, and the suggestion has been made that the unattacked trees owe their security to the presence of a

standing army of ants, which they retain to repel the invasion of the leaf-cutters. Imaginative naturalists have gone even further and have suggested that a true symbiosis, or condition of mutual advantage, exists between the retainer-ants and the trees which retain them. On this hypothesis the trees in question offer certain facilities in the way of food and lodging to the ant army in return for its protection. In support of this hypothesis they point out, first, that the protected trees are immune from attack by leaf-cutter ants; second, that, in various species of *Acacias* shunned by the leaf-cutters, curious food bodies, much affected by ants, occur on the tips of the leaves or in other situations on the plants; third, that the plants, to ensure that the defending ants shall be thoroughly at home, prepare them places whereby their mercenaries may enter readily into the hollow stems—hollowed on this hypothesis to serve as lodgment or barracks for the ants.

The more sober-minded naturalists have been inclined to regard this interpretation as more romantic than real; though, as their sober-mindedness has generally also led them to stay at home, they have not been in a position to disprove this hypothesis of symbiosis or mutualism.

Recently Karl Fiebrig has published in the *Biologisches Centralblatt* an account of his investigations into the subject carried out in Paraguay. Fiebrig admits many of the facts advanced by Müller, Schimper and other naturalists, but finds that they can scarcely be used to establish the attractive hypothesis which we have just outlined. Thus the thin places in the stems of *Cecropia* are often used by the ants as places of entrance; but they are often *not* so used, the ants finding their way into the stems by biting through it elsewhere. Moreover, *Cecropias* occur frequently on marshy ground, where they are free from ant attacks. Again, though most trees of Paraguay are subject to attack by ants, these attacks are not sufficiently grievous to exterminate the non-protected trees, and thus the presence of retainer-ants does not make the fundamental difference between the survival of the trees which retain them and the destruction of those which do not. Further, though the retainer-ants give immunity from the attacks of leaf-cutters, they attract all sorts of other insects and birds, which do great damage to the trees.

Hence the conclusion is reached that the thin places in the stem, and the thin pits which occur between the nodal partitions within the stems of *Cecropia*, are not to be regarded as special adaptations on the part of the plant to make the retainer-ant "feel at home." Nevertheless, the romantic school of naturalists may still hold that till the extraordinary "food bodies" of the *Acacias* are explained, their fanciful hypothesis of myrmecophilous adaptations has not been discredited altogether.

A NURSERYMAN AS JUSTICE OF THE PEACE.

—We observe that in a list of new Justices for Renfrewshire there appears the name of Mr. ROBERT MACFEE. Mr. MACFEE is a member of the firm of JOHN MACFEE, nurseryman and seedsman, of Paisley. He acted as secretary for the Paisley Horticultural Society for many years.

FLOWERS IN SEASON.—Messrs. ROBERT VEITCH & SON send us from their Exeter Nursery a few sprays of *Notospartium Carmichaeliae*, and *Ononis fruticosa*. The *Notospartium* succeeds well in the western counties. Messrs. VEITCH's bush is 8 feet in height, and possesses a stem 12 inches in circumference. It grows against a wall having a western aspect. The plant flowers profusely most seasons. The *Ononis* also flowers abundantly. Its neat habit of growth, together with the bright rosy flowers, make it a most attractive plant for the rock-garden.

HYBRID RASPBERRY.—Messrs. STUART LOW & Co. send us specimens of a new berry obtained from crossing the Loganberry with the Raspberry. The berry is known as Phenomenal, and is said to have the same habit of growth as the Loganberry. The fruits unfortunately were damaged upon receipt. They appear to be very like those of the Raspberry, and they certainly do not possess the hard core which is characteristic of the Loganberry.

GLASGOW'S FRUIT SUPPLY.—Remarking on the subject of the fruit supply to that city, the *Glasgow Evening Times* says: "Not so long ago the Clydesdale valley provided most of our supplies of soft fruits; nowadays, apart from the trade from overseas in refrigerator-fitted steamers, even most easily perishable varieties are brought from the South of England and the Continent within such a short space of time that they have not lost their original freshness when they are placed in the hands of the consumer. An illustration of this swiftness of transit and its importance as a revenue-producer to the railway companies is afforded by the inauguration by the London and North-Western Railway Company of an express service by which fruit grown in the north of France, and leaving Boulogne at eight o'clock in the morning, is conveyed by Folkestone and London, and is delivered in Glasgow on the following morning. This saves a day. At present this train brings Plums and Apricots; later on Pears will be the chief freight. Of course, the service has not been instituted for Glasgow alone; that would not pay in itself. Birmingham, Manchester, and the other large cities and towns in the Midlands and North of England get large quantities, and Edinburgh has also its share."

NOMENCLATURE OF ORCHID HYBRIDS.—

According to *Le Jardin*, the commission nominated by the National Society of Horticulture of France has suggested, in reply to the circular on nomenclature of Orchid hybrids, forwarded to the French Society by the Royal Horticultural Society (London):—1. Compound generic names employed currently for bigeneric hybrids should be retained (a list of such has been published). 2. For tri- or multigeneric hybrids the names should be the generic name of the seed parent and the name of the hybrid should be followed by those necessary to indicate its parentage. 3. Compound generic names should be written as single words, e.g., *Laeliocattleya* and not *Laelio-Cattleya*. 4. Varietal names should be always commemorative or "dedicative" and should not be Latin names.

INTERNATIONAL EXHIBITION IN FLORENCE.—

In order to celebrate the 50th anniversary of the proclamation of the kingdom of Italy, it has been decided to hold in Florence during 1911 an international horticultural exhibition. No more beautiful setting for such an exhibition could be imagined than the great square with its marvels of antique and modern statuary and its stately palaces.

UNION OF GERMAN LANDSCAPE GARDENERS.

—The annual general meeting of German landscape gardeners is taking place at Görlitz from the 7th to 10th inst. The meeting is held in conjunction with an exhibition of shrubs, Roses, herbaceous perennial plants and summer flowers. Numerous papers will be read. The landscape at Görlitz is famed for its beauty.

PRUNUS TOMENTOSA.—Experiments made with *Prunus tomentosa*, sown in Ottawa, appear, according to a writer in *Le Jardin*, to indicate that this species, which bears Cherry-like fruits, is likely to succeed in cultivation in countries with cold winters. Trees raised from seeds and transplanted in 1900 in the Experimental Farm at Ottawa yielded fruit in July, 1903. The fruit is rounded or heart-shaped, half an inch in diameter, and borne on a short peduncle. It is brilliant crimson, smooth, the flesh being soft and juicy, flavour agreeable, but slightly acid.

COMPARATIVE PURITY OF SWEET PEA STOCKS.

—Messrs. E. W. KING & Co. inform us that in January last Mr. ROBERT SYDENHAM challenged any grower to send to Reading for trial 10 packets of 20 seeds each of 10 varieties of the Countess Spencer type. If there was not a single variety that had more than two rogues, Mr. SYDENHAM would pay £10 to the gardening charities as well as all expenses. Messrs. E. W. KING & Co. sent 12 varieties of the Spencer type, some of which they had grown for several years (including Mrs. Wm. King, which they sent out two years ago with a guarantee of 90 per cent. fixity). The judges appointed were Messrs. C. FOSTER and H. H. THOMAS, and they have given an award in favour of Messrs. E. W. KING & Co., not one variety having given two rogues. The six varieties Mrs. Wm. King, E. W. King & Co.'s White Spencer, Paradise Ivory, Princess Victoria, Malcolm's Waved Cream, and E. W. King and Co.'s Blush Spencer came true; Evelyn Hemus, Countess Spencer, Marjorie Willis, and Mrs. Henry Bell gave but one rogue each.

SALE OF DUTCH BULBS.—At the Norwich County Court on the 26th ult., Dr. OSBURNE sued Mr. FRED. H. RAY, an auctioneer of that city, for the recovery of £3 16s. damages for the alleged fraudulent description by the defendant of certain flower-bulbs sold by him to plaintiff by auction in September, 1908, but which bulbs were entirely different to those described. Mr. JOHN CLAYTON, manager for Messrs. DANIELL BROS., Norwich, deposed to visiting plaintiff's garden at his request. The flowers he saw there were very much inferior to the flowers stated on the list from which Dr. OSBURNE made his purchases. His Honour, in giving judgment, said that there had been a gross misrepresentation of fact contained in a document which was said to be, and he had no doubt was, sent to the auctioneer from the firm of growers in Holland. The catalogue contained very precise descriptions of certain flowers, and plaintiff sold the bulbs by auction as they were represented in the catalogue. It would be wrong for him (the Judge) to hold that an auctioneer who sold goods in this way without making any enquiry, should, upon complaint, turn round and say he was not responsible in any way. He accepted the evidence of the plaintiff that he knew nothing of the conditions, and that he was not bound by them. A good deal had been said about fraud, but he did not think Mr. RAY did anything except what was perhaps often done in such cases, that was to say, he did not make sufficient enquiry. There would be judgment for plaintiff for the amount claimed, with costs. Mr. KEEFE asked for leave to appeal, but his Honour declined to grant it.

BUDAPEST INTERNATIONAL HORTICULTURAL EXHIBITION, 1910.

—Among the judges nominated to serve on the International Committee are the following representatives of this country: Messrs. FOSTER, SANDER, SUTTON, VEITCH, WATSON, and the Rev. W. WILKS.

THE CARDIFF SHOW.—In addition to the non-competitive exhibits at this show mentioned by our representative in the report published last week, we are informed that Messrs. J. PEED & SONS, Roupell Park Nurseries, Norwood, were awarded a Gold Medal for a fine exhibit of plants, and Mr. GEORGE REUTHE, Keston, Kent, obtained a Silver Medal for a rock-work exhibit planted with Alpine species. Messrs. WALLACE & Co., Colchester, were awarded two Gold Medals by the Cardiff Society.

PLANTING IN SAN FRANCISCO.—We are informed that the contract for planting the ground belonging to the Spring Valley Water Co. in San Francisco and district has been given to the McRorie-McLaren Co., of that city. Upwards of 5,000,000 trees will be required for this work, which is expected to extend over a number of years.

FIG. 42.—PLANTATION DENUED OF FOLIAGE BY CATERPILLARS.

MR. JOHN C. GOULD.—On the 6th inst., Mr. JOHN C. GOULD, a director in the firm of Messrs. CHARLES SHARPE & Co., Sleaford, completed 60 years association with the firm. During that time Mr. GOULD has assisted in the development of the business from a small local seed trade into one of the largest seed-growing and dealing establishments in the country. Mr. GOULD is still in good health, and continues to take an active part in the management.

PUBLICATIONS RECEIVED.—*Flora of Cornwall*, with six portraits and a map, by F. Hamilton Davey. (Penryn: P. Chegwidgen.) Price 21s. net.—*The Young Naturalist*, by W. Percival Westell. (London: Methuen & Co.) Price 6s.—*Fruit Farming on the "Dry Belt" of British Columbia. The Why and Wherefore.* By J. S. Rodinayne, M.A. (Illustrated) (London: The Times Book Club, 376-384, Oxford Street, W.) Price 1s. net.

PLAGUE OF CATERPILLARS.

In certain districts the forest trees have suffered this season from unusually large numbers of leaf-eating and leaf-rolling caterpillars. The Oak Leaf-roller moth (*Tortrix viridana*), in company with the Winter moth (*Cheimatobia brumata*), has caused much destruction to Oaks. In fig. 42 we have reproduced a photograph taken on Midsummer Day on the estate belonging to Sir William Cameron Gull, Bart., at Yattendon, in Berkshire. The plantation, extending for upwards of half an acre, had scarcely a leaf upon it. The Oak trees were just as bare of foliage as the undershrubs. The principal cause of this extraordinary devastation was the caterpillar of the Mottled Umber moth (*Hybernia defoliaria*). The only plants uninjured by the pest were the Rhododendron and common Bracken; even Conifers were attacked. Sir William Gull informs us that the portion of the wood most exposed to the north winds suffered most; trees and undergrowth on a southern slope being scarcely injured.

The appearance of the landscape is much improved now that the trees have made fresh shoots since the worst of the attack ceased.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

ERLANGIA TOMENTOSA (see tab. 8269, *Bot. Mag.*, August, 1909).—I am indebted for the possession of this most charming and free-blooming greenhouse shrub to the kindness of the Director of the Royal Gardens, Kew. It belongs to the Compositæ and is, I believe, a native of Africa. Its flowers are produced in loose branching bunches and are of a pretty shade of pale blue colour, with white centres exactly resembling those of *Ageratum Princess Pauline*, which is now also blooming in one of my borders. Seeds of *Erlangia tomentosa* were introduced into this country in 1907. W. E. Gumbleton, Belgrove, County Cork.

THE EFFECT OF SALTS UPON PIGMENTS.—Experiments made from time to time by Molisch and others have demonstrated that the colours of flowers are, in many cases, definitely changed in tone and, in some cases, even in hue by the addition of certain salts to the soil. The case of the *Hydrangea* is one in which this change is a matter of common knowledge and of horticultural practice. A paper recently read by Professor Henry Kraemer before the American Philosophical Society gives details of certain experiments which he has carried out, which are of interest to the horticulturist as well as the plant physiologist. In the experiments with *Hydrangeas*, the red-flowering variety, H. Otaksa, was used, and the following results obtained. Blue flowers were produced by plants growing both in sand and in garden soil when supplied with the following chemicals:—Potassium and aluminium sulphate (potash alum), aluminium sulphate and calcium hydrate. Plants which were grown in sand, and to which nutrient solution as well as potassium carbonate was added, showed blue flowers also. Plants growing in sand or soil, and having ammonium sulphate or lead acetate added, showed no blue flowers; but the lead salt showed that it has the power of considerably intensifying the red pigment—a fact of some horticultural importance. Some experiments made with a white Rose, Kaiserine, gave interesting results. This variety was supplied with the following salts:—Potassium hydrate, potassium carbonate, calcium hydrate and lead acetate. A red pigment was produced at the base of the petals by the use of all these salts. In the present state of our knowledge, the reason for this production of new pigment is a matter of conjecture. It is, of course, well known that many white flowers have the power of forming a red pigment under certain circumstances, as, for example, the Rose Frau

Karl Druschki, of which the outermost petals are strongly carmine: the cold nights of this present summer have produced a noticeable amount of red pigment in the White Abbey Geranium, which colour does not appear in flowers produced in the higher temperatures of the greenhouse. *Freesia refracta alba* is another well-known case where low temperature will produce a red pigment. The addition of certain salts would, therefore, seem to stimulate the latent colours into activity, but the exact manner in which this is done being yet unknown, a promising field for research is thus presented. *E. A. Bunyard.*

CARROT FLY (see pp. 60, 80).—The appearance of this fly in West Norfolk has been widespread and disastrous, especially to the small growers, allotment holders, &c. In many instances half the crop has already been destroyed, whilst in others it will not be worth harvesting. The first appearance of the malady is the death of the crown or of some of the larger leaves. If the affected Carrot be pulled up it will be found to be covered by an abundant outgrowth of new rootlets. The track of the insect may be seen as it has burrowed into or along the surface. *C. B. P.*

THE PROPOSED INTERNATIONAL HORTICULTURAL EXHIBITION.—The suggestion put forward by the Council of the Royal Horticultural Society to hold a great International Exhibition in London in 1911 will arouse great enthusiasm. Now that it is the custom to pay international visits, it is not for horticulturists to be behindhand. It is not enough that our colleagues from beyond the seas should be invited to talk. We must be able to show them an exhibition of interest. The progress of horticulture in the British Isles during the past 45 years has been truly wonderful. No words can well describe it. Could we on the one side reproduce the exhibition of 1866, and on the other such an exhibition as is possible in 1911, then, indeed, would the growth and development of horticulture during that period of almost half a century be made fully manifest. It is given to few living to-day to recall the famous South Kensington Show, but in respect of material, those now held at the Temple Gardens and Holland Park are doubtless much superior. The 1866 show was very largely a display by the horticultural trade. To-day, horticulture is not merely a great commercial industry; it is the property of the people, and enters into every phase of life. To organise an exhibition that shall fully represent even British horticulture alone, presents a huge, but none the less a magnificent task, which it should be the joy and delight of our people to conquer. It is a task which will call forth great experience, wisdom, and judgment, involving some personal as well as pecuniary sacrifice. If the undertaking be embarked in the proper spirit, it will be a brilliant success. The committee promoting the gathering should be widely representative and comprise the best intellects of the horticultural community. It should be chosen for that end regardless of social status or of wealth. Money may be easily secured, for a fund of some £10,000 to £15,000 is a mere nothing for wealthy Britain to subscribe, and rather than the welcome to foreign visitors be lacking in thoroughness it would be better to ask for £20,000 at the outset. At least £5,000 should be set apart for prizes. The committee should consist of 100 persons, and it should form itself into finance, show, reception, festival, entertaining, publication, and scientific sub-committees, but in relation to general business every member should take his or her share, and nothing be left to a select executive of a small inner circle to control. Their Majesties the King and Queen should be invited to become patrons, the Prince of Wales to become President, and the Princess of Wales to preside over a ladies' committee. The chairmanship of the general committee would probably be taken by the President of the R.H.S. Probably Mr. Leopold de Rothschild would accept the office of treasurer. The chief problems to solve would be the relationship of the Fellows of the Royal Horticultural Society to the exhibition, the most suitable place in which to hold the show, and the best dates to select for the event. Those are details which a thoroughly representative committee would soon be able to settle satisfactorily. *F.R.H.S.*

SOCIETIES.

ROYAL HORTICULTURAL.

AUGUST 3.—This meeting, following as it did immediately upon Bank Holiday, was a small one. The exhibits were few in numbers, but, as a rule, the quality was excellent. The outstanding features were Messrs. J. VEITCH & SONS' Gooseberries, Messrs. KELWAY & SON'S Gladioli, and Messrs. R. HARKNESS & CO.'s Roses.

The Orchid Committee recommended one First-class Certificate, one Award of Merit, and two Botanical Certificates; the Floral Committee nine Awards of Merit, and the Fruit and Vegetable Committee one Award of Merit.

In the afternoon Mr. Fred. W. Moore delivered a lecture on "Water-gardens."

Steyne, Sunbeam, Professor Cooper, Mrs. W. Heriot, Ladybird and Chas. Henwood. Mr. CHARLES TURNER sent also a most interesting group of Spiræas, including those forms known as *Bumalda*, *sorbitolia*, *Nobleana*, *tomentosa*, *callosa alba*, and *callosa superba*. (Silver-gilt Banksian Medal.)

Messrs. J. VEITCH & SONS, LTD., Royal Exotic Nursery, Chelsea, sent a superb collection of Gloxinias arranged in blocks of distinct colours. The varieties were numerous, and showed to perfection the excellence of the strain. Self shades were the most striking, but many of the spotted blooms were very beautiful. All the plants showed much refinement. (Award of Merit for the strain.)

Sir D. GOOCH, Bart., Hylands Park, Chelmsford (gr. Mr. Wilkinson), contributed a group of cut

FIG. 43.—CARNATION "ELIZABETH SCHIEFFNER": COLOUR RICH BUFF OR APRICOT.
(Awarded R.H.S. Award of Merit on Tuesday last.)

Floral Committee.

Present: W. Marshall, Esq. (Chairman), and Messrs. H. B. May, A. Kingsmill, T. W. Turner, W. Howe, J. Douglas, A. Turner, C. Dixon, J. T. Bennett-Poe, C. E. Pearson, C. E. Shea, W. P. Thomson, E. H. Jenkins, W. J. James, G. Paul, J. G. Fowler, J. Hudson and R. Hooper Pearson.

MR. CHARLES TURNER, Royal Nurseries, Slough, arranged a group of admirably-grown and flowered Carnations. Among the more conspicuous varieties were Merlin, Mrs. Wilson, Purple Emperor, Amphion, John Pope, Lord

Carnations. The blooms were clean, of good size and form, and the colours were effectively arranged. Notable varieties were H. J. Jones, Enchantress, Calypso, Floriana, Princess of Wales, Aurora, Lancelot, The Colonel, Lady Audley Neald, Lady Rose, and Mrs. H. Burnett. (Silver Banksian Medal.)

The display of Gladioli by Messrs. KELWAY & SON, Langport, was brilliant, and the quality of the spikes, in a wide variety of colours, made the exhibit especially interesting. Mrs. Lund, Lady Llangatock, Lord Milner, Lady Montague, Abercorn, Dovedale, Captain Bradford, King of Gladioli, Princess Victoria, Mrs. James Kelway,

Canon Smith, Valdora, Duke of Norfolk, Evelyn, Vanburgh, Irish Ivy, Mrs. Coddington and Earl Compton were particularly conspicuous. (Silver-gilt Flora Medal.)

Hardy herbaceous flowers in great variety were contributed by Messrs. G. BUNYARD & Co., LTD., Royal Nurseries, Maidstone. The collection of Phloxes brightened the exhibit, while Pentstemons, Heleniums, Achilleas, Potentillas, Geums and Spiræas added to the interest. The group also comprised an attractive mass of Gladioli. (Silver-gilt Banksian Medal.)

Messrs. G. & A. CLARK, Dover, sent a collection of border Carnations, none of which had been disbudded. There were Oliver Twist, Elaine, Vivid, W. Austin, Shannon, Mrs. Hayward, Alpha, Mrs. Bryant, Kenmore, Fire King, Mark Twain and many others.

Messrs. H. B. MAY & SONS, Upper Edmonton, sent a large group of flowering and foliage plants, conspicuous for excellence of culture. The flowering plants comprised Campanulas, Lappagierias, Abutilons and Ixoras, Ferns being interspersed. (Silver-gilt Banksian Medal.)

The collection of hardy flowers from Mr. G. REUTHE, Keston, was not large, but the quality was high and the variety excellent. There were Scabiosas, Heleniums, Coreopsis, Alstromerias, Gaillardias, Spiræas and others. (Silver Banksian Medal.)

Carnations were grandly exhibited by Mr. CHAS. BLICK, Hayes Nurseries, Kent. The colours were splendid, and the blooms beautifully clean and fresh. Amongst the varieties were King Arthur, Her Majesty, Mrs. Julian Orde, Agnes, Merlin, Linkman, Orby, Criterion, Goose Gibbie, Constantine, John Ruskin, Solfaterre, Silver Fox, Mandarin, Marjory Devas, Peter Temple and Mimosa. (Silver-gilt Banksian Medal.)

Messrs. BLACKMORE & LANGDON, Twerton Hill Nursery, Bath, sent a bright exhibit of Carnations, the varieties including Twerton Clove, Constance, Volunteer, Richness, Fiery Furnace, Mrs. Nicholson, Brightness, Mrs. H. Chandler and Cantor.

A small collection of Carnations was arranged by Mr. JAMES DOUGLAS, Great Bookham. The flowers were exceptionally fine, and the varieties included Robert Burns, Lady Roscoe, Splendour, King Solomon, Mrs. George Marshall, Harlequin, Delicia, Brigadier, Daffodil, Elizabeth Schiffner and King of Spain. (Silver Banksian Medal.)

Out sprays of flowering shrubs and Rambler Roses were shown by Messrs. J. CHEAL & SONS, Lowfield Nurseries, Crawley. Most kinds now in season were represented, and the exhibit was of special interest. (Silver Banksian Medal.)

Mr. AMOS PERRY, Enfield, had a splendid group of Spiræas in variety. Particularly noticeable were *S. venusta magnifica*, *S. venusta carnea*, *S. venusta gigantea*, and *S. gigantea delicata*. (Silver Flora Medal.)

LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton (gr. Mr. Jas Hudson, V.M.H.), arranged a most beautiful water-garden, which attracted the keen attention of all the visitors. The Water Lilies were superb, and all the best varieties were represented. The charm of the group was enhanced by the inclusion of many other water and water-side plants. (Silver Flora Medal.)

Messrs. R. HARKNESS & Co., Hitchin, exhibited a large collection of Roses. All the leading exhibition varieties were shown in the regulation boxes, and there were in addition handsome stands of Richmond, Mme. Ravary, Frau Karl Druschki, Hiawatha, Dean Hole, Eva Meyer, Dorothy Perkins, Duke of Edinburgh, and Mme. Abel Chateauy. (Silver Banksian Medal.)

AWARDS OF MERIT.

Carnation Elizabeth Schiffner (see fig. 43).—A distinct and splendid self-coloured flower of the best form. The shade is rich buff or apricot. Shown by Mr. JAMES DOUGLAS.

Carnation King of Spain.—A grand fancy flower of the largest size. The basal colour is pale red and the outer edges blackish maroon. Shown by Mr. JAMES DOUGLAS.

Carnation Jupiter.—A magnificent yellow ground, the basal colour being almost wholly obscured by rich salmon-rose. Shown by Mr. CHARLES BLICK.

Carnation Fiery Furnace (see fig. 44).—A splendid "fancy" variety of crimson and scarlet shades. Shown by Messrs. BLACKMORE & LANGDON.

Galega Hartlandii.—A large and handsome

variety of the Goat's Rue. The colour is rosy-lilac. Shown from the R.H.S. GARDENS, Wisley.

Glorinia (strain).—This strain was shown by Messrs. JAS. VEITCH & SONS. (See note printed above.)

Spiræa venusta magnifica.—This is a variety of decided merit, for the flowers are much larger than the type and the colour richer. Shown by Mr. AMOS PERRY.

Tunica saxifraga alba plena.—A double, white form of a well-known and useful plant. Shown by Messrs. BAKERS, Wolverhampton and Codsall.

Nymphæa "Countess of Warwick".—This is a very beautiful tropical variety, and distinct from others in cultivation. By those who grow varieties of this section it is thought to resemble the *N. zanzibarensis* form rather than the *N.*

Harry J. Veitch, de B. Crawshay, Gurney Wilson, F. J. Hanbury, W. Boxall, H. A. Tracy, C. H. Curtis, H. G. Alexander, and F. W. Moore.

Sir JEREMIAH COLMAN, Bart., Gatton Park, Reigate (gr. Mr. Collier), staged a select group containing many rare plants. The centre was of the bright citron-yellow *Sobralia Colmanii*, a dwarf, compact plant, with several large flowers. With it were the pretty *Lelia Gattonenis* (anceps × *cinnabrosa*); *Cattleya Gaskelliana* *cerulescens*, white, with a slight lavender tint; the curious *Catasetum tabulare*, with an elevated tongue-like arrangement on the lip; *Cynoches chlorochilon*, with six creamy-yellow flowers on one spike; *Ancistrochilus Thomsonianus*, with seven spikes, having over 30 white and purple blooms; *Cryptophoranthus Dayanus*; *Cirrhopetalum picturatum*; a very fine *Bulbophyllum grandiflorum*; the ele-

FIG. 44.—FANCY CARNATION "FIERY FURNACE."
(Awarded R.H.S. Award of Merit on Tuesday last.)

stellata group. The flower is the size of *N. zanzibarensis rosea*, which was awarded a First-class Certificate some few years ago, but the flowers are not so stellate as in that variety. They open in the same manner as *N. zanzibarensis rosea*, and have a width of some 9 inches when fully expanded. The outer petals are of a clouded pink shade, the inner ones are suffused with a faint tinge of purple on the pink ground. It is stated that this variety was raised from seeds obtained from America as *N. stellata*. Shown by the Countess of WARWICK, Easton Lodge, Dunmow, Essex (gr. Mr. Henry Lister).

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair), and Messrs. Jas. O'Brien (hon. sec.),

gant, bearded *B. lemniscatoides*; and the rare *Phaius pauciflorus*. (See Awards.)

Messrs. SANDER & SONS, St. Albans, were awarded a Silver Flora Medal for an effective group, the principal novelty in which was the remarkably beautiful new white *Dendrobium Sanderae*. (See Awards.) At the back was a charming, bright blue *Vanda cœrulea*, with flowers almost circular in form; the new hybrid *Lycaste formosa*, with large, cream-white flowers having red spots at the bases of the petals; *Odontioda Devossiana*, with a branched spike of blood red flowers; *Dendrobium longicornu*, *D. regium*, *D. bellatulum*; the fine rose-coloured *Melia cætu-lata*; *Phaius Zollingeri*, with white flowers, the labellums marked with sepia brown; a curious hybrid between *Lelia grandiflora* and *L. xanthina*,

with fleshy, cream-white flowers, marked with purple lines on the lip, an interesting but not showy hybrid; two strong specimens of *Brasso-Cattleya Plato*; *Cypripedium Martin Cahuzac superba*, with a fine, rose-tinted dorsal sepal; *Maxillaria venusta magnifica*; and a number of curious species of botanical interest.

Messrs. STUART LOW & Co., Royal Nurseries, Bush Hill Park, Enfield, were awarded a Silver Banksian Medal for a group containing the large, violet-coloured *Bollea Lalindei*; a fine specimen of *Dendrobium sanguinolentum*, with many spikes of buff and claret-coloured flowers; *Bulbophyllum miniatum*, having slender sprays of purple flowers with white feather-like labellums; E. Dearei, B. Godseffianum; *Cirrhopetalum maculosum*; *Masdevallia calura*, and other *Masdevallias*; a singular little *Notylia*, with racemes of small, whitish flowers; *Lycaste aromatica*; *Oncidium Kramerii*; *Dendrobium glomeratum*, with pretty, rose-coloured blooms; *D. macrostachya*, a rather rare, but not showy species; *Epidendrum trachybilum*, a pretty species, resembling *E. alatum* in general appearance; the singular little *Angraecum distichum*, &c.

Messrs. CHARLESWORTH & Co., Haywards Heath, showed a small group of rare Orchids, in which were a very fine and well-flowered example of *Chysis laevis*, with many large, waxlike, yellow flowers, deeply tinged with red; a compact specimen of the dwarf *Oncidium uniflorum*, a near ally of *O. longipes*; a well-flowered *O. trulliferum*; *Otomeria diaphana*, and *Catasetum Bungeothii*. Also in the group was a very pretty secondary cross of *Cattleya Mendelii*, having very handsome, silver-white flowers with deep, ruby-purple front to the crimped labellum.

J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr. Mr. J. Davis), showed *Laelio-Cattleya Louisa Fowler* (*L.-C. callistoglossa* × *C. granulosa*), a large flower, with bright rose-coloured sepals and petals veined with a darker rose tint. The fine labellum gives strong indication of *C. granulosa* in the abruptly-expanded front lobe of the lip, which is rose-purple, darker at the base, where there are some yellow markings.

FREDERICK J. HANBURY, Esq., F.L.S., Brockhurst, East Grinstead, sent a fine plant of *Cattleya Euphrasia Brockhurst* variety, with five flowers; *Cattleya Maron* var. *aurea* (*Maronii* × *Dowiana aurea*) with buff-coloured sepals and petals and rose-veined lip; and two plants of *Brasso-Cattleya Joan* (*B. Perrinii* × *C. Warscewiczii*). The form of the flowers resembled the *Brassavola* and there was little trace of the *Cattleya*. Flowers whitish the labellums spotted with purple in different degree.

Mons. MAURICE, Mertens, Ghent, showed a selection of hybrid *Odontoglossums*.

H. S. GOODSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), sent *Cattleya Wavriniana* and *Odontoglossum crispum Primrose*, the latter of a pale, whitish yellow tint.

R. G. THWAITES, Esq., Chessington, Christchurch Road, Streatham (gr. Mr. J. M. Black), showed several plants of his *Odontioda Thwaitesii*, which has developed into a remarkably beautiful and distinct hybrid. It was obtained between *Cochlidia vulcanica* and *Odontoglossum Harryanum*, and has flowers of good size, which last in perfection a very long time. The sepals and petals are claret-red, the labellums mottled with violet of different shades, the variety *superba* being the best and darkest.

Messrs. J. & A. A. McBEAN, Cooksbridge, showed a selection of their fine type of *Odontoglossum crispum*, the small central plant having a model flower, with all the segments very broad and flat in arrangement, like the variety *Magnum Bonum*; white, with clusters of red spots on the sepals.

AWARDS.

FIRST-CLASS CERTIFICATE.

Dendrobium Sanderi, from Messrs. SANDER & SONS, St. Albans. This beautiful new species was described by Mr. R. A. Rolfe in the *Gardeners' Chronicle*, June 12, 1909, p. 374, where an illustration of it is also given. It is one of the finest of recent introductions, a most floriferous plant, and evidently a strong grower. The large, pure white flowers have the side lobes of the lip striped with purple, and the base tinged with emerald-green, from which to the centre rim there are feathered deep rose-purple lines. It is quite distinct from *D. Dearei*, for

it has larger flowers, bearing well-marked botanical features. The old pseudo-bulbs bore evidence of several racemes on each, and when so flowered it must be a very handsome object.

AWARD OF MERIT.

Cattleya Warscewiczii var. *W. Waters Butler*, from W. WATERS BUTLER, Esq., Southfield, Norfolk Road, Edgbaston. One of the highest examples of typical *C. Warscewiczii Sanderiana*, having in the intense ruby-crimson colouring of the lip a suggestion of *C. Hardyana*, but the light yellow blotches on each side of the tube are of true *C. Warscewiczii*. The plant bore a spike of four very large, broad-petalled flowers, the sepals and petals being deep carmine-rose, with a delicate darker veining.

BOTANICAL CERTIFICATES.

Phaius pauciflorus, from Sir JEREMIAH COLMAN, Bart. (gr. Mr. Collier). A rare and distinct species, with tall, slender stems, furnished on the upper part with broadly-ovate,

(Photograph by J. Gregory.)

FIG. 45.—GOOSEBERRY "LANGLEY BEAUTY," AS SHOWN BY MESSRS. JAMES VEITCH & SONS ON TUESDAY LAST.

plicate green leaves. The flowers, which are borne in pairs close to the stem, are pure white, with reddish markings on the lip.

Eria ornata, from Messrs. STUART LOW & Co., Bush Hill Park. A remarkable species, figured in the *Botanical Register*, 1841, t. 42, as *Eria armeniaca*. It is of the *E. flava* section, with fleshy, green leaves, and an erect inflorescence of brownish flowers, downy on the exterior, and with a peculiar narrow, red labellum.

CULTURAL COMMENDATION

to R. K. FOLEY, Esq., Peckham, Fordingbridge, Hants., for a grand specimen of *Angraecum caudatum*, with four spikes, each bearing from 10 to 12 of its singular, long-spurred flowers.

Fruit and Vegetable Committee.

Present: George Bunyard, Esq. (Chairman), and Messrs. W. Bates, J. Davis, A. Dean, H. Parr, G. Reynolds, C. Foster, G. Hobday, G. Wythes and J. Cheal.

One of the most remarkable exhibits in the Hall was the collection of Gooseberries contributed by Messrs. JAS. VEITCH & SONS, LTD., Chelsea. No fewer than 100 distinct varieties were represented by fruits contained in baskets of considerable size. There were also plants in pots, the stems of which were literally roped with fine fruits. Some of the finest varieties were *Langley Beauty*, *Langley Gage*, *Golden Gem*, *Queen of Trumps*, *Careless Pet*, *Dan's Mistake*, *Marlborough*, *Monarch*, *Early Green Hairy*, *Keepsake*, *Leveller*, *Fearless*, *Transparent*, *Talfourd*, *Matchless*, *Tiger*, *Leader*, *Lion*, *Shiner*, *Whitesmith*, *Gunner*, *Gretna Green*, *Surprise*, *Pretty Boy*, *King John*, *May Duke*, *High Sheriff*, *Crown Bob* and *Speedwell*. (Gold Medal.)

Messrs. SPOONER & SONS, Hounslow, sent splendid examples of *Mr. Gladstone*, *Early Red Margaret* and *Red Astrachan Apples*, with *Morello Cherries*.

Messrs. J. K. KING & SONS, Coggeshall, Essex, arranged an interesting collection of culinary Peas, comprising no fewer than 70 varieties.

COMPETITIVE CLASSES.

Messrs. JAS. SALSBURY & SON, The Shaw, Melbourne, Derby, were awarded the 1st prize for 18 dishes of Gooseberries. The fruits were large and clean, especially *Lord Leigh*, *Lady Houghton*, *Transparent*, *Lord Derby*, *Surprise*, *Norden Hero*, *Dan's Mistake*, *Princess Royal* and *Mount Pleasant*.

E. J. PRESTON, Esq., Kelsey Park, Beckenham (gr. Mr. Mark Webster), deservedly received the premier prize in the class for six Gooseberries, distinct. The varieties were *Booby*, *Fearless*, *Lancashire Lad*, *High Sheriff*, *Dan's Mistake* and *Whinham's Industry*.

AWARD OF MERIT.

Melon Barnet Hill Favourite.—The fruit of this variety much resembles *Blenheim Orange*. It has a rich yellow and handsomely netted rind, but white flesh. When the variety was first sent to the Committee last year for opinion, it was decided to try it at Wisley. Plants have been cultivated there this year, and a fruit was tasted at Wisley by a deputation from the Committee on the 27th ult. The fruit then proved to be so good it was unanimously recommended for an Award of Merit. This was granted at the full meeting of the Committee. The sender of the seed was Mr. A. MITCHELSON, Womersh, Guildford.

LECTURE ON WATER PLANTS.

At the 3 o'clock meeting in the lecture-room a discourse on water plants was given by Mr. F. W. MOORE, V.M.H. The chair was occupied by Mr. Jas. HUDSON, V.M.H. The speaker's remarks were illustrated by lantern slides taken from plants and groups of plants grown at the Royal Botanic Gardens, Glasnevin. Mr. Moore impressed upon his audience the fact that the watering of plants is a scientific operation, even in the case of applying water to water plants. The plants of the *Nymphaea* or *Water Lily* family were brought under review, as also were the *Nelumbiums* and the *Nuphars*. Many of the plants shown upon the screen could be easily recognised, notably *Nymphaea Gladstoniana* and *N. Marliacea albida*, both white forms, but having different form. Others, such as *N. atropurpurea*, *N. collosa*, and even *N. pygmaea* were given well-merited recognition. So also was *N. stellata*, of which a beautiful picture was presented. Mr. Moore pointed out the great beauty of the leaves of *Nelumbium speciosum*, with the dewdrops moving about like quicksilver upon them. He advocated the formation of ponds of informal character, chosen for their natural beauty, and for the opportunity afforded of giving suitable shade, or, if needful, shelter to varieties that require these conditions. The lecturer strongly recommended the planting of robust-growing forms, such as those of the *N. Marliacea* section, as represented by *albida*, *rosea* and *chromatella*, likewise of *N. collosa*, *N. Ellisiana* and *N. gloriosa*. He also alluded to artificial brick, or cement-made ponds, and stated that a depth of 2 feet was ample, with a provision made for a lesser depth in the case of

weaker-growing kinds. He drew the attention of his audience to the important fact that in the present race of hardy Nymphaeas we have a much more extended period of flowering, as they commence to bloom in May and continue until October. Other water plants and their culture were treated upon. In speaking of these Mr. Moore advocated the claims of the native aquatic plants, such as *Myosotis palustris*, *Mimulus luteus* and others. Plants of semi-aquatic growth, such as *Lobelia fulgens* and its forms, and various *Primulas*, the *Droseras* and the *Pinguiculas* were treated upon. Of the latter a splendid cultural example was illustrated by means of the lantern. Water plants, and particularly Nymphaeas, are benefited by liberal applications of cow manure in the early spring. Amongst the many slides shown by Mr. Moore were several which illustrated the culture of the Victoria regia, from the seedling, to the flowering plant.

Scientific Committee.

JULY 20.—Present: E. A. Bowles, Esq., M.A., F.L.S., F.E.S. (in the Chair), Sir J. T. D. Llewellyn, Messrs. W. E. Ledger, J. T. Bennett-Poe, J. Fraser, C. E. Shea, and F. J. Chittenden (hon. secretary).

Water Lilies dying.—Mr. G. S. SAUNDERS reported that he had examined the Water Lily rhizome sent to the last meeting, and had failed to find any organism present which would account for the death of the plants. He considered the water in which they were growing very foul. Some further material was referred to Mr. SAUNDERS.

Galls on Rhododendron.—Galls similar to those frequently seen on *R. ferrugineum*, caused by the fungus *Exobasidium rhododendri*, were exhibited on behalf of Mr. VEITCH on *Rhododendron Wilsonianum*. The occurrence of these galls in succeeding years may be materially lessened by their removal before they acquire the white bloom which marks the time of spore formation.

Late-flowering Rhododendron.—Sir J. T. D. LEWELLYN made some remarks upon a *Rhododendron* now flowering at Wisley, which he considered to be a hybrid of *R. Aucklandii* or *R. Fortunei*. The bush always flowers at this season, and bears bunches of white flowers on long viscous peduncles subtended by deciduous bracts.

Malformed flower in Liliun auratum.—Mr. C. E. SHEA showed a flower of this species which for the third year in succession produced very narrow perianth segments, which were green. The plant was very strong, but all the flowers were of this type.

Sweet Pea stripe.—Mr. SHEA also showed specimens of Sweet Peas with the "stripe" disease, the cause of which is unknown.

Sweet Pea double.—Mr. CHITTENDEN showed a flower of Sweet Pea with three standards, the only one of the kind on the plant.

Agapanthus umbellatus branched.—Mr. WORTHINGTON SMITH, F.L.S., sent one of two samples of a branched scape in *Agapanthus*. Originally there were two branches, but the upper branch was accidentally knocked off; the remains of this were, however, quite distinct. In the umbel will be seen two buds on one pedicel. The growth is caused by the fasciation of scapes, one major and two minor. Whether the character will remain permanent or not is uncertain, as this is the first season of branching.

Sweet Pea with foliar tendrils.—Mr. BOWLES drew attention to an exhibit of Sweet Peas in which all the tendrils were replaced by leaflets, a condition which was said to be fixed.

Ceropegia.—Mr. W. LEDGER showed specimens of *Ceropegias* from his garden. *Ceropegia Rendallii*, N. E. Brown (*Kew. Bull.*, 1894, p. 100, and revised in *Flora Capensis*, vol. iv., 1908, p. 814). Belongs to the section having an umbrella-like canopy surmounting the corolla, as in *C. Sandersonii*, C. Monteiroae, and the not-yet-introduced *C. fimbriata*. The tuber of the plant exhibited was sent without specific name by Mr. THORNCROFT, of Barberton, to Mr. W. E. GUMBLETON, who presented it to Mr. LEDGER. A small twining species with a remarkable flower, originally sent to Kew by Dr. P. RENDALL, of Barberton, after whom it was named, in 1894, and since lost. *C. Barbertonensis*, N. E. Brown, n.sp. (*Flora Capensis*, vol. iv.,

1909, Addenda and Corrigena, p. 1.132). The flowers resemble in shape those of *C. Woodii* and of *C. debilis*. Plants were raised by Mr. W. E. GUMBLETON, from seed received from Mr. THORNCROFT. A certain number of the seedling plants produced leaves variegated with pale green along the veins. Both forms were exhibited. *C. hybrida*, N. E. Brown (*Gard. Chron.*, December 8, 1906, p. 383, with figs.). A distinct and large-flowered hybrid (*C. Sandersonii* ? × *C. similis* ?) raised in the Botanic Garden at Leiden from accidental insect fertilisation, and the first and only recorded hybrid. The pollen parent was sent to Leiden by Mr. LEDGER, who received it from Kew, where it had long been grown as *C. Thwaitesii*, a Ceylon species, not at present in cultivation. The habit of this hybrid is that of a very attenuated *C. stapeliiformis*.

Malformation in Honeysuckle.—Mr. J. FRASER showed specimens of *Lonicera Periclymenum*, Linn., as follows:—Specimen A showed (1) chloranthy of the corolla; (2) chloranthy of the stamens; (3) anthers shortened, fleshy, basified instead of versatile, and do not open, filaments hirsute instead of being glabrous; (4) chloranthy of the pistil. Specimen B showed (1) chloranthy of the corolla; (2) petalody of three stamens, phyllody of the other two stamens, two and three-lobed and glandular on both surfaces, like the back of the normal corolla; (3) phyllody of the pistil, the style and three carpels being separated nearly to the base. Specimen C showed a double Honeysuckle; (1) chloranthy and shortening of the corolla; (2) petalody of the five stamens; (3) petalody of the pistil and duplication of the three carpels, the style of the three carpels being separated nearly to the base and then duplicated, hose-in-hose fashion; thus there were 11 supernumerary petals. In each case the malformation occurred on plants attacked by aphides.

TRURO HORTICULTURAL.

JULY 21.—The first exhibition of this newly-formed society was held on this date. The number of entries was satisfactory, although a few classes were weak. Sweet Peas made the keenest competition. Roses and annual and perennial flowers also made good displays. The table decorations were an interesting feature, the 1st prize being awarded to an arrangement of Grasses and Poppies. Exhibits of vegetables were creditable, both in the amateur and professional classes, Onions being especially good. There were not many entries in the open classes for pot plants, but the quality fully made up for the lack of numbers. The entries totalled about 470. The attendance was fairly large, notwithstanding that other attractions were held in the city on the same day. There was a very fine display of non-competitive exhibits staged by nurserymen, including THE DEVON ROSARY COMPANY; MESSRS. TRESIEDER, Truro; MESSRS. W. TUPLIN & SONS, Newton Abbot; MESSRS. HELLAND & PHILLIPS, Penryn; and MESSRS. HALL & SONS, Truro.

The principal prize-winners in the classes for pot plants were Mr. M. STOCKER, St. Austell; Col. the Hon. H. FORBES TREFUSIS; MESSRS. HELLAND & PHILLIPS, Penryn; and Mr. G. H. CHILCOTT, Truro.

The best exhibit of Sweet Peas was shown by Mr. JAMES ELLIS, Tresillian, whilst in the Rose classes the principal exhibitors were THE DEVON ROSARY COMPANY and Mr. S. CLIMAS, Redruth.

In the fruit section prominent prize-winners were Mr. F. DYER, Mr. JOHN NORTH, jun., Mr. R. B. CHELLEW, Col. the Hon. H. FORBES TREFUSIS and T. R. POLWHELE, Esq.

Rev. A. PENDARVES HOCKIN, Hayle, met with great success in the vegetable competitions.

BATH GARDENERS'.

JULY 26.—A meeting of this society was held in the Foresters' Hall, Bath, on the above date. The Chairman (Mr. T. Parrott) presided over a large attendance of the members. The night was set apart for under gardeners, prizes being offered for the best essays on "Tomato Culture." Four good papers were sent in, these being read by the Secretary. The 1st prize was awarded to Mr. G. RUSS and the 2nd to Mr. C. FOSTER, J. B.

BISHOP'S WALTHAM HORTICULTURAL.

JULY 23.—The 35th show was held on this date in Swanmore Park, and was a distinct success. The gardens and grounds are each year thrown open to the public on the occasion of these shows. Swanmore Park is situated on a hill, from which distant views of the Isle of Wight, with the intervening Solent, are obtained. Prizes of £5, £3, and £2 were offered in a class for a decorated dinner table measuring 6 feet by 3 feet. In this and the other classes for table decorations 22 exhibits were staged, and all were of commendable taste. In the open class for a decorated table 11 competed. Mrs. A. BIDE, Alma Nurseries, Farnham, was awarded the first prize, her display consisting of Mme. Abel Chatenay Roses arranged in a central silver bowl and small silver trumpet-shaped vases with Rose foliage; 2nd, Mr. N. H. JEFFERY, Nursling, Southampton, with *Gloriosa superba*, Lily of the Valley and *Fraucoa ramosa*.

A class was provided for a decorated dinner table of wild flowers, which produced seven contestants. The premier award was made in favour of Miss MOLYNEUX, Swanmore Farm, Bishop's Waltham, who arranged an effective display with Scarlet Poppies, single Camomile flowers, Hornbeam, Brambles, Grasses, &c.; 2nd, Miss E. G. MACLEAN, Jervis Lodge, Swanmore, with Blue Chicory, a very attractive exhibit. In the class open only to lady members of the society, Miss M. LUTTRELL, Cudridge, Botley, won with a pale blue *Delphinium* tastefully arranged with suitable greenery.

In a class for 12 distinct vases of cut flowers H. A. FRANKLYN, Esq., New Place, Shedfield, Botley (gr. Mr. C. English), was awarded the 1st prize for a pleasing exhibit. Mr. FRANKLYN was also successful in a class for 18 varieties of flowers grown out-of-doors; 2nd, Mrs. MACRAE, Meonstoke House, Bishop's Waltham (gr. Mr. H. Childs). W. H. MYERS, Esq., Swanmore House (gr. Mr. G. Ellwood), easily led in the class for 12 varieties, the prizes in this class being given by Messrs. Ladhams & Son, Shirley.

Roses were an attractive feature. For six bunches of rambling varieties and for six of dwarf-growing sorts Mr. MYERS was placed 1st in each case with representative exhibits.

Sweet Peas were numerous and good. In the class for 12 bunches of distinct varieties Dr. E. C. PERU, Droxford, was awarded the 1st prize. For 12 bunches (the prizes offered by Mr. Eckford), Miss GLADSTONE, Hampton Hill, Swanmore (gr. Mr. W. Cooper), was placed 1st with a commendable exhibit, and she also showed best in the class provided by Messrs. J. Carter & Co. for six bunches.

Cactus Dahlias were well shown. Mrs. MACRAE winning the 1st prize in the class for six distinct kinds.

Fruit was good in quality, but not very plentiful. Mr. MYERS showed the best collection of six dishes, having good Grapes, a Melon, Peaches, Nectarine, and Cherries. In a class for four varieties, Grapes excluded, Mrs. MACRAE secured the leading award. Exhibits of hardy fruit were numerous and good. For four dishes T. C. WILSON, Esq., the Thickets, Bishop's Waltham (gr. Mr. G. Barnes), was placed 1st with capital Peaches, Gooseberries, and Cherries.

Vegetables were shown well. Mr. MYERS won the premier award for eight dishes (Too good's class), six varieties (Messrs. Sutton's class), and for a like number in which Messrs. Webb & Sons provided the awards. Miss GLADSTONE won Messrs. J. Carter & Co.'s 1st prize for six dishes.

SCOTTISH HORTICULTURAL.

JULY 31.—The members of this association paid a visit to Messrs. Downie's nurseries at Corstorphine on the above date. The company, which numbered almost 100, were welcomed by Mr. J. D. Adair, principal of the firm, who conducted the party over the nurseries. Propitious weather favoured the outing. The main object of interest were the Roses. The visitors also inspected the Scotch Firs, Rhododendrons, miniature Beech trees, and the fruit trees.

LEAMINGTON AND COUNTY HORTICULTURAL. INAUGURAL SHOW.

JULY 28, 29.—Notwithstanding the heavy rain-fall, low temperature, and sunless weather which prevailed during July, those responsible for this newly-formed society are to be congratulated upon the all-round excellence of the show held in the Victoria Park, Leamington, on the above dates.

The day preceding the opening was one of the wettest days experienced in the Midlands during the present summer, and the exhibitors were severely handicapped in their work; nevertheless, the morning of the 28th was fine and the sun shone practically all the day long. The schedule consisted of 141 classes, many of them being well filled, and the exhibits—except two—were contained in six marquees. The honorary exhibits were numerous, and added considerably to the variety, quality, and interest of the show.

The Mayor of Leamington, who is president and chairman of the committee, is ably supported by a good number of vice-presidents and a thorough-going, energetic committee. Being the first show, the inexperienced committee may, perhaps, be excused for the lack of courtesy shown by their action in excluding the representatives of the Press from the tents during the time the awards were being made. This was particularly inconvenient to them, as the judges were so long after the scheduled time in commencing their duties.

PLANTS.

There were two exhibits in the leading group class arranged on a ground space of 240 super feet. The 1st prize was won by Messrs. J. CYPHER & SONS, Cheltenham, with a well proportioned, bright, and artistically-arranged group.

In the centre a tall mound, clothed principally with well-coloured Codiaeums, Alocasias, Begonias, handsome Lilliums, and surmounted by a bold Kentia, was very effective. The groundwork between the centre and corner mounds consisted of choice foliage and flowering plants. The 2nd award went to Mr. W. VAUSE, Leamington, whose group was fashioned on similar lines to the 1st prize exhibit, but the colour scheme was not so well carried out.

In a similar but smaller group, restricted to amateurs and gentlemen's gardeners residing in the county of Warwick, two very creditable displays were made. 1st, the Misses ROBINSON, The Newlands, Leamington (gr. Mr. A. F. Friend); 2nd, R. M. GRIFFITH, Esq., Quorn House, Leamington (gr. Mr. E. M. Garlick).

Mrs. RAYSON, Newstead House, Leamington (gr. Mr. W. G. Jones), won the 1st prize in a class for three Fuchsias, dissimilar varieties. The plants were of good size, but below the standard of excellence one expects to find at important shows. The same exhibitor also had the best six Gloxinias.

There were four exhibits in a class for three varieties of Coleus. The 1st prize was won by ALFRED HOLT, Esq., Kenilworth Road, Leamington (gr. Mr. C. Finch), with large, well-shaped, bright-foliaged specimens. 2nd, G. H. BURLEY, Esq., The Grange, Leamington (gr. Mr. H. J. Finch).

The 1st prize for six tuberous-rooted Begonias was gained by Mr. W. ELLIS MASTERS, Warwick, whose plants were very vigorous and carried large, handsome, double flowers. 2nd, the Misses ROBINSON (gr. Mr. A. F. Friend).

The brightest and most useful collection of six table plants growing in pots not exceeding 6 inches inside measurement came from the gardens of F. E. MUNTZ, Esq., Umberslade Hall, Birmingham (gr. Mr. H. Foster), who showed five elegant Codiaeums and one Pandanus Veitchii. 2nd, Mrs. CHAPPELL, Wellesbourne Hall, Warwick (gr. Mr. T. Parry), who had nicely-coloured, rather broad-leaved Codiaeums. The last-named exhibitor led in a class for three specimen Ferns, G. H. BURLEY, Esq. (gr. Mr. H. J. Finch), being 2nd.

The Misses ROBINSON (gr. Mr. A. F. Friend) showed the best three Zonal Pelargoniums, as well as the best foliage plant in *Cycas revoluta*.

Mr. W. VAUSE, Leamington, was the only competitor in a class provided for one flowering plant. His specimen was a small, well-flowered *Ixora*.

CUT FLOWERS.

In the cut flower section Roses and Sweet Peas were well shown. Mr. GEORGE PRINCE, Kingstons Bagpuzze, won three 1st and one 2nd prizes in the four classes in which he competed.

Of the seven exhibits in the class for 24 Roses, distinct, the 1st prize was won by Mr. GEORGE PRINCE with superb blooms, amongst which Alfred Colomb, Captain Hayward, C. J. Grahame, Dean Hole, Suzanne Marie Rodocanachi, Mrs. Myles Kennedy, Horace Vernet and Earl of Warwick were unusually good. 2nd, Mr. ERNEST HICKS, Wallingford, Berks., whose best flowers were General Jacqueminot, C. J. Grahame, Horace Vernet and Comte de Raimband. 3rd, THE KING'S ACRE NURSERIES, LTD., Hereford.

In the next class, which was for 6 H.P. Roses of any one variety, Mr. G. PRINCE led with exquisite blooms of Frau Karl Druschki. 2nd, Mr. HENRY DREW, Longworth, Faringdon.

For 12 Tea Roses, dissimilar, Mr. G. PRINCE was again successful. Included in this stand were fine examples of Ernest Metz, Mrs. Edward Mawley, Comtesse de Nadailac and Mme. Jean Dupuy. The 2nd prize exhibit came from Mr. HENRY DREW, whose flowers appeared to have suffered badly in transit. The varieties Mrs. Edward Mawley and Muriel Grahame were, however, good.

In a smaller class for six Tea Roses the order was reversed, Mr. HENRY DREW being 1st and Mr. G. PRINCE 2nd.

In a class for 12 Roses, dissimilar, reserved for amateurs residing within the county of Warwick, Mr. FRANK DENNISON, Cranford, Leamington, beat his only competitor, Mr. W. NASH, of Coventry. Mr. DENNISON'S flowers were large, thick-petalled and of great substance. The best varieties were White Maman Cochet, Captain Hayward, William Shean, Earl of Dufferin, Earl of Warwick, Horace Vernet, Her Majesty and Alfred Colomb.

In another class for six Roses (one variety), CHARLES E. BLYTHE, Esq., Siddington (gr. Mr. F. Faulks), was the only exhibitor, and his flowers were of poor quality.

Messrs. A. R. BROWN, Wychall Lane, King's Norton, and Mr. C. H. HERBERT, Hazelwood Road, Acocks Green, were the only contestants in classes for (1) 12 self Carnations, dissimilar, and (2) 12 Carnations, dissimilar. The 1st and 2nd prizes in both classes were awarded in the order named above. The flowers in Mr. BROWN'S stand of selfs were large, shapely and of good colours. The best varieties were Crystal, Ajax, John Hughes, Snowdrop, Ariadne, Helen Gottwaltb and Mrs. Harry Skeels.

In the next class Mr. BROWN had beautiful examples of Lord Steyne, Billy Barlow, Sam Weller, Sir Olaf, The Nizam, Percy Radcliffe and Pasquin.

Mrs. CHAPPELL, Wellesbourne Hall, Warwick (gr. Mr. T. Parry), was the only exhibitor in a class provided for 12 bunches of annuals. This exhibit contained a beautifully fresh, well-arranged set of flowers, the Rhodanthes, Sweet Peas and Coreopsis being particularly good.

Of the three exhibitors of 12 bunches of hardy herbaceous flowers, Mr. C. H. HERBERT, Acocks Green, was an easy 1st. He showed a handsome lot of flowers, beautifully arranged. 2nd, Mr. D. CURTIS, Oxford.

In a class for 12 varieties of Sweet Peas there were four first-class exhibits. 1st, Sir THOS. G. F. HESKETH, Bart., Easton Neston (gr. Mr. G. F. Hallett), with very large, substantial flowers of the following varieties:—Lord Nelson, George Herbert, Frank Dolby, Paradise, Mrs. Routzahn, Jeannie Gordon, Evelyn Hemus, Mrs. Hardcastle Sykes, Nora Unwin, Queen Alexandra and two unnamed varieties. 2nd, Capt. W. H. STARKEY, Bericote House, Leamington (gr. Mr. G. L. Blackburn), whose flowers were rather small, but of good quality.

For six varieties of Sweet Peas Mrs. CHAPPELL (gr. Mr. T. Parry) was 1st, and the Marquis of EXETER, Burghley House, Stamford (gr. Mr. T. Grant), 2nd.

Classes were provided for (1) 12 Cactus Dahlias, dissimilar, and (2) 12 show Dahlias, dissimilar. The 1st prize in each class was won by

H. MITCHELL, Esq. (gr. Mr. T. Batchelor), whose flowers of the Cactus varieties were very good, but the show blooms were below average quality.

In classes for (1) bouquet for the hand, (2) bridal bouquet, (3) three sprays suitable for a lady, and (4) three buttonhole bouquets, Messrs. PERKINS & SONS, Coventry, were awarded 1st prize in each class. Mr. W. HARPER, Leamington, was 2nd in the first three, and THE LEAMINGTON NURSERIES Co. 2nd in the last class. The bouquets staged by Messrs. PERKINS & SONS were light and graceful, and much admired. Competition was very keen in a class provided for decorated dinner tables, each 8 feet by 4 feet, and notwithstanding Sweet Peas are so popular for this form of decoration, they did not figure on the tables which gained the first three prizes. The 1st prize was won by Miss ADA TOWNSEND, Lower Broadheath, Worcester, who used Allister Stella Gray and Laurette Messimy Roses, relieved with Francoa ramosa, sprays of Selaginella and Grasses. 2nd, Mr. D. CURTIS, Ifley Road, Oxford.

In another class for decorated dinner tables, open to ladies resident in the county of Warwick, nine pretty exhibits were placed before the judges, who awarded the premier position to Miss ALCOCK, Leamington, for a pleasing arrangement of Iceland Poppies, Statice and Grasses. The 2nd prize was gained by Mrs. GARLICK, Leamington Spa, who also depended principally upon Iceland Poppy flowers. The prettiest basket of flowers (same conditions as in last-named class) was also arranged by Mrs. GARLICK. It consisted of Roses and Asparagus.

SPECIAL PRIZES FOR SWEET PEAS.

Messrs. Webb & Sons offered prizes for six varieties. Two exhibits were made, but in neither case were the flowers of very good quality. 1st, the Marquis of EXETER (gr. Mr. T. Grant); 2nd, Mr. R. SUMMERS, Warwick.

Messrs. Robert Sydenham, Ltd., offered prizes for nine varieties, and six splendid exhibits were brought forward. 1st, Mrs. CHAPPELL (gr. Mr. T. Parry), with a superb set of flowers nicely arranged. The best varieties were Saint George, Clara Curtis, The King, The Marquis, Etta Dyke, and Apple Blossom. Capt. W. H. STARKEY (gr. Mr. G. L. Blackburn) was 2nd with a handsome lot of flowers, but indifferently arranged.

Mr. Henry Eckford's prizes were for nine varieties. 1st, The Marquis of EXETER (gr. Mr. T. Grant), with splendid flowers of Annie B. Gilroy, Nora Unwin, Helen Pierce, John Ingman, Evelyn Hemus, Countess Spencer, Frank Dolby, Menie Christie, and Primrose Waved. 2nd, Mr. H. MARRIOTT, Leamington Spa.

FRUIT.

Although fruit was not very plentiful, several good exhibits were noted. The most successful exhibitor was the Marquis of EXETER, who was awarded 1st prizes in classes provided for (1) eight dishes of fruit to include two bunches each of black and white Grapes (vines excluded); (2) four dishes of fruit to include two bunches of one variety of Grape; (3) two bunches of white Grapes; (4) one dish of Peaches; (5) one dish of Nectarines; (6) one dish of kitchen Apples; (7) three dishes of dessert Apples, distinct varieties; (8) three dishes of kitchen Apples, distinct varieties; (9) one dish of Black Currants; and (10) one dish of Cherries. With the exception of Apples, all the fruit was of good quality. Other 1st prize-winners included ALFRED HOLT, Esq., Kenilworth Road, Leamington (gr. Mr. C. Finch), with shapely, well-finished bunches of Black Hamburg Grape; Sir THOS. G. F. HESKETH, Bart., Easton Neston, Towcester (gr. Mr. G. E. Hallett), for one Melon; M. P. LUCAS, Esq., The Oaks, Leamington (gr. Mr. W. Wright), for (1) Apricots, (2) dessert Apples, and (3) Gooseberries; Lord WILLOUGHBY DE BROKE, Compton Verney, Warwick (gr. Mr. John Lloyd), for Red Currants; and Mrs. CHAPPELL, Wellesbourne Hall, Warwick (gr. Mr. T. Parry), for White Currants.

VEGETABLES.

Vegetables were very well shown. The principal class was for a collection of 10 distinct kinds, and five exhibits were placed before the judges, who awarded the 1st prize to the Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. E. Beckett), for a handsome collection nicely

set up, consisting of Stourbridge Marrow Pea, New Volunteer Beet, White Tripoli Onions, Emperor Tomatos, Bountiful Cucumbers, Giant White Celery, Selected Canadian Wonder Bean, Prizewinner Carrot, Early Mammoth Cauliflower, and Bountiful Potato; 2nd, Mr. JOHN HUDSON, Leicester; 3rd, Sir THOS. G. F. HESKETH (gr. Mr. G. E. Hallett).

Upwards of a dozen small classes were provided for special kinds of vegetables, in which 1st prizes were won by the Hon. VICARY GIBBS (gr. Mr. E. Beckett) for Cucumbers; Mr. JOHN HUDSON for (1) Kidney and Round Potatos, (2) Peas, (3) Dwarf French Beans, (4) Turnips, and (5) Cauliflowers; Lord WILLOUGHBY DE BROKE (gr. Mr. John Lloyd) (1) for Carrots, (2) for Onions, and (3) for Tomatos; G. H. BURLEY, Esq. (gr. Mr. H. J. Finch) for Vegetable Marrows; Mr. E. DEAKIN, Hay Mills, Birmingham, for Scarlet Runner Beans; and the Marquis of EXETER (gr. Mr. T. Grant) for Long-pod Beans.

Prizes were offered by Messrs. Sutton & Sons for six kinds of vegetables. 1st, Mr. E. DEAKIN, with a splendid lot of Best of All Tomatos, Century Peas, Duke of York Potato, New Red Intermediate Carrot, Magnum Bonum Cauliflower, and White Leviathan Onion; 2nd, Sir THOS. G. F. HESKETH, Bart. (gr. Mr. G. E. Hallett); 3rd, F. E. MUNTZ, Esq. (gr. Mr. H. Foster). There were five exhibits.

Messrs. Webb & Sons' prizes were also offered for six kinds of vegetables. Of the seven exhibits in this class the one from the Hon. VICARY GIBBS (gr. Mr. E. Beckett) was placed 1st; Mr. JOHN HUDSON was 2nd with a very good, heavy lot, but indifferently set up; 3rd, Sir THOS. G. F. HESKETH, Bart. (gr. Mr. G. E. Hallett).

HONORARY EXHIBITS.

Messrs. BLACKMORE & LANGDON, Twerton-on-Avon, Bath, showed about 150 double and single Begonias on boards, together with a small collection of Carnations in Bamboo stands and vases. Many of the single Begonias were beautifully frilled and crested. (Silver Medal.)

Mr. H. N. ELLISON, West Bromwich, had a collection of small plants of greenhouse Ferns.

Messrs. GUNN & SONS, Olton, Birmingham, sent a large group of Roses of excellent quality. Tall stands filled with blooms of Frau Karl Druschki, Hiawatha, Crimson Rambler, &c., formed a pleasing background, with masses of Hybrid Perpetuals, Hybrid Teas, Teas, and other sections pleasingly arranged in the front. In another part of the same tent an unusually fine group of hardy herbaceous flowers was displayed on a ground space of 35 feet by 8 feet. The flowers were placed at different heights in vases secured to strong canes driven into the ground. Each kind was represented by a bold mass, and the disposition of them showed artistic taste of a high order of merit. The collection contained good examples of Gaillardias, Iceland Poppies, Irises, Campanulas, Enocheras, Veronicas, Delphiniums, and a magnificent collection of Phloxes, amongst which were noted Sheriff Ivory, Regulus, Josephine Gerbeaux, Frau von Lassberg, Marie Corelli, and Le Mahdi. A pretty margin to the group was formed of the dwarf variety Tapis Blanc. (Gold Medal.)

Mr. W. HARPER, Leamington, showed a nice collection of cut flowers and plants of Liliums, Hydrangeas, and Campanulas. (Silver Medal.)

Messrs. PERKINS & SONS, Coventry, had some very beautiful floral designs, comprising baskets and bouquets of Orchids, Carnations, Roses, and Gloriosa superba. Messrs. PERKINS also exhibited flowers of White Dorothy Perkins and Lyon Rose. (Silver Medal.)

THE LEAMINGTON NURSERIES CO., Leamington, showed a good variety of floral designs. (Silver Medal.)

Mr. FRANK DENNISON, Cranford, Leamington, exhibited 36 beautifully fresh and shapely Roses. The best varieties were Avoca, J. B. Clark, Captain Hayward, and Horace Vernet.

THE KING'S ACRE NURSERIES, LTD., Hereford, had a good collection of Roses and a quantity of herbaceous flowers, consisting principally of Phloxes. The herbaceous flowers were not set off to the best advantage. (Gold Medal.)

Messrs. HINTON BROS., Warwick, sent a collection of hardy herbaceous flowers, Sweet Peas, and Roses.

The most representative group of water, bog, and similar plants came from Messrs. BAKERS, Wolverhampton. Clumps of Bamboos, Typha latifolia, and Delphiniums were placed at the back

of the group which was about 15 feet deep, and masses of Galega Hartlandii, Heleniums, Alstromerias, Campanulas, Spireas, and other plants were placed in suitable positions. In the centre of the group a lakelet was formed, on the surface of which Nymphaea flowers could be seen in full beauty, and along the margin Sarracenas, Primulas, and Cyripediums were used with good effect. (Gold Medal.)

Mr. W. N. PATTISON, Shrewsbury, had a collection of Violas in sprays arranged on sloping boards covered with black cloth.

Messrs. W. CUTBUSH & SONS, Highgate, London, contributed a collection of Carnations as pot plants and cut flowers representative of the various sections of this useful all-the-year-round flower. The cut flowers were arranged in big vases over a groundwork of dwarf pot Roses, comprising White Pet, Mrs. W. H. Cutbush, and Mme. N. Levavasseur. The centre of the group was relieved by tall Rambler Roses. (Gold Medal.)

Messrs. ISAAC HOUSE & SON, Westbury-on-Trym, brought a bright group of upwards of 40 vases of Sweet Peas and miscellaneous border flowers.

Messrs. ROBERT SYDENHAM, LTD., Birmingham, had an extensive display of Sweet Peas of superior quality beautifully arranged in rustic silver stands. King Edward, Sveira Lee, and Marjorie Willis were of outstanding merit.

Mr. J. P. PERRY, Banbury, exhibited hardy herbaceous flowers, Roses, Sweet Peas, and sprays of ornamental-foliaged shrubs.

Messrs. WEBB & SONS, Stourbridge, exhibited a quantity of Sweet Peas and a group of miscellaneous plants in flower on a large circular stand, the upper portion having arches decorated with Sweet Peas; also a collection of vegetables, in which Beet, Cauliflower, Tomatos, Turnips, Onions, Carrots, Cucumbers, Kohl Rabi, and a number of Melons were also included in this striking exhibit. (Gold Medal.)

Mr. C. H. HERBERT, Acocks Green, Birmingham, showed flowers of his new Pink "Progress" in wonderfully good condition.

Messrs. HEWITT & CO., Solihull, Birmingham, made an extensive exhibit of hardy herbaceous flowers and Roses. In the first-named, Phloxes, Delphiniums, Irises, Gaillardias, Campanulas, Violas, annuals, and other subjects were well shown. (Silver Medal.)

Mr. E. CRUMP, Leamington, showed a group of miscellaneous plants and cut flowers, together with a number of dishes of ripe fruit.

In the open air Messrs. JOHN WATERER & SONS, Bagshot, Surrey, had a group of specimen Conifers, silver-leaved Acers, Yuccas, and Portugal Laurels. (Silver Medal.)

Another out-of-door exhibit came from Messrs. TOM B. DOBBS, Wolverhampton, who showed rustic work in a variety of designs. Miscellaneous flowering plants were also included in this exhibit. (Silver Medal.)

Exhibits of horticultural sundries were made by Messrs. W. WOOD & SON, Wood Green, London, and Mr. J. DON, Park Row, Nottingham.

NORTHUMBERLAND, DURHAM, AND NEWCASTLE-ON-TYNE HORTICULTURAL AND BOTANICAL.

JULY 23, 29, 30.—The annual summer show of this society was held in the recreation ground, Newcastle-on-Tyne, on the above dates. The show opened under the most favourable conditions, and there was a large attendance of visitors on the first day. The exhibits generally were above the standard of the last few years, especially so in the groups arranged for effect. In the fruit classes upwards of 70 bunches of Grapes were exhibited. The competition in the classes for cut flowers was also keen, especially in those for Roses and Sweet Peas.

In the class for a group of plants arranged for effect on a space 25 feet by 12 feet, the 1st prize was won by Mr. J. S. SHARP, Valley Nursery, Almondbury, Huddersfield; 2nd, Mr. H. HILLIAR, Green Park Gardens, Darlington, whose group was somewhat crowded, but the plants were of good quality; 3rd, W. C. GREY, Esq., West Hartlepool (gr. Mr. T. Pattison).

In the class for a collection of six plants in bloom, the pitmen, as usual, were well to the fore. Mr. JOSEPH ELLISON, Cramlington, won the 1st prize, having fine plants of Allamanda Hendersonii, Clerodendron fallax, C. Balfourii,

Stephanotis grandiflora, Dipladenia amabilis, and Anthurium Scherzerianum. 2nd, Mr. R. ARTHUR, West Wylam, who had finely-flowered Ixoras, Rondeletia speciosa (5 feet through), Allamanda, Bougainvillea glabra, and a large specimen of Oncidium flexuosum with 15 spikes of flowers. Mr. J. HUNTER, Hexham, was 3rd.

The best collection of four specimen plants in bloom was shown by Mr. ELLISON, and Mr. ARTHUR was 2nd. Statiche profusa was especially noteworthy in Mr. ARTHUR's exhibit.

In the class for 48 Roses in 24 distinct varieties, Messrs. R. HARKNESS & CO., Hitchin, were placed 1st for a collection of finely-finished flowers, Earl of Warwick and J. B. Clark being the best blooms. 2nd, Mr. HUGH DIXON, Belfast, with smaller flowers; 3rd, Messrs. GIBSON & CO., Bedale, Yorks.

For 24 Roses in 12 distinct varieties, Mr. HUGH DIXON was 1st with finely-finished flowers, Lyon Rose, Earl Dufferin, J. B. Clark, and Hugh Dixon being excellent blooms. 2nd, Messrs. R. HARKNESS & CO.; 3rd, Messrs. GIBSON & CO.

For 36 Rose blooms in 12 distinct varieties, Messrs. R. HARKNESS & CO. were 1st and Mr. HUGH DIXON 2nd.

Messrs. R. HARKNESS & CO. had the best dozen blooms of a hybrid perpetual, showing the variety Hugh Dixon. 2nd, Mr. HUGH DIXON, with Her Majesty.

In Class 10, for any Tea-scented variety, Mr. T. PARK was 1st with Mme. Jules Graveraux. 2nd, Mr. G. FINLAY, East Layton Hall, Darlington.

In the restricted classes the Roses were of satisfactory quality and a keen competition resulted. In the class for 24 blooms, Mr. T. PARK was 1st and Mr. G. FINLAY 2nd.

SWEET PEAS.

For 24 bunches of Sweet Peas in variety, Sir G. O. TREVELLYAN, Wallington (gr. Mr. E. Keith), was 1st. He showed the varieties Etta Dyke, Prince of Asturias, H. Bell, Minnie Christie, James Grove, Jet, Herbert Smith, St. George, Evelyn Humus, The King, and Mrs. Masters in exceptionally good quality. 2nd, Mr. F. J. BELL, Whitley Bay.

For a collection of six distinct varieties there was a large entry. Mr. W. S. HESLINGTON, Ripon, was 1st and Mr. E. KEITH 2nd.

OTHER CUT FLOWERS.

For 18 bunches of herbaceous and border flowers Messrs. GIBSON & CO. were 1st, Messrs. R. HARKNESS & CO., Bedale, 2nd, and Mr. G. FINLAY 3rd. For 12 bunches Mr. G. CHARLTON, Dunston-on-Tyne, was 1st and Mr. G. FINLAY 2nd.

The best collection of Carnations set up in vases on a space of 15 feet by 5 feet came from Mr. W. LAWRENSON, Gallowgate, Newcastle. Mr. A. F. DUTTON, Iver, Bucks., was 2nd, and the Earl of DURHAM (gr. Mr. W. Smith) 3rd.

For a dinner table arranged with flowers and fruit, Mr. EDMONDSON, Newcastle, was 1st, and Mr. RICHARDSON, Wickham Lodge, Wickham, 2nd. For floral decorations, Mr. E. EDMONDSON won the 1st prize in each class.

VEGETABLES AND FRUIT.

For a collection of vegetables in nine distinct kinds, the Rt. Hon. Lady BEAUMONT, Carlton Towers (gr. Mr. W. Nicholls), won the 1st prize, Mr. E. KEITH the 2nd prize, and the Earl of DEVON, Powderham Castle, Exeter (gr. Mr. T. H. Bolton), the 3rd prize.

For six distinct kinds Mr. T. H. BOLTON was 1st and Mr. ED. KEITH 2nd.

For Messrs. Webb & Son's prizes for six varieties of vegetables Mr. E. KEITH was 1st and Mr. W. NICHOLLS 2nd.

In the class for eight dishes of fruit, distinct kinds, white and black Grapes included, the Earl of LONDENBOROUGH, Market Weighton (gr. Mr. J. C. McPherson), won the 1st prize, showing Muscat of Alexandria and Black Hamburgh Grapes, Smooth-leaved Cayenne Pine, Royal George Peach, Brown Turkey Fig, Lady Sudeley Apple, Dr. Jules Guyot Pear, and Jordan's Seedling Melon. Mr. W. NICHOLLS was 2nd.

For four dishes of fruit, Mr. McPHERSON also won the 1st prize, Mr. NICHOLLS being 2nd.

The best exhibit of four bunches of Grapes came from Mr. McPHERSON. He had Muscat of Alexandria and Gros Guillaume. 2nd, Mr. J.

R. GARDINER, Clifton Castle, Bedale, Yorks., who showed finely-finished bunches of Madresfield Court and Black Hamburg.

Mr. McPHERSON had the best exhibit of two bunches of White Muscats, and he won the 1st prize in the class for any other variety of white Grape, showing Buckland Sweetwater.

For two bunches of Black Hamburg, Mr. SHOTTON was 1st and Mr. J. R. GARDINER 2nd.

Mr. KEITH had the best Melon, and S. D. SHAFTOE, Esq., Beamish Park (gr. Mr. A. Wood), the best dish of Peaches; whilst Mr. NICHOLLS had the best Nectarines, and Mr. G. F. BROTHERSTON the best exhibit of 12 Tomato fruits.

TRADE EXHIBITS.

Mr. J. DOUGLAS, Edenside Nurseries, Great Bookham, showed a collection of Carnations; Messrs. CLIBRAN'S, Manchester, a very fine group of stove foliage plants; Messrs. LAING & MATHER, Kelso, a miscellaneous group of Carnations, Roses, &c.; Mr. W. A. WELSH, Sunderland, some finely-flowered *Lilium longifolium*; Mr. W. LAWRENSON a miscellaneous exhibit of *Neprolepis* and other Ferns, Orchids, stove and greenhouse flowering plants and Roses; Messrs. DICKSON'S, Chester, a large exhibit of herbaceous cut flowers and Roses; Messrs. STORRIE & STORRIE, Glencarse, Perthshire, a collection of fruit trees in pots, and a collection of Gooseberries; Messrs. SUTTON & SONS, Reading, a miscellaneous collection of fruit and vegetables arranged with herbaceous and hardy flowers; Messrs. ORD BROS., North Shields, a fine group of tuberous-rooted Begonias, *Lilium longifolium*, Caladiums and stove and greenhouse plants in variety; Mr. J. FORBES, Hawick, a fine exhibit of Delphiniums, Phloxes, Pentstemons, border Carnations, Violas and greenhouse plants; Messrs. DOBBIE & Co., Rothesay, a group of Sweet Peas, Violas, Dahlias and Pelargoniums; Messrs. J. THOMPSON & SONS, Forest Hall, a miscellaneous group of Carnations, Ferns, Tomatoes and vines in pots; and Messrs. S. FINNEY & Co., Newcastle-on-Tyne, a collection of Sweet Peas.

Mr. J. DOUGLAS received Certificates of Merit for three new Carnations—Lady Roscoe, Elizabeth Shifner and Robert Bruce.

SOUTHPORT HORTICULTURAL.

JULY 29-AUGUST 2.—This fine show was held under the auspices of the Royal Lancashire Agricultural Society in a pavilion covering an area of 18,000 feet. The arrangements and artistic staging reflected credit on Mr. Peter Blair, the superintendent.

The weather on the Thursday and Saturday was very bad, portions of the tent being under water.

COMPETITIVE CLASSES.

This section comprised 66 classes. For a group of plants arranged on a space of 300 square feet (open), Messrs. J. CYPHER & SONS, Cheltenham, won the 1st prize, showing an excellent group, comprising Palms, Crotons, Ferns, Cattleyas, Oncidium, *Odontoglossums*, &c. Mr. W. A. HOLMES, Chesterfield, was 2nd. In this exhibit some good single-stemmed Crotons were a feature.

In a class for a group of 12 stove or greenhouse plants, Messrs. CYPHER had well-flowered specimens of moderate size. These included *Ixora Pilgimii*, *I. Shawii*, *I. Williamsii*, *Chironia ixifera*, *Statie Gilbertii*, *S. intermedia*, *Clerodendron nobilis*, and *Bougainvillea Cypheri*.

For 12 stove or greenhouse plants in pots not exceeding 10 inches in diameter the same exhibitors won the 1st prize.

Mr. J. H. ANDERSON, Southport, had the best collection of six exotic Ferns, and Mr. J. HOWARTH, Tottington, was 1st for six tuberous Begonias.

Twelve table plants were shown best by Mr. W. J. GARNER, and six Orchids by Messrs. CYPHER & SONS, who showed *Epidendrum prismatocarpum*, *Laelio-Cattleya Purple Empress*, *L.-C. callistoglossa*, *L.-C. c. magnifica*, *Odontoglossum amabilis*, and *Cypripedium Curtisii*.

SWEET PEAS.

For 18 distinct varieties, Mr. THOMAS JONES, Raubon, was well to the fore with a fine collection, including Black Knight, John Inman, Henry Eckford, Queen Alexandra, Zepha, &c. This successful exhibitor won the 1st prize in seven other classes.

Mr. T. PROCTER, Carnforth; Mr. S. SALISBURY, Wallasey; Mr. W. SHUTTLEWORTH, Southport; and Mr. E. MALLEN secured one leading award each for Sweet Peas.

The best collection of cut Carnations was shown by Mr. C. A. YOUNG, West Derby, who had very charming blooms, and the best collection of cut "tree" Carnations came from Mr. J. C. WATERS, Balcane.

Messrs. GIBSON & Co., Bedale, had an excellent collection of hardy perennials, for which the 1st prize was awarded. For 12 bunches Mr. J. HOWARTH was placed 1st.

ROSES.

In the class for 34 blooms in not fewer than 18 varieties Messrs. A. DICKSON & SONS, Newtownards, had the premier stand with finely-coloured blooms of J. S. Mill, Lady Ursula, Capt. Hayward, Prince Arthur, &c. THE KING'S ACRE NURSERY Co., Hereford, were 2nd.

Messrs. DICKSON & SONS secured 1st honours in the remaining open class, and Mr. T. COLTHERWAITE, Hednesford, in the amateur class.

FRUIT AND VEGETABLES.

For 12 dishes in not fewer than nine kinds, the Duke of PORTLAND (gr. Mr. J. Gibson) was awarded the 1st prize, staging Buckland Sweetwater, Black Hamburg, Muscat of Alexandria, and Gros Maroc Grapes, Hero of Lockinge and a seedling Melon, good Crimson Galande Peaches, Lord Napier Nectarines, Brown Turkey Figs, &c. The Earl of HARRINGTON, Elvaston Castle, Derby (gr. Mr. J. Goodacre), was 2nd; and the Earl of DERBY, Knowsley, Liverpool (gr. Mr. E. F. Hazleton), 3rd.

The best two bunches of Black Hamburg Grapes came from J. BECHAM, Esq., Huyton (gr. Mr. W. Oldham), and the best exhibit of any other black variety from J. BRENNARD, Esq., Thirsk (gr. Mr. J. E. Hathaway), who showed well-coloured fruit of Madresfield Court.

For two bunches of Muscat of Alexandria, Mr. E. F. HAZLETON obtained the 1st prize for large bunches, and for any other white Mr. W. OLDHAM, who showed Buckland Sweetwater.

Mrs. PARRINGTON, Huyton (gr. Mr. T. Eaton), had the best scarlet-fleshed Melon, and Mr. J. GOODACRE the best white-fleshed fruit.

For six Peaches Mr. HAZLETON was 1st, showing well-finished fruits of Dymond, Humboldt Nectarines from the same exhibitor were also awarded the 1st prize.

Mr. BEN ASHTON secured the leading award in five classes for vegetables, in each case staging fine examples of almost every seasonable kind. In the single dishes, Mr. J. E. HATHAWAY won in five classes; Mr. JOHN CARROLL, Birkdale, the remaining class.

NON-COMPETITIVE EXHIBITS.

There were many fine exhibits of a non-competitive nature. In addition to the following, which were awarded Medals, others were granted Awards of Merit.

GOLD MEDALS.—Messrs. STUART LOW & Co., Bush Hill Park, for Orchids, Sweet Peas, and Roses; Mr. R. BOLTON, Carnforth, for Sweet Peas arranged in pillars, baskets, and vases; Messrs. ALEX. DICKSON & SONS, Newtownards, for Roses; THE KING'S ACRE NURSERY Co., for fruit-bearing trees; Messrs. DICKSON, BROWN, & TAIT, Manchester, for 100 dishes of vegetables, and Melons and Tomatoes in pots; the Rt. Hon. Earl of LATHOM (gr. Mr. B. Ashton), for a group of stove and greenhouse plants.

SILVER MEDALS.—Mr. H. ECKFORD, Wem, for Sweet Peas; Messrs. YOUNG, West Derby, for Carnations; Mr. H. MIDDLEHURST, Liverpool, for Sweet Peas; Mr. T. W. DARLINGTON, Carnforth, for Sweet Peas; Messrs. BOLTON BROS., Carnforth, for British Ferns; Mr. H. N. ELLINSON, West Bromwich, for Ferns; Messrs. W. SHAND & Co., Lancaster, for herbaceous cut flowers.

WEST DERBY HORTICULTURAL.

AUGUST 2.—The eighteenth annual show was held in the Rectory grounds. The entries were satisfactory both in numbers and quality.

The Silver Rose Bowl presented by the chairman, Mr. C. A. Young, was well won by the Rev. P. STEWART (gr. Mr. T. J. Edgar) with good flowers well arranged.

Dr. COOKE (gr. Mr. G. Osborne) led in the class for a collection of half-hardy and hardy annuals. This exhibitor also won the 1st prize for 12

bunches of hardy herbaceous cut flowers and for six Tea Roses. Mr. T. J. EDGAR showed best in the class for six hybrid perpetual Roses. Mr. H. OGDEN excelled in the classes for 12 Carnations distinct and for a bouquet of flowers. Mr. EDGAR was placed 1st in the class for 12 vases of Sweet Peas.

In the classes for vegetables, Mr. G. OSBORNE won the 1st prize for nine distinct kinds, having good Tomatoes, Peas, French Beans, and Onions. W. McCUBBIN, Esq. (gr. Mr. R. Cleaton) was placed 1st for six distinct kinds, the same exhibitor having the best Peas. Mr. H. OGDEN showed the finest Cucumbers, and Mr. G. OSBORNE the best Tomatoes.

White Grapes were best shown by Mr. R. CLEATON, the variety being Foster's Seedling. The best two bunches of black Grapes were exhibited by Mr. T. J. EDGAR, who had Black Hamburg.

In the class for a group of plants arranged for effect, Mr. G. OSBORNE won the 1st prize with a pleasing combination, having Palms, Crotons, and Ferns, with a judicious addition of flowering plants. 2nd, Mr. H. SPENCER.

Mr. C. A. YOUNG, West Derby, contributed some pots of *Lilium Harrisii*.

Mr. W. ROWLANDS, Childwall Nurseries, showed Roses.

BASINGSTOKE FLOWER SHOW.

AUGUST 2.—The annual summer show was held in Golding's Park on this date. The entries were fewer than in past years, especially in the plant section.

PLANTS.

In the class for a group of miscellaneous plants occupying a space of 10 feet by 7 feet there were four competitors. H. WELCH THORNTON, Esq., Beaurepaire Park (gr. Mr. J. Keen), showed much the finest group, having a bright arrangement of Crotons, *Ixoras*, Palms, and *Humea elegans*. 2nd, S. E. BATES, Esq., Manydown Park, Basingstoke (gr. Mr. W. Green).

The best specimen flowering plant was shown by Mr. WELCH THORNTON in a good example of *Stephanotis floribunda*. This exhibitor also excelled in the class for a specimen foliage plant with *Cycas revoluta* in perfect condition. Exotic Ferns made a fine display, Mr. WELCH THORNTON winning the premier prize offered for them with *Asplenium Nidus*, *Dicksonia antarctica*, *Neprolepis elegantissima*, and *Adiantum cuneatum*.

Tuberous Begonias were well shown by the Rev. A. H. GAY, Worthing (gr. Mr. W. E. Parris), who easily won the premier award. Exhibits of plants suitable for table decoration were much better than are commonly seen, the subjects chosen being light, bright, of even size, and not too large. The best 12 were displayed by Mr. WELCH THORNTON.

CUT FLOWERS.

In the class for two dozen Roses, distinct, Mr. F. W. FLIGHT, Cornstiles, Twyford, Winchester (gr. Mr. W. Neville), won the 1st prize with clean, well-coloured examples of Miss A. M. Kirker, John Cuff, Lady Ursula, G. Laing Paul, A. K. Williams, Mrs. Theodore Roosevelt, and Lyon Rose. Mr. FLIGHT also excelled in the class for 12 Tea varieties.

Carnations, as grown with their own foliage and undressed, in 12 varieties, three blooms of each kind, made an interesting display. Mr. FLIGHT won the premier position with highly-coloured blossoms neatly arranged.

The Hon. Mrs. F. BARING BROWN, Candover (gr. Mr. A. Childs), was first for 12 bunches of Sweet Peas and for 12 Cactus Dahlias.

Mr. WELCH THORNTON staged a choice collection of stove flowers in the class for 12 varieties. The exhibit embraced *Ixoras*, *Cypripediums*, *Clerodendron fallax*, and *Stephanotis*.

For a collection of flowers grown out-of-doors to occupy a space of 6 feet run of tabling, L. DE L. SIMONDS, Esq., Andleys Wood (gr. Mr. T. W. Dean), was placed 1st with an interesting exhibit of Roses, Delphiniums, &c.

In the class for a collection of six varieties of fruits, Lord CURZON, Hackwood Park, Basingstoke (gr. Mr. Bowerman), was the only competitor. He was awarded the 1st prize for Black Hamburg and Muscat of Alexandria Grape, *Violette Blanche* Peaches, Humboldt Nectarines, Sutton's Scarlet Melon, and Onlin's Early Apricot. The best two bunches of Black Hamburg

MARKETS.

COVENT GARDEN, August 4.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

Cut Flowers, &c.: Average Wholesale Prices.

Table listing prices for cut flowers such as Asters, Carnations, Gladioli, and various roses.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing prices for cut foliage including Adiantum, Agrostis, and various grasses.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing prices for potted plants like Ferns, Fuchsias, and various flowering plants.

Table listing prices for plants in pots including Pelargoniums, Roses, and various other varieties.

Fruit: Average Wholesale Prices.

Table listing prices for various fruits such as Apples, Apricots, Bananas, and Cherries.

Vegetables: Average Wholesale Prices.

Table listing prices for various vegetables including Artichokes, Beans, Broccoli, and Cabbages.

REMARKS.—English Cherries are not so badly damaged as last week, but the trade in them has been very quiet, and consequently their prices are low. Turkey Heart and Bigarreau Napoleon are the varieties chiefly in demand. Plums are arriving from Kent; the variety Morocco is very unripe, but there have been some good samples of the variety Early Rivers. Tomatoes are a little cheaper, and there is a ready sale for well-coloured fruits. French Plums and selected Gages continue to sell freely. There is no improvement in the Grape trade. E. H. R., Covent Garden, Wednesday, August 4, 1909.

Potatoes.

Table listing prices for various potato varieties like Bedford's, Early Portland, and others.

REMARKS.—Trade is quiet and prices are very low. E. H. R., Covent Garden and St. Paul's, August 4, 1909.

Grapes were shown by Dr. MAPLES, Kingsclere (gr. Mr. H. Tomalin). Lord CURZON was first in the class for any other black Grape with Madresfield Court. Muscat of Alexandria was best shown by Mr. BATES, the bunches being long and tapering and with well-finished berries. The same exhibitor also had capital bunches of Foster's Seedling, with which he won the 1st prize in the class for any other white Grape.

In the vegetable classes Lord CURZON was successful with a collection of Potatoes, a collection of eight varieties of vegetables, and also in the classes for Messrs. Sutton and Sons' and Messrs. J. Carter & Co.'s prizes.

Trade exhibits were not numerous. Messrs. B. LADHAMS & SONS, Shirley, had a fine display of hardy flowers, in which Gaillardias figured prominently. Charles Ladhams, a new seedling variety with a deep crimson zone and gold edge, was conspicuous.

Messrs. E. HILLIER & SON, Winchester, showed cut shrubs and roses.

Messrs. W. H. ROGERS & SONS, Southampton, had an extensive collection of cut Roses of new and old varieties.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending July 31, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The temperature was below the average, the deficit ranging from a little more than 1° in the English Channel district to slightly above 3° in Scotland E. The highest readings occurred, as a rule, on Friday or Saturday, when the thermometer rose a trifle above 70° in many parts of England, as well as in the west of Scotland and the north of Ireland. The lowest readings were observed in the early morning, either of Wednesday or Thursday. In the south-east of England the sheltered thermometer did not fall much below 50°, but at several places situated in the western and northern parts of the Kingdom it went slightly below 40°. Owing to the cloudy state of the sky the minimum readings of the grass were, as a rule, not very much lower than those in the screen, but at Crathes the thermometer on the 27th fell to 31°.

The rainfall was considerably in excess of the average over the United Kingdom generally, but agreed very closely with the normal in Ireland S. and the English Channel, and was rather deficient in Scotland N. The heaviest rainstorms of the week occurred respectively in the south and east of Scotland on Sunday, and over England and Wales on Tuesday; amounts exceeding an inch being recorded on each day at a large number of stations. On Sunday the principal falls reported were 2.0 inch at Stonehaven and 1.7 inch at Crathes, and on Tuesday the largest amounts were 1.3 inch at Plymouth and 1.5 inch at Tavistock and Shaftesbury.

The bright sunshine amounted to less than the average in all districts excepting Scotland N. and Ireland N., where there was a slight excess. The percentage of the possible duration ranged from 46 in the English Channel and 33 in England E. and S.W. to 25 in Ireland and 21 in Scotland E.

THE WEATHER IN WEST HERTS.

Week ending August 4.

Another cold and wet week.—Until to-day there had not occurred a single unseasonably warm day for more than a fortnight, while the nights during the same period have been on the whole about average in temperature. On the coldest night, however, the thermometer exposed on the lawn fell to within 1° of the freezing point, a very low reading for the time of year. Both at 1 and 2 feet deep the ground is now 3° colder than is seasonable. Rain fell on five days of the week to the total depth of 1/2 of an inch. About two gallons of rainwater has passed through each of the percolation gauges during the week. The sun shone on an average for only 4 hours a day, or for as much as 2 1/2 hours a day less than is usual at the beginning of August. The winds were rather high in the early part of the week, but the last few days have been calm. For the fourth week in succession the wind has come almost exclusively from some westerly point of the compass. The mean amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by 9 per cent.

JULY.

Exceptionally cold and wet.—This proved with one exception the coldest July recorded here for 17 years. As was the case in June the days were, as a rule, much more unseasonably cold than the nights. In fact there occurred only five days during the month when the temperature in the thermometer screen exceeded the average, and on the warmest of those days the highest reading was 76°, which is the lowest maximum in July for 19 years. On the other hand, on the coldest night the exposed thermometer fell only to 34°, which is a high extreme minimum for the month. Rain fell on as many as 19 days, to the aggregate depth of two and three quarter inches, or about half an inch in excess of the July mean. The sun shone on an average for six hours a day, which is half an hour a day short of the usual duration in July. The winds proved on the whole moderately high for the time of year, but in no hour did the mean velocity exceed 16 miles—direction W.S.W. For as many as 510 hours, or 21 days, the direction of the wind was some point of the compass between south and west. The mean amount of moisture in the air at three o'clock in the afternoon exceeded a seasonable quantity for that hour by 7 per cent.—E. M., Berkhamstead, August 4, 1909.

COVENT GARDEN FLOWER MARKET.

Holidays always interfere with the London trade in flowers, and this season the effect has been worse than usual. Carnations, Roses, and Sweet Peas cause the greatest trouble to the salesmen. The American Carnations are over abundant, and in addition to these there are large supplies of border varieties. Of these, one of the most popular is the yellow variety Ruby Castle. Very few buyers favour the flaked or fancy flowers. This morning blooms of Enchantress were selling at about the price of ordinary border sorts. The long-stemmed Roses, for which good prices were obtained a year or two ago, are now so cheap that they are offered in the streets at about 1d. each. The variety Mrs. J. Laing, is one which may be instanced in this connection, and supplies of Mme. Abel Chateau are equally overdone. Sweet Peas can hardly pay for the expense of marketing, as very many are left over after all orders are supplied. Liliams sustain fairly good prices. Blooms of *L. auratum* are very good; but *L. longiflorum* is frequently seen in very moderate condition. Those of *L. speciosum rubrum* are bright, but there are many pale blooms of *L. roseum*, and the white Lilies are rather small. Asters are over plentiful with little demand. Sweet Sultan sells slowly. It is one of the most easily damaged flowers in wet weather. There are still persons who damp their flowers, which is the worst thing that can be done. They will keep better fully exposed to the sun than when damped and placed in the shade. The white-flowered variety sent out by Messrs. Jarman and Co., should also be kept quite dry. Gaillardias, Coreopsis, Poppies, and other hardy flowers are abundant. *Gypsophila paniculata* now takes the place of *G. elegans*. I have seen very little now of the double-flowered variety up to the present. It would pay to cultivate this flower under glass, for the blooms are a clear white when protected. Saponarias in pink and white colours are extensively grown, but with *Gypsophila* and *Statice* so plentiful, they are not greatly wanted. Large quantities of hardy Grasses are seen, also Fern fronds and hardy foliage.

POT PLANTS.

Trade is practically over for the season, and many stands are empty. There will be very little business until the middle of September. Most growers have some of their stocks unsold, and even at the end of last week there were large quantities of ordinary bedding plants in the market. Zonal and Ivy-leaved Pelargoniums are still plentiful; also Fuchsias, Marguerites, Hydrangeas, Crassulas, and Liliams. Campanulas are good. There is little that is new in foliage plants. *A. H., Covent Garden, August 4, 1909.*

LAW NOTES.

THE USE OF THE WORD "PATENT."

At the Bow Street Police Court recently Messrs. Carter & Co., seedsmen, were summoned for selling an article to which the word "patent" was falsely applied, contrary to the Patents and Designs Acts of 1907.

Mr. Clement Edwards appeared in support of the summons, and Mr. Charles Rowe Sawyer for the defendants.

Mr. Edwards, in opening the case, said the article in respect of which the summons was issued was known as "Raffiatape," which was used for tying plants and flowers. It was first manufactured in this country in 1899 by Mr. S. H. Wheatcroft, of Derbyshire, but it had been sold here prior to that period. Mr. Wheatcroft supplied, amongst others, a man named West, a dealer in gardeners' sundries. West eventually claimed Raffiatape as his own invention, and obtained a patent for it. He threatened a number of persons with actions for infringing his patent, but Mr. Wheatcroft took proceedings in the High Court, and West's patent was revoked by Mr. Justice Parker. Mr. Wheatcroft sent a notice of the revocation to people in the trade, but in spite of that the defendants sold Raffiatape in a wrapper describing it as a patent.

Mr. Sawyer said that his clients would plead guilty to a technical offence. They had only sold a small quantity of Raffiatape since the patent was revoked, and had no idea they were doing wrong. The Act under which these proceedings were taken was a comparatively new one, and created a new offence, which was unknown to many tradesmen and some lawyers.

Sir Albert de Rutzen said that, as the defendants had pleaded guilty, they would only be fined £1 and £3 costs.

A similar penalty was imposed in the case of Messrs. Barr & Sons, who were summoned for a like offence.

DEBATING SOCIETY.

BRISTOL AND DISTRICT GARDENERS'—

Exhibits of Sweet Peas were a special feature at the meeting held on July 28. Mr. Arnold, gardener to Lord Bathurst, Cirencester, gave a lecture upon *Souvenir de la Malmaison* Carnations. The lecturer said this type of Carnation originated in the garden of the Empress Josephine, and derived its name from the chalet to which she retired. Various details of culture were given, including propagation. Mr. Arnold said French growers do not lay their plants in the soil, but after making the layer fill the severed portion with chopped moss, and wrap this part with tinfoil. The layers should be potted about the beginning of September and housed not later than mid-October, in a house having a temperature not higher than 45°. *H. W.*

ENQUIRIES AND REPLIES.

PRIMULAS.—In answer to the enquiry by *B. L.* on p. 86, we may say that *Primulas Bulleyana*, *Muscarioides*, *Forrestii*, *malacoides*, and *Littoniana* having been collected for us by Mr. Forrest on the high Alps of Yunnan, are quite hardy and will seed themselves in the open. Respecting *P. sikkimensis*, we find it does exceedingly well in the wood at our Sealand nursery, and we have not experienced the trouble in replanting this species described by *B. L.*'s friend.

* * * The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as Supplementary Illustrations in this Journal.

ASPHALT. *J. P.* Generally speaking, the appearance of vegetation on an asphalt path is an indication that its surface has commenced to deteriorate, and is absorbing some moisture instead of passing off all that falls upon it. Asphalt paths should be brushed over with a thin coating of tar every year. Paths treated in this manner are made impervious to moisture, wear the better, do not show unsightly cracks, and rarely, if ever, get any moss on them. We would advise you to have the moss scraped off your path, and allow it to get perfectly dry, then thoroughly cleanse it by the aid of a hard whalebone brush. When this has been done give the surface a thin coating of boiling coal tar. After the surface has been treated in this way it should be dusted over with fine limestone grit, so as to prevent the tar adhering to the boots. Applications of salt made during dry weather are often successfully employed to destroy moss on paths, but, as this does not get rid of the cause of the trouble, this method is unsatisfactory, for the moss soon reappears.

BEGONIA. *H. Wood.* The leaves show traces of what is termed Begonia mite. These microscopic bodies infest the under side of the leaves and eat the epidermis, which, on becoming brown, is often called Begonia "rust." The best remedy for this is to dip them in tobacco water. The leaves also show on their edges that they have suffered from unsuitable atmospheric conditions, which occasionally cause the plants to suffer a slight check, the effect being exhibited first in the margins of the leaves.

BROAD BEAN. *Mark Zebra.* For some reason or another the seeds have not developed. There is nothing to show why they have not done so. Probably it is a shy-bearing variety. In any case, you can do nothing to remedy the state of things. Obtain fresh stock for another year.

CARNATION. *C. F. A. van D. S.* The excrescence on the roots denotes the presence of eel-worm. It is an exceedingly bad case, and we should not, therefore, advise you to have the plants potted. It will be better to consign them to the fire heap.

CARROTS. *C. S. & Co.* The trouble appears to have been caused by the Carrot fly (see p. 98).

COMPETITIVE SHOW. *T. S.* The exhibitor clearly committed an infringement of the schedule. The schedule stated that no more than six varieties were to be shown. The exhibitor staged Cauliflowers, Onions, Carrots, Potatoes, Peas and two varieties of Vegetable Marrow. There were, therefore, at the least, seven varieties. It is possible that the exhibitor read the word "variety" as meaning "kind," in which case he would consider the two varieties of Vegetable Marrow to be of one kind. But the Royal Horticultural Society's *Code of Judging* clearly limits the word "variety" to variations of a particular kind, such as varieties of Peas, or Carrots, or Cauliflowers. Had the schedule said six kinds of vegetables, the exhibitor would have been justified in showing the produce he actually staged.

CUCUMBER. *A. J.* The leaves received appear to owe their disfigurement to scorching. We have not been able to find any trace of the Cucumber blotch (*Cercospora melonis*). If the plants continue to be unsatisfactory, send fresh material for examination.

CYANIDISING A PLANT HOUSE. *H. B.* The quantity of the cyanide salt and sulphuric acid necessary for each 1,000 cubic feet of space is given in the issue for April 23, 1904, p. 271.

DWARF TREES. *J. T. H.* If you will send samples of the injured trees, we will endeavour to assist you.

FIG. *J. L.* The Fig leaf is badly attacked with the Fig leaf disease (*Cercospora Boileana*). All diseased leaves and fruits should be collected and burned. If the trees are sprayed with diluted Bordeaux mixture it will help to check the disease, but in very bad cases the best thing to do is to root up and burn the trees, intending afterwards to plant clean stock in fresh soil.

GRAPES DISEASED. *G. D.* The berries are affected with the spot disease, so often described in these columns. Cut out and burn all diseased Grapes, and spray the bunches with liver of sulphur, using ½ ounce in two gallons of water.

GRAPES SPLITTING. *L. A. K.* See reply to *W. C.*, p. 86, in the last issue. As you suggest, the cold rainy weather has doubtless accentuated the trouble. The sulphur will be valuable should mildew put in an appearance, but it will not prevent the berries cracking.

MORELLO CHERRIES. *J. P.* Your letter leaves us in doubt as to the general health of the trees, but if they have only been planted eight years, and are healthy trees in full vigour, the fact that a large proportion of the fruit falls when of the size of Peas points to some error in their cultivation. Young Cherry trees on a fertile soil are usually very vigorous in growth, and, unless good crops of fruit are taken off the trees, artificial manuring is not only unnecessary but harmful. Excess of manuring would be likely to cause the trees to make gross wood. It is wood of this character that usually casts its fruit. Do Cherries thrive in any other part of the garden? Is there any harmful substance that can reach the roots, or can the roots get into any such thing as sewage? There is the possibility of a deficiency of lime in the soil, this being necessary for all stone fruits. Next autumn lift the trees carefully, cutting off any tap-roots; and see that the drainage is put into a good condition. For replanting mix a proportion of old mortar rubble with some good sweet loam, placing this carefully about the roots, making the soil thoroughly firm. A good dressing of lime applied in the winter on the top soil round fruit trees, is beneficial. After being exposed for some time it should be lightly forked in.

NAMES OF PLANTS. *J. M. & Sons.* The flowers received are those of what is known as The Mummy or Bunch Pea. It has been known in gardens as *Pisum sativum umbellatum*, but the botanists now consider it to be a variety of *P. elatius*.

NETTLES. *D. P. H.* The best thing you can do in the circumstances is to keep cutting the Nettles with a scythe, never allowing them to make much growth. You will soon find that if this treatment is persistently carried out, the plants will become weaker. It is not possible for you to apply weed-killers to exterminate the Nettles, as these would at least destroy the Grass, and possibly some of the shrubs also.

RAINFALL. *Penzance.* You will find all particulars in *British Rainfall*, edited by Hugh Robert Mill. This work can be obtained from our publishing department, price 10s. 4d. free by post.

ROSE BUGS DROPPING. *Cole-Green.* We can only suggest injury by cold as the cause of the trouble.

EVERGREEN HEDGES.

PROBABLY no feature imparts such a finished appearance to a garden as a well-kept hedge enclosing the site. It is essential that a hedge, whatever plant is employed in its making, should be given regular attention every year. It may even be necessary to cut it twice each year, to ensure its being kept in proper condition. There are not many trees and shrubs suitable for forming hedges, more especially when we consider the large number of ligneous subjects hardy in this country. The best in their order of merit are Holly, Yew, Box, *Thuja plicata* (T. Lob-bii), *Cupressus Lawsoniana*, *C. nootkatensis* (*Thuja borealis*), *C. macrocarpa*, *Thuja occidentalis*, *Osmanthus Aquifolium* var. *ilicifolius*, Common and Portugal Laurels, *Rhododendron ponticum*, *Berberis Darwinii*, and Privet.

THE HOLLY.

The premier position as a hedge plant is held easily by the Holly. Under proper treatment it forms a dense, impenetrable screen, and presents a good appearance at all seasons of the year. Before planting a Holly hedge, the ground should be worked 3 feet wide and 3 feet deep.

A good proportion of well-rotted manure should be incorporated in the soil at a depth of about 2 feet. If the ground is poor, a little fresh, rich loam, together with some extra manure, may be placed around the Hollies at the time of planting. The ground should be prepared some time before it is planted, to allow of its settling down properly. The size of the plants must depend upon the expense to be incurred, but Hollies 3 feet to 4 feet in height can be obtained at fairly reasonable rates, and they will soon form a good-sized hedge. Smaller sizes are cheaper, but they are not to be equally recommended for the purpose under consideration. The month of May is always said to be the proper time to plant Hollies, but from my own experience (and I have had to do with the planting of thousands of these plants of all sizes) the early autumn is far better. As soon as the young growths are ripened sufficiently to prick the band when gently squeezed, which is usually from September 20 to October 10, Hollies are in a fit condition for transplanting, and if the weather is showery success may be regarded as certain. It is not, however, the weather conditions at the time of planting that matter most, but the state of the atmosphere during the ensuing three weeks. In the autumn the atmosphere is usually moist, the ground is warm, and the roots of the Hollies become active again almost immediately. In May the weather is usually dry and there are hot sunshine and easterly winds. These conditions are the worst possible for transplanting anything, more especially such a capricious subject as the Holly. A Holly hedge requires no attention during the first season after planting, beyond keeping it clear of weeds, and supplying a thorough soaking of clean water if the weather is very dry. The second year the hedge may be clipped lightly in somewhat the shape it is to assume ultimately. This pruning should be done in May, and perhaps again in October, where the hedge is young and vigorous, but with old-established hedges an annual clipping in late September or October is sufficient. Old hedges that have been neglected may be brought into shape again by severely cutting the sides, going right back into the old wood, and reducing the height by one-fourth or even one-half. If the top is not reduced the sides will never regain a perfect condition. It is advisable to look into the interior of a good hedge occasionally for the purpose of removing any accumulation of dead leaves at the bottom. In some cases I have known these to reach 2 feet or more up the centre of the hedge, and, if left, they cause the base to become thin and weak. The ultimate height of a Holly hedge is a matter of taste. A hedge of this character may be kept perfect up to a height of 40 feet. If allowed to grow more than 8 feet high, the upper halves of the sides should be sloped inwards instead of being cut square throughout, so that the top will not grow vigorously at the expense of the base.

THE YEW.

The common Yew is a rival to the Holly as a hedge plant, more particularly within the garden, as, for example, around a Rose garden, on the edges of terraces, or to shut out some unsightly spot, since it can be kept to any height from 3 feet to 15 feet. In the matter of preparing the ground and planting, the

same procedure should be followed as advised for the Holly, the Yew being a gross feeder. It will not, however, thrive in ground that is inclined to be wet, a point that should be borne in mind before selecting Yew for the purpose. Ground that is on the dry side and well drained suits Yews admirably once they are established, provided they have plenty of root room and are well fed. The best time to clip Yew hedges is in May, but young, vigorous hedges may also require a second trimming in the autumn. The Yew will stand any degree of clipping, and in course of time may be cut into any desired shape, as is proved by the grotesque monstrosities in Yew known as "topiary work." Old hedges that have been neglected and become ragged may be cut hard like the Holly, but they take rather longer to regain their good condition.

THE BOX.

The Box is not so much used for the making of hedges as it might be, though its dwarf form is fairly common as Box edging. On heavy soils or in limestone districts the Box makes a splendid hedge up to 8 feet or so in height. The ground should be well prepared in the first instance, using plenty of manure, with an addition of old mortar rubble, assuming there is only a little lime in the soil. Box is not capable of making a good boundary hedge, where persons or cattle are likely to push through, but in other situations it forms a capital hedge which is always attractive if kept in good condition. It should be clipped in April or early in May just as growth is commencing, and, unless growing very strongly, need not be pruned again until the following year. Box hedges sometimes turn yellow from lack of nourishment, but this can be soon rectified by affording a good top-dressing of well-rotted manure and soot, with an addition of lime in some form or other. An old-Box hedge that has been neglected cannot be cut back hard, as the Box does not break readily from the old wood, though much can be done by cutting it in harder each spring for a few years.

THUYA PLICATA, CUPRESSUS LAWSONIANA, AND C. NOOTKATENSIS.

These three plants may be treated together in the matter of their suitability for hedge plants, as their manner of growth and method of treatment are identical. All three make capital hedges 10 feet in height and upwards, but they are not suitable for low hedges. In point of appearance there is not much to choose between them, this being more a question of individual taste than anything else. All three are strong, rapid growing plants and soon attain a good size when once established. The ground should be well trenched for them, but no manure need be used; in fact, it is injurious to them if used in any considerable quantity. If the soil is rather poor, so much the better, as the rate of growth will be slower, and therefore less heading back will be needed. These plants should be clipped in May, and, until the hedge has reached its required height the leading shoots should be cut to 6 inches or a foot each year. This prevents them becoming thin in any part, and a new leading growth is soon developed. They can be cut into square-topped hedges, but I think they look better and keep better when they are cut into their natural shape—an elongated pyramid.

CUPRESSUS MACROCARPA.

This plant can only be recommended for the warmer parts of this country. In other districts it may thrive for a few years, but a sharp frost or two afterwards will be sufficient to ruin its appearance, even if it does not kill it outright. The tender green foliage and graceful, feathery appearance make it a handsome hedge plant where it can be used with safety. It is a tall, quick-growing Conifer, and should be used for hedges of not less than 10 feet in height. An open, well-drained soil suits it best, and no manure is necessary at any time, as the plants grow quite fast enough without any stimulant. It should be clipped towards the end of May, shortening the leading shoots if necessary at the same time. The hedge may be cut in any desired shape, as the natural growth of this plant is upright and columnar, but for high hedges the top should be kept narrower than the base. *J. Clark, Bagshot, Surrey.*

(To be continued.)

THE ROSARY.

ROSES AT FARNHAM.

In the nursery trade, especially the wholesale trade, Mr. S. Bide, the proprietor of the Alma Nursery, Farnham, is well known. He cultivates every year 200,000 Rose plants, 14,000 of these being standards. In addition to the Roses, there may be seen in the nursery collections of fruit trees, forest trees, and general nursery stock, including 50 acres of Seakale. There are also extensive ranges of glasshouses, in which Tomatos, Cucumbers, Melons, and Roses are grown in large numbers.

In addition, Mr. Bide farms well, is a noted Hop grower, and has a dairy of 70 cows. He has two sons, who assist in the business—Arthur manages the general nursery department, whilst Herbert is the florist, with a strong penchant for Sweet Peas, of which he has four acres under his control.

To return to the Roses, Mr. Bide produces large stocks of new or popular varieties. Grafting therefore commences in January and continues for several months. Mr. Bide is also a raiser of new sorts, having at the present time many promising varieties under trial. Of his new variety Queen of Spain, a handsome, pale pink H.T. Rose, no fewer than 8,000 plants are now growing in the nursery quarters. So full and solid are the blooms of this variety that some blossoms contain as many as 200 petals.

The rich sandy loam of this nursery is well suited for Roses; the plants grow strongly and flower freely. Of the newer varieties that arrested my attention was a fine batch of Lyon Rose, Mme. Melanie Soupert, Mme. Constant Soupert, and John Cuff, with its extra large shell-like petals of deep rose. Rhea Reid, as seen here, exhibits more cherry colour than Richmond; it is sure to become a popular Rose. Comtesse Cecelia Lurani has delicate pink flowers of most shapely form, whilst Joseph Lowe is intensely rich in its salmon hue. A large stock of Mrs. Sophia Neate, Mr. Bide's new pink Tea Rose, was noticed; its parents are Anna Olivier and Mme. Lambard. Mrs. Aaron Ward, of an Indian yellow shade, is shapely and attractive. Yeluvezoom, the new famous Gold Medal variety, is rich in rose colour, with an edging of silver. It has a slight tendency to split its petals at the edge. Lady Rossmore has crimson and claret shading. H. Armytage Moore promises to be a fine bedding Rose, so free and showy is it in its delicate shade of silvery-pink.

Of older varieties in the H.T. section excellent blossoms of Mrs. Theodore Roosevelt were plentiful; this Rose has closely imbricated petals of delicate pink colour. William Shan, with its veining of pink, was abundant. The brilliant scarlet Ecarlate showed as a good bedding Rose. John Ruskin, with its immense rose-

coloured petals, was attractive by its rich perfume and freedom of flower.

Rev. David R. Williamson, in its velvety crimson hue, was glorious beside Killarney, Marjorie, Prince de Bulgarie, Pharisæer, Oberhofgarter Terks, Mrs. D. McKie (creamy yellow), and Mme. Ravary. The variety mentioned last vied with the newer Le Progres in its intensity of orange-yellow. La Tosca, Lady Ashtown, Mildred Grant, Mrs. E. Mawley, Mamie, Jakob's Perle (with its dainty buds), Duchess of Portland (creamy white), Dr. J. Campbell Hall (rose-pink), David Harum, Goldelse, Dean Hole, C. J. Grahame, and Betty (which is undoubtedly one of the finest of garden Roses) go to make up a capital display.

Although not so popular as the Tea and H.T. sections, the H.P. varieties are largely grown; such standard varieties as Captain Hayward, General Jacqueminot, A. K. Williams, Hugh Dickson, Hugh Watson, Duke of Edinburgh, Her Majesty, Marchioness of Londonderry were prominent, not forgetting huge batches of that ever-popular variety Frau Karl Druschki.

Single-flowered varieties included Mrs. O. G. Orpen, Irish Harmony, Irish Brightness, and Sarah Bernhardt. Sarah Bernhardt is especially brilliant in colour, with a deep flush of crimson. A new copper-tinted variety, Mrs. W. H. Massey, especially noteworthy in the bud, is deserving of attention.

Of Rambler Roses the new Stella was flowering freely in the open, and so was the "blue" variety Veilchenblau. Flower of Fairfield, the new Crimson Rambler seedling, White Dorothy, and that popular variety, Blush Rambler, are grown in immense quantities. *E. Molyneux.*

CULTURAL NOTES FOR AUGUST.

AFTER the showery weather generally experienced, the remaining Rose stocks can now be budded with every chance of success. The sap being very active, as large a number of buds as possible should be got in. Some failures have been reported amongst the early-budded Standard Briars. These can now be made good by applying fresh buds, inserting them as near to the first as possible or on subsequent growths that have matured since. This is the best month for budding on the Manetti and dwarf De la Griffere stocks. If a sufficient number of matured scions is available, the buds should be got in without delay. Where a stock of strong-growing climbers of Teas and Noisettes is desired, it should be remembered these do admirably on the climbing Rugosa and Crimson Boursault, which are late growers of vigorous habit and can be budded at any time until early in September. I had almost forgotten the seedling Briar. This will do for all classes of Roses of moderate growth.

Continue the pruning back of the Rambler and Cluster varieties as soon as they have done blooming, for if the old flower-stems are left on for a time they check the development of the new growths. These fresh growths should be tied in to secure them from the wind, whether they are growing on trellis, pillar, or pergola. The early-flowered varieties of Hybrid Perpetual, Tea and China Roses, can also be pruned to two or three eyes, which will induce a strong secondary growth and bloom, especially, if after being well mulched, an occasional dose of weak liquid manure is given them, or sprinklings of some good fertiliser.

The present time is a good opportunity for improving old and worthless varieties by inserting buds of rare, choice, or new varieties in the young wood, and gradually eliminating all useless growths after the bud has taken. The heavy rains lately experienced will cause the early buds to swell, and as the tying material if left unloosened is apt to cut into the bark, this must be remedied from time to time. The hoe should now be used frequently on the beds and borders, not only to prevent the surface getting baked hard, but also to admit air and destroy small

weeds. Green fly is very prevalent, and frequent syringings with a solution of soft soap, quassia, and tobacco are necessary.

August is the best month for layering bush Roses and thus increasing the stock of any desirable kind. Straggling or worn-out plants that have lost their bottom growths can be converted into bushy specimens. Cut out a sloping trench 1 foot deep some distance from the stem, according to the length of the shoot, and fill the trench with burnt earth, sharp sand or grit, and turf. Then bend the shoot carefully down in the trench, make an incision or tongue about an inch long under the shoot or branch about half-way through, leaving the head 9 inches or a foot above the ground. The layer must be secured by a stone or firmly-fixed hooked peg, and the growth tied into a position nearly upright.

Market growers propagate General Jacqueminot and other varieties by this method, which enables them to get good strong plants on their own roots in a reasonable time.

After the buds on the Standard Briars have commenced to grow, they can be shortened to within 8 inches of the bud. This should be done towards the end of the present month. Prepare some good turfy loam, decayed manure, and sharp sand in readiness for potting in autumn. It is usual to stack the loam and manure in a heap for six or more months before using.

Roses in pots plunged out-of-doors will now be growing vigorously. If they are stopped for the last time in July and all flower-buds pinched off, they will make handsome specimens for flowering under glass in autumn and winter. In the meantime they must be kept perfectly clean from insect pests. Indoor Roses growing in borders will need frequent syringings. If the roof of the house can be removed during the hot weather, so much the better. A description and illustration of an inexpensive span-roof Rose house, with removable roof, were given in the issue of the *Gardeners' Chronicle* for September 19, 1908. The kind of house then illustrated affords ample ventilation, and is suitable in every respect for the purpose it is intended. *J. D. G.*

VEGETABLES.

CULTURE OF CULINARY PEAS.

My practice is to dig trenches during the month of November, about 1 foot wide and 2 feet deep, extending north and south. As soon as these are ready, sewage water is run into them. This is continued until about January, when the sediment obtained from catchpits is emptied into the bottom of each trench to the depth of about 6 inches. A 6-inch layer of well-rotted manure mixed with wood-ashes is next placed in the trench, and afterwards soil is added to within 4 inches of the surface. This is left undisturbed until March, when the sides of the trench are drawn in so as to leave a trench about 6 inches wide. The seeds are sown at about 1 inch apart over the whole width of the trench. The remainder of the soil is then filled in and made firm. Wood-ashes, if obtainable, should always be used for the cultivation of culinary Peas, as the potash they contain imparts a firmness to the haulm, so that it is less subject to an attack of mildew. But wood-ashes should not be employed later than January. Peas require supporting early, and the shoots cling most readily to twiggy sticks. I have tried using wire Pea trainers, but I found during very hot summers that the wire becomes heated and burns the vines. The variety Supremacy is a very quick Pea in furnishing a crop. From plants sown on March 14 I commenced picking on June 9. Other good varieties are Gradus, Alderman, Telephone, Telegraph, and Ne Plus Ultra. I have also planted Colossal, a new Pea sent out last spring. If it crops as freely as it grows I shall add it to my permanent list. By the method of culture I adopt mildew is unknown, mulching is unnecessary, and the plants withstand drought to a wonderful degree. *Thos. Francis.*

BOWKERIA GERARDIANA.

THIS rare South African shrub was formerly known as *B. triphylla* (see *Gard. Chron.*, December 10, 1904), owing to its leaves being borne in threes, and this name is such a descriptive one that it is a pity that it has been superseded by that of *B. Gerardiana*. The flowers are pure satin-white and shaped somewhat like those of a *Calceolaria*, with a hood and lip. They measure an inch across and the same from the top of the hood to the base of the lip. The flower is flattened in shape and is barely half-an-inch in depth. In the south-western counties its growth is very rapid, an example here having increased from a height of 18 inches to 7 feet in four years. The species is a very free flowerer, and in August is smothered with blossom. It will also bloom in a very small state, little plants scarcely more than a foot in height bearing flowers. On a spray 18 inches in length cut from the big plant two years ago, there were 30 fully-expanded flowers and 21 buds. The blossoms are borne at the axils of the leaves on the old wood sometimes singly, but often with as many as seven on a branching raceme. The lower lip of the flower is three-lobed, these three lobes being closely folded over the tube of the corolla, thus effectually preventing the ingress of insects. The pollen is shed while the flower is still in bud. This *Bowkeria* is not in commerce at the present time, though about 17 years ago it was cultivated at Messrs. Bulls' nursery at Chelsea. It is a handsome shrub that succeeds admirably in Devon and Cornwall. The plants are fairly hardy, as they have experienced 12 degrees of frost totally unprotected, and, beyond the browning of the leaves, are uninjured, starting into growth again in the spring. The species is a native of Natal, where it is said to flower in the month of December. *Wyndham Fitzherbert, South Devon.*

THE FERNERY.

THE COMMON POLYPODY.

ALTHOUGH we have headed our notes "The Common Polypody," *Polypodium vulgare*, it will soon be seen that it is the uncommon Polypodies which we have most in our mind, since, though they are the direct outcome of the sportive common one, they are far more beautiful, while equally hardy and easy of culture. The common type should be familiar to everyone who keeps his eyes open in Ferny districts, since its once-divided fronds, like double, broad-toothed combs, may be seen peeping out from the hedgerows, forming clusters in the forks of old trees, especially pollarded ones, or forming fringes near and on the tops of old walls or in the chinks of rocks and ancient ruins. As it is evergreen, it easily holds its own, and only drops its old fronds when the new ones are well in evidence. Occasionally, but fortunately nowadays rarely, we may see the peripatetic Fern-vandal hawking it about in clumps embedded in moss as a basket plant, and for such purpose it is admirably adapted, since, if bedded in loose, leafy compost retained by a lining of moss in a wire basket, it soon pushes its way through the sides, and makes a very pretty object. It does this by virtue of a stout, fleshy, travelling root-stock somewhat on the lines of the Haresfoot Ferns or *Davallias*. The root-stock travels on or near the surface of the soil, but, as we have implied, does not fail to descend if it can find an opening laterally for the expansion of its fronds. The fronds, when healthy, and grown in a well-lighted position, bear on their undersides rows of very beautiful golden spore heaps, much larger—as are the orange-yellow spores themselves—than Ferns

usually produce, so that they constitute a distinct addition to the beauty of the Polypody. So much for the common or hedge type, against which, as regards prettiness, we have not a word to say. The Fern connoisseur, however, never dreams of devoting space to it as an ornamental plant, since Nature, having endowed it with great variability, produces far more beautiful sports which are equally amenable to culture, fully as evergreen and hardy, and, therefore, more deserving of places of honour than their comparatively humble progenitor. The Welsh Polypody, or *P. v. cambricum*, is one of the best-known varieties, so old, indeed, that it is figured in Gerard's *Herbal*. It is doubtless so named as being first found in

a frond or two and a growing point, can be made into a specimen by proper culture. This remark applies to all varieties, whether fertile or not. The superior varieties of *cambricum* are *P. v. cambricum Harrowii*, a bolder, broader form; *P. v. c. Pristonii*, a denser grower; and *P. v. c. Hadwini*, a distinct, erect variety. All of these were found wild in the Lake District; they make fine specimens, either in shallow, well-drained pans filled mainly with leaf-mould, or in suspended baskets. Then there are fertile varieties, in which the comb teeth are divided and redivided into smaller ones, greatly enriching the appearance of the Fern, such as *P. v. pulcherrimum*, a very robust form; *P. v. semilacerum*; *P. v. omnilacerum*, which, however,

FIG. 46.—BOWKERIA GERARDIANA: FLOWERS WHITE.

Wales, but since then it has turned up in several other places as wild sports among the type-form, and, as we shall presently see, some of these sports are decidedly distinct and improved types. In this section, which constitutes the plumose or extra feathery type of the species, the teeth of the comb are greatly broadened and lengthened, and also divided again into sharply-pointed broad divisions, the frond thus being roughly a pointed oval, very much wider than the common one. The fronds are also of thinner texture and are invariably devoid of spores, so that the Fern can only be propagated by division of its root-stock, every piece of which, provided with

rarely assumes its full character; and, last, but by no means least, *P. v. cornubiense* or *elegantissimum*, found in a pollard Willow in Cornwall. This last is indeed an extraordinary Fern, since it bears three kinds of fronds, some normal, some twice divided, and some thrice divided on very fine lines indeed while all three types may appear piecemeal in one and the same frond, as if the Fern were constantly altering its mind as to what it should do. One form of this, obtained by selection, *P. v. trichomanodes*, is of the best type throughout, save for the very rare production of normal bits, which are best removed when they appear. It was the crossing of this with the

[Photograph by Wyndham Fitzherbert.]

big-growing tropical *P. glaucum* which gave us *P. Schneideri*, a huge edition of *cornubiense*, with all its eccentricities, with only a touch of *glaucum*, and nearly hardy. Then we have fine tasselled varieties: *P. v. cristatum*, with all tips splayed out into several points; *P. v. bifido mul-*

ker has often a great bunch crest, several inches across on an almost bare stalk. *P. v. glomeratum* Mullens is an eccentric, no two fronds being alike, though all are divided and crested after a fashion. All these were found wild, but as the fertile *Polypodiums* are avail-

or seven types, the normal, normal crested, and the two different types of fine and finer division, also crested or non-crested, appearing generally as entire fronds or parts of one and the same frond. There are numerous other varieties, but these are the best, and we think we have said

FIG. 47.—EXHIBIT OF SWEET PEAS, LILIES, MELONS, VEGETABLES, ETC., AT THE LEAMINGTON SHOW, FOR WHICH MESSRS. E. WEBB AND SONS, WORDSLEY, WERE AWARDED A GOLD MEDAL.

(For report of show see last issue *Gardeners' Chronicle*, page 102.)

tifidum, a long, narrow variant of this, quite distinct; *P. v. grandiceps* Fox and *P. v. g. Forster*, two varieties with fine bunch crests at all tips, the terminal one being very heavy, especially in the latter, while *P. v. grandiceps* Par-

able for propagation by the spores, a successful cross has been made between *P. v. bifido multifidum* and *P. v. cornubiense*, the result being an exaggeration of the capabilities of that versatile Fern, since the joint offspring may display six

enough to show that however pretty the hedge *Polypody* may be, it is surpassed in interest by its offspring, in which Nature, in some subtle fashion, has shown so many very varied forms. *Chas. T. Drury, F.M.H., F.L.S.*

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, ante, pp. 70-76.)

(Continued from page 93.)

3, ENGLAND, E.

SUFFOLK.—The fruit crops generally in this district are looking remarkably well, taking into consideration the trying season. In May we registered frost on nine mornings, and a very severe frost of 10° on May 16. All early Strawberry blossoms were destroyed, therefore the crop was a fortnight late. The Apple blossom was fully out when the frosts occurred; but only in exposed gardens was it damaged. Had there been moisture on the trees the result would have been disastrous. The winter moth has been very prevalent in this district for some years past, and, where nothing has been done to combat this pest, the trees are nearly bare of leaves and fruit. Where grease banding and spraying have been practised, the trees and crops are very healthy. Plums, Peaches, Pears and practically all fruit trees and bushes have been badly attacked with green and black aphid; but with continual spraying it has been checked. What all fruit crops require now is sunshine. *Thos. Simpson, Henham Hall Gardens, Wangford.*

—All fruit trees here set good crops, but the late frost (9° on May 16) thinned them severely, especially Plums and the blossom on young Pear trees on trellises. Wall trees did not suffer so much. Red Currants, Raspberries and Gooseberries are good. Black Currants are half a crop. Strawberries have been much damaged with the wet weather and lack of sunshine. *F. Smith, Oakley Park Gardens, Eye.*

4, MIDLAND COUNTIES.

BEDFORDSHIRE.—Fruit trees in this district passed the flowering period entirely uninjured by frost, and there was good promise of very heavy crops, no doubt due to a thorough ripening of wood last autumn. Cold winds in May and June, however, caused green fly to be very prevalent. Wall fruit is a good and full crop. Bush fruits set splendid crops. Gooseberries were the finest crop I ever remember to have seen. The soil here is a very heavy clay. *P. J. Foster, Cranfield Court Gardens, Woburn Sands, R.S.O.*

BUCKINGHAMSHIRE.—Owing to the remarkable amount of sunshine experienced in the autumn of 1908, fruit trees of all kinds promised well for this season, and an exceptionally late spring aided in retarding the blossoming period until the danger of late frosts was past. Fruits of all kinds set well, but cold, sunless weather during May and early June brought insect pests of all kinds, entailing a vast amount of labour in keeping the trees clean. Where proper attention has been paid to spraying and hand-picking, the crop is a good one, and, in the event of a good autumn, some fine samples of Apples and Pears should be harvested. Of culinary Apples here the best are Bramley's Seedling, Lane's Prince Albert, Norfolk Beauty, Newton Wonder, Ecklinville Seedling, Lord Grosvenor, and Peasgood's Nonesuch. Of dessert sorts Cox's Orange Pippin, American Mother, Lady Sudeley, Langley Pippin, Wealthy, St. Edmund's Pippin, Adam's Pearmain, and Worcester Pearmain. Pears on walls promise to be excellent, the trees are clean and the fruit free from blemishes. *Chas. Page, Dropmore Gardens, Maidenhead.*

CHESHIRE.—The fruit crops for 1909 promised at one time to be very heavy. The genial weather towards the end of April was followed in May by a long spell of dry weather, with bright sunshine and north-east winds, accompanied by frost at night. The result was that blight and caterpillars did much harm to small fruits. *Peter Wilkinson, The Gardens, Walton Lea, near Warrington.*

HERTFORDSHIRE.—On the whole the fruit crops are good, for the lateness of the season retarded the blossoming of the trees until the frosts were over. Apples are an exceptionally heavy crop, and the fruit good up to the present. Gooseberries and Currants are good, but the latter trees are somewhat blighted. Our soil is very cold and heavy, and not favourable

for Strawberry and Raspberry cultivation, but even these crops are better with us this year than for some time past. Pears are almost a failure. *W. Hedley Warren, Aston Clinton Gardens, Tring.*

—The fruit crops in this district gave every prospect at one time of being very heavy. There was an abundance of blossom, but owing to late spring frosts many of the blossoms were destroyed on Apples, Pears and Plums. Still, in some gardens near here the Apples and Pears are average crops. Such sorts as Blenheim Pippin, Bramley's Seedling, Peasgood's Nonesuch, and Lane's Prince Albert are the best. Among Pears carrying good crops are Durodonne, Doyenné du Comice, Pitmaston Duchess, Brockworth Park, and Conference. Gooseberries are a remarkable crop. Red and Black Currants are good. The early blooms of Strawberries were destroyed by frost. On May 16 we had 8° of frost. The soil is a medium loam, and the subsoil, gravel. *C. E. Martin, The Hoo Gardens, Welwyn.*

—Generally, the crops in this district are good especially when allowance is made for the attacks of insect pests and the cold, wet weather. *H. Prime, Hatfield House Gardens, Hatfield.*

—Fruit trees of all kinds flowered well, but a succession of late frosts destroyed most of the blossom on all Plum, Pear and Apple trees which had not the shelter of a wall or the protection of the walled-in kitchen garden. Pyramid Apples and Pears in the kitchen garden and Plums on walls are carrying good crops of fruit. Peaches, Nectarines and Cherries on walls are all good. Some of the blossom of the small fruits was killed by the frosts, but the crops are not seriously affected, with the exception of Strawberries, which lost all the early flowers. Apples and Pears suffered the most severe attack of caterpillar that I remember. *C. R. Fielder, The Gardens, North Myms Park, Hatfield.*

—What promised early in the season to be a good crop of Apples is now a very poor one. More than two-thirds have fallen off, those that remain being small. Peaches, Nectarines and Plums are good crops and look well. Strawberries were a very heavy crop, but the rains caused a large number to decay before they were ripe. Black, Red and White Currants, also Raspberries and Gooseberries, are clean average crops. Our soil here is very stiff, with a light-coloured clay subsoil. *Wm. Poole, Hadham Hall Gardens.*

LEICESTERSHIRE.—The condition of the Apple and Plum crops in this district is very disappointing, after the abundance of bloom displayed on the trees. The crop of early Strawberries was much damaged by the May frosts. Later varieties are producing satisfactory crops. Gooseberries, Red Currants, and Raspberries are over-average crops. Black Currants are scarce and the bushes are affected by blight. Aphid and caterpillars have been unusually numerous. The late abundant supply of rain has been beneficial to trees on the Paradise stock. *D. Roberts, Prestwold Gardens, Loughborough.*

—Apples, Pears, and Cherries are healthy, but Plums are much blighted; so also are Currants, especially Black Currants. Gooseberries are very healthy, and carry abundant crops of fine fruit. The soil is red marl, the situation only 400 feet above the sea level, and near to the River Soar. The season is cold and late, with very little sunshine. February, March, April, May and June were very dry months, but there has been frequent, though not heavy, rains during July. The temperature has been low throughout. *John Harrison, Aylstone, Leicester.*

—We had very cold weather in May when the Apples and Pears were in bloom. The thermometer on the grass registered frost 13 times between April 30 and May 21, the lowest being 20° on the grass and 27° 4 feet above the surface on May 19. During the first 21 days of May we had only 0.31 inch of rain and 195 hours of sunshine; the sun heat and maximum shade temperatures were very high during that time. Flowering was profuse on Apples, Plums, and Cherries, but less so on Pears. The best crops of Apples are on the tall standard trees; bush trees have very few fruits, and have suffered much from caterpillars. The winter wash is of no use in this respect. Pears have the best crops on west walls where they were sheltered from cold winds. Plums on standards are a thin crop, but are

heavy on the walls. Damsons are a good crop, following a very heavy one of last year. Aphides have been very troublesome. The increase of sparrows has driven away the swallows, which formerly caught them. *W. H. Dicers, Belvoir Castle Gardens, Grantham.*

NORTHAMPTONSHIRE.—Considering the season, the fruit crops in these gardens are very good. Gooseberries are an abundant crop. Everything is very late. I cannot speak too highly of Lane's Prince Albert Apple; this variety does well on our heavy soil, whilst many other sorts growing by the side of it are complete failures. Blight and caterpillars have been very troublesome on all fruit trees here. Had the trees not been given constant attention, most fruit crops must have failed completely. *W. Butcher, The Garden, Stoke Bruerne Park, Towcester.*

NOTTINGHAMSHIRE.—The crops in these gardens are satisfactory. All fruit trees and bushes produced much blossom, and they set pretty well. Apples and Pears are very good crops. Plums not so good. White Heart and Black Tartarian Cherries are plentiful, and Morellos promise well. Peaches and Nectarines are average crops and of good quality. When the Apricots were in flower there occurred 10° of frost, consequently the crop is not more than average. Small fruits generally are very good, Strawberries being a heavy crop. Foliage this year is vigorous, but in many cases it has been badly attacked by fly. *James B. Allen, Osberton Gardens, Worksop.*

—Apples and Plums suffered from cold winds, and where the trees are in exposed situations the crop is bad. In sheltered positions we have rather more than an average crop of these fruits: frequently one side of a tree is bare of fruits, whilst the other side is laden with them. Frost destroyed all the first blooms of Strawberries, but later trusses gave a plentiful crop. *J. R. Pearson & Sons, Lowdham.*

OXFORDSHIRE.—There is a great quantity of blight this year, and its presence has retarded growth, Cherries, Apples, Plums and Black Currants being the worst sufferers. Gooseberries, Black Currants, and Raspberries are enormous crops. Pears are very clean, but fruit is scarce. The soil is a light sandy loam resting on gravel. *John A. Hall, Shiplake Court Gardens, Henley-on-Thames.*

—There never were better prospects of heavy crops of Apples, Plums, and Pears than this spring. The bloom on the trees was a grand sight, but although these latter were late in flowering, the bitter cold weather for such a long time crippled nearly all the flowers. To make matters worse, about the end of May many of our trees, especially Apples, were attacked by thousands of small green caterpillars, causing some of the trees to look as they do in mid-winter. Gardens and orchards exposed to the east have suffered the worst. Currants, Gooseberries and Strawberries just managed to have crops set before the cold weather set in. The soil here is poor and stony, and the subsoil, clay. *A. J. Long, Wyfold Court Gardens, near Reading.*

SHROPSHIRE.—The Apple crop cannot be said to be heavy; although there are some trees loaded with fruits, there are many exceptions. After two fruitful seasons, Plums and Damsons are very few. Cherries were a fair crop, but have suffered from wet. Strawberries were unsatisfactory. *A. S. Kemp, Broadway, Shifnal.*

—We have good average crops if all are considered collectively. Black Currants showed very good prospects in the spring, but turned out a failure, blight being very prevalent. Trees generally have suffered badly from fungi and insect pests. We are continually fighting pests with insecticides, but meet with little success; some of the remedies do more harm than good. All fruit trees are making very good growth; with a dry autumn a good fruit harvest may be expected. *John Taylor, Hardwick Grange, near Shrewsbury.*

—Fruit trees of all kinds have been badly infested with fungal diseases and insect pests. Where such trees have been left to themselves further trouble will be experienced later. Now that the warm rains have come, things are improving, and there will be an abundance of fruit in this district of all kinds excepting Apricots. *Chas. Roberts, Hulston Gardens, Oswestry.*

(To be continued.)

ORCHID NOTES AND GLEANINGS.

CATLEYA ELDORADO.

In the gardens of Leopold de Rothschild, Esq., Gunnersbury Park, Acton (gr. Mr. Reynolds), a batch of this pretty and delightfully fragrant *Cattleya* has been giving a display of bloom for some time past, scarcely two of the specimens having flowers exactly alike. The sepals and petals of most of the forms are pale rose pink, but some have blush-white flowers, all being furnished with a deep orange-coloured tube to the labellums, some of which have dark, purplish-crimson blotches at the apex. One very beautiful form has a four-flowered inflorescence, the blooms being silver-white with a purple spot in front of the greenish-orange tube of the lip, which is crimped and fringed. The plants were forwarded to Mr. Rothschild from Manaus, on the Rio Negro, South America.

Cattleya Eldorado is easily recognised by its rounded, smooth pseudo-bulbs, bearing erect, leathery, grey-green leaves. Although it has been included under *C. labiata*, it is one of the most widely separated of the large-flowered group.

Inhabiting the low country between the rivers Amazon and the Negro, it requires to be grown in a warmer and more moist house than *C. labiata*, *C. Mendelii*, and other large-flowered *Cattleyas*, but during its season of rest the *Cattleya* or intermediate house is sufficiently warm. The species dislikes a long, dry resting period, for if the pseudo-bulbs are allowed to shrivel the plant so declines in vigour it rarely recovers.

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burtford, Surrey.

Bulbophyllum and *Cirrhopetalum*.—These so-called "botanical curiosities" have characteristics, both in the pseudo-bulbs and flowers, that commend them to an increasing number of cultivators. It is undesirable to name here all the species and varieties of *Bulbophyllum* and *Cirrhopetalum*, or to attempt to give an adequate idea of their beauties, peculiarities, and varied charms, which, in such a collection as we have at Burtford, are present in a more or less degree throughout the year. For the benefit of intending cultivators, however, a few of the more interesting and pretty species, which would form a good collection for the beginner, may be enumerated. These are *Bulbophyllum* *barbigerum*, *B. Lobbii*, *B. Ericssonii*, *B. virescens*, *B. Reinwardtii*, *B. grandiflorum*, *B. fusco-purpureum*, *B. longisepalum*, *B. comosum*, *B. Saltatorium*, *B. umbellatum*, and *B. tremulum*. Amongst the best of the *Cirrhopetalums* are *C. Rothschildianum*, *C. Meduse*, *C. Cumingii*, *C. Collettii*, *C. ornatisimum*, *C. Mastersianum*, *C. robustum*, *C. Thouarsii*, *C. elegantulum*, *C. appendiculatum*, *C. nutans*, *C. pulchrum*, *C. Roxburghii*, *C. Wendlandianum*, *C. gracillimum*, *C. Amesianum*, *C. retusiusculum*, *C. Andersonii*, and *C. chinense*. As regards cultivation, special provision must be made for the rambling habit of such species as *B. Ericssonii*, *B. virescens*, and others that have long creeping rhizomes. A long, flat, teak raft will be found very suitable for this purpose, upon which should be placed a layer of rough, freshly-gathered Sphagnum-moss, about half an inch thick, after which fix the plants to the raft by means of small copper wire. For those of less vigorous habit, such as *B. Reinwardtii*, *B. grandiflorum*, *C. Meduse*, and *C. Cumingii*, large shallow pans or shallow teak wood baskets are the most suitable receptacles. The baskets or pans should be filled to nearly three parts their depth with drainage materials, over which place a layer of coarse Sphagnum-moss, which in its turn should be covered with a layer of the compost, firmly pressed upon the moss. On this place the plants, carefully spreading the roots over the surface. Afterwards fill up to the rhizome (which should be on a level with the rim of the pan or basket) with a compost consisting of *Osmunda* fibre, *Polypodium* fibre,

and Sphagnum-moss in equal proportions, with plenty of small crocks intermixed. Cut up the potting materials moderately fine to facilitate mixing together, and pot each plant with moderate firmness. For several weeks after this operation only very slight sprayings of water over the surface of the compost will be necessary until after the roots and growths have fairly started, when the quantity of water should be gradually increased, until they are fully established, when they will require an almost unlimited supply of water. As regards the plants placed on rafts, they should be sprayed over often enough to induce the moss to grow vigorously. When in full growth most of these species require a certain amount of training so as to confine the rhizomes to within the limits of the receptacle in which they are planted. If not carefully attended to in this respect, they soon became unmanageable. Therefore, when the growths are an inch or two in length and likely to grow over the edge of the pan, gently and gradually train the rhizome round towards the centre, using, for this purpose, small sticks about the size of a match. This should be done before the new roots make their appearance, otherwise many will be injured. All these plants grow well in a shady part of the *Cattleya* house, or they can also be cultivated in the warm plant stove. They may either be suspended near to the roof glass, or arranged together on elevated stages so as to bring them well up to the light. Insect pests rarely trouble them, but nevertheless an occasional spraying is beneficial.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir Edmund G. Leder, Bart., Leonardslee, Sussex.

Shrubs.—*Stuartia grandiflora* has been very beautiful this season. Its white Camellia-like flowers, with yellow anthers, are produced alike on quite small bushes and on trees nearly 30 feet in height. *Eucryphia pinnatifolia* is showing grandly for flower. These shrubs, which flower in August are the more valuable because few shrubs bloom at this period. Shrubby *Spireas*, including *S. canescens*, *hullata*, and *ariefolia*, should be pruned after flowering as much as is necessary to bring the trees into proper shape.

The Alpine garden.—Proceed with the propagation of any species it is necessary to increase or perpetuate the stock. Such, for instance, as *Campanula Allionii*, *C. garganica*, *C. muralis*, and *C. pulla*. Take good strong cuttings and place them round the margins of the pot, putting the pot under a bell-glass, which will require to be shaded from the sun's rays. Take care that Alpine plants are not neglected during dry, hot, or windy weather. Many of the species require considerable shade and moisture, and in the absence of these conditions, they may shrivel. *Gypsophila repens* is just now very beautiful, its flowers falling down over the rocks or stones. *Cytisus schipkensis* is a mass of bloom; grown as a standard it makes a very imposing display.

Narcissus.—The present month is a good time for lifting *Narcissus* bulbs, especially those that are growing in masses amongst shrubs or in beds surrounded with grass. The bulbs should be lifted by means of a fork, and the ground should be thoroughly broken up and trenched, clearing out any roots or rubbish that may be found. A little fresh soil, bonemeal and sand, or well-decomposed cow manure may advantageously be added before replanting the bulbs. As soon as the ground has been prepared in this manner the bulbs should be replanted without delay, selecting the largest of them for planting together, so that the beds will appear uniform when in flower. The smaller bulbs should be put into beds in the nursery or in some out-of-the-way piece of ground. *Narcissi* need to be lifted and replanted at least every three years, the result being very much superior when this treatment is practised.

General bulbs.—Orders for bulbs should be prepared as soon as possible for transmission to the seed merchant, and arrangements made for the usual autumn planting. Tulips, Ranunculi and Hyacinths should now be taken from the nursery ground where they have been ripening, in order that they may be cleaned and afterwards stored in boxes or bags in a cool shed to await the planting season. All bulbs that have to be lifted should be lifted during dry weather.

Brompton Stocks.—Seeds of this type of stock should be sown at once in pans or boxes or even on a warm border. It is a good plan to thoroughly dig a good piece of land and prick out the seedlings into this prepared soil, putting them 6 to 9 inches apart. They should be shaded for a day or two by bending sticks over the bed and covering these with tiffany or similar material. The great point is to get the plants as hardy as possible in order that they will stand the winter out-of-doors. In some localities they are not capable of this, and in such cases it is better to pot them up at once and place them in a cool frame, or under a south wall.

Pentstemon.—The *Pentstemons* are growing freely, and they need to have small twiggy stakes applied to them. Cuttings may be prepared at the earliest opportunity, it being unwise to rely on the old plants passing safely through the winter.

Amaryllis Belladonna.—As soon as the foliage of this plant has ripened, it should be cleared away and the soil about the bulbs should be lightly pricked over. A little liquid manure may afterwards be given. The flower-spikes will soon be showing above ground.

General work.—Apply stakes to any plants in the herbaceous borders needing them. Lawns and tennis grounds which have been much used during the season will be benefited if a little grass manure is sown upon them. They should be rolled and watered frequently. Push on with the budding of *Roses* and the layering of *Carnations*. Stir the soil between *Violets* and other growing plants and cut away the old flowering shoots from shrubs and dead flowers from bedding plants.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. King, Esq., Eastwell Park, Kent.

Outdoor vines.—The growths upon outdoor vines must be kept thinned out so that the air may circulate freely through the foliage, thus encouraging the plants to become firm and healthy, and less liable to attacks of both insect and fungal pests. Pinch out all laterals as soon as they appear, and stop the leading shoots immediately the allotted space has been filled. Mildew is likely to be more than usually troublesome this year. A sharp look-out must therefore be kept, and on the first appearance of the disease, the plants should be sprayed with a reliable fungicide.

Pears.—These fruits, having been thinned out, are now swelling freely, and at present both the growth and fruit are very clean. If the summer pruning is not already completed, give very attention to this work. Afterwards it will only be necessary to stop the later growths at a point one or two leaves above where the shoot was previously stopped. Any shoot growing unduly strong should be pruned to maintain the proper balance of the tree. Earlier varieties, such as *Citron des Carmes*, *Jargonelle*, and *Williams' Bon Chrétien* will soon be ripening in warm situations. With the approach of this stage, give strict attention to the trees and see that the fruits are gathered just before they are fully ripe. Early varieties of both *Pears* and *Apples* should be used almost direct from the trees. In some cases the fruits become mealy and are scarcely worth eating only a few days after being picked. Trees of later varieties bearing good crops should be given dressings with artificial manures. The grower, however, must study the requirements of individual trees, and by no means treat them as collections. Established trees bearing heavy crops derive great benefit from occasional dressings of manure, but in the case of young vigorous trees this treatment would result in an abundance of unfruitful growth. Owing to the many damp and sunless days, waterings have not been so necessary as usual, but now that hot, dry weather has set in, attention will have to be given to this matter, water being required more abundantly on light, thin soils. Expose the fruits to the sun as much as possible. It should be borne in mind that high colour in *Pears* is much admired, and it is a strong point at exhibitions. According to the fruit returns just published, the present appears to be a favourable season for *Pears* as compared with the previous year, but do not allow the trees to mature too heavy a crop, otherwise they will fail in the following season.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Early Peaches and Nectarines.—Continue to give attention to the ripening of the young shoots on trees which will be required to supply the earliest crops next season. If the old fruiting wood has not already been cut out this should be done without delay, so that the young shoots may receive the full benefit of sunshine and air. So far the present season has been unusually sunless, and this, combined with a moist atmosphere, has greatly delayed the maturing of fruit trees. Keep the foliage clean, but do not syringe the trees except in the afternoon on hot days.

Mid-season trees.—Directly after gathering all the fruits from the trees, give the roots a thorough soaking with clear water. Trees affected with insect pests must be syringed with an insecticide two or three times at intervals of a few days, afterwards washing them with clear water late in the afternoon on fine days. Cut out the old fruiting wood, with the exception of what is required for extension, and loosen the young growths from the trellis. As the shoots, especially on young trees, swell considerably during the autumn months, attention must be given to see that the ties do not become too tight, otherwise irreparable damage may be caused, as canker is a direct result of neglect in this matter.

Late trees.—Old-established trees maturing full crops of fruit require copious supplies of water at the roots, and, until the fruits commence to ripen, stimulants should be given at every alternate watering. Syringe the trees with rain-water twice daily and encourage a moist atmosphere in the house by frequently spraying the borders and paths, but as soon as the fruits begin to ripen syringing must be discontinued and the surface of the borders allowed to become quite dry. Varieties of Peaches and Nectarines liable to scalding should be shaded, or many of the fruits will be spoiled. A double thickness of fish-netting is useful, or, if this is not available, a little limewash syringed over the glass will answer the purpose.

Early trees in pots.—Repot the earliest trees, for it is important that the roots should be firmly established in the new soil before bringing the trees into the forcing house. Young trees growing in small pots may be given a shift into a slightly larger size, but old-established ones should be taken out and repotted into pots of the same size. A suitable compost is one consisting of rich loam, with a fair quantity of old lime rubble, crushed bones, soot, and a sprinkling of some approved fertiliser mixed thoroughly together. Pot firmly and place the trees where they will be sheltered from the fierce rays of the sun till they recover from the check. Water very carefully until the roots again become active, but use the syringe freely during fine weather.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

Succulents.—Plants of such genera as *Cereus*, *Echinocactus*, *Mammillaria* and *Opuntia*, which have thick, fleshy stems, should now have their supply of water gradually reduced, until, after three or four weeks have elapsed, they may be kept quite dry until next spring. Let the plants be exposed to as much sun as possible, and admit air freely whenever outside conditions will permit. This treatment is necessary in order to thoroughly ripen the growths and enable them to pass safely through the winter. Cacti, may, in some cases, be kept alive and of healthy appearance, notwithstanding water is given them throughout the year; but growth is then always more or less active, and the shoots remaining comparatively soft, they produce few, if any, flowers. Plants of *Epiphyllum*, *Rhipsalis* and *Phyllocactus*, the stems of which are not so thick, and therefore not such reservoirs of moisture as the members of the genera previously mentioned, do not require to be kept so strictly dry. They must, however, be kept decidedly on the dry side during the winter months. At the present time, they should be moved to a cooler and more airy house than that in which they have been growing. If the base of a Cactus plant shows signs of decay at any time of the year, the decayed portion should be cut away. The healthy part, after having been exposed to the air for three or four days, should be treated

as a cutting, inserting it in a comparatively small pot of sandy soil, and placing it on the shelf of a warm house.

Achimenes and Caladium.—As these plants cease to be ornamental, let them be moved to brick pits and exposed to full sunshine, gradually reducing the amount of water until the foliage fades away, when the pots containing the corms and tubers should be stored in their winter quarters.

Chrysanthemums.—The plants, being now thoroughly well rooted, they require feeding with manure water. Let this be very weak to commence with, but increase the strength gradually, changing the nature of the manure from time to time. Continue to remove surplus side shoots, and, if blooms are required for exhibition, three of the strongest growths will be sufficient, each of which will bear one large bloom. For ordinary purposes, however, five or six growths may be retained. When the plants are sufficiently advanced, commence disbudding on the large blooming varieties, choosing the early morning for the operation, at which time the growths are more brittle. In determining the degree of disbudding, and whether to select the crown or terminal bud, the grower should be guided by the particular variety, the purpose for which it is cultivated, and the peculiar circumstances of locality. As a rule, the crown bud produces the finest bloom, but when "taken" early, the crown buds of many varieties develop badly, and produce coarse flowers. During hot days the plants must be frequently examined and watered if necessary. The damping of the surrounding ground will do much to check excessive evaporation. Syringe the plants morning and evening on fine days, directing the water underneath the leaves. In cases where space was left at the time of potting for a later top-dressing, let this be applied at the time of disbudding. A daily search should be made for earwigs.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Cucumbers.—Plants which have been grown in frames on hot-beds should have their growths well thinned out and be given surface dressings over the roots. Close the lights early in the afternoon, and spray the growths with tepid water. Should the weather continue wet and cold, Cucumbers will derive much benefit if a good lining of sweet stable manure is placed around them; the lights should be thoroughly covered at night. Make another sowing of a free fruiting variety in pots, and raise the seedlings in heat. These should be ready for planting in the houses towards the end of the present month, and should produce a good crop through the autumn. Outdoor or ridge Cucumbers have done badly this year, but, providing the growths are kept thoroughly clean and the plants relieved of their fruits immediately they are ready for cutting, there is yet time for them to yield an abundant crop.

Spinach.—This crop is perhaps in greater demand throughout the year than any other vegetable, but in many localities it is an uncertain one during the autumn and winter. Particularly is this the case as regards early sowings in the autumn, for a large percentage of the plants, and frequently the whole crop, dies off with very little warning. Consequently, it is advisable to make frequent small sowings in various parts of the garden at intervals of a week or ten days until the middle of October. That known as the prickly seeded variety is generally recommended for sowing for winter, but after many years' experience, I have found the best of the round-seeded varieties equally as hardy and very much more prolific. The ground should be deeply dug, and if it has been well manured for the previous crop, no more manure need be added. Break the ground up finely and apply a good dressing of fresh soot and burnt garden refuse. The surface should be broken down to a fine tilth and made very firm. Sow the seeds thinly in rows from 12 to 15 inches apart. Hoe the surface soil frequently, and, when well above the ground, thin out the plants to 6 inches apart. Little further will be required after this, beyond occasionally dusting over the foliage with soot.

New Zealand Spinach.—This plant makes a capital substitute for the true Spinach during autumn. It is scarcely equal to Spinach in flavour, but few can detect the difference when

it is cooked and served. The plants require abundant sunshine. Keep the crop closely cut, as it will be found that a few plants will yield a considerable supply. The variety known as Perpetual Spinach is very hardy and generally serviceable during the winter months. Late sowings should be thinned until the plants are 9 inches apart.

Onions.—Preparations should be made for this important crop. Select an open position in the garden, which will not require manuring, but let the ground be deeply dug and exposed to the weather if possible, afterwards turning it over and applying a good dressing of wood-ashes and soot. Leave it in this condition until just before sowing the seed. Do not place the seed in the ground before the 15th inst, as if sown too early many of the plants will undoubtedly run to flower in the spring. The 25th inst. may be regarded as the latest date for sowing. The ground must be finely broken down, neatly raked, and made very firm. Draw the drills 9 or 10 inches apart. Some excellent varieties for successional planting are White Emperor, White Leviathan (two of the best early varieties I know), Blood Red, and Lemon Rocca.

Turnips.—Owing to the wet and cool weather, Turnips have given great satisfaction all through the summer. Thin out successional sowings immediately the rough leaf is made and keep the surface soil frequently moved with the Dutch hoe. Make frequent small sowings of Snowball, Jersey Lily, and Red Globe. Red Globe is especially good for late sowing. It is a green-topped variety, and the flesh is white and excellent. This Turnip is good for any purpose, but perhaps its chief merit lies in its extreme hardiness.

THE APIARY.

By CHLORIS.

How to get bees out of awkward places.—Swarms often find a home in hollow walls, roofs and other difficult places, and people are at a loss how to remove them without either taking out a portion of the wall or stopping up every inlet. The following method is tedious, but not difficult:—Make up every entrance, save one, and over this entrance place a Porter bee escape by fixing the escape on a piece of wood, with a hole bored through it. Nail the wood to the wall, or whatever the bees are in, taking care that the hole in the wood and escape fit over the entrance. It will be well to perform this operation at night. Take a skep containing a queen and about a pint or more of workers, securing the hive on a board with rope, so that it may hang on a nail just above the bee escape. Another method is to take two frames of bees and a queen, and place them in a nucleus hive, or other small hive, and fix them in a similar position. The bees will be able to get out of their undesirable home, but unable to return, and will join the bees in the hive about their old entrance. While this operation is in progress it will be well to watch if the bees have found other outlets, for these, of course, become inlets, and must be plugged up with putty or other suitable material. If the bees have occupied the cavity for a few days only, then the whole of them may be captured in the hive in about two or three days.

Taking bees to the Heather.—Great care must be taken when bees are packed for transit by rail, as they often are when the owner desires to take full advantage of the Heather honeyflow. It is a good and safe plan to screw down the frames at the projecting ends, the whole being then quite firm, and the frames immovable. Under these conditions bees are easily suffocated, unless good ventilation is provided. Above the brood chamber tack on some perforated zinc, and nail similar zinc over the entrances. The roof should have a good ventilator in it, especially when the weather is hot. It will also be necessary to secure the floor-board to the hive, and this is easily performed with the aid of about six screws. When the whole is securely roped together, all will be ready for the journey. It should be added that hives intended for transit in the manner described should always be fitted with wired foundation for new combs; unwired foundation will not bear the jarring. The hives should be carefully unpacked directly they are placed on the stands after arrival, at their destination.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, AUGUST 17—

Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. Walter F. Reed, on "Bees in relation to Gardening").

WEDNESDAY, AUGUST 18—

Shropshire Hort. Soc. Sh. at Shrewsbury (2 days). Hemel Hempstead Fl. Sh.

THURSDAY, AUGUST 19—

Roy. Hort. Soc. of Aberdeen Exh. in Duthie Park (3 days). Abingdon Fl. Show.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—62°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, August 11 (6 P.M.): Max. 78.4°; Min. 57.2°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, August 12 (10 A.M.): Bar. 30.3; Temp. 75°; Weather—Bright sunshine.

PROVINCES.—Wednesday, August 11: Max. 78° Guildford; Min. 68° N.E. Coast of Scotland.

SALES FOR THE ENSUING WEEK.

MONDAY, WEDNESDAY, AND THURSDAY—

Trade sale of large quantities Dutch Bulbs in variety, at 67 & 68, Cheap-side, by Protheroe & Morris, at 10.

MONDAY—

15,000 Liliun Harrisii, 50,000 Tulips, 75,100 Roman Hyacinths, 150,000 Narcissus, &c., at 67 & 68, Cheap-side, by Protheroe & Morris, at 5.

FRIDAY—

Imported and Established Orchids, at 67 & 68, Cheap-side, by Protheroe & Morris, at 12.45.

The proposal of the Royal Horticultural Society to hold an International Exhibition in London in 1911, on the lines of the Exhibition and Congress of 1866, has reawakened interest in that historic event. The two illustrations of that Exhibition we now publish are from photographs which were found to afford quite sufficient detail for reproduction, notwithstanding their considerable age—44 years. We are indebted for these to Mr. W. P. Wright, who obtained them from Mr. E. Easton, a surviving member of the Executive Committee. The official Report of the proceedings (p. 300) gives the following information respecting Class 103, in which Mr. Turner's plants, illustrated in fig. 49, were exhibited. The class was one for eight greenhouse Azaleas exhibited by nurserymen, and the prizes were awarded to Mr. Charles Turner, Slough; Messrs. James Veitch & Sons, Chelsea; and Mr. O. Rhodes, Sydenham, in this order. The following varieties were shown by Mr. Turner:—Perryana, illustris nova, variegata, Sir Charles Napier, Criterion, Barclayana, Iveryana and Chelsonii. Messrs. Veitch's plants were Criterion, Magnificent, Extrani, Juliana, Trotteriana, carnea superba, Chelsonii and Cedo Nulli.

A similar class for eight Azaleas was reserved for amateurs, and it is interesting to recall the names of the winners, for several

were well known in horticulture for many years after the exhibition. They were W. R. G. Farmer, Esq., Nonsuch Park, Cheam (gr. S. M. Carson); Thos. Canning, Esq., Westbury-on-Trym, Bristol (gr. A. Morse); H. H. Gibbs, Esq., St. Dunstan's, Regent's Park (gr. C. Penny); Mrs. Tredwell, St. John's Lodge, Norwood (gr. B. Peed); and Madame C. Legrelle d'Ilanis, Berchem, Antwerp (gr. F. Vervoort). The four prizes were awarded to the English exhibits in the order the names are now given. The value of the awards were the same in the amateurs' as the nurserymen's class, namely, £12, £10, £7 and £5.

We are not able to describe the details concerning the fine foliage plants illustrated in fig. 48, for the photograph bears no indication of the class in which the group was exhibited. Altogether there were 238 classes.

Regarding the prospects of the proposal that has been made, we believe that it is becoming more and more recognised that the advantages which would result from an adequate display of the horticultural resources of the nation are clear and considerable. The chief characteristic of science is that it grows. Like the growth of things in general, that of such a science as horticulture is slow, and often imperceptible to those occupied in tending it. Therefore, it is well that from time to time we should pause in this latter work, and take stock of the progress which our science has made in recent time.

For the same reason, the proposed Genetic Conference will be welcomed. The progress which has been made in the science of plant-breeding during the last decade is little short of wonderful. Now that the less difficult things in hybridisation have been accomplished, and accomplished by none to a greater extent than by horticulturists of this country, it is necessary that the new methods should become more widely known and practised. By no means can this desired end be brought about better than by such a conference as that contemplated. In the direct exchange of views between men who perforce look at problems of hybridisation from widely different standpoints, new paths become outlined, old prejudices removed, and undue sanguineness curbed.

If such an exhibition be held, it is to be hoped that not only these islands, but all parts of the Empire, may be represented, and worthily represented. We would go so far as to suggest that, besides the independent exhibits, there should be one which displays the horticulture of the Empire. We should also like to see well-organised exhibits illustrative of—and also conferences on—the various departments of science which bear on horticulture, and which ought more than is the case at present to render important service to the horticulturist. Among such departments of science axillary to horticulture we may mention those dealing with plant diseases and with the new and rapidly-growing soil-science. The art of horticulture has reached such perfection in this country that we can be sure that in an international exhibition it will render a good and imposing account of itself. We should like to see the scientific aspect of horticulture represented so adequately as to form a worthy complement to the main and essential display of the art and craft of horticulture.

The State has indicated that it does not propose in the future to leave all the burdens incident to an enterprise so great as that of an international exhibition to be borne by societies and individuals. May we not look to the State, therefore, through the Board of Agriculture, for sympathy and support? We hope that a powerful and thoroughly representative committee will be formed, in order that the plans for the organisation of the exhibition may be well and truly laid.

In another column we reproduce a summary of the general proceedings at the 1866 Exhibition, as printed in the official Report, in the hope that the details may afford some help to those who may be called upon to prepare plans for 1911.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees will take place on Tuesday, the 17th inst., in the Society's Hall, Vincent Square, Westminster. At the afternoon meeting of Fellows a lecture on "Bees in Relation to Gardening" will be delivered by Mr. WALTER F. REED, F.L.S., F.C.S.

"THE BOTANICAL MAGAZINE."—In the issue for August there are illustrations and descriptions of the following plants:—

CARALLUMA NEBROWNII, tab. 8267.—This species, named by BERGER, was discovered by Mr. DINTER near Barmen, in German South-west Africa. Living plants were sent by him to the late Sir THOMAS HANBURY at La Mortola, where they flowered in July, 1907, and again in November, 1908. *C. Nebrownii* is one of the largest-flowered species and is most nearly related to *C. lateritia*, from which the plant now figured in the *Magazine* differs in having longer pedicels, a more rugose corolla of a blackish-crimson colour flaked with very small yellowish spots on the disc and at the base of the lobe instead of a uniform brick-red. The corona in the present plant is also larger than that of *C. lateritia*. The plant requires very dry treatment, especially in winter, when little or no water should be given.

CYNOCHES DENSIFLORUM, tab. 8268 (see fig. 19 in *Gardeners' Chronicle*, January 9, 1909).—Mr. R. A. ROLFE states that this remarkable Colombian Orchid flowered in the collection of the Rev. J. C. B. FLETCHER, Mundham Vicarage, Chichester, in November, 1908, shortly after having been obtained from Messrs. HUGH LOW & Co. The new species appeared unexpectedly among some *Mormodes* collected at Simacota, near the River Opon, Colombia, by Mr. J. BIRCHENALL. It is interesting on account of the great diversity between the sexes. Male and female flowers are occasionally borne together upon the same pseudo-bulb, the females being many times larger and heavier than the males, and different not only in the shape of the sexual organ but also in the shape, texture and colour of the perianth. The column of the male is long and slender, bearing the anther at the summit, while in the female it is very short and stout, with a pair of triangular fleshy wings at the sides of the stigma. The lip in the female is a large, ovate, fleshy body, but in the male it is reduced to a small circular disc, surrounded by a number of clavate, marginal appendages. The sepals and petals are membranous in the males and very fleshy in the females.

ERLANGIA TOMENTOSA, tab. 8269.—This greenhouse plant was referred to in these pages last week by Mr. W. E. GUMBLETON, a specimen having recently flowered in his greenhouse at Belgrove. *E. tomentosa* is a member of the Composite, and is widely distributed in

FIG. 49.—GROUP OF FINE FOLIAGE PLANTS IN THE INTERNATIONAL EXHIBITION OF 1860.

(From a photograph supplied by Mr. Easton.)

tropical Africa, from British East Africa to the Zambesi. The genus *Erlangea* differs from the genus *Vernonia* only in respect of its reduced achenes and in having the pappus reduced to very short caducous hairs. Until a few years ago it was deemed a monotypic group, but now it is believed to consist of at least 32 species, several of which, however, had formerly been included in *Vernonia*. Mr. HUTCHINSON points out that the nearest ally of *E. tomentosa* is *E. fusca*, from which it is readily distinguishable by the bright green leaves and the scariously-edged involucre bracts. *E. tomentosa* is a shrub which in habit much resembles some of the *Eupatoriums*, and it attains a height of 5 feet. It flowers freely and continuously during winter and spring. It admits of easy cultivation in a greenhouse, treated in the same manner as the winter-flowering species of *Eupatorium*. The campanulate flower-heads are of a shade of lilac, and the leaves oblong or oblong-lanceolate, pubescent above and villous-tomentose beneath.

SPIRÆA HENRYI, tab. 8270.—This species of *Spiræa*, belonging to the section *Chamadryon*, was discovered by Mr. A. HENRY in Hupeh, near Ichang, in 1885, and later in Szechuen. It was not introduced to cultivation, however, until Mr. E. H. WILSON found it in 1900, also in Hupeh. Mr. W. J. BEAN now states that amongst older species it is most closely related to *S. canescens*, and its flowers, as in that species, are arranged in rounded corymbs on the upper side of the long, arching branches. Its nearest ally is, however, *S. Wilsonii*, which is also described as having the peduncles and pedicels covered with silky hairs, but is in reality almost glabrous. *S. Henryi* is a lax, spreading shrub, 7 to 8 feet in height. It has long oblanceolate leaves and the white flowers are produced in compound corymbs 2 inches across, which are terminal on short twigs springing from the branches of the previous year.

AGAVE WRIGHTII, tab. 8271.—This is a new species, described by Mr. J. R. DRUMMOND. The plant figured was acquired for Kew from the collection of Mr. T. H. KELLOCK in 1903 under the name of *A. Taylori*. It was at once recognised that it was not the true *A. Taylori*, but for some time it was treated as a variant of *A. geminiflora*. Upon its flowering in the Mexican house at Kew in November, 1908, Mr. C. H. WRIGHT found it to differ from *A. geminiflora* in the colour of its flowers as well as in its leaves, which are smooth and subulate in place of being narrowly loriiform and striate. Mr. DRUMMOND points out that his new species approached most closely to the plant figured as *A. geminiflora*, *Botanical Register*, tab. 1145, in 1828, which, however, was not the true *A. geminiflora*.

NATIONAL CHRYSANTHEMUM.—The members of this Society held their annual outing on Monday last, visiting Friar Park, Henley, the residence of Sir FRANK CRISP. The party, which numbered 116, entrained at Paddington for Taplow, and from thence the journey to Henley was by steam launch. After luncheon the garden at Friar Park was inspected under the guidance of Sir FRANK CRISP and his gardener, Mr. KNOWLES.

HORTICULTURAL TRADES' ASSOCIATION.—The annual meeting of the Horticultural Trades' Association of Great Britain and Ireland has taken place this year in Belfast. The members arrived in that city on Monday last. On Tuesday visits were made to the nurseries of Messrs. HUGH DICKSON and Messrs. ALEX. DICKSON & SONS. At 7 p.m. on the same day the members met at dinner in the Grand Central Hotel, and, following the dinner, the officers for the ensuing year were elected and other business transacted.

On Wednesday the party visited Castlewellan, and on Thursday the Portadown Nurseries, belonging to Messrs. MCGREY & SONS, and the Newry Nurseries, belonging to Mr. T. SMITH.

"THE SCOTS GARDNER."—Mr. BROTHERSTON, Tynninghame, Prestonkirk, writes that he will be glad to hear from anyone who has a copy of *The Scots Gard'ner* (1633) and is willing to dispose of it.

CEYLON BOTANIC GARDENS.—From the Administration Report of the Royal Botanic Gardens, Ceylon, for 1908, it appears that much interesting material in the form of fungus plant disease has found its way to the Peradeniya Government Laboratory. This included some 20 diseases new to the island, comprising such an *Olla podrida* as a "witches' broom" on Cinnamon, stem and root disease of Camphor, a canker of the Indianrubber-yielding *Hevea*, a root disease of Nutmegs, a smut disease of Citronella grass, leaf and pod disease of Vanilla, &c. Special mention is made of a root disease of Tea caused by a species of *Diplodia*, which usually produces the death of the bushes after pruning. As it is spread by the spores, the Government mycologist, Mr. T. PERCH, urges the importance not only of burning the dead bushes, but also all the prunings, as the fungus lives upon these as a saprophyte when they are left upon the surface of the ground or buried. The practice of using the prunings for manure is much to be deprecated.

THE OAT CROP OF AMERICA.—Among the recent publications of the Bureau of Plant Industry of the U.S. Department of Agriculture is one on the *Improvement of the Oat Crop* (circular No. 30, 1909), by Mr. C. W. WARBURTON. The author, in the introduction, states that no less than 32,000,000 acres were devoted to the production of Oats in the United States in 1907, and that not only was this acreage larger than that of any previous year, but also that the yield—about 25 bushels to the acre—was the lowest since 1893. Mr. WARBURTON therefore considers that there is ample room for improvement. He points out that the possible lines along which this amelioration may be effected are: Mechanical selection; introduction of new seed; use of the seed plot; individual plant selection and hybridisation. The several methods are discussed in the order named. Mechanical selection, e.g., the separation of the heavier and so presumably better seeds by mechanical means—wind power or gravity—though it may be of service in removing weed seed and shrivelled grains, will not effect any permanent improvement in the variety. For, as has been shown to be the case with Wheat, &c., the ordinary field crop of Oats is a mixture of several varieties, some of which are necessarily inferior. The introduction of new seed, e.g., from Europe, has been beneficial in the past, but the available new varieties are not numerous. Exchange of seed from one locality of the United States to another does not in the case of Oats lead to better results than are obtained by home-raised seeds. Therefore, since hybridisation requires considerable skill and time, the most promising method for the improvement of the crop is that offered by the seed plot—in other words, the raising of seed from grains selected from individual plants. The circular contains useful advice as to the way in which the variety testing, i.e., the raising of seed from individual heads, should be carried out and the manner in which records of such testing should be kept. Inasmuch as there is a wide field for the application of these methods to all kinds of other crops, we commend the excellently clear account of improvement by individual selection to all interested in the amelioration of plants.

ANGRÆCUM CAUDATUM.—We are asked to state that the specimen of *Angræcum caudatum* mentioned in our report of the Royal Horticultural Society's meeting last week was exhibited by the Hon. Mrs. FOLEY (gr. Mr. Newman), and not by R. G. FOLEY, Esq. The specimen was a very fine one and received a Cultural Commendation.

TILE FOR EDGING PATHS.—*The Weekly Florists' Review* (Chicago and New York) inserts (July 22) the following letter and note: "Kindly give me the name and address of a firm handling the blue-fluted tile used extensively in the vicinity of London for edging paths. The *Review* will be pleased to hear from any reader who can give the desired information.—Ed."

EDELWEISS AND ALPINE DISASTERS.—In the *Times* for the 6th inst. appeared the following letter from Sir FRANK CRISP:—"In your impression of yesterday you record further deaths of tourists in the Alps. One through 'making a detour in order to gather Edelweiss,' and others as 'due to attempts to gather Edelweiss.' Perhaps you would allow me the same space as you did a few years back to again call attention to the fact that Edelweiss is not an Alpine prodigy. It will grow on the roof of the Bank of England and in an ordinary London back garden. Whatever may be said of the fertility—financial and otherwise—of the area which the Bank's roof covers, the roof itself is as infertile a place as could well be selected, whilst a London back garden has always been the ideal of abomination as regards the growth of floral rarities. Assuming that anything can be said in favour of the wisdom and foresight of risking one's life to gather a unique and remarkable flower, nothing can surely be said in support of taking such a risk for a flower that will readily grow in the waste places of civilisation."

HORTICULTURAL EXHIBITS AT BRUSSELS.—It is now evident that the Brussels exhibition will be of special interest to horticulturists, and even to fruit-growers and market-gardeners. The centenary of the Royal Agricultural and Botanical Society of Gand was celebrated last year by the quinquennial exhibition, but it will be further emphasised on the occasion of the Brussels show. In one form or another, this great society has existed since 1622, but its present basis was only created 100 years ago, when it started an annual public show in the Frascati Gardens. Its members now export from Belgium flowers to the value of £600,000 a year. It is therefore strong enough to have arranged that there shall be permanent flower shows throughout the exhibition from May to October, and that the grounds shall be beautified with gardens. The special centenary show will begin on April 24 and extend to May 5, and on the second day it will be visited officially by the KING OF BELGIUM. In the course of this celebration there will be an international flower show from April 30 to May 5, in which it is hoped that British gardeners will participate. A similar show for Chrysanthemums and other autumn flowers will be held from October 29 to November 2; while an international show of fruit and vegetables will take place from September 24 to 27. These are the dates desired by the meeting at the Royal Horticultural Hall that Lord LYTTON and Sir ALBERT ROLLIT attended, when the exceptional facilities for showing which are offered by the Board of Trade were explained. No fewer than 250 foreign experts will serve on the juries. It should be understood also that British gardeners, or groups of gardeners, may take space in the grounds with a view to their permanent decoration during the exhibition. The special regulations under which this kind of advertisement is possible are to be issued shortly.

DEATH OF AN AGED GARDENER.—We are informed of the death of Mr. JAMES HARLOCK, late gardener to Lord LILFORD, Bardwell, Oundle, in his 96th year. For 32 years he had charge of Lilford gardens, but retired from this position with a pension 13 years ago. He removed to Peterborough, where he remained for two years. His death occurred at Stamford. The late Mr. HARLOCK was, in the 'fifties, a frequent exhibitor of Cape Heaths, New Holland plants, Pelargoniums, and Cinerarias at the Stoke Newington, South Kensington, and Botanic Garden shows. Under his charge, the gardens at Lilford were enlarged and improved. For 64 years he was a member of the Stepney Lodge of Oddfellows, and for 50 years had no occasion to demand sick benefit. The funeral took place at Stamford Cemetery on the 28th ult.

FORESTRY IN ABERDEENSHIRE.—A scheme in connection with the afforestation movement in Scotland was outlined at a recent meeting of the Governors of the Aberdeen and North of Scotland College of Agriculture. It was decided to make immediate application to Government for a sufficient grant to acquire from 3,000 to 4,000 acres as a demonstration area, the management of which might be undertaken by the Governors as part of the ordinary scheme of administration. In a report on the subject, a sub-committee which had been considering the matter pointed out that the district embraced by the College included considerably more than half of the total forest area of Scotland, while the counties of Kincardine, Aberdeen, Banff, and Elgin themselves contained over 200,000 acres of wood. But there were great possibilities for development, as these four counties contained over half-a-million acres of bare land from which plantable ground could be selected. Although classes were conducted in the College and lectures given to actual forest workers, the teaching facilities were insufficient. Therefore, to meet present needs it was necessary to have absolute control of an area of forest and plantable ground to provide for the training of working foresters. An area of from 3,000 to 4,000 acres with a certain amount of standing timber would best meet the case. A certain number of apprentices would be engaged each year, and would form part of the working staff of the forest, whilst in addition to being a training ground for foresters, the area would also serve as a demonstration area. Experiments would be carried out, but, on the whole, the forest would be worked on commercial lines, and would form part of any scheme of afforestation that might subsequently be started by the State. Districts were known where land-owners were ready to start planting schemes, but, as the labour available was unskilled, it was essential that a supply of properly-trained foremen should be provided. The proposed scheme, it was emphasised, involved no financial risk, and would in time be not only self-supporting, but profit-earning. Commenting on the report, Mr. R. H. N. SELLAR, vice-convenor of the county of Aberdeen, explained that they hoped to get the support of the various town and county councils within the College area, and he trusted that with this influence they might get £30,000 or £40,000 from the Government. The report was adopted, and the Governors approved of the action of the committee in memorialising the Chancellor of the Exchequer on the subject.

PUBLICATIONS RECEIVED.—*Manihot Dichotoma, ulc, et sapii species Americanae*, A. W. Potting Hemsley, Descriptive. (Kew: Royal Gardens.)—*Platanthera Truei Peloria*, by W. Botting Hemsley. Extracted from the Linnean Society's Journal, *Botany*, vol. xxxviii., October, 1908. (*The Journal of the County Laboratories*, Chelmsford: Vol. 1, Nos. 1 and 2.) Price 2d.

A MARKET FRUIT-GROWER'S YEAR.

JULY, like June, was a month not at all propitious to fruit-growers. In these first two months of what should have been summer there was not a single day of genuine summer heat, according to the Meteorological Office records, while the hours of sunshine were greatly below the average number. The period was the coldest and most gloomy for the time of year that has been experienced since I was old enough to make observations. In most parts of the country the excessive rainfall of June was repeated in July; but in my own district there was not any excess in either month. Indeed, double the quantity that fell here would have been welcome for tree fruit crops.

DAMAGE TO FRUIT.

Where the rainfall was excessive great damage was done to the Strawberry crop, while Cherries split badly, and Plums to some extent. But the injury to the interests of fruit-growers was not confined to the damage to fruit; for a much greater disadvantage was the reduction in the demand for fruit due to the coldness of the weather.

GOOSEBERRIES AND CURRANTS.

Owing to the unusually plentiful crop of Gooseberries, together with the poor demand, there was a disastrous glut in the market. Hundreds of tons were sold at 1s. to 1s. 6d. per half-sieve of 28 lbs., and many tons at even less than 1s. Only fine berries, after the time of maturity, made as much as 2s. per half-bushel. In many cases where sales were at 1s., the return was less than the costs of picking, rail carriage, and market expenses. At this place (Hailsham) part of a crop of ripe berries, the remnants left after the best had been picked when green, were given away to the pickers, because they were not worth marketing, one lot of small fruit having been sold at 6d. per half-bushel in London. Black Currants sold better, fine fruits of Boskoop Giant having made from 6s. to 7s. 6d. per half-sieve of 24 lbs. Here may be noted the curious fact that one half-sieve of Black Currants at the highest price made as much as 15 half-sieves of the cheapest Gooseberries. But during the latter part of the season the price of Black Currants fell, in spite of the shortness of the crop. Red Currants did not sell particularly well in any part of the season.

FOREIGN FRUIT PULP.

In connection with this poor demand for fruit, it is worth while to notice a cause other than the coldness of the weather in July. Common report declares that the jam makers were very poor buyers of British fruit, because they increased their consumption of foreign fruit pulp. This is a system of foreign "dumping" that the country could do very well without. Home-grown fruit for jam is cheap enough surely, and it is a question whether half the foreign pulp that we import arrives in a wholesome condition.

PLUMS AND APPLES.

Where Plums escaped damage from frost when they were in blossom, the crop is a good one; but in the most important Plum districts reports state that the yield is small as a rule, though fair on some varieties. The Apple crop is certainly a very poor one in Kent, and in districts of Sussex, Essex, and Suffolk that I have visited. Not only are Apples thin on the trees of most varieties, but they are also below the usual size, and large quantities have been rendered unmarketable by the damage done to the trusses of fruit by aphides.

SUMMER PRUNING.

When time allowed in July, progress was made in the summer pruning of young Apple trees. In the course of the work a difficulty occurred as to what should be done to main shoots covered with a mass of curled leaves, and twisted in many cases, through the persistent attacks of the aphids, which lasted up to the end of the

month, in spite of repeated sprayings. To leave them till the autumn or winter pruning was not desirable, unsightly objects as they were, and yet, to cut them back to where it would be advisable to cut them in the winter seemed a hazardous experiment, because new shoots would grow from a point just below the cuts, and these might not mature sufficiently to live through the winter. One thing was certain—it could not be of any advantage to leave the whole of a deformed shoot to use up the nourishment of a tree, and in most cases a portion of the malformation was cut off, but not as much as will be cut later. In a few cases, however, the experiment of cutting aphid ruined shoots back below the point of injury was tried, and the results will be awaited with interest.

THE WOOLLY APHIS.

The so-called "American blight" was not as troublesome as usual during the period of cold weather, though it was bad enough in a plantation of young trees and stocks grafted in the spring, where the pest was introduced with a consignment of Apple stocks. Beyond all comparison, so far as my experience goes, the best remedy is methylated spirit, used neat. In penetrative action, this fluid surpasses any other that I have tried, and it is immediately fatal to every aphid that it touches. An objector to the use of this remedy once declared that undiluted methylated spirit was injurious to trees; but I have tested it thoroughly and found it quite harmless. It has been used repeatedly to destroy colonies of woolly aphid in the budded portions of Apple stocks, the spirit having run all over the buds. The stocks so treated have been labelled, and examination afterwards has proved that the buds wetted with the spirit grew as well as others not so treated. Similarly, young shoots have been treated when the aphid was found in the axils of the leaves, without any apparent harm.

OUT-DOOR STANDARD PEACHES.

Eight or nine years ago an account was given of good crops of Peaches, and, I think, Nectarines also, having been grown on standard trees in the open by Messrs. Veitch and Mr. Turner at Slough. This induced me to plant a few trees on one side of my home orchard, as it seemed likely that my locality would be more favourable than Slough. The Nectarines have been a failure, never bearing more than a slight sprinkling of fruit, and the Peach trees have borne a fair crop only once before the present season, in which they are fairly covered with fruits. The experiment is not recommended for imitation. *A Southern Grower.*

INTERNATIONAL EXHIBITION OF 1866.

SUMMARY OF GENERAL PROCEEDINGS.

The International Horticultural Exhibition and Botanical Congress of London was originated amongst a few representatives of British horticulture and botany, who had accepted the invitation to attend the first of these international meetings, held in 1864, at Brussels, under the auspices of the Federation of the Horticultural Societies of Belgium, and under the immediate patronage of the Belgian Royal Family. The action then taken was followed up by those who attended the Exhibition and Congress at Amsterdam in 1865, when a pledge was given or implied that a similar meeting should, if possible, take place in London in 1866.

With the object of carrying out these views, a preliminary meeting was held in St. James's Hall on May 18, 1865. Present: J. J. Blandy, Esq., chairman; Messrs. J. Fraser, J. Gibson, Dr. R. Hogg, C. Lee, Dr. M. T. Masters, T. Moore, G. U. Skinner, J. Standish, C. Turner, and H. J. Veitch. At this meeting a Provisional Committee was formed (Mr. Thomas Moore acting as secretary) for the purpose of preparing a scheme for carrying out the proposed Exhibition and Congress. One of the first steps taken by the Provisional Committee was to confer with the Council of the Royal Horticultural Society,

with a view to secure its co-operation in carrying out the scheme. Somewhat later the Linnean Society and the Society of Arts were invited to take part in the movement, and the Council of the latter body accepted the invitation, and set apart the sum of £50 to be offered as prizes for implements.

The general preliminaries having been arranged by the Provisional Committee, a meeting of supporters took place on July 1, 1865, when a prize schedule was agreed to, and it was announced that subscriptions in aid of the undertaking to the amount of £1,001 6s. had already been promised, while the further sum of £2,296 5s. had been guaranteed.

The following gentlemen were, at this meeting, delegated to act as an Executive Committee to carry out the Exhibition and Congress, namely:—

- Chairman.*
SIR C. WENTWORTH DILKE, BART., M.P.
Deputy Chairman.
JOHN J. BLANDY, ESQ., V.P.R.H.S.
Treasurer.
SIR DANIEL COOPER, BART.

and several interviews with these gentlemen were held, in the course of which, so many difficulties in the way of framing a guarantee deed were pointed out, and it was found that the expenses connected therewith would be so heavy, and the delay occasioned so considerable, that the Executive Committee decided on dispensing with a guarantee deed, which was therefore never executed. Cards of admission, and other privileges, were nevertheless forwarded to all those who had expressed their willingness to join in the execution of such a deed.

By the month of September the Executive Committee was enabled to decide finally as to its course of action. It had been felt from the first that the exhibition should be held in connection with the garden of the Royal Horticultural Society; and upon negotiation with the Council, it was agreed that a sum of £300 should be paid to the Society as a consideration for the use of its garden during the Exhibition week, the Committee providing the necessary music for the week (£194 16s. 8d.), and that the Fellows of the Society, the holders of their transferable tickets, and the debenture holders should have

charges on account of glass sashes for lighting the Orchid tent, and for iron gutters and other fittings; and these, with the necessary outlay for ground-work, raised the cost of the Exhibition tent and ground to £3,946. Since the close, the Committee has been called on to restore the ground to its original level, which will cost about £150. When it was proposed to prolong the Exhibition for five additional days, it was agreed that Mr. Unite should take 20 per cent. of the receipts, after payment of the expenses consequent upon the extension of the duration of the show, and this percentage amounted to £700. The Orchid tent was, with great liberality, heated by Mr. Ormson, of Chelsea, free of charge.

The plan for laying out the interior of the tent was designed by Mr. Gibson, and was carried out under his superintendence. The area covered with canvas was 3 acres 2 roods and 38 poles. Of this space, 55,000 feet were allotted for plants, 50,000 feet for promenades, and 20,000 feet for single specimens and decoration, exclusive of the compartments devoted to Orchids, to fruit, and to vegetables. The pathways, in-

FIG. 49.—SOME OF MR. C. TURNER'S AZALEAS IN THE INTERNATIONAL EXHIBITION OF 1866. (See p. 114).

- Committee.*
Professor BENTLEY, F.L.S. Dr. M. T. MASTERS, F.L.S.
Mr. W. BULL, F.L.S. Mr. T. OSBORN.
Mr. E. EASTON. Mr. W. PAUL.
Mr. C. EDMONDS. Mr. J. STANDISH.
Mr. JOHN FLEMING. Mr. C. TURNER.
Mr. R. FORTUNE. Mr. J. VEITCH, F.L.S.
Mr. J. GIBSON. Mr. B. S. WILLIAMS.
Mr. J. LEE.

- Secretaries.*
Mr. THOMAS MOORE, F.L.S. (Exhibition).
Dr. BERTHOLD SEEMANN, F.L.S. (Congress).
Dr. R. HOGG, F.L.S. (General Business)

Messrs. Coutts & Co., and Messrs. Barclay, Bevan & Co. were nominated bankers to the undertaking; and Messrs. Fladgate, Clarke & Finch were named as solicitors. At a later period Mr. Richard Dean was appointed assistant secretary.

As it was early seen that the expenses would be very considerable, it was deemed advisable to invite subscriptions, in return for which certain privileges and tickets were assured, as explained in the Regulations as to admission.

With reference to the Guarantee Fund, a Sub-Committee was appointed to consult the solicitors,

the privilege of free entry to the Exhibition on the day after the opening, the garden being open to them on every day. It was at first intended to have had the main portion of the show in the western annexe of the Royal Horticultural Gardens; but, at a later period, the permission of the Government, and of the first Commissioner of her Majesty's Works, that it might be held on the adjoining and more convenient site of the Exhibition of 1862, was obtained. Subsequently, when it was found desirable to extend the period of the show beyond the four days originally contemplated, a fresh arrangement was made with the Council of the Royal Horticultural Society, by which the Committee, on granting the Fellows another free day at the show, and on providing music in the gardens of the Society for the five additional days (£100), was permitted to have the use of the garden up to the close of the Exhibition.

The Exhibition building, erected after plans recommended by the Building Committee (Messrs. C. Lee, J. Gibson, H. J. Veitch, and J. Standish), was contracted for by Mr. Unite, of Paddington, the amount of the contract being £2,000. To this sum, however, have to be added further

including those of the Orchid tent, occupied 60,000 feet—sufficient to accommodate 15,000 persons within the tent, allowing 4 feet for each person. Several van loads of large plants, upwards of 100 in number, were kindly lent from the Royal Gardens at Kew for the purpose of being placed in certain prominent positions in the tent. Some Palms and other fine specimen plants were also lent by the Royal Horticultural Society.

As regards railway transit, all the principal companies (the Great Eastern only excepted) agreed to convey truck loads of plants to and from London at a single fare; but no reduction could be obtained for smaller quantities, and the several companies declined to grant special concessions as to passengers, in consequence of the show being held in the Whitsun week, during which unusual facilities for travelling, of which visitors to the Exhibition could avail themselves, were, it was pointed out, always granted to the public.

(To be continued.)

*These glass sashes, adopted as a precaution against injuring the plants, proved to be unnecessary. The tent without them was found to be light enough, and where the glass was used, it had to be painted over.

*Succeeded by Dr. Masters.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE RAINFALL AT ROTHAMSTED.—The total rainfall at the Rothamsted Experimental Station for the month of July amounts to a little over 3 inches, which is rather more than half an inch in excess of the average of the past 56 years. The rainfall for the first seven months of the year (January to July) amounts to 15½ inches, which is also half an inch in excess of the average for the corresponding period of the previous 56 years. March gave 1.83 inches over the average fall, June 1.70 inches over, and July 0.58 inch in excess. The total excess of rain for these three months amounts, therefore, to 4.16 inches, equal to 420 tons of water per acre above the average. The other four months, January, February, April and May, each showed a considerable deficiency compared with the average, which more than balanced the excess of March, June and July. The greatest fall in 24 hours occurred on June 1, when 1¼ inches of rain were recorded. So far, the present season, in this district, has not suffered from an excessive rainfall, but from a continuance of dull, gloomy and sunless weather, which has had a bad influence on the satisfactory ripening of the grain crops. The majority of the Wheat and Barley crops are quite three weeks later than usual in this neighbourhood. *J. J. Willis, Harpenden.*

SPOTTED FUCHSIAS.—I have contributed occasionally to the *Gardeners' Chronicle* for a period of over 50 years, being now nearly 80 years of age. It is gratifying to me to see that lately the Fuchsia is more often mentioned than for many years past. It has occurred to me, therefore, that raisers of the present time may be interested in the following notes. In 1881 I discovered four seedlings in a shady border with flowers, the white corollas of which were spotted like *Odontoglossums*. No. 1 had large white corollas with black spots; No. 2 had brown spots. No. 3 small spots, No. 4 tiny spots. I lifted them to pot up, but just at the moment my attention was required to another matter, and I laid them in the border for the time. It was two or three days before I went for them again, and I was sorry to find the sun had parched them up. I have never heard of such things as spotted Fuchsias since. I have at the present time a batch of seedling Fuchsias. The foliage is as handsome as some varieties of *Colens*, but none is in flower yet. *Edmund Bland, Belmont, Fordham, Cambs.*

A PEOPLE'S ARBOUR DAY.—Anyone who has travelled along the country roads in Germany cannot have failed to observe that they are planted on both sides with fruit trees. To see them in early summer, when they are avenues of Apple, Pear and Cherry trees in full bloom, or in the late summer and autumn, when the branches are laden with fruit, is a sight not easily equalled or forgotten. From a report before me, issued by the Minister of Agriculture of Saxony, I notice that, after providing employment for a large number of "tree-wardens," and occasional work for a larger number of persons engaged in picking and marketing the fruit, after providing all who choose to have them with free meals of fruit throughout the autumn, and after beautifying a countryside corresponding in parts to our own Black Country, this department made, during 1908, a profit of £12,000. I am prompted to suggest that a similar system of roadside fruit-tree planting be instituted here, and, by way of making its realisation practicable in the near future, I would further suggest that we take also a leaf out of the book of the Colonies, and establish a people's Arbour Day. An additional holiday seems greatly needed to break the long spell of work from now until Christmas. Such a day would most naturally fall in the first part of October, the most suitable time for fruit-tree planting. If an influential society were formed—I suggest Lord Avebury as its natural president—to lead the agitation, to make the necessary arrangements with the public bodies controlling the roads, and collect funds and trees, there is little doubt that, in a few years, it would literally "change the face of the country," and provide an enormous amount of productive employment for capable and willing

hands. To give details of the organisation as it presents itself to my mind would take up too much of your valuable space; but I venture to submit that, since there are the roads and the un- and under-employed, and thousands of public-spirited people desirous of helping the unemployed as long as their donations are spent usefully, the task of organising this scheme of roadside fruit-tree planting as a rational investment of money and surplus labour does not seem to present extraordinary difficulties. *W. R. Bortler, 83-91, Great Titchfield Street, London, W.*

THE 1866 EXHIBITION.—Your correspondent in last week's issue (see p. 98) states it is given to few living to recall the famous South Kensington Show of 1866. I for one can recall the most striking exhibits of that show, and I have missed very few exhibitions and meetings of the R.H.S. since that time. May the 1911 exhibition be a great success! The progress in horticulture since 1866 is indeed marvellous. *John Carvill.*

THE POTATO DISEASE.—Phytophthora infestans has at last made its appearance in this district. A week ago merely scattered specimens were met with, but now it is widely distributed. Considering we had 4.52 inches of rain in July and 1.99 inches the first three days of August, we must be thankful the disease did not come sooner. *C. B. P., North Wootton, King's Lynn.*

UNANSWERED APPLICATIONS FOR EMPLOYMENT.—Being out of employment through no fault of my own, I have advertised several times for a situation, and I have replied to numerous advertisements of situations I am qualified to fill. Some employers have been kind enough to reply, but the majority have not done so. Being out of work, I have to look at the penny before buying the stamp to post the letter, and I think that anyone who is in a position to employ a gardener might reasonably be expected to reply to a letter which is merely an answer to an advertisement published by himself, and this even though the vacancy has been filled. *Nemo.*

RAFFIATAPE.—The actions against two of our leading firms of seed merchants compel me to make the following explanation.—In the *Inventors' Manual* may be seen the following: "Letters patent may be obtained for: 'The application of a known substance to a new purpose, when some inventive power is evidently necessary to make the application available for the new purpose.'" Raffiatape was never used for tying up plants before I applied my inventive power and patented the stuff for the perfectly new purpose of tying up plants, because it stretches to enable the plants to grow. The patent was fully granted me, but in 1906 it was revoked, causing me much loss, through no fault of my own. Due notice of this revocation was given to the trade, yet some firms still marked raffiatape, pure and simple, as "West's Patent Raffiatape." Prior to this patent being annulled, I applied for the registration of the word Raffiatape, and a second patent for the improved mode of coiling tape, to prevent it entangling had been secured. This second patent, being granted under the new Act, is a valid one, and cannot be set aside like the first patent, which was under the old Act; therefore it comes about, that although it is wrong to mark Raffiatape as "West's Patent," yet it is quite correct to style the improved raffiatape coils as "West's Patent Coils," as was done before the revocation of the first patent and ever since. *C. E. West.*

PRINCIPLES OF MENDELISM.—I have been disappointed in not seeing any comment regarding the leading article on Prof. Bateson's work, published in the issue for July 24. It would be interesting to many to know if anyone else has attempted the crossing of the two white Sweet Peas Emily Henderson and Blanch Burpee. If so, have the results obtained by them been identical with those of Prof. Bateson? What is the parentage of these two Peas? As Mendelism is a subject of great importance to horticulturists, it would be advantageous to have the opinions of hybridists, particularly those who have worked with Sweet Peas. *P. S. Follwell, Drumpellier, Coatbridge.*

A CURIOUS SPRAY OF SWEET PEAS.—At a village show held near Reigate recently there was shown an extraordinary spray of Etta Dyke Sweet Pea. The stem was fasciated and flattened, and at its upper part divided into two separate spikes. At the base of the fork or division was a twin flower having two standards, four wings, two keels, and two styles, with many stamens. On either of the divided points were four normal flowers but all close together. Thus there were on this spray no fewer than nine flowers, and when first brought to me I regarded it as a truss or spike from the large, white *Lathyrus latifolius*, but a closer inspection revealed its singular nature. It gave me an idea of a race of Sweet Peas which, in a normal state, would produce twin points or sprays on ordinary stems that some day perhaps may become common. To obtain new colours or finer flowers on the existing race seems difficult. Raisers may well seek for newer qualities. *A. D.*

SOCIETIES.

ROYAL HORTICULTURAL
Scientific Committee.

August 3.—*Present:* E. A. Bowles, Esq., M.A., F.L.S. (in the Chair); Messrs. A. W. Sutton, J. T. Bennett-Poë, J. Douglas, W. Hales, G. S. Saunders, and F. J. Chittenden (hon. secretary).

Diseased Water Lilies.—Mr. G. S. SAUNDERS reported that he had been unable to discover any insect or fungus pest upon the Water Lilies sent to the last meeting, and he considered it probable that the condition of the water, which smelt very unpleasant, was the cause of the death of the plants.

Sparrows and Water Lilies.—Mr. W. HALES showed leaves of Water Lilies with a large number of scratches upon them, caused by sparrows' feet. The sparrows stand upon the leaves in order to reach the water, and scratch the leaves in their endeavour to retain their balance.

Poincianna regia.—Mr. S. P. LANCASTER, of Alipur, Calcutta, sent drawings illustrating the variation in the gorgeous flowers of this beautiful plant.

Green Sweet Pea.—Rev. W. WILKS exhibited flowers of a Sweet Pea of a yellowish-green colour. The plants had come true from seed.

Malformed Pea.—Mr. E. E. TURNER, Coggeshall, sent a flower of the culinary Pea showing axial proliferation and various malformations, particularly in producing free stamens and regular petals in some of the small flowers. Mr. SAUNDERS took the specimen for further examination.

Cones of Pinus Sabina.—Mrs. HADLEY, of Parkside, Reigate, sent two huge cones of this Pine from a tree grown in her garden which had carried five cones.

DERBY GARDENERS'.

The first annual show in connection with the Derbyshire Gardeners' Association was held recently in the Albert Hall. The Mayoress of Derby performed the opening ceremony and judged the table decorations.

Trade exhibits were of high quality. Mr. SYDENHAM, of Melbourne, showed a fine display of herbaceous perennials; Mr. LOWE, of Beeston, and Mr. SIMS, of Borrowash, splendid collections of Roses. Mr. COLE, Ashbourne, contributed Sweet Peas of excellent quality.

Competitive classes were numerous, the most important being those for Sweet Peas and Roses. A Silver Challenge Cup was offered by Messrs. Haywood, Ltd., for six vases of Sweet Peas, and this brought 15 competitors, Mr. SIMS winning with the varieties Evelyn Hemus, Princess Beatrice, Dorothy Tennant, Etta Dyke, Helen Lewis, and J. Ingman. A Silver Cup was also offered by Councillor Johnson for the best exhibit in the three classes for Roses. This was secured by Mr. J. BEARDSLEY, Ilkerton.

By the kind permission of Sir Peter Walker, Bart., a large party of members of the Derbyshire Gardeners' Association recently visited Osmaston Manor gardens. *P. M.*

PRESCOT HORTICULTURAL.

AUGUST 2.—The 25th annual exhibition was held in Knowsley Park. The entries were fully up to the average in number and the quality of the exhibits, especially plants, was superior to those of former years. There was only one exhibit in the class for a group of plants measuring 11 feet in diameter. This was shown by F. D. NUTTALL, Esq. (gr. Mr. W. H. Roberts), and was awarded the 1st prize.

Mrs. HARDING (gr. Mr. J. McFALL) won the 1st prize in the class for two Palms or Cycads.

Four stove or greenhouse plants were best shown by T. HENSHAW, Esq. (gr. Mr. J. George). He had *Clerodendron Balfourianum* and *Allamanda Hendersonii* in good condition.

Mr. H. McFALL led in the class for four greenhouse plants in flower, and he was the most successful exhibitor in most of the classes for plants.

The best Begonias were shown by Mr. D. McKELVIE.

In the classes for three Zonal Pelargoniums, three Fuchsias, three Coleus and six table plants respectively, Mr. W. H. ROBERTS won the 1st prize in each case.

In the classes for Roses Mr. J. GEORGE, Mr. H. McFALL, and Capt. YOUNG (gr. Mr. T. Kilshaw) were prominent prize-winners.

Fruits were generally well shown. In the class for four dishes of distinct kinds, JOHN STONE, Esq. (gr. Mr. D. McKelvie) secured the leading place, staging Black Hamburg Grapes, Melon, Crimson Galande Peach, and Elruge Nectarine. 2nd, Mrs. PARRINGTON (gr. Mr. Thomas Eaton).

The best two bunches of Black Hamburg Grapes were shown by JOSEPH BEECHAM, Esq. (gr. Mr. W. Oldham).

Mr. H. McFALL was 1st for two bunches of Muscat of Alexandria.

In the class for two bunches of any other black Grape, JOHN STONE, Esq. (gr. Mr. D. McKelvie), won the 1st prize with Gros Maroc; whilst for two bunches of any other white Grape Mr. W. OLDHAM won with well-coloured examples of Buckland Sweetwater.

F. STAPLETON BRETHERTON, Esq. (gr. Mr. T. Nelson), showed the best Peaches; and Mr. D. McKELVIE the best Nectarines.

In classes for vegetables the 1st prize for eight varieties was won by Mr. J. GEORGE with a capital collection, including Intermediate Carrots, Magnum Bonum French Beans, Early Gem Peas, Ailsa Craig Onions and A1 Tomatos.

In the classes for single dishes the following exhibitors secured 1st prizes:—Messrs. W. J. ROBERTS, H. McFALL, and D. McKELVIE.

RAMSEY HORTICULTURAL.

AUGUST 2.—The annual exhibition of this society was held on the above date in the beautiful grounds of the Abbey. The entries were not quite up to the average, and the decrease was emphasised owing to the inclement weather of the morning, which prevented exhibitors from a distance taking their produce to the show.

In the open classes for Roses some delightful varieties were shown. Lord DE RAMSEY won the 1st prize in the class for a group of plants with a fine collection skilfully arranged.

Exhibits of Sweet Peas were the finest that have been seen at Ramsey. Pot plants were, on the whole, good, but there was a slight falling off in the number of exhibits in the class for Coleus.

The fruit shown in the open classes was well up to the average. Lord DE RAMSEY won the 1st prize for Nectarines.

Quite up to the usual high standard of the Ramsey show were the cut flowers, the display of Carnations being praiseworthy. The vegetables were also of a high order, Potatos being the outstanding feature. In the special classes for which the prizes were presented by Lord DE Ramsey, some exquisite Roses and Sweet Peas were seen. Lady DE Ramsey presented the prizes for the table decorations, and although there were only four entries, the exhibits were very charming.

Lord DE RAMSEY won the cup in the open section for the greatest number of points, and Mr. G. D. HAY secured that for the amateurs' classes for the second time, whilst Mr. H. HARRISON won the Royal Horticultural Society's bronze medal in the cottagers' section. Messrs. W. & J. BROWN, of Peterborough, had an ex-

cellent exhibit of Roses and Sweet Peas, which were greatly admired. Messrs. WOOD & INGRAM also had an interesting exhibit.

SCOTISH HORTICULTURAL.

AUGUST 3.—The monthly meeting of the above association was held at 5, St. Andrew Square, Edinburgh, on this date. Mr. Whytock, the president, presided over an audience of about 70 members. A paper on "The Flora of Tannahill" was read by Mr. Alex. Johnstone, Hay Lodge, Trinity, Edinburgh.

The exhibits were as follow:—A plant of *Nicotiana collosea variegata* and flower-spikes of *Eriogon macranthus* (Aster mesa), from Mr. THOS. HAY, Hopetoun Gardens, South Queensferry, were each awarded a Certificate of Merit. Other awards were as follow: Nectarine "Lord Napier," 9½ inches in circumference, from Mr. THOS. McPHAIL, Archerfield Gardens, Dirliton (Cultural Certificate); 12 varieties of Cherry from Mr. CHAS. WEBSTER, Gordon Castle, Fochabars (Cultural Certificate). Further exhibits included a collection of Roses from Messrs. DICKSONS & Co., Royal Nurseries, Craigmillar, Edinburgh; 12 varieties of Sweet Peas from Mr. LITTLE, Laughton House, Edinburgh; double Begonias, fancy Pansies and plant of *Nephrolepis Smithii* from Messrs. JAMES GRIEVE & SONS, Redbraes Nursery, Edinburgh; Gooseberry and Strawberry fruits from the DISTRESS COMMITTEE'S farm at Murieston (per Mr. R. Cairnes, superintendent); double Paris Daisy and a variety of Ox Eye Daisy from Mr. HAY; varieties of Iris *Kämpferi* and *Lilium superbum* from Messrs. DICKSONS & Co.; vases of Roses from Messrs. TODD & Co., Edinburgh; and a plant of *Oncidium Wentworthianum* from Mr. R. McANDIE, Inveresk Gate, Musselburgh.

Three new members were admitted.

On July 22 about 70 members of the association, including the President, visited Tulliallan, the Scottish seat of Sir James Sivewright. They returned to Dunfermline shortly after midday, and spent the afternoon inspecting the summer flower show held by the Carnegie Trust and in exploring the fine public park at Pittencrieff Glen, in the grounds of which the show is held. The party was afterwards conducted over the baths and gymnasium, where tea was provided by the Carnegie Trustees.

A second excursion took place on July 31, when, on the invitation of Mr. Adair, upwards of 70 members paid a visit to the nurseries of Mr. John Downie. Before leaving, the party were provided with tea and other refreshments by Mr. Adair.

NORTHAMPTON MUNICIPAL HORTICULTURAL SHOW.

AUGUST 4, 5.—Northampton held its first municipal horticultural show on the above dates in the Abington Park, it being eight years since the lapse of the old horticultural society. Judging from the large number of exhibits and their high quality, it is likely this event will be the first of a very successful series.

The arrangements were carried out splendidly, and reflected great credit on the efforts of the Advisory Committee to the Council, which consisted of the leading gardeners in the county.

Great praise is also due to the Mayor of Northampton (Councillor John Brown), who has taken a keen interest in the movement. Immediately after the first meeting he set to work and made himself responsible for raising a guarantee fund of nearly £1,000. It is satisfactory to state that it will not be necessary to call on the guarantors for any portion of this sum, as the receipts have not only equalled the expenses, but there is also a balance in hand.

The schedule was a good one for a new society. It gave plenty of scope in the 145 classes for all exhibitors, and prizes to the value of nearly £400 were offered.

The awards in the principal classes were as follow:—

For a group of plants (open).—1st, Sir G. KENDRICK, Edgbaston (gr. Mr. J. Macdonald); 2nd, Mr. WM. VAUSE, Leamington; 3rd, Marquis of NORTHAMPTON, K.G., Castle Ashby (gr. Mr. A. R. Searle).

For 2½ Roses.—1st, Mr. HENRY DREW, Longworth, Berks.; 2nd, Messrs. W. & J. BROWN, Stamford.

Carnations, 12 bunches.—1st, Marquis of NORTHAMPTON.

Sweet Peas, 2½ bunches.—1st, Earl SPENCER, K.G., Althorp (gr. Mr. Silas Cole); 2nd, J. MANSFIELD, Esq., Weston Favell (gr. Mr. E. Bull).

Collection of hardy herbaceous flowers.—1st, Marquis of NORTHAMPTON; 2nd, Messrs. THOMAS PERKINS, Northampton.

Decorated dinner table.—1st, Mr. W. MATTOCK (with a superb table, using Irish Elegance Rose); 2nd, Miss JAMES, York Road.

FRUIT.

Collection of nine kinds.—1st, Marquis of NORTHAMPTON, who had good Muscat of Alexandria and Madresfield Court Grapes, Downton Nectarines, Royal George Peaches, Brown Turkey Figs, Moor Park Apricots, Oullin's Golden Plums, Bigarreau Cherries, and a large seedling Melon; 2nd, Earl SPENCER.

The 1st and 2nd prizes in the classes for both Black and White Grapes were won by H. A. ATTENBOROUGH, Esq., Catesby House, and the Marquis of NORTHAMPTON in the order named.

The best Peaches and Nectarines were shown by the Marquis of NORTHAMPTON; 2nd, Col. E. D. LEE, Hartwell House, Aylesbury.

The Marquis of NORTHAMPTON also showed the best Apricots, Plums, Cherries, and green and scarlet-fleshed Melons.

The best collection of nine kinds of vegetables was shown by the Marquis of NORTHAMPTON; 2nd, Mr. JAS. MANSFIELD.

The Marquis of NORTHAMPTON won 1st prizes for Tomatos, Peas, Beans, Carrots and Onions.

In the classes for collections of vegetables in which special prizes were offered by Messrs. YARDE & Co., Northampton, and Messrs. SUTTON & Sons, Reading, the prizes were won by the Marquis of NORTHAMPTON and Earl SPENCER.

NON-COMPETITIVE EXHIBITS.

Medals were awarded to Messrs. JAMES VEITCH & SONS, Chelsea, for a grand exhibit of choice vegetables (Gold Medal); Messrs. STUTTON & SONS, Reading, for a miscellaneous exhibit of fruit, flowers and vegetables, nicely arranged (Gold Medal); Messrs. YARDE & Co. for a choice and varied collection of hardy flowers, Sweet Peas, Roses and Pansies (Silver-gilt Medal); Messrs. JOHN PERKINS for collection of hardy flowers, shrubs and fruit (Silver-gilt Medal); Messrs. THOMAS PERKINS for miscellaneous exhibits (Silver-gilt Medal); and Messrs. BARRY & BROWN, London (Silver-gilt Medal.)

MIDLAND CARNATION & PICOTEE.

AUGUST 5, 6.—In consequence of the late season, this Society's 19th annual show, arranged for July 28 and 29, was postponed until the above dates. Both Carnations and Picotees were extensively shown, and the quality of the flowers surpassed expectations. The most successful all-round exhibitor was Mr. A. R. BROWN, of King's Norton, who won 12 1st and 15 2nd prizes, as well as two silver medals. Mr. HAYWARD MATHIAS, of Medstead, succeeded best amongst the southern growers.

DRESSED FLOWERS ON STANDS.

In the class for 12 self Carnations, Mr. A. R. BROWN, Wychall Lane, King's Norton, won the 1st prize with exquisite flowers of Cecelia, W. H. Parton, Alba, Alma, Mrs. Eric Hambro, Southwell, Helen Gottwalt, Crystal, Cardinal Newman, Helen, Cardinal and Mrs. Howard Green; 2nd, Mr. HAYWARD MATHIAS, Medstead, whose best flowers were Daffodil, Carabas, Mrs. Cherrington, Beta, Miss Willmott and Eva; 3rd, Mr. C. F. THURSTAN, Wolverhampton.

In the next class, which was for six selfs, the Rev. C. A. GOTTWALTZ, Hadzor Presbytery, Droitwich, took the lead with large, well-formed flowers of Mrs. Howard Green, Cambria, Mrs. Eric Hambro, Helen Gottwalt, Theodore Galton and Connie Humphreys. Mr. HARRY SKEELS, of Walsall, who won 2nd prize, had beautiful flowers of W. H. Parton, Sir Galahad and Miss Willmott.

In a class for 12 yellow-ground Picotees, Mr. HAYWARD MATHIAS had superb examples of Libra, Styx, Mayflower, Exquisite, Togo, Verena, Goblin, Leonora, Coquelin, Astrophel,

Mrs. Heriot and Ariel; 2nd, Mr. A. R. BROWN, whose best flowers were Ida Pope, Lady Gascoigne, Peregrine and Morgiana; 3rd, Mr. W. SYDENHAM, Melbourne.

In a smaller class for six yellow-ground Picotees, Mr. HARRY SKEELS was awarded the 1st prize for very good flowers of Isolt, Ida, Lady Freemantle, Leonora, Goblin and Togo; 2nd, the Rev. C. A. GOTTWALTZ.

The stand of 12 fancy Carnations which gained 1st prize for Mr. A. R. BROWN was a wonderfully good one, every flower being large, shapely and of rich colour. The varieties exhibited were Lord Steyne, Highland Lass, Elaine, Becky Sharp, Erl King, Pluto, Billy Barlow, Pasquin, Westfield Seedling, Mandarin, Clement and Margaret Thurstan. Mr. A. W. JONES, Stechford, was a good 2nd. His best flowers were Sam Weller, Hengist, Robin Hood and Linkman. 3rd, Mr. W. SYDENHAM.

For 12 white-ground Picotees, Mr. C. F. THURSTAN won the 1st prize with shapely specimens of Mrs. H. Hoskier, Amy Robsart, Excelsior, Ganymede, Fair Maiden, Thomas William, Carrie Goodfellow, Molly, Myra, Brunette, Elaine and Mrs. Holden. 2nd, Mr. A. R. BROWN; 3rd, Mr. HAYWARD MATHIAS.

For 12 Flakes or Bizarras, Mr. C. F. THURSTAN was 1st with splendid flowers of Master Fred, Gordon Lewis, Mrs. Rowan, J. D. Hextall, Wm. Skirving, Sportsman, J. S. Hedderley, John Herbert, Admiral Curzon, Merton, George Rudd and Arthur. 2nd, Mr. C. H. HERBERT, Acock's Green; 3rd, Mr. A. R. BROWN.

SINGLE BLOOMS—CARNATIONS AND PICOTEES.

There was good competition in nearly all the classes provided for single blooms, in which 1st prizes were won by Mr. A. R. BROWN for (1) scarlet Bizarras, (2) light red-edge, (3) heavy scarlet-edge, (4) light rose or scarlet-edge, (5) yellow-ground Picotee, (6) buff or terra-cotta, (7) dark crimson or maroon, and (8) purple; Mr. C. F. THURSTAN for (1) pink and purple Bizarras, (2) purple Flakes and (3) heavy red-edge; Mr. W. SYDENHAM for (1) crimson Bizarras and (2) yellow selfs; Mr. F. W. GOODFELLOW for (1) heavy red-edge and (2) white selfs. Other 1st prize-winners included Messrs. HERBERT, FORD, MATHIAS, SKEELS, JONES, R. SYDENHAM, CHATWIN, WILLIAMS, BOYS, ALCOCK and the Rev. C. A. GOTTWALTZ.

UNDRESSED FLOWERS.

Undressed flowers were extensively and well shown, and much admired by visitors. There were seven excellent exhibits in a class for 12 self Carnations, staged on a space of 24 inches by 20 inches. 1st, Mr. W. H. PARTON, Hollywood, Birmingham, with a splendid set of moderate-sized flowers. The varieties were W. H. Parton, Helen Gottwaltz, Daffodil, Mrs. Flight, Hildegarde, The Sirdar, Sir Bevyss, Miss Willmott, Sappho, Much the Miller, Britannia and Bridegroom. 2nd, Mr. A. R. BROWN; 3rd, Mr. W. SYDENHAM.

Competition was also keen in the next class, which was for six self Carnations. 1st, Mr. G. D. FORD, with exquisite flowers of Ann Hathaway, W. H. Parton, Guy Sebright, Miss Willmott, Mrs. McRae and Sir Galahad. The Rev. C. A. GOTTWALTZ and Mr. F. W. GOODFELLOW were 2nd and 3rd respectively with flowers of high quality.

In a class for 12 Fancies or yellow grounds, Mr. W. H. PARTON beat eight contestants. He showed superb flowers of Voltaire, Mr. Thurstan, Cavalier, Sam Weller, Lord Steyne, R. A. Rowberry, Mandarin, Gibron, The Seer, W. F. Seedling, Merlin and King Solomon. 2nd, Mr. A. W. JONES, with well-set-up flowers of good quality; 3rd, Mr. A. R. BROWN.

FLOWERS STAGED IN THREES.

Eight classes were provided for trebles, namely, one for 12 varieties of selfs, yellow-ground Picotees or Fancies, one for six varieties as above, and six for single vases. The 1st prize in the first-named class was won by Mr. W. SYDENHAM, Melbourne, who showed magnificent flowers of Captain Dobbin, Mandarin, Celestial, Douce Davie, Lord Steyne, Ronny Buchanan, Sir Galahad, Claude Egerton, Exquisite, Mrs. W. Sydenham, R. A. Rowberry and Coquelin. 2nd, Mr. A. R. BROWN; 3rd, Mr. C. ALCOCK, Blundell-sands. In the smaller class, Mr. J. D. WILLIAMS, Smethwick, and Mr. G. D. FORD were awarded the 1st and 2nd prizes respectively.

Competition was spirited in the single vase classes; 1st prizes were won by Mr. W. H. PARTON for (1) yellow, buff or terra-cotta self Carnation, with Britannia, (2) dark self, with W. H. Parton, and (3) yellow or buff-ground Fancy, with Lord Steyne; Mr. A. R. BROWN for (1) white, blush or pale pink self Carnation, with Crystal, and (2) yellow-ground Picotee, with Ida Pope; Mr. C. WALL, Bath, had the best rose, salmon, or scarlet self Carnation with Enid.

AMATEUR CLASSES.

Although the number of exhibits in the classes reserved for amateurs were fewer than in 1908, the quality of the flowers was exceedingly good. Mr. J. HANCOCK, Bearwood, Birmingham, won 1st prizes in classes for (1) six self Carnations (dressed), (2) six Fancy or yellow-ground Carnations or Picotees (dressed), and (3) six self Carnation (undressed). Mr. E. KENWRIGHT, Smethwick, took the lead in a class for six white-ground Carnations or Picotees (dressed); and Mr. J. B. WILLETTTS, Yardley, had the best half-dozen Fancies or yellow-grounds (undressed).

AWARDS TO NOVELTIES.

First-class Certificates were awarded to:—

Self Carnation Mrs. Howard Green, a refined flower of a warm, rose-pink colour, quite one of the best of its class, shown by the Rev. C. A. GOTTWALTZ. *Hadzor Presbytery*, Droitwich; *Fancy Carnation Linkman*, a beautiful yellow-ground Fancy, heavily marked with scarlet, shown by Mr. A. W. JONES, Stechford; *Mrs. H. W. Twist*, a heavy rose-edged white-ground Picotee, of medium size and perfect form, shown by Mr. F. W. GOODFELLOW, Walsall; *Libra*, a medium, rose-edged, yellow-ground Picotee, of great size and substance, shown by Mr. HAYWARD MATHIAS, Medstead; and *Iota*, a light or wire-edged, white-ground Picotee, of medium size and good form, shown by Mr. HAYWARD MATHIAS.

PREMIER FLOWERS (DRESSED).

Bizarre Carnation Master Fred, shown by Mr. C. F. THURSTAN; *Flake Carnation Gordon Lewis*, shown by Mr. C. F. THURSTAN; *heavy-edged, white-ground Picotee Mrs. W. H. Twist*, shown by Mr. F. W. GOODFELLOW; *light or wire-edged, white-ground Picotee Mrs. Gorton*, shown by Mr. G. D. FORD; *heavy-edged, yellow-ground Picotee Santa Claus*, shown by Mr. C. F. THURSTAN; *light-edged, yellow-ground Picotee Astrophel*, shown by Mr. A. W. JONES; *yellow-ground Fancy Carnation Lord Steyne*, shown by Mr. A. R. BROWN; *self Carnation Sir Galahad*, shown by Mr. F. W. GOODFELLOW.

PREMIER FLOWERS (UNDRESSED).

Self Carnation Sir Galahad, shown by Mr. F. W. GOODFELLOW; *Fancy Carnation Lord Steyne*, shown by Mr. A. R. BROWN; *yellow-ground Picotee Mrs. W. H. Twist*, shown by Mr. C. H. HERBERT.

SPECIAL MEDALS AND PRIZES.

The Birmingham Botanical and Horticultural Society offered two medals to the exhibitors gaining the greatest number of points in the large classes, and two medals to the most successful exhibitors in the smaller classes. The Silver Medal in the larger classes was won by Mr. A. R. BROWN, with 154 points; and the Bronze Medal by Mr. C. F. THURSTAN, with 87 points.

Mr. G. D. FORD won the Silver Medal offered to the most successful exhibitor in the smaller classes with 105 points. The Rev. C. A. GOTTWALTZ and Mr. HARRY SKEELS tied for the Bronze Medal, each winning one 1st prize, but as the Rev. C. A. GOTTWALTZ won the greatest number of 2nd prizes he became entitled to the medal.

The Carnation Society's Silver Medal offered to the most successful exhibitor in the single bloom classes (dressed flowers) was won by Mr. A. R. BROWN, with 65 points, and the Bronze Medal offered to the most successful exhibitor in the amateur classes was won by Mr. J. HANCOCK, with 60 points.

SWEET PEAS.

Special prizes were offered by Robert Sydenham, Ltd., in three classes. The quality of the flowers exhibited was excellent.

HONORARY EXHIBITS.

Mr. C. H. HERBERT, Hazelwood Road, Acocks Green, had a large bank of hardy cut flowers at

the end of the exhibition hall, consisting principally of Delphiniums, Galegas, Campanulas and Gaillardias pleasingly arranged. (Silver Medal.)

Messrs. B. R. DAVIS & SONS, Yeovil, contributed an extensive and meritorious display of double and single flowers of tuberous-rooted Begonias. (Silver-gilt Medal.)

Messrs. PHILLIPS & TAYLOR, Bracknell, sent Carnations. (Bronze Medal.)

Messrs. W. H. SIMPSON & SONS, Birmingham, exhibited a large collection of Sweet Peas effectively arranged. The best varieties were The King, John Ingman, Henry Eckford, Saint George, The Marquis, Nora Unwin, Helen Lewis and Evelyn Hemus. (Silver-gilt Medal.)

Messrs. GUNN & SONS, Olton, had a splendid group of Roses, in which Princess Marie Merchertsky, La Tosca, Mme. Abel Chatenay, Lady Roberts, Liberty, Killarney, Frau Karl Druschki and Her Majesty were of outstanding merit. (Silver-gilt Medal.)

Messrs. YOUNG & Co., Cheltenham, showed cut flowers of tree Carnations artistically arranged in tall bamboo stands and earthenware vases of different sizes. White Enchantress, White Perfection, Aristocrat and Beacon were noteworthy varieties. (Silver Medal.)

READING GARDENERS.

AUGUST 6.—The members visited Mr. Leonard Sutton's gardens at "Hillside." Reading, on the above date. The party numbered nearly 200. After partaking of tea, a tour of the gardens was made under the leadership of Mr. Sutton and Mr. Townsend, the gardener. Annuals, together with certain perennials grown as annuals, formed delightful colour effects in the beds on the lawn. In the houses were to be seen splendidly-grown specimens of Gloxinia, Gesnera, Coleus, Schizanthus, Celsia arcturus, &c. After spending an hour and a half in the gardens, the party visited the private recreation ground at "Cintra" provided by Messrs. Sutton & Sons for their employees.

CATALOGUES RECEIVED.

CHARLES TURNER, The Royal Nurseries, Slough—Strawberries.

CLIBRANS, Altrincham and Manchester.—Strawberries.

BULBS

FISHER, SON & SIBBAY, LTD., Handsworth, Sheffield.

DICKSON, BROWN & TAIT, Corporation Street, Manchester.

HAAGE & SCHMIDT, Erfurt—Bulbs, &c.

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending August 11.

Hot sunny days, and cool nights.—On each day of the past week the temperature in the thermometer screen rose to or exceeded 77°, and on the two warmest days reached 81°—or a higher reading than at any previous time during the present year. The nights, on the other hand, proved cool for the time of year. Consequently the differences between the lowest and highest readings in the thermometer screen have been very great—on one day amounting to as much as 34°. The ground temperatures have risen rapidly during the week, the reading at 2 feet deep being at the present time 2°, and at 1 foot deep as much as 5° warmer than is seasonable. No rain at all has now fallen for eight days, and no measurable quantity of rainwater has come through either of the percolation gauges since the first day of the week. The record of bright sunshine proved unusually good—averaging as much as 11½ hours a day, or nearly twice the usual quantity in August. Calms and light airs have alone prevailed during the week, the direction being principally some point of the compass between north and east. The atmosphere remained singularly dry in the afternoon, the mean amount of moisture in the air at 3 p.m. being as much as 15 per cent, less than a seasonable quantity for that hour. E. M., Berkhamsted, August 11, 1909.

COVENT GARDEN FLOWER MARKET.

The approach of autumn is seen on all sides, and Chrysanthemums in pots are already available, but up to the time of writing I have seen only those of the Masse varieties, and these are not very good. Although the plants would be of little use for florists' purposes they would be serviceable to take the place of annuals or other flowering plants that have done flowering. *Campanula isophylla* alba and *C. i.* Mayi are well flowered; for market purposes the shoots are trained erect, in which form they are better for transit than when falling over the pots. They soon drop into shape when the growths are anted. Many who frequent the market will regret to hear of the sudden death of Mr. W. Fairhead, which occurred on Monday, the 9th inst. It is some time since he frequented the market himself, his son, Mr. H. Fairhead, acting as salesman in his place.

CUT FLOWERS.

There has been no improvement in trade during the past week. This morning large consignments of Carnations failed to find a purchaser. Carnations of all colours are abundant, but I have never before seen such large quantities of beautiful white blooms in the market. The border varieties are passed over when those of the American type are so cheap. Roses were sold at very low prices. Fine blooms of Mme. A. Chateyau went for 6d. per dozen, and very good flowers of General Jacqueminot were sold at half that price. It is difficult to quote the prices of Liliums. At the end of last week I bought good blooms at 1s. per bunch, and they could have been purchased for even less this morning. Tuberoses, Gardenias and Stephanotis are all well supplied. A. H., Covent Garden, August 11, 1909.

ENQUIRIES AND REPLIES.

PRIMULAS FOR THE WILD GARDEN.—On p. 86 *B. L.* enquired for Primulas other than *P. denticulata* and *P. japonica* that, being of easy growth, would reproduce themselves from seed in the damper portions of the wild garden. There are many species that are capable of doing this. The chief difficulty is that in such circumstances the seeds fall too closely to the parent plant. The seedlings appear in such numbers that their transplanting becomes an absolute necessity. The species best suited for getting a wide distribution of their seeds are those whose flowers are arranged in whorls; the pedicels and ovaries being horizontally disposed shoot out their seeds to greater distances when the seed vessels are ripe enough to burst. Of the new species recently brought to notice I consider *P. Bulleyana* to be by far the best for the purpose under consideration, but it is necessary to know what kind of soil there is in the position which these plants are desired to occupy and what herbage grows there. The well-known *P. japonica* will seed freely within a foot or two of the parent plant, and hundreds of seedlings may appear in a space only large enough for the full development of a very small number. I have seen hundreds of plants where there was not sufficient room for half a dozen to develop fully. In these circumstances the seeds are best gathered and thinly distributed to save the trouble of replanting. Large-growing species like *P. japonica* and *P. Bulleyana*—the first named will produce rosettes of leaves more than 2½ feet across—require ample space when growing in permanent shade and moisture. Curiously enough, *P. sikkimensis*, *P. Munroii*, *P. rosea*, and others, whilst producing quantities of good seeds, do not appear to germinate so freely in the immediate vicinity of the original specimens. For garden purposes these are best raised in pans or boxes. Even the common Primrose is not a free-seeding plant if we are to judge by the seedlings that appear naturally, although there are notable instances to the contrary. At Gravetye, for example, there are some acres in the wood which in spring is covered with fine plants in bloom. In this instance, as Mr. Robinson has informed me, Nature has been the only gardener, and doubtless the work of carpeting such an area took much time. At one period this same spot had a good deal of brushwood as an undergrowth to the Oaks, and the clearing of this probably effected a freer distribution of the Primrose seeds. At Clendon Park, Lord Onslow's Surrey seat, such Primulas as *P. capitata*, *P. rosea*, *P. japonica*, *P. denticulata*, and others are to be seen in thousands in damp positions in the woodland, but all of them give the impression of having been raised by hand and transplanted. Many of the seeds of those species of Primula whose capsules are held erect perish, I fear, as a result of the moisture they collect, the stems remaining sound for a considerable time. A difficulty to be overcome in our attempts to naturalise such things in the garden is the flatness of the ground. In their native homes the same species may be assisted in their distribution by the inequality of the soil, by melting snows or the constantly moving debris of a mountain slope. E. H. Jenkins.

BERLIN BOTANICAL GARDEN: *G. N. & P. N.* Apply to M. Ledien, the Curator of the Imperial Botanical Garden, Dahlem, near Berlin, explaining your wish.

CARNATION SOUVENIR DE LA MALMAISON: *H. J. W.* It is a usual occurrence for flowers of this type of Carnation to split the calices during the process of opening. This is caused by the excessive development of petals, and may be considered the price the cultivator pays for his selection of an unnatural production. It may, however, be said that certain varieties are less troublesome in this respect than others. If you apply to the sundriesmen you can obtain thin wire supports, which are used for placing round the calyx, to act as collars, and thus hold the petals in a natural position. These appliances serve their purposes much better than the old indiarubber rings.

CONIFER: *R. J. H.* The specimen appears to be nothing but the common Spruce. Cattle are not likely to eat this plant, but if they should eat a considerable quantity, they will, at the least, suffer injury.

CORRECTION.—In the note on Freesias (p. 94), for *motes* read *volts*.

CUCUMBER: *J. G.* You have adopted the best means of preventing a spread of the disease. Continue to cut off any leaves which give unmistakable signs of attack, and destroy them by burning. In cases where the whole plant appears to be attacked, we should unhesitatingly remove it to the fire heap.

EXAMINATION OF ROYAL HORTICULTURAL SOCIETY: *M. W. J.* Write to the Secretary, Royal Horticultural Hall, Vincent Square, Westminster.

GARDEN REFUSE: *Thomas A. B.* If you burn the materials described in your letter the ashes will be valuable as manure for the land. Fellows of the Royal Horticultural Society may have samples of soil analysed by Dr. Voelcker on payment of a small fee. Write to the Secretary, Vincent Square, Westminster. We are unable to recommend you a book that would enable you to carry out such an analysis yourself.

IMPROVED HOE: *W. H.* Apply to the Patent Office, 25, Southampton Buildings, London, W.C.

NAMES OF PLANTS: *W. H. S.* *Deutzia crenata plena purpurea*.—*D. M.* 1, *Galium verum*; 2, *Matricaria Chamomilla*.—*J. C. S.* *Poa Chaixii*.—*W. M.*, *Calthness*. These are the fruits of *Populus nigra*. The downy coating is often called vegetable down, and is sometimes used for stuffing cushions.—*A. J. W.* *Dendrobium Gibsonii*.—*P. L. T.* *Asplenium fœniculaceum*.—*W. C. S.* The yellow-flowered species is *Polystachya (Epiphora) pubescens*. The other slender little species is quite dried up and beyond recovery even after immersion in water. It is probably *Disperis capensis*.—*K. & B.* *Millium effusum*.—*F. King*, 1, *Eleagnus angustifolia (syn. hortensis)*; 2, *Kalanchoe sp.*, probably *K. somaliensis*.—*W. S. V.* 1, *Carex riparia variegata*; 2, *C. acutifolia*; 3, *Adiantum Pacottii*; 4, *Davallia Mooreana*; 5, *Aconitum Napellus bicolor*.—*W. Fulford*, *Echium vulgare*.—*C. C.* Both specimens are seedling forms of *Cupressus Lawsoniana*.—*Jet*, *Olearia macrodonta*.—*Evcles*, *Hyoscyamus niger (Henbane)*.

OXIDONS: *J. J. C.* The growths are covered with a superficial fungus, which has spread owing to the continued wet weather. You might syringe them with a weak solution of liver of sulphur or sulphide of potassium.—*Oignon*. We cannot hazard an opinion without seeing specimens. Send some of the bulbs affected by disease.

PEAR SHOOTS: *G. H.* The worm-like creatures which you state have been found upon the leaves of your Pear tree for the first time are the larvae of the Pear slug-worm and Cherry sawfly (*Selandria atra*). The perfect insect lays its eggs just under the upper surface of the leaves of the Cherry and Pear in June, or even earlier. The slug-worms, which are covered

with a greenish secretion when about six weeks old, cast their green or blackish-looking coats, and appear as buff caterpillars, free from slime, being smooth and transversely wrinkled. These caterpillars go down into the ground, spin a cocoon, and from these the sawflies emerge in the following summer. The larvae, or slug-worms, feed upon the upper surface of the leaves, which in some instances they remove entirely. The best remedy is to dust the slug-worms over with quicklime or gaslime. The first application they will throw off by exuding a coating of slime, but they cannot continue doing this; therefore, if a second application is made soon after the first, it will destroy them. The trees may be syringed with strong soapsuds or tobacco water, or with water containing 2 lbs. of soft soap and a peck of lime to each 30 gallons of water. Following a severe attack, the surface soil should be removed during winter to the depth of 3 or 4 inches. This soil will contain cocoons, and should be burned or buried deeply with some quicklime or gaslime. If for some reason it is impracticable to remove the soil during autumn, then some Vaporite should be inserted in it. In June some of the sawflies may be caught by shaking the trees in the evening over a freshly-tarred board or cloth.

PEAS: *W. F. H.* As you state that all the main crop varieties have succeeded well, it is probable that the very early sowing suffered from unsuitable climatic conditions prevalent at the time they were sown. If seeds of any kind are sown either in autumn or very early in spring, and, for this reason, remain a considerable time in the ground before germinating, there is always more or less loss due either to rotting of the seed, or to the presence of rodents such as rats or field mice. There is nothing on the scraps of roots received that would lead us to attribute your failure to other circumstances. *Subscriber*. You might apply one ton of gas tar to the acre, but it will be necessary to allow four or five weeks to elapse before digging the ground and planting or sowing a crop.

SWEET PEAS: *Raymer H.* There is no known disease present on the shoots received, but, like many other specimens from different gardens, they exhibit an abnormal condition, which may be due to some obscure disease at present unknown to science. Although nothing is known of the science of this malady, it is certain that the best means a cultivator can take to prevent its occurrence is to plant his Peas in rich, loamy soil that does not require large additions of fresh or artificial manure at the time of sowing, or during the growth of the Peas.

TOMATO: *R. S. & B. C.* The flowers fall from Tomato plants for various reasons, but the trouble is usually due to excessive vigour in the plants themselves, or unsuitable climatic conditions. You may have noticed that early in spring, when the plants are making growth of extra vigour, more flower-buds are cast than at any other time. Later when the resources of the plants are called upon to develop fruits, growth being less rapid, fewer flowers fail to set. As your plants are cultivated in boxes indoors, it is more than likely the soil has been made richer than was desirable.—*C. S.*, *Wrotham*. The plants are attacked by a fungal disease. Employ rather more ventilation, and keep the conditions of the house drier for a time. As soon as a plant exhibits signs of an attack, remove it to the fire heap and plant afresh.

VINE LEAVES: *W. F. H.* There appears to be no fungal disease in your leaves, they have developed the brilliant tints prematurely, owing either to the operation of climatic or cultural agencies. It is well known that vine leaves lose their green colouring sooner in certain districts and soils than in others. It is probably due more to the chemical composition of the border than to any atmospheric influence. At the same time, if you wish to keep the green colouring, it would be advisable to employ a slight shading from the rays of the sun.

ALTHORP PARK, NORTH-AMPTON.

(See figs. 50 and 51, and Supplementary Illustration.)

ALTHORP Park, the seat of Earl Spencer, K.G., is situated at about eight miles from Northampton, on the Rugby route of the London and North-Western Railway. The park gates are not far from the local station, but a long drive through a delightful park intervenes between the gates and the mansion. The policies around, with the beautiful old timber and herds of deer and cattle, form a suitable setting.

The building (see Supplementary Illustration) has the form of a rectangle. It is a plain, but substantial edifice, and contains a rich collection of artistic treasures, including a gallery of rare pictures. The building was erected by Sir John Spencer early in the 16th century, and represents a good example of the architecture of the Tudor period. Surrounding it are broad, closely-cut lawns, with numerous flower-beds and coniferous trees, some of these latter being clipped in columnar shape. A dwarf, stone wall encloses a terrace around the house, the balustrading being entwined with Roses of the Crimson Rambler variety. In the lower picture of the Supplementary Illustration the dwarf, Rose-clad wall is seen at the very bottom, and this

overlooks a parterre forming the garden-front on the south. The illustration shows but one half of this formal garden, there being a corresponding portion on the right-hand side. It will be noticed that two of the beds are planted to represent butterflies, the body and head being worked in *Coleus Verschaffeltii*, and the wings in blue *Lobelia*, with spots of the yellow-leaved *Pelargonium* known as Crystal Palace Gem. The circular bed in the centre is furnished with *Pelargonium Raspail* and edged with *Coleus Verschaffeltii*. The columnar trees are specimens of *Cupressus Lawsoniana erecta viridis*. Besides these *Cypresses* there are half-circular trained *Yews*, green and golden varieties alternating.

The sundial is on a plateau known as the Octagon. Looking towards the house from this spot, both the north and the west fronts are seen, also the flower-beds and lawns. There are beds of *Rhododendrons*, closely clipped *Golden Yews*, and several columnar *Cypresses*. The bedding plants have made but little growth this season, and the effect is not so good as usual. *Fuchsias*, *Pelargoniums*, *Begonias*, *Heliotropes*, *Pentstemons*, *Zinnias*, *Salvia splendens*, and similar flowers are utilised largely, with *Santolina*, *Stachys*, *Lobelia*, and other plants as edgings. *Calceolarias* appear to have been suited by the dull, showery weather of the early summer, for here and in other places *Calceolaria amplexicaulis* is unusually effective this season. *Antirrhinums* were flowering abundantly. The view shown in fig. 50 was taken from a point near the north-east corner of the mansion. It may be interesting to refer in detail to the coniferous trees seen on the right-hand side of the illustration, but before we reach them from the portion of the pleasure grounds already described, we pass some borders presenting a definite colour scheme. These are planted with flowers, some of them with white kinds exclusively, and others with blue, red, yellow, purple, and scarlet flowers respectively. The blue border is planted with *Delphiniums*, *Lupinus*, *Salvia patens*, *Asters*, *Lobelia*, *Heliotrope*, &c. The white combination is made of *Nicotiana affinis*, *Chrysanthemum maximum*, *Phlox deussata*, *Asters*, *Matricaria*, *Antirrhinum*, and *Galtonia candidans*. Various species of Composite furnish most of the subjects in the yellow border.

Passing along a broad path proceeding westwards, we notice oblong beds furnished with Indian *Rhododendrons*, raised from seeds sown in these gardens. Alternating with these are *Golden Yews* backed with taller pyramidal plants of the common *Yew*. Clumps of *Honeysuckle* are disposed between these beds. Facing these are the *Conifers* to which we have already alluded. They are very large trees, but several are already past their best condition. The most notable examples are *Pinus Strobus*, *Abies Douglasii* and its golden form, *Cedrus Deodara*, a very large and well-balanced specimen of *Picea orientalis*, *Cryptomeria japonica*, *Cedrus Libani*, *Taxodium distichum*—one of the finest specimens of this tree in the country—*Abies canadensis*, *Thujaopsis borealis*, and the variegated form of *Sequoia sempervirens*. Other notable trees included a magnificent specimen of the Tulip tree (*Liriodendron tulipifera*), with hundreds of its handsome flowers expanded, several large *Cedars*, *Quercus Suber*, *Q. serris*, an exceptionally large and well-balanced tree of the common Oak, large *Copper Beeches*, and some very big *Elms*. There are large *Elms* overhanging a piece of ornamental water which is known as the Oval

This artificial lake is of sufficient size to permit of boating. In the centre is an island planted with trees.

SWEET PEAS.

The name of Mr. Silas Cole, the gardener at Althorp Park, will always be connected with the development of the Sweet Pea, for at Althorp Park originated the Countess Spencer variety, the forerunner of the race having a waved, instead of an erect, smooth standard. This is still one of the best of this type of Sweet Pea, but in addition Mr. Cole has raised several others of sterling merit, some of which are in commerce and others have yet to be distributed. Mr. Cole regards as one of his finest novelties the variety named after Earl Spencer. It is a self-coloured flower of a deep orange shade, the inflorescences bearing three and four flowers on strong stems. Other notable seedlings are *Mabel Cole*, a yellow-ground colour with a deep *Picotee* edge of pink; *Lord Althorp*, with orange standard and rose-coloured wings, a very large flower; a maroon-coloured, unnamed seedling, so dark in colour as to appear almost black; *Sea Foam*, creamy-yellow; *Miss Lavinia Spencer*, having a pink standard and pure white wings; *G. C. Waud*, a shade of red approaching scarlet—the wings are waved so as to almost make the flower appear double; and *Althorp White*.

Mr. Cole described the parentage of the Countess Spencer Sweet Pea as follows:—The varieties *Lovely* and *Triumph* were crossed in 1898, and in the following year a variety obtained from that cross was crossed with *Prima Donna*. From this latter cross was obtained Countess Spencer.

Mr. Cole, who may be seen amongst his Sweet Peas at fig. 51, prepares the land for their planting by trenching it to a depth of 3 feet. The seeds are sown indoors in pots, and the seedlings are planted 1 foot apart in trenches. Farmyard manure is freely incorporated with the soil, but soot is Mr. Cole's favourite manure for Sweet Peas. The plants exhibit remarkable vigour and attain a height of about 12 feet. With regard to "fixity," Mr. Cole holds that varieties will come true in their fifth year if proper attention is paid to "rogueing."

FRUIT AND VEGETABLES.

The fruit and vegetable gardens, with the glasshouses, are reached by a long, narrow path that winds through rising ground. There are several vineries, and in these there were fine crops of *Muscat of Alexandria*, *Lady Downe's Seedling*, *Gros Maroc*, and *Apley Towers Grapes*, the berries being remarkably well finished and the bunches of a desirable size. There were also seen abundant crops of *Melons*, *Peaches*, *Nectarines*, *Figs*, *Tomatos*, and *Cucumbers*.

The vegetable garden alone covers an area of 14 acres, and it is divided by high walls into three main portions. The walls provide warm sheltered borders for the cultivation of stone fruits and the raising of early crops of vegetables. The main quarter devoted to vegetable culture is intersected by two broad paths running through the centre either way, and dividing it into four quarters. The path on either side is bordered with a broad band of *Stocks*, which were in splendid flower. In addition to dwarf fruit trees in the kitchen garden, there is a large orchard. The *Peach*, *Apricot*, *Nectarine*, and *Cherry* trees, trained against the walls, have all borne abundant crops of fruits this season, but the most beautiful of

all are Apricots, large, healthy trees having exceptionally choice fruits, and principally of the variety known as Ormskirk. Standard bushes of Gooseberries were seen with their branches borne down with the crop, whilst Raspberries, Strawberries, and Currants have been almost equally plentiful.

The vegetable crops looked promising, especially Celery, Onions and Leeks.

Mr. Cole is in his 18th year of service at Althorp Park, having succeeded his father, who was gardener to Earl Spencer for 14½ years. In all departments of the garden are to be seen the satisfactory results of his care and skill.

former Lily, I presume, the bulb eventually dies, and apparently does not throw off any offsets. In their natural condition such Lilies must, I suppose, increase by seeding themselves. We have here every facility for Lily cultivation, and every kind of soil, and only one serious difficulty. Most of my Lilies have to be grown in a Fir wood, where the soil, a sandy loam, is full of wood mice. Out of 30 kinds, only about nine succeed really well. These are *L. pardalinum*, *L. testaceum*, *L. tigrinum*, *L. Washingtonianum*, *L. giganteum*, *L. superbum*, *L. candidum*, *L. Martagon album* and *L. umbellatum erectum*. Such species as *L. speciosum*, *L. pomponium verum*, *L. Henryi*, *L. auratum*, *L. Szovitzianum* and *L. canadense* manage to

not grow here quite so vigorously as *L. superbum*, which has attained to a height of nearly 6 feet in this wet season."

In my reply to Mr. Basil Levett, I told him that, according to my experience, *L. Humboldtii* flowers comparatively well in fibrous soil for one or two seasons, and then entirely disappears. It is quite possible that it might prove more enduring if planted in peat or leaf-mould. This material, I imagine, would also be suited to the requirements of *L. superbum* and *L. Washingtonianum*. In this garden *L. Henryi* and *L. Szovitzianum* have been grown for years amongst Roses, in loam occasionally fertilised with liquid manure. I have had them flowering in the same position for at least 10 years. *L. Henryi* has a habit of

FIG. 50.—VIEW IN THE PLEASURE GROUNDS AT ALTHORP PARK. (See p. 123.)

[Photograph by H. N. King.]

THE CULTURE OF LILIES.

MR. BASIL LEVETT, of Wychnor Park, Burton-on-Trent, has addressed to me a communication, extracts from which he has kindly permitted me to publish in this journal, regarding his experience with the culture of Oriental and Occidental Lilies. "I have," he says, "been wondering whether a question which I asked in the *Gardeners' Chronicle* was the cause of a remark of yours in the issue of June 12? It was so curious that you should have answered the very question I had asked, namely, if there was any chance of *Lilium Washingtonianum* or *Lilium rubellum* ever becoming permanently established? In both cases your answer is, No. In the

exist, and that is all. *L. Brownii*, *L. Humboldtii* and *L. rubellum* die out. *L. Szovitzianum* is frequently attacked by mice, and even when it escapes their attentions it only grows 4 feet high, and bears from three to four flowers. I have been told that, in order to grow this great Lily successfully, very young bulbs must be obtained and allowed to get established. *L. Humboldtii*, you say, does fairly well with you, and yet I have been told it is one of the Lilies almost impossible to grow. Here it died even before flowering. For years I had the Californian form of the beautiful Washington Lily, which, it is generally supposed, will not flower in England after the first year. The ordinary form of this Lily does

bending forward, which is sometimes so emphatic as to be very reprehensible. Mr. A. Grove, of Kentons, Henley-on-Thames, who is, like Mr. Levett, an ardent Lily cultivator, tells me that Dr. Henry told him in a recent conversation that this was quite a characteristic of *L. Henryi* in its native regions.

I may add that *L. Kramerii* and *L. rubellum*—both natives of the mountainous regions of Japan—do not, at least in my own garden, last very long. Under the influence of our persistently wet Scottish winter seasons the somewhat miniature bulbs of those fine Lilies decay prematurely. *L. longiflorum*, in all its forms, soon renders itself quite impotent for floral effect by the production of a crowd of exceedingly

minute bulbs that never seem to attain to flowering size. *L. giganteum*, which, when grown from an offset, usually takes about four years for its perfect maturation, has occasionally reached here, in fertilised soil enriched with leaf-mould, a height of 10 feet. *L. monadelphum* var. *Szovitzianum* has this season aspired to an almost equal height. *David R. Williamson.*

INTERNATIONAL EXHIBITION OF 1886.
SUMMARY OF GENERAL PROCEEDINGS.

(Concluded from page 117.)

THE disposition of the several subjects of exhibition throughout the tent was delegated to

which preceded the show, and to various accidental causes. The respective numbers in the various departments of the show were as follow:—In the plant sections, 655 entries, of which 66 failed; in the fruit section, 285 entries, of which 136 failed; in the vegetable section, 302, of which 123 failed; and in the miscellaneous sections, 244, of which four failed. These numbers do not include duplicate exhibitions by the same exhibitor in the classes for seedlings, implements, and miscellaneous objects. The aggregate number of entries, including those withdrawn before the opening day, was 1,751. The number of exhibitors was 361. The amount of prize-money offered was £2,550, inclusive of the £50 offered for implements by the Society of Arts. Of this sum, £2,007 9s. was actually awarded, and a further sum of £219 16s. was

respective localities amounted altogether to £859 13s. 6d., and is included in the total before-mentioned.

The amount of the receipts from subscriptions, sale of tickets, and other sources was £16,018 4s. 7d., distributed as follows:—

	£	s.	d.
Subscriptions paid	5,604	0	0
Cash taken at doors—			
Tuesday, May 22 (12½)	£292	6	0
Wednesday, May 23 (10s. 6d.)	945	10	0
Thursday, May 24 (2s. 6d.)	1,603	8	0
Friday, May 25 (1s.)	1,043	0	0
	3,974	4	0
Saturday, May 26 (2s. 6d.)	932	10	0
Monday, May 28 (1s.)	754	17	6
Tuesday, May 29 (1s.)	1,103	7	6
Wednesday, May 30 (1s.)	1,018	0	0
Thursday, May 31 (1s.)	566	11	0
	4,375	6	0
	8,349	10	0

Sale of admission tickets, less commission*—

553 4s. tickets	529	5	6
1,002 10s. tickets	478	9	7
3,223 2s. 6d. tickets	309	16	8
2,061 1s. tickets	102	6	6
	1,419	18	3

Sale of gardeners' tickets—

1,120 2s. 6d. tickets	140	0	0
1,029 1s. tickets	51	9	0
	191	9	0

Percentages on refreshment receipts (five last days) and sundry

small items	151	9	10
Sale of catalogues	225	6	6
Advertisements in catalogue	76	11	0
	453	7	4

*Which, however, the nursery trade, most liberally, did not charge.

To the numbers admitted by money payments at the doors must be added those to whom admission was granted in virtue of some of the following considerations:—The tickets issued to subscribers; the tickets presented to guarantors; the free admissions accorded to the Fellows and debenture holders, as well as to the holders of the transferable tickets of the Royal Horticultural Society; the passes given to jurors, and to exhibitors and their assistants; and the invitations sent to foreign guests, to members of the Press, &c.

The principal items of expenditure, including the levelling and readjustment of the Exhibition Ground, were the following:—

	£	s.	d.
Tent, including fittings	2,056	3	0
Groundwork, materials, &c.	987	17	4
Band stand	10	16	0
Percentage to Mr. Unite for continuance	700	0	0

The printing of the catalogue of the Exhibition, of the report of the proceedings, of the admission tickets, and of the cards used for marking the various objects of exhibition, was executed by Messrs. Truscott Son & Simmons, of Suffolk Lane, Cannon Street.

At the close of the Exhibition an auction sale of such plants as the exhibitors did not wish to remove took place, and in many instances good prices were realised by the vendors, while the purchasers were gratified by thus being able to secure some tangible memento of the Exhibition.

The Councils of the Royal Botanic Society and of the Zoological Society, as well as the directors of the Crystal Palace, offered every facility to the foreign guests to visit their respective establishments. Dr. Hooker also, in his capacity of Director of the Royal Gardens at Kew, allowed special privileges to foreign visitors desirous of having access to the gardens and museums.

FIG. 51.—COUNTESS SPENCER SWEET PEA AND THE RAISER OF THIS VARIETY AT ALTHORP PARK. (See p. 123.)

an Arrangement Committee, consisting of Messrs. Gibson, Eyles, and Moore, and Dr. Hogg.

It was at first proposed to open the Exhibition on May 22, and to close it on May 25, but the success of the Exhibition as a show, and the uncertainty whether the extraordinary expenses, which it was necessary to incur, would be reimbursed in that period, determined the Executive Committee to keep it open until May 31, the consent and active support of the principal exhibitors having been willing granted.

The schedule for the exhibition embraced 238 classes, distributed in 10 sections. The aggregate number of entries in these classes on the morning of May 22, after allowing for withdrawals, was 1,486, of which number 329 were not sent in, owing to the unfavourable weather

paid in liquidation of extra expenses incurred, in accordance with claims sent in, to those exhibitors who allowed their plants to remain during the additional days to which the show was extended.

The amount of paid subscriptions (for which equivalent privileges were offered and given) was £5,604, and the sum guaranteed (for which stipulated privileges were also given) was £4,739 4s., although, as before stated, the guarantors were not asked to incur any liability. Further subscriptions to the amount of £161 14s. were promised, but not paid.

Considerable assistance was rendered to the Executive Committee by the various local committees established throughout the country. The amount of subscriptions thus obtained in the

EVERGREEN HEDGES.

(Concluded from page 108.)

THUYA OCCIDENTALIS.

THE American Arbor-vitæ makes a capital hedge plant, and is also a quick grower, but it has the one drawback of turning to a rusty-brown tint in winter, which is sufficient to condemn it in the eyes of many planters. For places where a fairly high hedge is necessary, but where it will not be too conspicuous, as in the kitchen garden, this is a capital plant to use, as it can be procured fairly cheaply, and soon forms a good screen. It should be clipped in May or early in June, shortening the leaders if necessary at the same time.

OSMANTHUS AQUIFOLIUM VAR. ILICIFOLIUS.

In general appearance this plant has a strong resemblance to the Holly. It makes a capital low hedge, up to 4 feet or 5 feet in height, for

without much labour. The chief item is the clipping, which should be done in June, after the first growth is made. By cutting away this growth, the tendency to become ragged-looking is checked, and a second short shoot is soon made, which keeps the hedge in good condition for the remainder of the year. Where there is time for the purpose, Laurel hedges should be trimmed with a knife instead of shears, as the latter cuts many of the leaves in half, and makes the hedge look rather shorn for a time. This appearance is, however, soon hidden by the new growth.

RHODODENDRON PONTICUM.

In those districts where Rhododendrons grow freely, a hedge of the common *R. ponticum* can be quickly made, and will be found satisfactory in every way. The ground should be well trenched, working in some leaf-mould, peat, or good fibrous turf if the soil is poor, as all Rhododendrons like a certain amount of decaying vege-

height. It is rather a difficult subject to transplant, but I have invariably found it do well if moved about the middle or end of April, especially if the weather is showery at the time. A fair proportion of manure should be added when planting, but it must not be put too near the roots. When the hedge is established it will produce its short racemes of orange-yellow flowers profusely every year, to be followed later by the shining blue-black berries. The hedge should be trimmed with a knife as soon as the flowers are past, removing any misplaced shoots and shortening the long ones to about half their length. Some of the side-shoots may be tied in if necessary, especially if there are any bare places in the hedge.

PRIVET.

The kind of Privet most commonly used for hedges is the Japanese species *Ligustrum ovalifolium* (Oval-leaved Privet), which makes a fair hedge up to 6 feet in height. It is cheap to buy and is also a quick grower, but, in my opinion, is the very last plant to use for a hedge, as it is not at all handsome, and its roots rob everything else near it. In cold localities and on light soils it is very apt to lose most of its leaves in the winter. It may be clipped at almost any time, but May is the best month. If the plants are at all bare at the base at the time of planting, they should be cut down the second spring, when strong growths will be made low down that will form a good foundation for the hedge.

In addition to the plants mentioned above, there are the Black Spruce (*Picea nigra*), White Spruce (*Picea alba*), and the Hemlock Spruce (*Tsuga canadensis*), which are largely used in America for hedges, though I have no knowledge of their use in this country. The first two species would not be of any use, here, but *Tsuga canadensis* might easily be made into a very neat and effective hedge. *J. Clark, Bagshot, Surrey.*

FIG. 52.—HEDYCHIMUM GARDNERIANUM FLOWERING IN THE OPEN.

the interior of a garden. It is not stout enough for a boundary hedge if there is any likelihood of its being pushed through. Its growth is strong and bushy, but not stiff like the Holly, and it bears clipping extremely well. The latter operation can be done at almost any time from April to September, but a strong-growing hedge may require clipping both in spring and autumn. A section we have here has to be cut three times in two years, missing the second spring. The preparations for planting and manuring require to be the same as those for the Holly.

COMMON AND PORTUGAL LAURELS.

Laurels make good hedges if well treated in the first instance and properly looked after when once established. The ground should be well broken and a fair proportion of manure added at the start. Good hedges from 3 feet to 10 feet in height can be obtained and kept in good order

table fibre in some form or other in the rooting medium. Manure may be added sparingly, taking care to keep it well away from the roots. Bushy plants about 2 feet high are the best for a start, and if kept clear of weeds they will soon grow into a good-sized hedge. Trimming should be done with a knife in April. It consists chiefly in keeping the sides cut in, leaving the top alone until the required height is obtained. It is better, however, if possible, not to cut the top of the plant, as by leaving it uncut a fair proportion of flower may be expected every year.

Berberis Darwinii.

Though not often seen this species makes a capital low hedge of 3 feet or less in height for the inner portion of a garden. The growth is usually short and prickly, though long shoots are sometimes made from the lower part of the plant which will reach upwards of 4 feet in

HEDYCHIMUM GARDNERIANUM.

WHEN this plant was first introduced into this country it was thought to require a high temperature, one writer going as far as to recommend its culture in a moist stove. As a matter of fact, it is almost hardy, being a native of the temperate regions of the Himalayas. Over 70 years ago, Wallich, the great Indian botanist, described it as "the queen of the genus," which it may still be considered. It was introduced into England in 1819, having been discovered by Wallich in Nepal. Sir J. Hooker afterwards found it on the Khasia Mountains, and also on the Sikkim Himalayas, in both instances at elevations of from 4,000 to 5,000 feet. The specific name was given to it in honour of Mr. Edward Gardner, an official in the service of the East India Company, and one of the pioneers of Indian botany. *H. Gardnerianum* throws up annual growths, which attain a height of about 5 feet, and are furnished with large, Canna-like leaves, 18 inches in length and 6 inches in breadth, which clasp the stem. The growths are crowned with large flower-spikes from 1 foot to 18 inches in length and 6 inches in width. The blossoms are pale lemon-yellow in colour, with crimson styles, and are most deliciously scented. In Devon and Cornwall the plant is perfectly hardy in the open, and in Mr. Howard Fox's garden at Rosehill, Falmouth, there is a large bed of this *Hedychium*, which, in September, shows over 50 flower-spikes, making a grand display and filling the air with their fragrance. In the open the shoots are invariably cut to the ground in the winter, but this does not appear to harm the plants, as they push up strongly again in the spring. It is, however, advisable to surface the bed with rough manure to mitigate the effect of the frost. The species should be planted out in rich loam, and it delights in a liberal supply of water during its growing season. Indeed, it is often a difficult matter to keep it adequately supplied with moisture

in dry weather when permanently planted in the open, especially if the bed in which it is growing be a sloping one. In districts where the winters are too severe for it to be allowed to remain out-of-doors, it may be lifted, potted, and kept under glass until the early summer, and then replanted in the open. Plants also succeed well in pots plunged beneath the water level. Where room can be found for the species in the conservatory it should always be grown. It is also extremely useful for associating with sub-tropical plants in the garden. It never fruits in the open, but by artificial fertilisation it may be induced to set seed under glass. Each fruit springs from the axils of the bracts, and splits up into three orange-yellow valves with a seed attached to the middle of each. These seeds are of a brilliant crimson colour, and, along with the orange-yellow of the valves and the bright green of the bracts, form an exquisite study in colour, while they remain in beauty for a long period. *Wyndham Fitzherbert, South Devon.*

FLORISTS' FLOWERS.

SWEET PEAS AT ADDLESTONE.

WHEN a grower of Sweet Peas becomes literally a champion exhibitor, it is no matter for surprise if his great success then leads to some desire for information as to his cultural methods. Not merely in the present, but in preceding years, Mr. T. Stevenson, Mr. Mocatta's able gardener at Woburn Place, Addlestone, has won the highest honours in Sweet Pea competitions. His flowers have shown great size, singularly beautiful colouring, and length of sturdy stem, such as few others have been able to emulate. Yet the Woburn Place soil, so very hard and tenacious, so disposed to become mossy on the surface, so liable to crack and contract in dry weather, is probably the last which ordinary growers would select for their purpose. Mr. Stevenson has to use the soil there for all purposes alike, and as he cultivates it as deep as he well can, although it has a base of solid, impervious clay, for all descriptions of crops, he varies his Sweet Peas with Celery or other vegetable crops, annually working into it a large quantity of tree leaves, as well as giving liberal straw manure dressings. Although many years of this working, together with liberal dressings of lime, have ameliorated its natural harshness somewhat, yet the old Adam in the soil still remains. Whilst several long, double rows of plants are devoted specially to the production of exhibition blooms, there is all the same a wealth of superb flowers for ordinary uses. To keep these cut is imperative if good blooms over a long season are to be maintained. There are other rows elsewhere grown for garden decoration, the plants growing to a great height and flowering abundantly. In the case of the exhibition rows, sowings are made in pots, both early in October (the plants being housed in frames) and again in February and March. In both cases the growth, as seen recently, is wonderfully strong, the stems resembling Bean rods almost in stoutness, and the height of the plants ranges from 8 to 9 feet. Autumn-sown plants in rows had been cut back and were making new and very strong growths 6 feet in height, and would flower right into November, weather permitting. In many rows the stems were so long that they had been brought low down, then tied with their points upwards, yet were still higher than a man's head. With all this splendid growth and vigour the plants were full of health, hence it does not do to say that, in this case, rich, deep soil and luxuriant growth lead to disease. Mr. Stevenson plants in twin rows, of from 12 inches to 15 inches apart, and the plants are from 10 inches to 12 inches apart in the rows. The main twin rows are from centre to centre, 5 feet apart, yet by no means is this too much space. Whilst some of the rows are supported by ordi-

nary Hazel sticks, others are held up by lengthy, soft, stout strings suspended from long rods held above by stout uprights, the strings being loosely attached to the Pea stems. The grower's impression is that the Peas like the string supports best. Still, that liking may be largely due to the absence of crowding caused by the presence of the Hazel branches. Side shoots are rigidly suppressed, as the points of the stems, up in ample air and light, are chiefly looked upon as the finest flower producers. Just recently a mulch of animal manure has been given to the rows. None the less, the soil was exceedingly hard and tenacious. Mr. Stevenson is far from being a mere Sweet Pea gardener. Woburn Place is indeed a lovely spot, and it is admirably kept. The Rose garden is a feature, the great sloping lawn and flower gardens are glorious, fruits and vegetables are first-rate, and the assumption that a great exhibitor must be in other directions negligent is emphatically disproved. Gardening has good reason to be proud of its numerous Stevensons. *A. D.*

BEST BEDDING VIOLAS.

ON the invitation of Messrs. Dobbie & Co., a party of some 27 members of the Scottish Pansy and Viola Association visited the nurseries of this firm at Rothesay on Saturday, July 31, for the purpose of inspecting a trial of 80 varieties of bedding Violas. The trial consisted of practically the same varieties as were tested last year at Messrs. Dobbie and Co.'s seed grounds in Essex, and the object was to ascertain whether the Scottish experts might come to any conclusions different from the southern growers. Instead of being planted in autumn, as were last year's trials, the Violas in this instance were not, owing to weather conditions, got into their quarters till the end of April. The soil of the border selected for the trial was somewhat heavy in character, and the abnormal rainfall during July was rather against some of the varieties, consequently the trial lines were not so regular as might have been expected under more favourable conditions. Each member, on entering the grounds, was handed a typewritten sheet with the names of the varieties on trial classified into colours, with the request that XX might be put against the best variety in each shade and X for the next best. They were further requested to name what, in their opinion, were the three best whites, yellows, and certain other shades, irrespective of the flowers being rayed or rayless. The results, which are given below, will show that, on the whole, the decisions in the English trials are pretty well borne out by the Scottish jurors.

White, rayless: 1st, Cygnet; 2nd, Mrs. H. Pearce. *White, slightly rayed:* 1st, Countess of Hopetoun; 2nd, White Empress. *White, rayed:* 1st, Bethea; 2nd, Alexandra. *Cream shades:* 1st, Iliffe; 2nd, Sylvia. *Primrose shades:* 1st, Primrose Dame; 2nd, Maggie Clunas. *Yellow, rayless:* 1st, A. J. Rowberry; 2nd, Wm. Lockwood. *Yellow, slightly rayed:* 1st, Redbraes Yellow; 2nd, Kingcup. *Yellow, rayed:* 1st, Canary; 2nd, Grievci. *Dark blue:* 1st, Archie Grant; 2nd, Edina. *Light blue:* 1st, Lady Marjory; 2nd, Ithuriel. *Lilac and lavender:* equal 1st, Favourite and Kitty Bell; 2nd, Florizel. *Mauve:* 1st, Mauve Queen; 2nd, Lady Warwick. *Dark mauve:* 1st, Jubilee; 2nd, Councillor Waters. *Bronze:* 1st, Redbraes Bronze; 2nd, Bronze Kintore. *Edged varieties:* 1st, Lady Grant; 2nd, White Duchess. *Crimson and rose:* 1st, Wm. Niel; 2nd, Mrs. J. H. Rowland. *Three best whites in above classes:* 1st, Cygnet; 2nd, Bethea; 3rd, Mrs. Pearce. *Three best yellows in above classes:* 1st, Canary; 2nd, Primrose Dame; 3rd, Grievci. *Three best mauves and lilacs in above classes:* 1st, Mauve Queen; 2nd, Favourite; 3rd, Kitty Bell. *Two best borders in other fancy types:* 1st, Mrs. Chichester; 2nd, Azuc Kay.

On the conclusion of the inspection the party made a round of the nursery grounds, and found much to interest them in the large breadths of

Roses, Dahlias, Pansies, Violas, and Sweet Peas grown by the firm. Messrs. Dobbie & Co. afterwards entertained the visitors in the Hotel Madeira, and the usual compliments were exchanged. The weather was splendid, and everyone enjoyed the day's outing. Many had come long distances, and the company included Major Milne (president of the Scottish Pansy and Viola Association), and Mr. John Smellie (secretary).

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, ante, pp. 70-76.)

(Continued from page 111.)

4. MIDLAND COUNTIES.

SHROPSHIRE.—The Apple trees in some instances suffered from the winter moth, although grease bands were applied as usual. A hailstorm of unusual severity on June 25 damaged all exposed fruits, otherwise the trees look healthy and promise to finish the fruit well. The same may be said of Pears, Plums, and Damsons. Cherries were an extra fine crop, but black and green fly injured them badly. Gooseberries are a tremendous crop; Strawberries and Black and Red Currants are also good crops. Raspberries look well. Apricots suffered when in flower from early morning frosts, which thinned the crops considerably. *Alex. Haggart, Moor Park Gardens, Ludlow.*

STAFFORDSHIRE.—The fruit prospects for this year were very good, for there was a profusion of blossom. The Apple crop, which is now very thin, suffered from continued frosts; one or two of the severest were experienced when the flowers were damp after rain. Pears, with few exceptions, are a good crop. The atmosphere was dry, and only slight frosts were registered whilst the trees were in bloom. Plums suffered badly from frost, but the Damsons escaped, and there is a good crop. The early flowers on Strawberries were damaged by frost, but the remainder set well. Bush fruits are a good crop, but the severe wintry weather damaged the Raspberry canes, hence the crop will not be so good as in previous years. Walnuts are a failure; but Filberts and Cob Nuts promise well. The soil is a stiff loam on a cold, clayey subsoil. *Geo. Woodgate, Rolleston Hall Gardens, Burton-on-Trent.*

WARWICKSHIRE.—Apples and Pears are average crops. Plums are not so plentiful as last year, but Damsons are plentiful, though the trees are badly blighted, owing to cold winds. Apricots are unsatisfactory. Bush fruits are all carrying heavy crops, especially Gooseberries and Red Currants. Strawberries were good both in quantity and quality. The soil in these gardens is of a light nature, and the subsoil gravel. *Chas. Harding, Ragley Hall Gardens.*

—The Apple crop is very irregular in this neighbourhood owing to pests, chiefly the Apple sucker (*Psylla Mali*). Espalier trees being frequently sprayed are well cropped. *Jno. Masterson, Weston House Gardens, Shipston-on-Stour.*

—The hardy fruit crops in this district appear to be, on the whole, above the average. There was an abundance of bloom on both Apples and Pears; but owing to east winds and cold nights, many did not set, especially on Pears. Bush fruits—Gooseberries in particular—are very plentiful. Strawberries, in spite of frequent rains, were very good, both in quantity and flavour. Apricots, Peaches and Nectarines are more plentiful than for several years past. Cherries have done well, but are badly attacked with blight. The soil here is sandy and the subsoil gravel. *H. F. Smale, Warwick Castle Gardens.*

5. SOUTHERN COUNTIES.

BERKSHIRE.—The crops on wall trees are exceptionally good and plentiful, if we except Apricots. Bush and small fruits are unusually plentiful. Apples have suffered from the high winds, especially standards in the orchards. During the month of June Apples and Pears made the least headway that I ever remember at that season. The soil is clayey loam, and the subsoil solid clay. *W. Barnett, Bear Wood, Woking Lane.*

DORSETSHIRE.—Apple, Pear, Plum and Cherry trees, with small fruit bushes, have all suffered

from aphid, which has greatly affected the quality of the fruit. Peach, Nectarine and Apricot trees, on the contrary, are very healthy, and are bearing abundant crops. Strawberries rotted a little owing to the continuous rains, which, however, suited the Raspberry crop. Both Cobs and Walnuts are plentiful and the trees healthy. *T. Turton, Castle Gardens, Sherborne.*

HAMPSHIRE.—The market growers have had a record crop of Strawberries. The sorts mostly grown are Royal Sovereign, The Leader, The Laxton, Bedford Champion and Sir Joseph Paxton. *A. J., Botley.*

—The Apple crop is an exceptionally heavy one, but the recent wet and sunless weather has greatly injured the foliage on some sorts, retarding the progress of the fruit. Cox's Orange Pippin is an exception; never have I seen the trees having a healthier appearance. A similar remark applies to Warner's King. Gooseberries are an extraordinary crop, especially Golden Drop and Whinham's Industry. Strawberries were a record crop, and, owing to the continued dull weather, lasted a long time; but the flavour was inferior. *E. Molyneux, Swanmore Park, Bishop's Waltham.*

—Taking Apples as the most important outdoor fruit crop, they are disappointing. Although the trees were as a sheet with blossom, the crop is, with a few exceptions, very light indeed, and the trees are much devastated with caterpillar. Pears may be described in the same terms. Plums are a good average crop and clean, and Cherries of the Morello variety also. Apricots are the best crop I have had for the past nine seasons. Black and Red Currants are heavy crops. Some of the Black Currant bushes were infested with aphid, and, consequently, lost a quantity of foliage, while others in another part of the garden remained clean and healthy. Raspberries are a good crop, and Gooseberries abundant. Strawberries have been plentiful, but owing to the wet and sunless season, although attaining a goodly size, they have been inferior. *A. G. Nichols, Strathfieldsaye Gardens.*

—Apples and Pears set very well, but owing to cold winds, drought and caterpillar, most of the fruits have fallen. We have a few Apple trees which are more sheltered and away from the Oak trees; these are looking very well. The soil is light and gravelly, resting on clay. *R. Learmonth, Manor Gardens, Basinstoke.*

KENT.—All kinds flowered well, but, owing to weather conditions, Apples, Pears and Plums are almost failures in this district. *George Woodward, Birham Court Gardens, Maidstone.*

—Strawberries were soft and flavourless owing to wet and cold weather. Black Currants suffered from frost and were scarce. Apple trees have been infested with caterpillars; the crop is below the average. Common sorts of Pears are plentiful, but on choice varieties the fruits are scarce. *George Bunyard, Royal Nurseries, Maidstone.*

—The effect of the winter frosts on the different varieties of Apples was very marked. Gascayne's Scarlet Seedling and Cox's Orange Pippin are absolute failures: there is not one Apple for each tree. Baumann's Red Winter Reinette and Dumelow's Seedling have very small crops. On Peasgood's Nonesuch there is a fair crop, and the same may be said of Warner's King. Smart's Prince Arthur is good, and Annie Elizabeth bears a fair crop. *Charles E. Shea, The Elms, Foot's Cray.*

—The fruit crops vary much. Apples in some orchards are light; in others they are good. Those that had heavy crops last year are light this year, particularly Apples and Plums. Apples have suffered with blight very much in these gardens. Pears and Plums are more satisfactory. Raspberries, Strawberries, Peaches and Nectarines are good. The soil here is chalk. *J. T. Shann, Bretteshanger Park Gardens, Easby, near Dover.*

—Apples set freely, and, after having been well thinned, are now swelling rapidly. Young trees are clean, with strong and healthy foliage. Pears are clean and healthy. Strawberries were a very heavy crop, but, owing to the extremely bad weather just at the ripening period, a large percentage were damaged, flavour being also very deficient. Small fruits generally were very heavy crops, especially Gooseberries. The soil in these

gardens is a heavy retentive loam, with a subsoil of chalk. *J. G. Weston, Eastwell Park Gardens, Ashford.*

MIDDLESEX.—We have an average crop of Apples, some trees bearing freely and others less so. The foliage was attacked by a quantity of caterpillars. The soil here is light and sandy, resting on gravel. Strawberries were a good crop, but the rain has spoiled a large number of the best fruits. Peaches are one of the heaviest crops which have been experienced here. Pears and Cherries are about average crops. Many of the Cherries split owing to excessive wet and cold nights. The season is late. We require a good amount of sunshine to hasten the fruits and ripen the wood. *H. Markham, Wrotham Park, Barnet.*

—Speaking generally, our fruit crops this season are most satisfactory, probably never more so for some years past. The rains of June and the first half of July have done an immense amount of good to us in the case of Apples, Pears, and Plums. To Cherries it has been somewhat destructive, causing some kinds to split, for instance, Governor Wood, Black Circassian and Bigarreau de Schreken. Early Strawberries, too, have suffered, but as we use Strawberry supports, and thus keep the fruits well off the ground, we have saved many more berries than we should otherwise have done. Aphides have been somewhat troublesome. Our soil is light loam resting on gravel. *James Hudson, Gunnersbury House Gardens, Acton.*

—Fruit, on the whole, is a fair crop; better than was expected, considering the cold, sunless spring. There has been a plague of insect pests, but the trees are now making clean, healthy growth, and they only want warmer weather. Most of the soils about here are of a heavy nature, though in places there are patches of a lighter soil, and on this fruit trees of all sorts do well. Apples and Pears seem to be freer from the scab fungus this season than usual; but there is a good deal of a black, burning-like malady. It seems as though the leaves and shoots were scalded; eventually they die back. *W. Watson, Hatfield Place Gardens.*

—There was an abundance of blossom on Apples and Pears, but after the fruits were set many fell from the Pear trees. Peaches set an immense crop, and were thinned heavily. Gooseberries are the heaviest crop for years. The best fruits of Strawberries were entirely spoiled by the continuous rain, otherwise they would have been a record crop. Currants are good; Raspberries poor. The extraordinary cold weather experienced during June and part of July, with absence of sunshine, has considerably retarded the fruit crops this season. Aphid on the trees has been very troublesome; also caterpillar. *J. Hawkes, Osterley Park Gardens, Isleworth.*

SURREY.—Our soil is of a poor sandy nature, requiring liberal feeding. With this, fruit trees do very well. The prospects generally were very good, all kinds blossoming freely, but frost, cold winds and insect attacks injured Apples, Pears and Plums, reducing the crop to under the average. *S. T. Wright, R.H.S. Gardens, Wisley, Ripley.*

—But for the chilling effects of long-continued low temperatures, with an excessive early summer rainfall, it would have been my duty to report one of the heaviest hardy fruit crops of recent years. But whilst such fruits as Strawberries have been singularly fine and abundant, great quantities of the fruit have been spoiled by continuous rains or robbed of flavour by absence of sunshine. Raspberries have greatly suffered in the same way. Apples, Pears and Plums will be exceptionally fine. Cherries have been a huge crop, but to save them from cracking vast quantities have been gathered for market before ripening. In spite of alarms as to Gooseberry-mildew and Black Currant mite, there is an immense crop of both fruits, and they are very plentiful and cheap in the markets. In spite of drawbacks, the season should give a strong impetus to fruit culture. *A. Dean, Kingston-on-Thames.*

—Fruits in general here are very satisfactory crops, but the growth of the trees is somewhat crippled by the unusual quantity of aphid. *George Kent, Norbury Park Gardens, Dorking.*

—Apples and Pears in this neighbourhood were thickly set with bloom, and made a mag-

nificent display; particularly was this the case on old orchard trees attached to small holdings and cottage gardens. Although the crops appeared to set successfully, the actual result is a poor one, for which continual cold rains, wind and caterpillars appear to be responsible. The close proximity of numerous forest trees such as Oaks, on which the caterpillars were first noticed, make it difficult to destroy them. The soil being a heavy clay, the trees are not making much growth. *W. H. Honess, Hopedene Gardens, Holmbury St. Mary, Dorking.*

SUSSEX.—Apple, Pear, Plum, and Cherry trees were badly infested with caterpillars, which did great damage to the trees and fruit crop. Arsenate of lead paste soon cleared off all the caterpillars, and the trees are making good growth. *J. Muddell, Sedgwick Park Gardens, Horsham.*

—This report refers to the district near Hailsham, and not to my own farm alone. For example, I have a good crop of Plums, which is exceptional. With respect to Apples, the quality is fair, rather than good, and this remark applies to some other fruits. I think Apples will be smaller than usual. They are very backward. Small fruits together cannot be estimated in one verdict. Gooseberries were a great crop, and Red Currants are fair, while Black Currants are under average generally, though I have just picked a good crop of Boskoop Giant of very fine quality. I do not grow Strawberries for market, and I have only one variety for private use. *William E. Bear, Magham Down, Hailsham.*

—The trees in orchards have been almost stripped of foliage by caterpillars. All fruit trees are much infested with aphid. *T. H. Slade, South Lodge Gardens, Horsham.*

—The Apple crop is very good indeed, and most varieties have had to be severely thinned. The trees have had to be sprayed several times owing to a terrible attack of aphid. The Pear crop is very good and promises well. Cherries are the largest crop I have seen. Early Rivers, Frogmore Bigarreau, Bigarreau de Schreken, B. Napoleon, Elton, and Geant d'Heldefingen have been excellent. Peaches are good, and the trees are clean. Gooseberries, Currants, Medlars and Quinces are wonderful crops. Raspberries and Figs are doing well. *W. A. Cook, Leonardlee Gardens, Horsham.*

WILTSHIRE.—The fruit crops in this part of Wiltshire have suffered seriously from the inclement weather. The trees and bushes are in many cases covered with aphid. Strawberries were an abundant crop, and Gooseberries and Currants are unusually abundant, especially Gooseberries. *W. Tinley, Malmesbury.*

—The condition of the fruit crops, generally, is bad, blight being very prevalent, especially on small fruits and Apples, caused, in my opinion, by the exceedingly low temperatures. The ground temperature at 12 inches deep, during June and July, being 10° below the average, and the daily atmospheric temperature 8° below the average. The surface soil is a marly loam, rather light, resting on a subsoil of chalk and gravel. *Thomas Challis, Wilton House Gardens, Salisbury.*

7, ENGLAND, N.W.

LANCASHIRE.—The fruit crops are, upon the whole, satisfactory; most of the early bloom of Strawberries was destroyed by late frosts, but succeeding ones were sufficient. Green and black fly and caterpillars have been very prevalent on fruit trees. Apples and Pears are perhaps the most satisfactory crops, especially on bush and pyramid trees worked on the Quince and Paradise stocks. The soil is a retentive loam on heavy marly subsoil. The aspect is north-west. *E. F. Hazelton, Knowsley Gardens, Prescott.*

—There is a very heavy crop of Apples in this garden, but in consequence of the leaves having been destroyed by caterpillars, the fruit is poor. Pears have fared a little better, and there is a heavy crop on those that usually bear well in this garden. Many of the forest trees have their leaves riddled by caterpillars. The leaves of Black Currants are curled and look crippled, in spite of repeated sprayings. *Wm. P. Roberts, The Gardens, Cuckdon Hall, Prescott.*

(To be continued.)

CORDYLINÉ AUSTRALIS.

THIS *Cordyliné*, better known as *Dracæna australis*, is an extremely handsome object in the early summer when bearing its great, white flower-panicles. It is a very common plant in the south-west, and in every town in south Devon and Cornwall fine plants are to be seen on every side. In Torquay alone there must be some thousands, for in the public gardens there are fully 150 fine specimens, and they are also to

A short distance above the soil the plant divides into four main branches, which are subdivided into some 50 branchlets, about 10 of which usually flower annually. This plant is 49 years old, and was raised from seed sent home from Australia. It was illustrated in *Gardeners' Chronicle* for February 23, 1907. I have lately seen in the south of Ireland a specimen 25 feet in height, but it could not compare with that at Enys, as its girth was small, and it had but one head. This year almost every plant in the gar-

being far handsomer than the type. *Cordyliné australis* is considered perfectly hardy in Devon and Cornwall. Exceptionally severe frosts, followed by a sunny day, sometimes kill the heads of the plants, but generally a number of suckers are, later on, thrown up from the base.

Like *Cordyliné australis*, *Banksii* is a native of New Zealand, but they are easily distinguished. *C. Banksii* rarely attains a greater height than 6 feet, and is usually clothed to the ground-level with drooping leaves about 4 inches in breadth. The flower-panicles are lighter in appearance than those of *C. australis*, having fewer branchlets, and the blossoms are white. An excellent supplementary illustration of *C. Banksii* appeared in *Gardeners' Chronicle*, vol. xxix., p. 44, and a representation of a specimen at Castlewellan on October 6, 1906. *Cordyliné Banksii erythroracis* is a variety having bright red midribs to the leaves, and is a very ornamental plant. In a certain garden in the south of Ireland there is a colony of 20 plants of this *Cordyliné*, which furnishes a charming picture, and it is also to be met with in a few Cornish gardens, but it is still a comparatively rare variety.

Cordyliné indivisa is often confounded with *C. australis*, though perfectly distinct from that species. Illustrations of *C. australis* have repeatedly appeared with the name of *C. indivisa*, and in many gardens *C. australis* is still grown as *C. indivisa*. *Cordyliné indivisa* is an extremely handsome foliage plant, the arching leaves being about 5 feet in length and 5 inches in breadth, while in colour they are blue-grey, with a midrib of bright red. It flowered in the Tresco Abbey gardens, Isles of Scilly, in 1895, but until last year had never bloomed on the mainland. It then flowered at Enys, and the plant that bore the blossoms is shown in the illustration which appeared in *Gardeners' Chronicle* on February 23, 1907. The flower-panicle hangs down by the side of the stem, and, being composed of countless, minute blooms, yellow and blue-black in colour, is more curious than beautiful. A quantity of seed was secured from the Enys specimen, and the seedlings are already good-sized plants. *C. Hookeri*, *C. Doucettii*, and *C. Prince Albert* appear to be forms of *C. indivisa*. *C. lentiginosa* is similar in habit to *C. indivisa*. Its leaves, when young, are yellow, but they eventually turn to a deep bronze-brown. *Wyndham Fitzherbert, South Devon.*

FIG. 53.—CORDYLINÉ AUSTRALIS FLOWERING IN THE PUBLIC GARDENS AT TORQUAY.

be found in almost every private garden. The illustration in fig. 53 shows a remarkably fine example in the public gardens of Torquay bearing no fewer than 17 huge flower-heads, a number almost unprecedented on a single plant. This specimen had a stem about 12 feet in height. The largest example growing in this country is probably one in the gardens at Enys, in Cornwall, and is 20 feet in height, with a trunk circumference of 6 feet at a foot from the ground.

dens has flowered, and they presented a beautiful sight, the great, branching flower-sprays, 3 feet or more in length, crowded with white blossoms, resembling giant plumes. They are very sweetly scented, and are all day haunted by insects innumerable. In the type the leaves are narrow, but the seedlings, which are raised in great numbers in the south-west, vary considerably in their foliage, the leaves of some being fully 3 inches in breadth, these wide-leaved forms

TREES AND SHRUBS.**CUPRESSUS MACROCARPA AS A HEDGE PLANT.**

My former note (see p. 196, March 27, 1909) respecting this Cypress did not bring any answer to my enquiry, but I noted with interest the remarks of Mr. Lucas, Mr. Gooden and *E. M.* As *E. M.* says, the frost injures *Cupressus macrocarpa* badly, but what I wanted some of our scientific men to tell me is why does this beautiful hedge plant die off so mysteriously? I have not heard of a single case of it dying when grown in its natural form as a tree, but several instances when used as a hedge. Can it be the result of clipping, or is it because we disturb its roots by digging and manuring? In these gardens the portion of hedge bordering the herbaceous border is less healthy than that which enclosed the tennis court, which is turfed on both sides.

Mr. Lucas advocates the claim of *Griselinia littoralis*, and although I have not seen an instance, I am sure it would make a bright and uncommon hedge. There is another plant which might be used in favoured localities, namely, *Pittosporum Buchananium*, the crimped foliage would, I am sure, make it a very distinctive hedge. The following is a list of some of the shrubs and trees used as hedge plants in these gardens—*Escallonia macrantha*, a grand, bright looking hedge; *Viburnum Tinus*, fairly good, but it some times resents cutting; *The Bay (Laurus nobilis)*,

a well-known and very trim-looking hedge; the English Yew (*Taxus baccata*) and the golden variety, which is lovely if the young growths are not cut in the summer-time; Fortugal Laurel; Sweet Briar; *Cupressus Lawsoniana* (which gets very ragged at the base, and is not a suitable subject for a hedge); Hornbeam, a fine subject for forming a high wind-breaking hedge, and *Cryptomeria elegans*. The *Cryptomeria* is in a bad position, but if given an open situation it would prove a good subject. *A. J. Elgar, Killarney House Gardens, Co. Kerry.*

A FINE OLD APPLE TREE.

The specimen Apple tree illustrated in fig. 54 is growing in the kitchen garden at Preston Place, near Worthing, the residence of B. A. Warren, Esq. Mr. R. Herriott, the gardener at Preston Place, informs us that the tree is 70 years old. It bears a bountiful crop every alternate year. This season it has a good crop, and it had every prospect of bearing well when our photograph was taken, for it was literally covered with flowers. The spread of the branches covers a distance of 36 feet. The variety is described as Dewson or Dewtson, but this is unknown to us. Perhaps it is an old Sussex variety, and may be known to some of our readers living in the locality.

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Catasetum.—Particular attention should now be given to such Orchids as *Catasetum*, *Cynoches* and *Mormodes*, especially to those plants which have bloomed or completed their growth. Such plants should be removed from the hot atmosphere of the growing quarters to a much cooler house, where the atmosphere is comparatively dry, and air can be admitted during the hottest hours of the day. It is often found that under our artificial cultivation plants of these species do not retain the vigour they have in their native habitat. The chief cause of this is usually traceable to the fact that the pseudo-bulbs fail to mature perfectly. Therefore, everything should be done to induce the plants to finish their growths as early in the season as possible, so that there will be a sufficient amount of sunlight to ripen the bulbs. During the time the plants are under resting conditions they may be fully exposed to the sunlight. The roots should be supplied with water as long as the leaves remain fresh. When growth is matured, and the leaves have fallen away naturally, the plants will remain perfectly safe for a long period without any waterings whatever. During the whole period of rest no water need be given unless there are signs of shrivelling.

Chysis.—Plants of *Chysis bractescens*, *C. aurea*, *C. Limminghii*, *C. kevis*, *C. Chelsonii* and *C. Sedenii* that are half-way through their growing period may now be taken from the *Cattleya* house and placed in an atmosphere a few degrees hotter; they will still require plenty of water at the root, and a spraying overhead several times a day. The space afforded by the removal of the *Catasetums*, &c., will suit them perfectly. When growth is completed return them to their old position in the *Cattleya* house.

Phionces.—In the last-named house the *Phionces* will now be completing their new pseudo-bulbs, and will need exposure to light, with more liberal ventilation. Give them sufficient water to keep the compost just moist, there being no necessity to dry them up to induce them to flower. The cool-growing varieties as *P. humilis*, *P. Hookeriana*, *P. Yunnanense*, &c., will require liberal and frequent supplies of water till growth is completed. The best position for them is near to the roof ventilators in the cool house.

Miltonia vexillaria.—The present is a good time to repot this well-known Orchid, but previous to the operation, it is advisable to eradicate any small yellow thrips, which are apt to get low down in the young growths. The most effectual method is to dip the plants in some safe insecticide, and immediately afterwards to rinse the

foliage with clean, tepid soft water. Employ clean pots and make them two-thirds full of drainage material, over which place a thin layer of Sphagnum-moss; keep the base of each plant just on a level with the rim, and pot with moderate firmness. A suitable compost consists of *Osmunda* fibre, *Polypodium* fibre and Sphagnum-moss in equal parts, which should be cut up and be well mixed together, adding plenty of crocks broken up into small pieces. Until the new growths begin to root freely, merely damp the surface of the compost with a fine sprayer, the object being to induce the Sphagnum-moss to grow over the surface. The cool house will suit these plants for the present, but after a few weeks they should be removed to the intermediate house.

Cochlioda.—Plants of *Cochlioda Noezliana*, *C. vulcanica*, and *C. sanguinea* may also be repotted in the same kind of compost as that used for *Miltonia vexillaria*. A light position in the Odonoglossum house will suit them at all seasons.

Oncidium ampliatum.—Plants that have been at rest in a cool temperature, being now starting to grow, should be removed to the warmer atmosphere of the East Indian house, where they will have the benefit of conditions favourable to growth. Owing to the present hot weather, the

placed out-of-doors in a sunny position to ripen their shoots; they must be syringed frequently, otherwise the foliage will become infested with thrips. Fuchsias which are still blooming will derive great benefit from frequent waterings with manure water.

Calceolaria.—Prick off seedling *Calceolarias* as soon as they can be handled. For their potting use equal quantities of sifted loam and leaf-soil, adding plenty of silver sand to keep the compost open. In potting, press the soil firmly, but take care not to bruise the tiny plants. Afterwards place them in a cool frame or pit where they may enjoy plenty of sunlight without being directly exposed to the sun's rays. Keep the frame closed for a short time after potting, but when they have recovered from the disturbance at the roots afford them an abundance of ventilation. Slugs are very fond of these plants, and must be guarded against.

Bulbs.—It is advisable to secure a stock of bulbs early, as those who order first obtain the best of the nurseryman's stock. The earliest bulbous plants to be potted are Hyacinths, *Polyanthus Narcissi*, and *Gladiolus Colvilei* and its varieties. These bulbs can be potted in two ways, either in 5-inch pots or closely together in

FIG. 54.—APPLE TREE AT WORTHING, SUSSEX: SPREAD OF BRANCHES 36 FEET.

Cattleya and intermediate houses will require plenty of air through the day, and the bottom ventilators should be kept wide open at night. Admit plenty of air to the East Indian house during the middle hours of the day, but in every case prevent draughts.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. Ford, Pencarrow, Cornwall.

Fuchsia.—Cuttings should now be inserted for the purpose of raising young plants for flowering early next summer. The cuttings should be selected from those plants which have nearly finished blooming, those with the wood half ripened being most suitable for the purpose. Insert the cuttings rather thickly around the sides of small pots, and place them in a gentle bottom heat; or, failing this, they can be placed under hand-lights in a cold frame, although by this method they are slower in forming roots. As soon as roots have formed, stand the plants on a shelf close to the roof glass in a cool house, and a few weeks later pot them singly into 3-inch pots, after which they must be kept steadily growing throughout the winter. Older plants which have finished flowering should be

boxes, according to the purposes for which they are required. In either case, the receptacles should be covered with a 3-inch layer of ashes after they are stood in a suitable spot in the open.

Richardia africana.—Plants with their root-stocks quite dry and hard after resting should now be turned out of their receptacles and repotted. Shake away all the old soil from the roots, and grade the rhizomes into their respective sizes. Select the largest pieces for placing in 8-inch or 10-inch pots, potting those of second size into 5-inch or 6-inch pots. If it is desired to increase the stock of these plants, the best pieces that are left may be planted moderately closely together in boxes and wintered in cold frames. A suitable compost is composed of three parts loam and one of decayed cow manure. This plant is semi-aquatic in its habits, and as it requires a very large amount of water when it is actively growing, special attention must be directed to see that the pots are amply provided with material for drainage. After potting place the plants in a cool pit. For the first few weeks little water will be required at the roots, a syringing both morning and evening being sufficient, but afterwards copious waterings should be given.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Figs.—Trees that are developing a second crop of fruits should not only be supplied liberally with water, but also with liquid manure and some approved chemical fertilizer alternately. Syringe the trees early in the morning and late in the afternoon, and frequently damp the walls and other available surfaces in the house. Even trees that are ripening their crops must not be allowed to become dry at the roots, notwithstanding that in this house the conditions should be kept rather drier than those in an earlier stage of development. When water is needed it should be applied on a fine morning when the ventilators can be opened wide. No stimulants must be applied to these trees until the crop has been gathered.

Fig trees in pots.—Trees which will be required for supplying the earliest crops next season may now be repotted if this is necessary, but it is not desirable to repot every year specimens which are already growing in pots or tubs of sufficient size. Such trees will remain in a satisfactory condition in the same receptacles for several years together, provided the drainage is kept good. In cases where repotting is not done, the roots must be given a good surface dressing of some good rich compost, and, in order to provide space for this top-dressing, as much of the old soil as can be conveniently loosened may be removed. The fresh compost may consist of good fibrous loam, decomposed horse manure and crushed bones, with the addition of a liberal sprinkling of old mortar rubble and wood-ashes. Young healthy trees needing repotting may be given pots of a slightly larger size. These pots should be perfectly cleaned and well drained. The potting compost should be similar to that already described. The potting should be done firmly, and every care taken to see that the whole of the space between the roots and the side of the pot is perfectly filled with soil. This end can be best secured by using a thin, rather than a thick, rammer. When the trees have been potted they may be placed in a shady position for a few days, and frequently syringed. Water must be afforded with extreme moderation until the roots have again become active.

Pot vines.—If these have been grown with a view to supplying ripe Grapes early next season, the first consideration is that they shall have thoroughly matured canes. Although the plants will still need a liberal amount of moisture at the roots, after this date the atmosphere may be kept drier than hitherto, therefore, if the weather is not very hot, syringing may be discontinued. Let there be a free circulation of air both by day and night, and when it is considered that the canes have become sufficiently hardened, let them be removed to a sunny position out-of-doors. In such conditions the ripening process will be greatly accelerated. Should there be any sign of red spider on the leaves, syringe them at once with a strong solution of soft soap and sulphur. It is desirable that the foliage should be retained in a healthy condition for as long a time as possible.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardslee, Sussex.

Early-flowering Chrysanthemums.—A certain amount of disbudding should be practised if flowers of moderately good size are desired, but the treatment should not be so severe as to spoil, or even alter, the character of the plant. Now that the weather has become hot, such plants as Chrysanthemums will need liberal waterings, and at every alternate watering liquid manure may be given with advantage. It is a good plan to occasionally substitute soot water and chemical manures for the liquid manure.

Propagation.—Continue to propagate bedding plants as quickly as possible, remembering that the better rooted the cuttings become before winter, the more likely are they to stand through that period without suffering injury. The cuttings may be inserted in pots or boxes. Pots are to be preferred, as these can be handled more conveniently during winter. In order to obtain the best plants, it is necessary to put each Pelargonium cutting into a separate pot, but if such a system is adopted considerable space is re-

quired for storing them. Iresine, Kleinias, and other plants of a similar nature may be put into 5 or 6-inch pots, inserting several cuttings in each pot. Place the pots in a frame, and shade the cuttings from hot sunshine. The Pelargonium cuttings should be placed in the open on a hard bed of ashes.

Romneya Coulteri.—See that this plant is not allowed to get dry at the roots. A specimen growing against a wall or fence, or even in the open garden, needs a liberal supply of water, and a little weak manure water occasionally is beneficial. The manure water, however, will not be so necessary in cases where a top-dressing was applied in spring. Notwithstanding the fact that the shoots of this plant were cut back by frost last winter, it is flowering most satisfactorily this season.

Climbing plants.—All plants of a climbing nature should be examined in order to see that the roots are sufficiently moistened, especially those which are growing against walls or buildings much exposed to the sun, for these become exceedingly hot. Syringe them occasionally by means of the garden engine, in order to prevent red spider. A liberal mulch will be of the greatest advantage in checking excessive evaporation, and a spraying with clear water, applied through the garden engine or hose, late in the afternoon is to be recommended. Abutilons, Ceanothus, Leptospermum, Solanums, Myrtles and Loniceras are some of the plants concerning which these remarks are written.

Hard-wooded plants.—Camellias, Azaleas, Rhododendrons, Ericas and all similar plants are amongst the first that need to be examined in regard to root moisture. Take every means to prevent them suffering from excessive drought.

Pruning.—Azaleas and Rhododendrons may still be pruned. Hedges formed of either of these plants soon get out of bounds if not given regular attention. Vistas and avenues that have been formed principally for affording attractive views will also need attention in the matter of pruning.

General work.—The season has been a very difficult one for keeping the ground clear of weeds. An opportunity to destroy weeds, however, presents itself in the present hot weather. Keep the hoe constantly at work, and go over the ground several times in quick succession. Collect all dead and decaying materials from the beds and borders. Keep the plants neatly secured to the stakes. Peg down any plants that are cultivated in this manner in the flower-beds, and endeavour to obtain an appearance of neatness and good order through the grounds.

THE KITCHEN GARDEN.

By E. BRETTE, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Spring-sown Onions.—Onions that are specially cultivated for producing large bulbs, have made good progress since the welcome change in the weather, therefore fine specimens may be expected late in the autumn. Decaying foliage and any rough outside skins should be removed so that each bulb will ripen down to one skin. This greatly improves the appearance of an Onion, besides adding to its keeping properties. Continue to water the plants during the present month, but do not apply any moisture to the tops. Onions sown in the open during March have never looked better than they do this season. The Onion fly has given little trouble in this district up to the present time. The tops should now be carefully bent down, turning them all one way, and leaving the bulbs as much exposed as possible. It should be remembered that bulbs which ripen early and are harvested early generally keep good for the longest period.

Peas.—Up to the present time Peas have been exceptionally good. Successional and late varieties should be kept mulched and thoroughly watered, occasionally giving them good drenchings of properly-diluted farmyard manure water. Should the hot weather continue, the plants must be thoroughly syringed early every morning. In order to hasten the development of the Peas, pinch out the points of the shoots, remove all lateral growths, and, if exceptionally fine Peas are required, let the pods also be thinned. Special varieties which may have been reserved for seed purposes should be examined in the hottest hours of the day, and any which are sufficiently advanced may be picked and laid out

thinly on trays or boxes fully exposed to the sun. Do not select any but the very finest pods for this purpose.

Endive.—Continue to plant out successional plants of this important crop on good ground. These and earlier batches must be supplied well with water. Make one or two more sowings in a warm situation.

French Beans.—The present is a capital time, especially in cold districts, for the sowing of French Beans in either frames or pots. A brick pit with just enough heat to keep out frost is the most convenient means of cultivation, but it must be one that provides sufficient head room for the plants. The foliage is the better for being moderately near to the glass. *Ne Plus Ultra* is an excellent variety for sowing at this season.

Globe Artichokes.—This crop will require abundant moisture at the roots, including liquid manure. Cut off the "heads" before they are too old for consumption, and store them in a cool place, where, if the stems are placed in a little water, they will keep in good condition for at least 10 days or a fortnight.

Tomatos.—The prospects of this crop have greatly improved since the advent of fine weather, especially in the case of those trained on walls or buildings. Let all surplus growth be removed so that the fruit will be exposed as much as possible.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Plums.—All varieties of Plums are later in ripening than usual. Some of the finest of the early varieties of Plums and Gages are *Damunston's Superb*, *Brandy Gage*, *Early Transparent*, *Greengage*, *Angelina Burdett*, *Onliu's Golden* and *McLaughlin*. These varieties provide a good succession of fruit from the end of July until the end of August or later, according to the season. Among the best early culinary varieties are *Belgian Purple*, *Early Orleans*, *Early Prolific*, *The Czar*, *Gisborne's*, and *The Sultan*. As the trees of any of these varieties become cleared of their fruits an opportunity will be presented for further thinning the wood according to the necessity in each case. Remember always that it is undesirable to crowd the wood in such a manner that it will obstruct the free circulation of air and sunlight amongst the branches. If the trees are not perfectly free from insects and fungus pests, now is the time to combat these, there being no fruits to consider. After spraying the trees with an insecticide, apply a good washing of clear water from the garden engine. Afford water to the roots if this is necessary. Varieties that will ripen in succession to the dessert Plums I have mentioned include *Bryanston Gage*, *Kirke's*, *Washington*, *Jefferson*, and *Late Transparent*, and later still *Reine Claude de Bayay*, *Golden Transparent*, *Coe's Golden Drop* and *late Orange*. These are the very best of the late varieties. Later culinary Plums than these I have mentioned are *Victoria*, *Goliath*, *Red Magnum Bonum*, *Pershore*, *Pond's Seedling*, *Monarch*, *Grand Duke*, *Primate* and *President*. In order to get the best dessert fruits possible it is necessary to thin them as soon after the stoning period as possible, for at that time it can be determined what crop the trees will bear. If the matter of thinning has been overlooked hitherto, late varieties may still be thinned, and the quality of the Plums will thereby be improved. Culinary Plums can be used before they are fully ripe, and the removal of a portion of the crop whilst in that condition will give to those that remain an opportunity to swell to a greater size. Plums need protection from birds as soon as they commence to ripen. In the case of choicest dessert varieties, it is advisable to protect these from wasps by enclosing the fruits in little bags made of wasp-proof netting, and sold by sundriesmen for that purpose. Happily wasps appear to be scarce this season.

General work.—See that the fruit room is well cleansed before the time arrives for storing hardy fruits. Let all the woodwork be washed down with soapy water and the walls covered with limewash. Do not allow any rubbish or decayed fruit to accumulate in the room at any time in the year. Ventilate it freely at this season, for any soft fruits that are placed therein will keep the longer in the presence of a quickly circulating atmosphere.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturalists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

THURSDAY, AUGUST 26—Sandy (Beds.) Fl. Sh. Peeblesshire Hort Soc. Sh. at Peebles.

AVERAGE MEAN TEMPERATURE for the ensuing week* deduced from observations during the last Fifty Years at Greenwich—60.8°

ACTUAL TEMPERATURES:—LONDON.—Wednesday, August 18 (6 P.M.): Max. 70°, Min. 56°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, August 19 (10 A.M.): Bar. 30; Temp. 68°; Weather—Cloudy.

PROVINCES.—Wednesday, August 18: Max. 62° Oxford Min. 55° N.E. Coast of Scotland.

SALES FOR THE ENSUING WEEK.

MONDAY, WEDNESDAY, AND THURSDAY—Trade sale of large quantities Dutch Bulbs in variety, at 67 & 68, Cheapside, by Protheroe & Morris, at 10.

WEDNESDAY—48,000 Roman Hyacinths, 50,000 Freesias, 50,000 Tulips, 150,000 Narcissus, &c., at 67 & 68, Cheapside, by Protheroe & Morris, at 5.

Street Trees.

The care of town trees is a subject of very high importance to urban communities. This much would appear to be a truism, but it is common knowledge that the treatment they receive frequently leaves much to be desired. Those who desire to see our towns made as beautiful as circumstances will permit them to be have several reasons for complaint. In the first place, there are many local authorities who have not yet recognised their duty in this matter. They neglect to plant trees although good situations are available and the conditions are favourable to growth. Next, there are those who plant a number of trees selected without proper knowledge of the habits and requirements of the different species. Neglecting to obtain the help of practical men in these matters, a Poplar, Lime or Plane is planted in an area scarcely sufficient for the proper development of a mop-headed Acacia. The result is that, when growth becomes greater than is desired, the saw and knife are brought into requisition, and the trees are sawn and chopped about in a deplorable manner. Minor reasons for complaint are that local authorities sometimes neglect to employ trained men to prune their trees, and even more often they omit to supply the trees with the necessary amount of root-moisture. The supply of root-moisture is in some cases of vital importance, for, owing to the construction of pavements and roads, the natural supply from the rain is prevented from reaching the roots.

It is hoped that Mr. Webster's articles on town planting, printed from time to time in these columns, will do much to dispel the

ignorance of municipal authorities and help to spread useful information on these subjects.

Many of our readers are doubtless familiar with the charm of the glorious Pine trees at Bournemouth, situated between the town and the beach. The following criticism of the Bournemouth trees generally is sent us by Mr. W. Botting Hemsley:—

No town that I have visited has, on the whole, prettier streets and roads than the borough of Bournemouth, and no other place is so well provided with public pleasure gardens and recreation grounds. Many of the streets and roads are made attractive by the tastefully-planted front gardens; and the trees, especially the Pine trees, the remains of the woods left standing at irregular intervals, add greatly to the general effect. The Chines, too, are charming, but might be better if the rules with regard to dogs had not been so greatly relaxed, or, perhaps, disregarded. It must be very discouraging to the gardeners to see the dogs, whether big or little, tearing up the young plants or seeds just put out or sown. What ruin a dog can accomplish when it gets to work with its hind paws needs no description, and I saw many engaged in this kind of destruction. But what is becoming more and more apparent is the fact that many gardens and streets are over-planted, with the result that mutilation follows to let in the light. Yet, generally speaking, trees are sacred in Bournemouth, especially the Pines, whether dead or alive, and this is much better than indiscriminate felling.

But this veneration for trees may be carried too far, especially if extended to Poplars, and result in their survival to the detriment of the Pines and other trees and shrubs, and also as a block to many pretty views. This danger is strikingly evident in the upper sections of Bournemouth Chine or Central Gardens. Bordering the stream, where Willows or other subjects of small dimensions should be planted, there are large, rapidly-growing Poplars, which will soon fill up the middle if left to themselves. On the slopes, too, in places, the other vegetation is being overtopped by Poplars. Possibly the Borough Council has no power over this part, for some of it is private property, to which the owner considerably admits the public. But if wise counsels prevail, apart from ownership, some of the Poplars will be removed before it is too late to save the more beautiful Pines and other trees.

DISEASES OF DECIDUOUS FOREST TREES.—

Messrs HERMANN VON SCHRENK and PERCY SPAULDING have published in *Bulletin* No. 149 of the Bureau of Plant Industry of the U.S. Department of Agriculture an admirably-illustrated account of the chief diseases to which the deciduous-leaved trees of America are subject. The diseases are classified under the heads of:—(1) Environmental disease, due to smoke and sulphur gases, unfavourable soil conditions, extreme cold, and mechanical injury by animals, wind, etc.; (2) diseases due to miscellaneous parasites, such as insects, parasitic higher plants and particularly parasitic fungi; the fungi being responsible for the mildews (on the Red Oak, *Quercus rubra*, and Elm, *Ulmus americana*, Sycamore, and Willow, &c.), tar spots (black leaf blotches) of Maples, &c., rusts on Ash, Poplar, Willow, Birch, &c., leaf-blisters of Oak, &c., and the root-rots, the chief of which, common on many

trees, is due to the fungus *Armillaria mellea*; (3) diseases due to wound fungi. The characteristic symptoms produced by the attacks of this last group of fungi, which include species of *Polyporus*, *Fomes* and *Hydnum*, are illustrated by an excellent and valuable series of plates at the end of the *Bulletin*.

FLOWERS IN SEASON.—Mr. AMOS PERRY has sent us specimens of *Spirea venusta* and others that were so greatly admired at the Royal Horticultural Society's meeting on the 2nd inst. Owing to the hot weather, the flowers were faded on receipt, but this is not surprising in the case of plants so greedy of moisture as *Spiræas*. Mr. PERRY says that in his nursery the plants are 6 or 7 feet in height, and we can well imagine the fine effect they produce there.

From Messrs. KELWAY & SON we have received a few inflorescences of *Gladioli*, representing large, erect-flowered varieties. Most of them are shades of rose or red, in some cases marked with white, whilst one is almost entirely white. The strain is a very choice one, and the specimens show first-rate cultivation.

THE BRITISH PTERIDOLOGICAL SOCIETY.—The 18th annual meeting of this Society was held at Kendal on the 2nd inst., Mr. J. J. SMITHIES, in the chair. The accounts disclosed a balance in hand of £59 15s. 6d. Forty-one new members were elected. It was decided to issue to the members a quarterly publication devoted to the objects of the Society. For this purpose a publication committee was appointed, with Dr. F. W. STANSFIELD, Reading, as chairman, and Mr. C. T. DRUERY, F.L.S., V.M.H., editor. Mr. ALEXANDER COWAN, Penicuik, Midlothian, was elected president of the Society for the year ending August, 1910. Mr. DRUERY sent a frond of his new seedling Fern, raised from spores discovered by Dr. STANSFIELD, upon Mr. GREEN'S plant of *Polystichum aculeatum pulcherrimum*. It is a great advance upon the parent and was very much and deservedly admired. Mr. A. COWAN exhibited a frond of his seedling *Asplenium Filix-foemina setigerum congestum*. The meeting was the best the Society has had for some years. It was decided to hold the next meeting at Moffat on August Bank Holiday, 1910.

GLADIOLUS MACKINDERI.—Our old and valued correspondent, Mr. MAX LEICHTLAN, of Baden-Baden, writes as follows: Does any amateur or nurseryman still possess bulbs of *Gladiolus Mackinderi*? I should like to obtain a bulb of this species, either by exchange or purchase.

THE WORKS OF PROFESSOR WILLIAM MACGILLIVRAY.—Some interesting additions have lately been made to the reference department of the Aberdeen Public Library in the works of the late WILLIAM MACGILLIVRAY, M.A., LL.D., Professor of Natural History in Marischal College, Aberdeen. What is considered the most valuable addition is the volume *The Natural History of Deeside and Braemar*. This work was completed by Professor MACGILLIVRAY just before his death in 1852. The MS. was afterwards bought by QUEEN VICTORIA, and, having been edited by Dr. EDWIN LANKESTER, was printed at the QUEEN'S expense for private circulation. As the work was a presentation volume from Prince ALBERT to the various recipients, it is scarce. Other of Professor MACGILLIVRAY'S works available in the Aberdeen library include:—*A Manual of Botany*, 1840; *A Systematic Arrangement of British Plants*, W. WITHERING, corrected and condensed by W. MACGILLIVRAY, two vols. (fifth edition, 1841; seventh edition, 1848); and *A Manual of Geology*, two vols. (first edition, 1840; second edition, 1844).

KNEBWORTH HOUSE GARDENS.—We are informed by Mr. CRESSWELL, the gardener, that these gardens will be open to the public free for one day only on Saturday next, August 28, by kind permission of the Right Hon. the Earl of LYTON. These gardens have not been open for public inspection for 20 years past. Knebworth Station is situated in Hertfordshire, on the main line of the Great Northern Railway Company.

WAGES IN LIEU OF NOTICE.—At the Croydon County Court, on the 9th inst., before Mr. Registrar FOX, GEORGE FRANCIS, gardener, Purley, sued J. BRIDGER, Purley, for £1 3s. in lieu of notice. Plaintiff said that on a certain Saturday he was sent to Coulsdon to work, but it was too wet to start. Later in the day he saw his employer, who at once discharged him without a moment's notice. Plaintiff said he had come to Purley on purpose because of the promise of regular work. The defendant said there was an agreement that the man should lose all wet days. He was only paid 25s. when he did a full week's work. It was the business of the plaintiff when he could not start at Coulsdon to come straight to him and see if there was anything else to do. The Registrar said if the plaintiff was to lose all time when it was wet surely he had a right to go home on this Saturday. There would be judgment for the plaintiff with costs.

LORD ROSEBERY ON THE SUBJECT OF GARDENING.—At the fourth annual show of the Crumond Horticultural and Industrial Association, held last week, Lord ROSEBERY delivered an exceedingly interesting speech. The following are a few extracts from the reports published in the daily Press. At the hour of manhood, when before us lie the vast plains of life with their various paths leading to good and to evil, we have the choice before us whether we will be gardeners or not. I do not mean practical gardeners, but gardeners in taste, in sentiment, in appreciation. From that moment I trace my deterioration, for I did not choose to be a gardener in taste, and I am sometimes afraid it is almost too late to adopt that special form of enjoyment. Yet, Sir, to this audience I am quite free to confess that I was wrong. I feel it every day more and more; because gardening is one of the enjoyments which one appreciates more and more with the advance of years. When other amusements leave us from want of strength or aptitude, gardening remains to us an increasing enjoyment and pleasure. That is the first reason. The second is this—there is no literature more delightful than the literature of gardening. I do not mean nurserymen catalogues, which are the most arid form that printed matter can assume. But I do mean the literature of gardening from Bacon's famous essay downwards, literature that gives you the wish to be a gardener and to taste the simple pleasures of the art. I will not mention any of those books that appeal to me, because it is an inconvenient form of advertisement—not that I object to advertisement, which has become a law of nature in the twentieth century—but the last time I did anything of this kind I did refer to a book on gardening, and received at once a dozen letters asking for a copy, and as it was privately printed and I had only one copy I was unable to reply to those letters with any satisfaction. Well, the literature of gardening is another reason which makes me regret that I did not choose to be a gardener in taste. The third is this: I cannot help believing, and believing very firmly, in the moral training and atmosphere of gardening. I cannot help thinking, without disparagement to other splendid classes of our rural dwellers, that gardeners, on the whole, physically and mentally are the cream of our rural

population. I do not mean by that any disparagement to the foresters or gamekeepers or ploughmen, for all are splendid classes in their way, and we never can forget that the most beloved of Scotsmen was a ploughman. But I do think that a gardener, by the nature of his occupation, is, or should be, physically and intellectually and morally the best of our rural population. It is his duty to deal in turn with all the miracles of Nature—the bud, the flower, and the fruit. He is the first to see the opening leaf and the first green spike that pierces the mould. And then, when the weather fails and when all is too inclement for other pursuits, he is able to devote himself to the preparation for another year in the sure and certain faith that the miracles of Nature which he has witnessed in the current year will recur in orderly but miraculous rotation in the coming spring. No one can fail to see who appreciates the daily task and toil of the gardener that there is none that can or should raise the nature and the mind of man as completely as his; and therefore, believing as I do that in these circumstances they are and they must be the best of our rural population, I, if I were a ruler—which, thank Heaven, I am not!—would do all I could to multiply and increase such men, for I should feel that by so doing I was best serving the interest of the rural part of our country, and then I would take off my hat, if I had not already taken it off, to the character of the gardener.

NEW USES FOR RAPHIA.—At the exhibition held by the Société Nationale d'Horticulture in Paris in May of this year numerous articles of very diverse kinds made from Raphia fibre were shown: umbrellas, ribbons, and even clothes. The umbrellas are said to have been light and particularly efficient as sunshades owing to the insulating property of the fibre. The ribbons and waistcoats, &c., do not appear to have struck the writer in the *Journal d'Horticulture Tropicale* (July, 1909) as quite so successful. We ourselves well recollect seeing a whole family of Tamil coolies marching along a sweltering road in Ceylon under the friendly shade of a single leaf of the Palm *Corypha umbraculifera*; so that in a sense the West has only exploited the invention of the East.

THE DESTRUCTION OF RATS BY CARBON BISULPHIDE.—Mr. M. E. DE KRUYFF describes in the *Journal d'Agriculture Tropicale* for July, 1909 (No. 97), a method which he has found to prove extremely efficacious for the extermination of rats in barns used for the storage of Rice in Java. The openings of the galleries of the rats are stopped with clay. On the following day 1 to 2 cubic centimetres (about 30 drops) of carbon bisulphide are poured into those holes which the rats are using (which will be found to have been opened by them). After a few seconds a light is brought near the vapour given off by the liquid. There is a slight explosion and the rats in the gallery are killed by the poisonous vapours produced during the combustion of the carbon bisulphide. A pound of the liquid is sufficient for about 250 holes, and the cost, therefore, is very small. In employing the method it has to be remembered that the light must not be brought near the bottle containing the stock of carbon bisulphide, and also that the poisonous vapours must be got rid of subsequently by ventilation. If, however, the carbon bisulphide is kept in a stoppered bottle and common-sense is exercised, there is no danger.

PUBLICATIONS RECEIVED.—*Introduced Dorders*, by W. Botting Hemsley. Reprinted from the *Journal of Botany* for August, 1908. (London: West, Newman & Co., 54, Hatton Garden.)—*Beautiful Flowers and How to Grow Them*, by Horace J. and Walter P. Wright. Part 17. (London: P. C. and E. C. Jack.) Price 1s. net. *Insect Pests*. HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE R.H.S. LECTURES.—As a frequent attendant at these lectures, may I suggest to future lecturers that, however complete their papers may be for publication in the Society's *Journal*, that they rigidly restrict their spoken lectures to 40 minutes at the outside? I have so often noticed that when lectures are prolonged, not only do some persons leave the lecture hall before their completion, but that the moment the lecture is over practically all others rise to leave. On a recent occasion, what with the briefly preliminary proceedings and the lecture itself, it was 4.10 before the chairman rose to invite questions. At this point almost everyone rose to leave, and the customary vote of thanks was given by just a few who remained for that purpose. With more time, questions and ordinary courtesies of thanks would be readily forthcoming. D.

SUB-TROPICAL PLANTS AND BOTTOM HEAT.

—At the commencement of "sub-tropical" gardening in this country we used to afford bottom heat to the plants thus employed in the flower garden; but, although its advantages were admitted, and the plants to which it was then applied developed splendidly, the method never became popular. Only very few gardeners now put bottom heat under their tender sub-tropicals. As a rule, the weather in the summer months is favourable to the growth of such plants in our climate to a certain degree; but they would become much more ornamental, developing greater stature, leaves of finer dimensions and more perfect form if we afforded bottom heat. The heat should be of a steady, enduring nature, capable of lasting from May till October. It was advised at about the time the late Mr. Gibson laid out Battersea Park, and the Crystal Palace grounds were laid out by Sir J. Paxton and Mr. Eyles, that if the gardener laid beneath his plants a thick layer of brickbats, chalk or coarse materials of a free, open nature, water would pass rapidly away, and the mass of soil be rendered warmer. For some of the less tender plants this manner answered well enough; but for those which require more heat this was not enough. Even this preparation, however, is now dispensed with in most places, with results that, to say the least, are not satisfactory in an average year. This year the growth of sub-tropicals is poor in the extreme in all cases that have come under my notice. Where tree-leaves are to be had for the raking, the gardener has suitable materials for this purpose at his hand; but the once abundant labour is missing. The heat from well-prepared stable litter is too fleeting, and apt to be too great for the plants, and, although the mixture of leaves and litter is more lasting and less liable to high fermentation, large quantities are required, and the preparation costs much money. I am reminded by an article in a German journal of recent date of materials of the right kind, which Turkish gardeners employ in growing Gardenias in frames, namely, the paper waste from the cigarette manufactories. Woollen waste would serve the same purpose. The materials are less bulky than tree leaves or stable litter, and probably cheaper, besides being cleaner and freer from disagreeable odour than either, and, therefore, suitable for the amateur's garden. The

stuff is prepared similarly to leaves and litter by being moistened and turned over repeatedly, till the heat engendered by fermentation has declined to a safe point. It is then thrown into excavations of a size capable of containing a mass of 3 feet in depth, which is firmly trampled down during the operation. The heat endures with but little fluctuation for the better part of a year when covered with the necessary mass of soil. It is no disadvantage if a bed thus formed comes 1 foot or 2 feet above the surrounding level; rather it gives a desirable prominence to such plants as Cannas, Palms, Solanums having ornamental foliage, Maize, ornamental Gourds, Eucalyptus, Nicotiana affinis hybrids, Ricinus, Ficus elastica, Buddleia variabilis, Dracena fragrans, tall-growing species of summer-blooming Begonias, Alocasias, Aralia papyrifera, Abutilons, Gerbera Jamesonii, Musas of species, the species of Vitis introduced by Wilson from China, Doryanthes Palmeri, Diospyros Kaki, Bambusas, Nandina domestica, Datura Knightii, D. suaveolens, Punica granatum, in several varieties of different-coloured flowers, and Japanese Maples. These plants are handsome subjects, which in our climate would be all the better for a certain degree of bottom heat, and more especially in summers like the present one. *F. M.*

FLORAL TRIALS AT WISLEY.—This year there has been conducted at Wisley a trial of tree Carnations, both inside and outside. I should like to suggest that next year a trial of border varieties be provided, the tests of merit to be found in compact border habit, robust growth, free-flowering, quality of flower, especially in relation to non-splitting of the calyx, and, finally, general effectiveness as garden varieties. I am tempted to make this suggestion because, having recently seen in a Surrey garden one of the very best border Carnations I ever beheld, I advised the placing of some plants and flowers before the Floral Committee; but on that occasion myriads of superb house-grown flowers were presented, hence the outdoor flowers obtained little notice. Yet it would be interesting to learn how many of these house-grown varieties would give such good effects when grown outdoors as did this disregarded variety. *A.*

HORTICULTURAL TRADES ASSOCIATION.—The Nurserymen's Congress is now a well-established event, but none of the previous meetings has approached in pleasure and interest the one just concluded in Belfast, which was the tenth annual meeting of the association. The meeting was favoured by three days of perfect summer weather, which added immensely to the pleasure of the excursions, and at the same time enabled the party to see the famous Belfast Roses at their best. Everyone is familiar with Irish Roses, but many, even of those in the trade, were not aware of the immense extent to which the industry of raising new varieties has developed in this neighbourhood. Some idea of this may be gathered from the fact that three firms, viz., Messrs. Alex. Dickson & Son, Hugh Dickson, and McGrody & Son, have this season each some 40,000 plants out for trial, and one of the firms burnt last year a batch of rejected seedlings which covered several acres. These at the lowest wholesale rate for ordinary varieties would have been worth £300. Many of the novelties seen are still unnamed, so that no useful purpose would be served by detailed descriptions, but it is a pleasure to record that the raisers have broken away from the rather monotonous series of bluish and cream flowers we have been receiving of late years, and have some glorious crimsons, yellows, and mixed orange and pink shades, which will make a sensation in the near future. The association spent a day at Castlewellan, where the late Marquis of Annesley formed a garden unique for the extent and rarity of its collection of flowering and other shrubs. Mr. Smith's nursery at Newry was also a revelation to many of the visitors, both from its picturesque situation on a mountain side and its wonderful collection of plants and shrubs, which probably for extent and rarity is unequalled in any nursery in Europe. The evening meetings were passed in routine business (the election of officers, &c.) and the discussion of matters of trade interest, such as the effect of the proposed new land taxes upon nurserymen and seedsmen, which, it is scarcely necessary to add, are, owing to the position of most nurseries in the suburbs of the

larger towns, a matter of most serious concern. The gathering was an instructive and pleasant affair, and was made doubly enjoyable by the hearty welcome and generous hospitality which met us at every turn. *Chas. E. Pearson, Hon. Sec.*

PRINCIPLES OF MENCELISM.—Mr. H. J. Chapman found (see *Gardeners' Chronicle*, vol. xlii. (1907), p. 401; vol. xliii. (1908), pp. 173, 222, 254) that by crossing the two albino Orchids, *Cypripedium bellatulum album* and *C. callosum* Sandere, only plants bearing coloured flowers were produced. Both albinos when self-fertilised give albino offspring. Here we have an interesting confirmation of the result obtained by crossing the two white Sweet Peas "Emily Henderson" and "Blanche Burpee," such as Mr. Folwell asks for in his note on p. 118. Similar results have been obtained by crossing *C. bellatulum album* and *C. Lawrenceanum* Hyeannum, and with Ten-week Stocks. Thus the evidence for the belief that the appearance of sap-colour depends on the simultaneous presence of two factors or "character determinants" is derived from several different groups of plants and not from Sweet Peas alone, and the phenomena thus experimentally established have suggested the explanation of the meaning of reversion. A plant is apparently an albino when the cells from which it has been derived are lacking in one or other (or both) of these factors, and only when the lacking factor is brought in will sap-colour be produced. No doubt in addition to these "character determinants" the production of sap-colour will depend upon certain other conditions as well, a fact that Mr. A. E. Binyard has recently called attention to in your columns. It is sincerely to be hoped that all who have reliable evidence bearing on these and similar important points will record it. It would be exceedingly interesting to learn of cases where coloured flowers have been produced as vegetative sports (not seedling variations) by plants normally bearing white flowers. *Fred. J. Chatterden.*

A VILLAGE GARDEN COMPETITION.—In most villages there are now competitions in which the cottagers receive prizes for their gardens or allotments, but I believe that the scheme in operation at Old Warden is the only one of its kind in the British Isles. The entire village is the property of Colonel Frank Shuttleworth, of Old Warden Park, Biggleswade, and is one of the most charming villages in Bedfordshire. Colonel and Mrs. Shuttleworth are exceedingly proud of the village, and their head-gardener, Mr. W. C. Modral, is called upon to keep all the hedges and grass banks in proper order. In 1905 Colonel Shuttleworth decided to do something substantial towards encouraging the cottage gardeners to cultivate the gardens. The formulation of a scheme was entrusted to Mr. Modral and myself. It was eventually agreed that every garden in the village should be inspected in July and that merit marks should be awarded to each vegetable crop, and collectively to fruits and flowers. Further, every man who secured more than 70 points was to receive a prize at the rate of one penny for every point scored. In the first year the sum divided between 14 cottagers was £4 8s. 2s., and subsequently there has been a steady improvement and a proportionate advance in the prize-winning minimum, until in the present year it stood at 100. Thus, instead of everyone securing 70 points having a prize it was necessary that no fewer than 100 should be obtained. The cottagers worked the harder, with the result that 28 took prizes among them to the total value of £13 17s. 10d. The average number of points scored by the prize-winners in the first year was 75, but in the present year the average was 119. The judging this year was done on July 30, and the prizes were distributed the same evening in the Institute by the Rev. Mr. Cassels. It may be interesting to add that Mr. J. Wiltshire, who was first with 165 marks, has charge of the pleasure grounds at Old Warden Park; that Mr. J. Palfrey, who was second with 151 marks, is one of the estate carpenters; and that Mr. W. Foster, who was third with 138 marks, is the stud groom. It will afford me the greatest pleasure to furnish fuller details of the scheme to anyone interested in the improvement of cottage gardening. *Horace J. Wright, Dault Road, Wandswoth.*

COLONIAL NOTES.

FLOWERING OF DENDROCALAMUS GIGANTEUS AT PERADENIYA, CEYLON.

We reproduce the following notes by Mr. H. F. Macmillan from the *Annals* of the Royal Botanic Gardens, Peradeniya.

The phenomenon of the simultaneous flowering of Bamboos has been often recorded and confirmed. Whilst no one seems to have explained the cause, a great many at the present day believe in the existence of a certain infectious condition which at once influences the flowering of all specimens of the Bamboo tribe, whether it be annually or once in a number of years. In the case of species of *Dendrocalamus* it is considered by expert Indian foresters that the occurrence takes place once in 30 years, and it is a common belief that when the given moment has arrived, every plant of the same species, whether old or young, over a vast region, will put forth its flowers simultaneously, and that having seeded the plant dies. August St. Hilaire, a botanist who explored Brazil, mentions a whole forest of a certain Bamboo disappearing in a few months after flowering. So recently as during the hot season of 1901 the *Indian Forester* records "the flowering of the ordinary Bamboo (*Dendrocalamus strictus*) extending over an estimated area of 1,200 square miles in the Central Provinces." Though a few clumps here and there have escaped, the phenomenon is described as universal, affecting not only mature clumps, but quite slender seedlings of a few years growth. But against this report there is the statement by Lord Redesdale in his book on Bamboos, that this same species (*Dendrocalamus strictus*), also known as the "Solid" or "Male Bamboo," flowers every year. At Peradeniya, where it has flourished for the last 59 years, an occasional stem has been seen to blossom, but neither annual nor periodical wholesale flowering has as yet been observed. We can therefore at least contradict the statement that it blossoms annually so far as Peradeniya is concerned.

In regard to the Giant Bamboo (*Dendrocalamus giganteus*), this species has now been in a condition of flowering here for the last eight years, and elsewhere in Ceylon at different elevations for a longer period. The first case of flowering in Ceylon was not at Peradeniya (elevation 1,500 feet), but on Abbotsford estate, at about 5,000 feet elevation. That occurred about 1886 (approximately 30 years after the introduction of the plant at Peradeniya), when Mr. A. M. Ferguson, the proprietor, sent specimens to Dr. Trimen, then Director at Peradeniya. This coincides very closely with the period taken by the Giant Bamboo to flower at the Royal Botanic Gardens, Calcutta, after its first introduction.

It may be interesting here to note the history of the introduction of this noble Bamboo into Ceylon. The plant is a native of moist forests of Lower Burma, and was introduced from Penang to the Royal Botanic Gardens at Calcutta in 1831. From there Peradeniya obtained it in 1856, and all the clumps now in Peradeniya Gardens, if not in Ceylon, have been derived by division from this source. The clumps at Peradeniya, especially those near the river or in moist situations, have grown to enormous sizes, much exceeding, it is said, the dimensions normally attained by them in their native habitat, and these majestic growths have formed a feature of Peradeniya Gardens for many years past. Some of the clumps are 150 feet or more in circumference, the stems reaching a height of 120 feet each, being about 10 inches in diameter at the base. At Calcutta it flowered for the first time in 1861, exactly 30 years after its introduction; at Abbotsford the recorded flowering was, as stated, about 1886, 29 years after the introduction of the plant at Peradeniya. It is interesting to note here that on the authority of Mr. John Fraser, the present manager of Abbotsford estate, the same Bamboo which flowered about 20 years ago is still alive and in a condition of mixed flowering.

The first signs of flowering in Peradeniya Gardens were noticed in January, 1903, when three or four stems in each of three clumps were in blossom. Each year since has in most cases

produced a greater number of flowering stems, the increase being noticeable in the dry hot season, February to May. In the course of three or four years the flowering condition extended to other clumps some distance away, whilst yet other clumps within a distance of 200 yards or so, being young and vigorous, have so far shown no signs of flowering. Up to the present, out of a total number of 21 clumps in these Gardens, 11 have partly flowered or are at present in a state of flowering, thus leaving 10 clumps which have not as yet blossomed. The first clump of all which flowered does not at the time of writing contain any flowering stems; on the other hand, a number of young leafy stems have sprung up on its circumference. Other cases of flowering of the Giant Bamboo have been observed in different parts of the island during the last several years at elevations varying from 1,000 to 5,000 feet, but no death of clumps has as yet been reported. Most probably all such clumps have originated from Peradeniya, and are, therefore, off-sets of the original plants imported, so that, strictly speaking, all the clumps so derived are of the same age.

It would thus seem as if the exhaustion of nutriment rather than an infectious influence were responsible for the more or less simultaneous flowering of the Giant Bamboo. The vigorous growth of the plant is such that it cannot go on growing and extending indefinitely. The enormous demands it makes on the soil can be realised by anyone who has seen the "ruins" of an old clump, the huge crevices and upheavals formed by the elevated stumps as if the result of an earthquake. The gregarious habit of the plant also prevents its spreading indefinitely over fresh areas for fresh nutriment. Two of the flowering clumps at Peradeniya having regained a more vigorous condition have now given up blossoming entirely, presumably because their circumference has struck richer soil. Although none of the flowering clumps have as yet actually died, one or two are so nearly exhausted, evidently as a result of flowering and starvation combined, that another year will probably see an end to their existence. All the flowering clumps regain energy to some extent in the wet weather; the stems produce young leaves, and new culms are put forth from the base.

The inflorescence consists of long drooping panicles (the branchlets varying from 1 to 6 feet in length) produced normally at the nodes all along the leafy portion of the stem. At first green, it gradually changes to dingy yellow, and then light brown. Although it ordinarily occurs only on the leafy top portion of the stem, the inflorescence also arises occasionally at the base of the stems.

Up to 1907 fertile seed had not been produced at Peradeniya, and even now only very scantily. Its presence was only discovered by chance, a few seedlings appearing from large quantities of the chaff-like empty glumes which were sown. The first seed actually handled and sown here was found by Mr. Petch, Government mycologist, amongst a mass of basal flowers. It was duly sown, and germinated in seven days, and the seedling is now growing rapidly. This suggested that the basal flowers might be more productive than the usual stem flowers. Accordingly a bushel each of both basal and stem mature "flowers" was carefully gone over one by one, but the number of seeds obtained was practically the same in both cases, viz., 44 and 47 respectively. Therefore, a very large quantity of the chaff-like glumes must be sown in order to obtain any seedlings.

NOTICES OF BOOKS.

* PRACTICAL SCHOOL GARDENING.

THIS little volume is the work of Mr. Percy Elford, M.A., Secretary of the Oxfordshire Education Committee, and Mr. Samuel Heaton, the staff instructor in horticulture to the same body. Mr. Heaton is well known as a good professional gardener, whose cultural instruction ought to be of the greatest use to his pupils. School gardening is now so generally recognised as a fitting subject to be taught in public elementary schools.

* Practical School Gardening: By Percy Elford, M.A., and Samuel Heaton. Clarendon Press, Oxford: 2s.

that we welcome any book that will help teachers and pupils alike to gain a more useful and practical knowledge of the subject, however elementary. The volume prepared by Messrs. Elford and Heaton contains a good deal of interesting and practical information. But in addition to such information there are numerous references to "nature study," which so many educationalists imagine to be gardening. If the pupils in the elementary schools of Oxford county can only assimilate one-tenth part of the zoological, entomological and meteorological material in the book, in addition to the gardening information, they will indeed be worthy of the classical county. Our own experience proves that it is with great difficulty lads who spend an hour or two per week at school gardening, for one or two or three years at the outside, acquire sufficient knowledge and dexterity to cultivate just the ordinary garden vegetables and a few common flowers with anything like success. It is, therefore, a great mistake to expect the lads to acquire a smattering of all the sciences connected with gardening during their short course of study, especially when the school teachers often know as little as the pupils themselves. It is far more essential that the lads should be able to handle the usual gardening tools with a fair amount of dexterity and at the right time, and also to perform with intelligence the various gardening operations. Those who use their eyes and brains at the same time will, through performing the practical operations, unconsciously acquire a lasting knowledge of the insect pests and fungal diseases which are ever ready to attack their plants. The authors have dealt with these subjects pretty fully, so far as the ordinary crops of fruits, flowers and vegetables are concerned, and the information given ought to be of help, not only to those actually engaged in school gardening, but also to "children of a larger growth." In the 224 pages before us there is much information that ought to whet the amateur's appetite for larger treatises on the art of gardening. J.

SOCIETIES.

ROYAL HORTICULTURAL.

AUGUST 17.—The meeting held on Tuesday last showed a considerable falling off in the number of exhibits and the attendance. There were, however, good collections of Orchids, greenhouse flowers, Gladioli, *Codæums*, Border Phloxes, and many other hardy flowers. Novelties were plentiful in all the departments. The FLORAL COMMITTEE conferred five Awards of Merit and one Botanical Certificate. The ORCHID COMMITTEE granted three First-class Certificates and four Awards of Merit; the FRUIT and VEGETABLE COMMITTEE granted Awards of Merit to four varieties of Dwarf Beans after trial at Wisley. At the three o'clock meeting in the Lecture Room an address on "Bees in Relation to Gardening" was delivered by Mr. Walter F. Reid.

Floral Committee.

Present: H. B. May, Esq. (in the Chair); and Messrs. C. T. Drucry, A. E. Bowles, Jas. Walker, W. Barr, E. H. Jenkins, James Hudson, W. Bain, C. Dixon, Chas. E. Pearson, C. R. Fielder, J. T. Bennett-Poe, W. P. Thomson, George Paul, and W. J. Gean.

MESSRS. JAMES VEITCH & SONS, LTD., King's Road, Chelsea, showed miscellaneous flowering plants, including improved varieties of *Primula obconica*, both rose and white-flowered; a batch of *Gloxinias*, the plants flowering well in small pots; *Cammas* in variety; a number of well-flowered specimens of *Amphicomo Emodi* and *Rhododendrons* of the japonico-jasminiflorum type. On an adjacent table the same firm exhibited sprays of flowering trees and shrubs, having many novelties in the collection. *Eudella variabilis magnifica* is a great improvement on the older kind. Other plants of especial interest

were *Eucypha pinnatifida*, *Tamarix Kashgaria*, *Sambucus canadensis* (a fragrant species), *Pavia macrostachya* and *Hydrangea Lindleyana*. There was also a fine collection of varieties of *Clematis*. (Silver-gilt Flora Medal.)

MESSRS. H. B. MAY & SONS, The Nurseries, Edmonton, showed about 50 varieties of *Codæums*, many of the varieties being grouped in batches. The best of the narrow, medium and broad-leaved varieties were included in the collection, the plants being admirable examples of the best culture. (Silver-gilt Flora Medal.)

MR. FRANK BRAZIER, Caterham, staged a semi-circular group on the floor. The principal subject was a yellow-ground *Carnation* named Mrs. Frank Brazier. Around this were arranged *Scabiosas*, *Antirrhinums*, *Gladioli*, *Stocks*, &c.

MR. L. R. RUSSELL, Richmond, showed varieties of hardy *Fuchsias*. *F. Riccarton Elysée* is the most floriferous of these hardy plants, and is especially suitable for summer bedding purposes.

MESSRS. PAUL & SONS, The Old Nurseries, Chessnut, showed varieties of *Phlox decussata* having fine spikes of most of the best kinds in commerce. (Silver Flora Medal.)

MR. E. POTTEN, Camden Nursery, Cranbrook, Kent, showed border *Phloxes*, *Campanulas*, a fine *Trollius* named Potten's variety, *Helieniums*, and other hardy flowers. Mr. POTTEN also showed a double-flowered variety of *Pelargonium* after the style of Paul Crampel.

MESSRS. JOHN PEED & SON, West Norwood, London, exhibited *Gloxinias*, including cut flowers and pot plants, the whole relieved with Ferns, Palms, and other greenery. The plants were raised from seeds sown in January, 1909.

MESSRS. GEO. BUNYARD & CO., Royal Nurseries, Maidstone, exhibited garden flowers in great variety. The exhibit occupied the whole side of one of the long tables. The collection included *Gaillardias*, *Chrysanthemum maximum* in variety; *Kniphofias*, *Hyacinthus candicans*, *Aconitums*, *Lupinus*, *Phlox*, *Saponaria officinalis alba*, *Montbretias*, *Pentstemons*, *Gladioli*, and other seasonal subjects. (Silver Flora Medal.)

MR. AMOS PERRY, Hardy Plant Farm, Enfield, Middlesex, exhibited hardy flowers. The subjects were arranged in large sheaves, with a few dwarfier kinds along the front. The more noticeable were *Tamarix hispida aestivalis* with pink flowers, *Sagittaria japonica plena*, *Aconitum variegatum alba*, *Veronica longifolia subsessilis*, *Asclepias tuberosa*, *Lythrum roseum superbum*, and *Lythrum dalcana*. A fine white-flowered *Phlox* was seen in the variety Graf von Lassberg. (Silver Banksian Medal.)

MESSRS. R. HARKNESS & CO., Hitchin, showed a large group of *Hollyhocks*, all unnamed varieties.

MR. GEO. REUTHE, Keston, Kent, staged hardy plants in variety, and a similar display was made by Messrs. T. S. WARE, Feltham, Middlesex.

MR. M. PRICHARD, Christchurch, Hants., exhibited a large group of perennial hardy flowers. The display was representative of the best varieties in season, and was well arranged. (Silver Flora Medal.)

MESSRS. KELWAY & SON, Langport, Somerset, showed an extensive exhibit of *Gladioli*, having large spikes, the flowers being of innumerable shades of colour. The exhibit included 300 spikes. (Silver Flora Medal.)

MR. CLARENCE ELLIOTT, Stevanage, showed a small rock-garden exhibit, in which were noticed *Acæna microphylla*, *Linna americana*, *Cyananthus lobatus*, and *Scabiosa Parnasi*.

AWARDS OF MERIT.

Astilbe rivularis gigantea.—A gigantic form of this creamy flowered species, the inflorescences attaining to a height of about 5 feet. The racemes of tiny flowers, with the large, pinnate foliage, would prove very effective by the side of a stream or in the bog-garden. Shown by Mr. AMOS PERRY, Enfield.

Gladiolus Lord Alverstone.—A magnificent variety of the gandaxensis type. The flowers are very large; the inner petals are a shade of purple on a scarlet base, and the outer segments are scarlet.

Gladiolus Miss Ada Bever.—A fine white variety, with a few lines of purple in the throat. The flowers are exceptionally large and they are borne on very big spikes. Both these *Gladioli* were shown by Messrs. KELWAY & SON, Langport.

Canna Roi Humbert.—This variety was exhibited to show its suitability for planting in the out door garden. The flowers are exceptionally large, and borne in big trusses. The colour is fiery-red with slight markings of yellow in the centre. The foliage is bronze-coloured. Shown by Sir Trevor Lawrence, Bart., and Messrs. JAMES VEITCH & SONS, LTD.

Polystichum aculeatum pulcherrimum plumosum.—This beautiful Fern originated from the same batch of spores which has already given two handsome varieties, which may be known as the "gracillimum" section. It closely resembles the charming plumose varieties of *P. angulare* raised by Col. Jones. It is decidedly the finest of the section, including the two varieties which have already received First-class Certificates. Exhibited by the raiser, Mr. C. B. GREEN, Acton.

BOTANICAL CERTIFICATE.

Anemoneopsis macrophylla.—This is a near ally of *Cimicifuga*, from which it differs in the large Anemone-like flower and in the shape of the petals. The flowers are drooping and are somewhat like a small bloom of *Anemone japonica*, but the central petals form a tube, containing the very numerous stamens. The colour of the flowers is faint purple on a white ground. They are about $\frac{1}{2}$ inches in diameter. The leaves are compound, the petiole being about 1 foot in length. The plant is a native of Japan. Shown by Mr. AMOS PERRY.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair), and Messrs. Jas. O'Brien (hon. sec.), Harry J. Veitch, W. Boxall, G. F. Moore, F. J. Ranbury, J. Forster Alcock, F. Sander, W. Cobb, J. Charlesworth, H. G. Alexander, A. Dye, W. H. Hatcher, H. A. Tracy, W. Bolton, Gurney Wilson, de B. Crawsbay, and Stuart Low.

Mrs. BISCHOFFSHEIM, The Warren House, Stammers, Middlesex (grower, Mr. Taylor), was awarded a Silver-gilt Flora Medal for a splendid group of *Disa grandiflora* made up of about 50 plants, each with one very strong, self-supporting spike, bearing in some cases seven flowers, each 5 inches across and with lateral sepals nearly 2 inches wide varying from brilliant scarlet to scarlet with a deep gold tinge, the large galeas being white to cream colour veined with purple. The plants are grown on a special system, all the offsets being removed, and the stronger potted on for flowering, with a single spike in comparatively small pots. The group represented this brilliant flower in better form probably than any previously staged.

MESSRS. SANDER & SONS, St. Albans, were awarded a Silver-gilt Flora Medal for an extensive group containing many novelties, the home-raised forms of *Odontoglossum McNabianum*, *O. Rolfeae*, and *O. crispo-Harryanum* being especially good. Of those noted were *O. Rolfeae* Sander's variety, a perfectly-shaped white flower blotched with purple; *O. McNabianum* Canary, a bright flower with a pale-yellow ground colour; *O. McNabianum superbum*; and *O. Harvengtense cinnamomeum*, a large, cream-white flower blotched with cinnamon brown. *Odontioda Bradshawiae* Sander's variety and *O. Vuylstekeae* Sander's variety, although undeveloped, showed distinct features. The central plant was the noble *Vanda cœrulea* Dreadnought, and beside it the new *Laelio-Cattleya* Invincible (for both see Awards), and with them was a fine selection of hybrid *Cattleyas* and *Laelio-Cattleyas*, L.-C. Gaston Doin (*L. tenebrosa* × *C. Rex*) being a beautiful novelty with yellow-petalled flowers, much resembling *L. tenebrosa* Walton Grange var. A small batch of the new *Dendrobium* regium, *Cattleya Gaskelliana* deliciosa (white with a pale-pink tint in front of the yellow disc), *Cypripedium Ultor*, *C. Lord Derby*, and many others, including some rare botanical species were shown.

MESSRS. CHARLESWORTH & CO., Haywards Heath, were awarded a Silver Medal for a very fine and interesting group, in which were the rare *Angreum Rothschildianum*, *A. arcuatum* var. *Sedenii* with curious, fragrant, white flowers; a grand plant of the white *Mormodes luxatum punctatum*, *Mast-vallia velifera*, *Odontoglossum hictoniense album*, and other rare species, including the handsome *Cirrhoptalum pulchrum Cliftonii* (see Awards). Among others

noted were a very fine *Cattleya Gaskelliana* alba; a handsome and distinct *C. Hardyana*, with large and richly-coloured flowers, having much golden yellow in the lip; *Cattleya Germania*; varieties of *C. Venus*; various *Laelio-Cattleyas* of fine quality; and other showy hybrids.

MESSRS. STUART LOW & CO., Eush Hill Park, secured a Silver Flora Medal for a very effective group, in the centre of which was a fine specimen of *Oncidium superbiens* with about 200 flowers. With it were good *Odontoglossum Rolfeae* and other *Odontoglossums*, *Oncidium Lanceanum*, *O. raniterum*, *Anguloa Clowesii*, and *A. Ruckeri* superba (very dark in colour), *Dendrobium Lecanum*, *D. sanguinolentum*, and *Cattleya Gaskelliana aurantiaca*, a very remarkable form with deep-orange base to the lip.

H. S. GOODSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), was awarded a Silver Banksian Medal for a small group of good and rare Orchids for the best of which see Awards. Among those noted were *Cattleya Germania*, *C. Atalanta illuminata*, *Brasso-Laelia Thwaitesii* Goodson's variety, *Cypripedium A. de Lairesse* Fairlawn variety, *C. H. S. Goodson*; several *Miltonia Roezlii* alba, &c.

Colonel G. L. HOLFORD, C.I.E., C.V.O., West-norbt (gr. H. G. Alexander), sent *Cattleya Tacitus* (bicolor × *Germania*), a beautiful flower formed like *C. Iris* and with bronzy-purple sepals and petals and bright mauve lip; also *Laelio-Cattleya Jason* (see Awards).

Mr. EDWARD V. LOW, Orchid Nursery, Hayward's Heath, showed a small group containing *Cattleya Gaskelliana Phyllis* a very finely shaped flower; *Cypripedium Juno*, *C. Princess*, *Cattleya Harrisoniae* alba, and some pretty *Laelio-Cattleyas*, &c.

Mr. WM. BOLTON, Warrington, showed a fine bloom of his *Cattleya Warszewiczii* Boltonii.

MESSRS. J. & A. A. McBEAN, Cooksbridge, sent *Odontoglossum Pescatorei* Pretty Polly, a fine flower with some spotting on the sepals and petals and many on the lip. Messrs. MOORE, LTD., Rawdon, Leeds, showed the rare *Prassia bicolor*, and Mr. GURNEY WILSON, Hayward's Heath, sent *Rodriguezia secunda*.

AWARDS.

FIRST-CLASS CERTIFICATE.

Odontoglossum Goodsonii (*Uro Skinneri* × *Pescatorei Charlesworthii*), from H. S. GOODSON, Esq., Putney (gr. Mr. G. E. Day).—A very remarkable hybrid with very prettily-formed flowers broad in all the parts. The ground colour of the flower is white, the sepals being nearly covered with a deep purple tinge, and the petals and rounded lip spotted with the same colour.

Dendrobium acuminatum, from Messrs. MOORE, LTD., Rawdon, Leeds.—A very handsome and distinct Philippine species already illustrated in the *Gardeners' Chronicle*. It is a beautiful species of the dwarf section and allied to the Bornean *D. Treacherianum*. It is probably the *D. Lyonii* Oakes Ames. The plant shown had an inflorescence of 16 flowers each over 2 inches broad, white, delicately tinted with rose-pink.

Cirrhoptalum pulchrum Cliftonii, from Messrs. CHARLESWORTH & CO., Haywards Heath.—One of the most beautiful of the genus, this variety being far superior to any other. The plant bore four umbels of handsome cream-white flowers profusely spotted with deep rose, the dorsal sepal being furnished with a peculiar bristle-like continuation.

AWARD OF MERIT.

Laelio-Cattleya Jason (L.-C. *Mossangeana* × *C. Dowiana aurea*), from Colonel G. L. HOLFORD, C.I.E., C.V.O. (gr. Mr. H. G. Alexander).—In form this beautiful hybrid is nearest to *C. Dowiana aurea*. Sepals and petals broad, primrose yellow, lip deep violet-purple, with fine gold lines at the base.

Vanda cœrulea Dreadnought, from Messrs. SANDER & SONS, St. Albans.—One of the finest forms yet shown, the flowers being very large and beautifully netted and tinged with bright blue. Lip, violet. The plant is of the same short-leaved type as the other fine varieties of Messrs. SANDER'S importation.

Laelio-Cattleya Invincible (*Dominiana* × *Blechnensis*), from Messrs. SANDER & SONS.—A grand hybrid, with large flowers, the sepals and petals bright purplish-rose; the large labellum of a deep ruby-claret colour.

Laelio-Cattleya Black Prince (*Blechnensis* × *C. Hardyana*), from H. S. GOODSON, Esq. (gr. Mr. G. E. Day).—Sepals and petals bright rose-purple. Lip, glowing claret-crimson. A very handsome hybrid.

CULTURAL COMMENDATION.

To Mr. G. E. Day (gr. to H. S. GOODSON, Esq.), for a very fine plant of the clear-white *Cattleya Gaskelliana* alba Goodsoniae, with 11 flowers.

Fruit and Vegetable Committee.

Present: G. Bunyard, Esq. (in the Chair), and Messrs. A. H. Pearson, J. Cheal, W. Bates, G. Hobday, H. Parr, W. Fyfe, A. R. Allan, J. Davis, J. Vert, W. Poupard, A. Dean, O. Thomas, and J. Jaques.

Exhibits before this Committee were not numerous. There were several novelties submitted for award, including a Melon, a variety of Blackberry, and a Tomato named Young's Mercury, but none was considered worthy. The Committee, however, recommended four awards to varieties of Dwarf Beans after trial at Wisley. The trial consisted of about 200 stocks, many being duplicates. The varieties to which Awards of Merit were made are as follow:—

AWARDS OF MERIT.

DWARF FRENCH BEANS.—*Cholet*, shown by Messrs. VILMORIN & SONS, Paris; *Everyday*, shown by Messrs. VEITCH & SONS, Chelsea; *Excelsior*, shown by Messrs. BARR & SONS, Surbiton; *The Belfast*, shown by Messrs. ALEX. DICKSON & SONS, LTD., Belfast.

COMPETITIVE CLASSES.

There were competitive classes on this occasion for Potatoes and Beans. In a class for six dishes of early varieties of Potato there were three competitors. The 1st prize was won by A. G. GENTLE, Esq., Little Gaddesden, Berkhamsted, Herts., who showed Duke of York, Sir John Llewelyn, Ringleader, The Canon, Advancer, and May Queen; 2nd, Countess COWPER, Panshanger, Hertford (gr. Mr. R. Stanard).

In the competition for three varieties of Potatoes, the 1st prize was awarded to CHARLES COOMBE, Esq., Cobham Park, Cobham, Surrey (gr. Mr. A. Tidy).

In the class for three dishes of Dwarf Beans, Countess COWPER was awarded the 1st prize, the varieties being Victoria, Negro, and Canadian Wonder; 2nd, Rev. L. C. CHALMERS-HUNT, Wilham Rectory, Hitchin, Herts.

The Rev. CHALMERS-HUNT was awarded the 1st prize for three dishes of climbing Beans, having Best of All, Prizewinner and Scarlet Emperor.

NATIONAL SWEET PEA.

We are informed by the secretary of this Society, Mr. C. H. Curtis, that the following awards have been made by the Floral Committee, after two visits to the trials of 350 stocks and varieties at Reading University College Gardens:—

FIRST-CLASS CERTIFICATE.—To Clara Curtis (Row No. 186), from Mr. W. J. UNWIN, Histon, Cambs.

AWARD OF MERIT.—To Charles Foster (Row No. 7), from Mr. ROBT. BOLTON, Carnforth; to Edrom Beauty (Row No. 350), from Mr. A. MALCOLM, Duns, Berwick; to Mrs. W. J. Unwin (Row No. 289), from Mr. W. J. UNWIN, Histon; to Dazzler (Row No. 334), from Mr. C. W. BREADMORE, Winchester; and to Sunproof Crimson (Row No. 338), from Messrs. DOBBIE & CO., Rothesay.

HIGHLY COMMENDED.—Mrs. Watson (Row No. 86), from Mr. ROBT. BOLTON, Carnforth.

COMMENDATION AS A MARKET VARIETY.—Mercia (Row No. 136), from Messrs. E. STARK & SON, Great Ryburgh; and to Colleen (Row No. 305), from Mr. WM. DEAL, Brooklands, Kelvedon.

BRITISH GARDENERS' ASSOCIATION (LONDON BRANCH).

AUGUST 14.—On this date the members visited Messrs. J. Veitch & Sons' nursery at Coombe Wood to inspect the collection of hardy shrubs and trees. Mr. Harrow conducted the party through the nursery, and described some of the more interesting plants.

SHROPSHIRE HORTICULTURAL

Exhibition at Shrewsbury, August 18 and 19.

THE 35th annual show of the Shropshire Horticultural Society took place on Wednesday and Thursday last in the Quarry Grounds, Shrewsbury. It is, perhaps, sufficient to say that, from the horticultural point of view, the event was equal to previous exhibitions in the old Salop town. Indeed, it was so nearly alike to recent shows that in this very circumstance certain of the critics profess to see some danger to the future prosperity of the Society. The Society may be said to be in its middle-age period. It has grown from the most modest beginning to be the greatest provincial exhibition of its kind in Britain. This unexampled prosperity has been obtained mainly by excellent management on the part of the honorary secretaries, Messrs. Admitt and Naunton, and the committee. Thus the basis of the present position the Society holds was formed many years ago. The chief contributory causes were the foresight and enterprise that led to the adding from time to time of certain features that made the annual exhibition of novel and increasing interest. The decorated collections of fruit, the decorated fruit tables and the Champion Grape class are only a few instances. But there has come a time when it is a more difficult matter to obtain novel competitions. However, those who visit Shrewsbury every year are hoping that it may still be found possible to continue the forward policy that has always characterised the Society's history.

On the most recent occasion there were certain regulations introduced for the first time. That respecting the exhibition of seedsmen's cards appeared to meet with general approval, it being recognised that the former practice was capable of abuse. In another direction there was considerable criticism of the regulation limiting the number of awards to honorary exhibits. A definite number of silver cups, gold and other medals being offered in this section, the honorary exhibits were in some measure made to appear competitive. More than this, the medals would not nearly go round, consequently many honorary exhibitors were denied any award save a Certificate of Appreciation. It rests with the Society to reconsider this matter, and, if it be found there is a real grievance, seek some means of removing it, because it is obvious the show gains much in attractiveness by the presence of nurserymen's exhibits.

Turning to the competitive classes, it appeared to us that Grapes generally were scarcely so good as usual, but that the variety Madresfield Court was an exception. The groups of miscellaneous plants were of average merit, but contained no new features. Dahlias and other late summer flowers were shown well, but Roses were poor. Sweet Peas, on the contrary, were good, and their numbers extraordinary. Vegetables were beyond praise, it being unlikely better samples will ever be shown.

The weather on the opening day was showery in the morning, but it improved later.

DECORATED FRUIT TABLES.

In this class the collections consisted of 30 dishes of ripe fruit in not fewer than 10 distinct kinds. Each exhibit was staged on a separate table measuring 12 feet by 4 feet 6 inches. The varieties of fruit to form each separate dish or other receptacle was left to the exhibitor's discretion, but not more than 14 bunches of Grapes were allowed, in not fewer than four varieties (to include black and white), and not more than four varieties of any one kind of fruit, nor more than two dishes of any one variety. Only one variety might be shown on a single dish. Each exhibit was judged on the quality of the fruit and as a decorative display. The 1st prize consists of a champion cup, valued at 25 guineas, £20 in cash, and the Society's large gold medal. The cup, to become the property of any competitor, must be won three times (not necessarily in succession). Last year the cup was won by the Duke of Westminster (gr. Mr. N. F. Barnes). This year there were five exhibits, and the average quality of the produce contained in them was very high. The class has been in existence

for many years at Shrewsbury, and the general effect from year to year may be said to vary but little. Nevertheless, the interest of the visitors in the "decorated fruit tables" seems to be maintained. The 1st prize was awarded to the Earl of HARRINGTON, Elvaston Castle, Derby (gr. Mr. J. H. Goodacre). This exhibit had an imposing and agreeable appearance, for not only were the fruits of unusually good quality, but the decorations were carried out in a bold and excellent fashion. Three large trumpet glasses contained magnificent bouquets of Lalum speciosum rubrum, with a few sprays of Francoa intermixed. Smaller glasses contained Roses and Odontoglossums. The fruits included first-rate specimens of most of the Muscat varieties of Grape and Gros Maroc. Peasgood's Nonesuch Apples were extraordinary in size and general appearance, Cox's Orange Pippin and Ribston Pippin being scarcely less remarkable. Souvenir du Congrès Pear was grand, so were several varieties of Peach and Nectarine, Golden Gage and other Plums, and there were excellent Apricots, Figs, Cherries, Melons, &c. A large seedling Melon with bright yellow exterior added much to the attractiveness of the exhibit. The 2nd prize was awarded to the Duke of PORTLAND, Welbeck Abbey, Notts (gr. Mr. J. Gibson). The pointing in this class was not exhibited to the public, contrary to previous practice, but we should suppose that the difference between the two first exhibits was not very great. The Duke of PORTLAND's exhibit contained Apples and Pears of capital quality, Gascoyne's Scarlet Seedling, Peasgood's Nonesuch and Cox's Orange Pippin Apples being excellent. The colour of Gascoyne's Scarlet Seedling was equal to the best exhibition standards. Peaches and Nectarines, Figs, Melons, Grapes, Plums and Apricots left little to be desired. Marguerite Marillat Pears were very large. The decorations, too, were light, but effective, being mainly composed of Odontoglossums and Oncidiums. The 3rd prize was awarded to the Duke of WESTMINSTER, whose exhibit may be described as above the average for such a prize; the 4th prize to G. FARQUHARSON, Esq.; and the 5th to J. DRAKES, Esq., Market Rasen.

COLLECTIONS OF FRUIT.

The largest class for a collection of fruit was one for 12 dishes in 12 distinct varieties, not fewer than nine kinds, and not more than two varieties of a kind. Black and White Grapes were considered distinct kinds of fruit. It was not permissible to include a Pineapple. Each collection was decorated with flowers, &c., but the decorations constituted a further and distinct competition, for which additional prizes were awarded. The 1st prize for the fruit was £10, the 2nd prize £6, and there were two others.

Among four competitors the most successful was E. BEWLEY, Esq., Dublin (gr. Mr. T. Cave), who had a collection of extreme merit, if some of the Grapes are excepted (see fig. 55.) The Grapes were Muscat of Alexandria (berries exhibiting much "rust"), Black Hamburg, and Madresfield Court. This last variety was shown in best condition. The other dishes included the following fruits:—Peach Dagmar, Nectarines Lord Napier and Pineapple, Apple Emperor Alexander, Pears Souvenir du Congrès and William's Bon Chrétien, Cherry May Duke, Plum Greengage, and Melon Duke of Edinburgh; 2nd, Mr. F. NEED (gr. Mr. J. Jones), whose best fruits were Marguerite Marillat Pear, Lady Sudeley and Emperor Alexander Apples; 3rd, the Exors. of Lady ASHBURTON, Romney (gr. Mr. G. Hall); 4th, H. ST. MARK, Esq., Newton Abbot (gr. Mr. G. Richardson). The prizes for the decorations were awarded as follows:—1st, Mr. F. NEED; 2nd, Lady ASHBURTON; 3rd, E. BEWLEY.

Collection of nine dishes.—This collection was to include not fewer than five kinds and not more than two varieties of a kind, including two bunches of Black and two bunches of White Grapes. (Open to growers in county of Salop only.) The 1st prize was

awarded to Capt. HEYWOOD-LONSDALE, Shavington (gr. Mr. J. Mills), for a creditable exhibit, excepting that it was wanting in one important detail, namely, the naming of the different fruits. At such a show such an omission is to be regretted, and the Committee would be well advised if they show their disapprobation—visitors invariably want the name of a fruit, or, for the matter of that, a flower also, if it excites their admiration; 2nd, Mrs. SWANN, Halston Hall. For the floral decorations of the groups the prizes were reversed, and, under the circumstances we have described, it would not have been surprising if the principal prizes had been awarded in the same order.

In a competition for the best collection of six dishes of hardy fruits (excepting Apricots, Peaches, Nectarines, and Plums) engaged in by Salop growers only, the prizes were awarded in the following order:—1st, Captain HEYWOOD-LONSDALE, Shavington (gr. Mr. J. Mills); 2nd, N. ROBINSON, Esq., Ellesmere (gr. Mr. W. Roberts); 3rd, Capt. T. A. M. DICKIN, Loppington (gr. Mr. T. Gilbert).

GRAPES.

Twelve bunches.—The most important class for Grapes called for exhibits of 12 bunches in four or more distinct varieties, but not more than four bunches of any one variety. Each bunch is judged on its individual merits and points awarded. A maximum of 11 points may be given to Muscat of Alexandria, 10 points to all other Muscat varieties (black or white and Black Hamburg), and 9 points to all other Grapes. The bunches were staged on boards, and each exhibit occupied a space of 8 feet by 4 feet 6 inches in two tiers 2 feet 3 inches wide. Superior cultivation and finish were to be regarded as of greatest importance. Each collection was decorated, mostly with cut flowers and suitable greenery, shown in receptacles of a kind chosen by the exhibitor. The 1st prize for the best exhibit of Grapes was £20, the 2nd £16, and the 3rd £12. There were three other prizes of proportional value. The 1st prize was awarded to the Earl of HARRINGTON, who gained 114½ points out of a possible number of 130 (see illustration in fig. 56). These points were awarded as follow:—

	Possible No.	Points of Points. Awarded.
Black Hamburg ...	10	9½
Muscat of Alexandria...	11	8
Muscat Hamburg ...	11	10
Madresfield Court ...	11	10
Muscat of Alexandria...	11	8½
Black Hamburg ...	10	9
Madresfield Court ...	11	10½
Muscat Hamburg ...	11	10½
Muscat of Alexandria...	11	9
Muscat of Alexandria...	11	8½
Muscat Hamburg ...	11	10½
Madresfield Court ...	11	10½
Total ...	130	114½

The varieties Muscat Hamburg and Madresfield Court were the best in this exhibit, and in respect to the Madresfield Court the point judging may be described as somewhat low—which is a good fault, if fault it is. The 2nd prize was won by J. DRAKES, Esq., Market Rasen (gr. Mr. W. Parker). His varieties were as follow, and the points are recorded:—

	Possible No.	Points of Points. Awarded.
Muscat of Alexandria...	11	10½
Madresfield Court ...	11	10½
Canon Hall Muscat ...	11	9½
Madresfield Court ...	11	9
Muscat of Alexandria...	11	8½
Madresfield Court ...	11	10½
Muscat of Alexandria...	11	8½
Gros Maroc ...	9	9
Canon Hall Muscat ...	11	9½
Gros Maroc ...	9	8½
Canon Hall Muscat ...	11	8½
Black Hamburg ...	10	9
Totals ...	127	111½

3rd, the Duke of WESTMINSTER (gr. Mr. N. F. Barnes). This exhibitor won 106 out of 124 points available for the varieties he selected for exhibition. His examples of Madresfield Court were the most meritorious in the exhibit, and the pointing in respect to these was rather on the low side. 4th, G. FARQUHARSON, Esq., Eastnor Castle (gr. Mr. J. Mullins), who was awarded 91 points. Again the Madresfield Court were good in comparison with the other varieties. 5th, G. A. GIBBS, Esq., M.P., Tyntesfield, Flax Bourton, Bristol (gr. Mr. J. Wilkinson), who was awarded 88½ points. 6th, H. ST. MAUR, Esq., Newton Abbot (gr. Mr. G. Richardson).

The prizes for decorations were awarded as follows: 1st, the Duke of WESTMINSTER, who employed pink Carnations, *Lilium speciosum* roseum, *Francoa ramosa*, and *Chironia exifera*. 2nd, the Earl of HARRINGTON, whose flowers were *Odontoglossum*, *Lilium*, *Roses*, &c. 3rd, G. FARQUHARSON, Esq.

Four bunches.—In this class there were two bunches of a black and two of a white variety. There were as many as nine exhibits, and therefore 36 bunches. The 1st prize was awarded to Lord HARLECH, Brogyntyn (gr. Mr. T. Lambert). His varieties were Muscat of Alexandria and Madresfield Court (very well finished), shapely and moderately heavy bunches. 2nd, H. ANDREWS, Esq., Winchcombe (gr. Mr. J. R.

Mr. A. H. Hall); the 2nd prize was won by the Earl of HARRINGTON; and the 3rd by E. BEWLEY, Esq., Dublin (gr. Mr. T. Cave).

Black Alicante.—We missed in this class the heavily-shouldered bunches sometimes seen of this Grape. The 1st prize specimens from G. FARQUHARSON, Esq., Eastnor Castle, Ledbury (gr. Mr. Mullins), were very short, thick bunches without shoulder development, but possessing large, well-coloured berries; 2nd, Col. FRANCE HAYHURST.

Any other Black Grape.—The 1st prize in this class was well deserved by two champion bunches of Gros Maroc shown by the Rev. T. M. BULKELEY-OWEN, West Felton (gr. Mr. J. Langley). These bunches were heavy, the berries large, and the development of "colour" excellent. The same variety from Mr. J. H. GOODACRE won the 2nd prize, and from Mr. F. NEED, Malvern (gr. Mr. T. Jones), the 3rd prize.

Muscat of Alexandria.—There were eight exhibits of a pair of Muscat bunches, and the quality generally was only a fair average. The best were from the Duke of WESTMINSTER, Eaton Hall, Chester (gr. Mr. N. F. Barnes); Mr. J. H. GOODACRE was 2nd; and H. ANDREWS, Esq., Winchcombe, 3rd. The best single bunch was shown by Lord HARLECH.

Any other White Grape.—Two first-rate

Melons.—In the class for white-fleshed Melons, the 1st prize was awarded to an unusually small fruit of Hero of Lockinge, shown by Mr. HARDING; the best scarlet-fleshed variety was Scarlet Seedling, shown by the Earl of DERBY; and the best green-fleshed fruit was an unnamed specimen from Lady DUCKWORTH-KING, Exeter (gr. Mr. S. J. Baker).

Apricots.—There were 10 exhibits of eight fruits of a variety of Apricot. An exhibit of "Large Early" from Mr. A. LANGSTER, Droitwich, was perfect in every respect.

Nectarines.—Of 12 exhibits in the class for eight fruits of Nectarine, the 1st prize was awarded to a dish of grand specimens of Pineapple, shown by the Exors. of Lady ASHBURTON, Romney (gr. Mr. Geo. Hall).

Peaches.—The best dish of Peaches among a collection of 16 exhibits was shown by G. FARQUHARSON, Esq., his variety being Bellegarde.

GROUPS OF PLANTS.

There were two classes of equal importance. These were for miscellaneous plants in or out of flower and for ornamental foliage plants respectively. The exhibitors in both cases were allowed a space of 250 square feet, and the prizes were awarded to the exhibits producing

THE SHREWSBURY SHOW.

FIG. 55.—FIRST PRIZE COLLECTION OF 12 DISHES OF FRUIT SHOWN BY E. BEWLEY, ESQ. (See p. 137.)

Tooley), who showed Alnwick Seedling and Muscat of Alexandria. 3rd, the Earl of DERBY, Prescott (gr. Mr. E. F. Hazleton), who had somewhat weak specimens of Muscat of Alexandria, and two good bunches of Alnwick Seedling.

Black Hamburgh.—There were 14 exhibits in the class for this early-ripening black Grape, and those selected for prizes were excellent specimens, which showed no signs of deterioration. 1st Mr. A. COATES, Glen Conway, who had very heavy bunches of perfectly finished berries, though one bunch was less shapely than desirable. 2nd, J. BRINTON, Esq., Stouport (gr. Mr. W. H. Wilson). 3rd, H. ST. MAUR, Esq., Newton Abbot (gr. Mr. G. Richardson). The best single bunch of this variety was shown by H. ST. MAUR, Esq.

Black Grapes of Muscat varieties.—The 1st prize in this class was won with two exquisite bunches of Madresfield Court. These were not particularly heavy, but they were very shapely and the berries perfect in form, development, and finish; 2nd, the Earl of HARRINGTON, who showed Muscat Hamburgh.

Madresfield Court.—This handsome Grape was best shown by Col. FRANCE HAYHURST (gr.

bunches of the variety Chasselas Napoleon were found for the 1st prize in this class; and the 2nd prize was obtained by Buckland Sweetwater from H. A. ATTENBOROUGH, Esq., Daventry (gr. Mr. A. Child); and the 3rd by Buckland Sweetwater from Lord TREVOR, Brynkynault.

LOCAL CLASSES.

In the classes reserved for exhibitors from the county of Salop, the best Black Hamburghs were shown by the Rev. T. M. BULKELEY-OWEN, the best Madresfield Court by Major A. H. O. LLOYD, Leaton Knolls (gr. Mr. H. G. Pritchard); and other 1st prizes were won by Lord HARLECH, Mrs. SWANN, and the Rev. R. A. NEVILL.

MISCELLANEOUS FRUITS.

Plums.—The best collection of 12 fruits of a red or purple Plum was one from the Marquis of NORTHAMPTON, Castle Ashby (gr. Mr. A. R. Searle). The best yellow Plums were Jefferson, shown by the Duke of PORTLAND (gr. Mr. J. Gibson), and the best "Gages" July Greengage, shown by Lady MARY HERBERT, Styehe (gr. Mr. J. Birch).

the best decorative effect. In each class six exhibitors competed.

In the class for flowering plants some admirable exhibits were presented, and the judges awarded the 1st prize to a magnificent group set up by Messrs. JAS. CYPHER & SONS, Cheltenham. A tall Kentia Palm dominated the background, and this was grouped about with *Lilium speciosum*, *Ixoras* and *Crocea angustifolia*. In the centre was elevated a tall plant of *Cyperus Papyrus*, and on either side of this were graceful plumes of *Humes elegans*. The corners had a *Cocos Palm* overhanging showy *Codiaeums*, from which arose spikes of *Francoa ramosa* and *Cattleyas*. The groundwork of the group was of elegant foliage plants, including *Anthurium argyrites*, *Alocasias*, *Dracaenas*, *Codiaeums*, &c. There were many finely-flowered plants of *Cattleyas* and *Laelio-Cattleyas*, with here and there a clump of *Lilium speciosum* as foils. In addition, long-branched sprays of *Oncidiums* served to add an appearance of lightness to the effect. Other Orchids were freely employed, the dwarfier subjects, such as *Odontoglossum* and *Cypripediums*, being disposed in the foreground. The front had a row of *Nertera depressa* and *Saxifraga sarmentosa* set in moss, with small

Codiaeums and Caladium argyrites at intervals. The 2nd prize was awarded to Sir GEORGE KENRICK, Edgbaston (gr. Mr. J. Macdonald). This also was a splendid group, but yellow-leaved Codiaeums were rather too plentifully employed. Mr. W. A. HOLMES, Chesterfield, with a rather heavier arrangement, but containing well-grown specimens of bright flowers and handsome foliage plants.

In the similar class for decorative foliage plants solely the 1st prize was made in favour of Sir GEO. KENRICK. In this group Codiaeums were the dominant feature, these not only being used as foils, but largely as a groundwork. The general effect, however, was very beautiful, and great skill was apparent in the method of staging. The back was built up with tall columnar Codiaeums, and a pair of elegant specimens of Acalypha Maccleana, these being grouped about with elegant-leaved Caladiums, Anthuriums, Abutilons and Codiaeums. In the centre was a tall plant of Aralia elegantissima. At either corner was a clump of Codiaeums with Caladiums, Nandina domestica, Abutilon Thomp-

SPECIMEN PLANTS.

There were four important classes in this section. In the one for 15 stove or greenhouse plants, including both flowering and ornamental-leaved species, there were three competitors. The 1st prize was won easily by Messrs. JAS. CYPHER & SON. Amongst the flowering plants, Statice profusa was remarkable for its large size and wealth of flowers. There were also good examples of S. intermedia, Phoenicoma prolifera Barnesii, Ixora Duffii, I. Williamsii, Rondeletia speciosa, Codiaeum Countess, and large Palms, which were arranged at the back. 2nd, Mr. WM. VAUSE, Leamington, whose best plants were Bougainvillea glabra, Ixora Duffii, and a greenhouse Erica. 3rd, Mr. W. R. MANNING, Dudley, with smaller plants.

There was a class for six stove and greenhouse plants, to include not fewer than four in bloom. It was contested by Messrs. JAS. CYPHER & SON and Mr. W. VAUSE, the former exhibitors winning the premier prize easily with Statice profusa, Ixora Duffii, I. Williamsii,

3rd, Mrs. SWANN, Halston Hall (gr. Mr. C. Roberts).

Two exhibits were staged in a class for a group of tuberous-rooted Begonias arranged for effect and occupying a space of 15 feet by 4 feet. The use of ornamental-leaved plants and Ferns was allowed. The better of the two groups was shown by Messrs. BLACKMORE & LANGDON, Twerton Hill Nursery, Bath; Messrs. T. S. WARE, LTD., Feltham, gaining the 2nd prize. The flowers in the 1st prize group, a portion of which is shown in fig. 57, were magnificent in every respect, and their tinting was charming. The plants were very large, and the blooms were thrown into greater relief by the use of Adiantum Ferns, which almost covered the Begonia foliage. Amongst the more noticeable varieties were those labelled Pink Pearl, King Alfonso (crimson), Lady Dorington (white with crimped petals), Mrs. J. Whalley (salmon-red), Winsome Partner (orange), Mrs. J. Blackmore (salmon), Empress Marie (white), Millicent (pink), G. Pike (crimson), Beatrice Rose (rose-pink), and Mrs. W. L. Ainslie (yel-

FIG. 56.—FIRST PRIZE COLLECTION OF 12 BUNCHES OF GRAPEs SHOWN BY THE EARL OF HARRINGTON. (See p. 137.)

sonii, Cineraria maritima, &c., grouped about them. 2nd, Messrs. JAS. CYPHER & SONS, with a very effective exhibit. These exhibitors also employed Codiaeums mainly, having well-coloured plants of this beautiful-leaved subject. A fine example of Cyperus Papyrus graced the centre, the pot being overhung with Selaginella. The exhibit contained, in addition to Begonias of the Rex type, Dracenas, Alocasias, Aralias, Ferns and many other species. 3rd, Mr. W. HOLMES, Chesterfield.

A special class was provided for Shropshire exhibitors only. This was for a group of miscellaneous plants in or out of bloom to occupy a space of 100 square feet. There was only one exhibitor, Mrs. SWANN, Halston House, Shrewsbury (gr. Mr. C. Roberts). The group was arranged in a semi circle near to the entrance of the tent.

Allamanda nobilis, Statice intermedia and Rondeletia speciosa, the Rondeletia being a fine specimen. Mr. VAUSE, who gained the 2nd prize, showed excellent plants of Allamanda nobilis and Ixora Williamsii.

In the class for 30 stove or greenhouse plants in pots, the receptacles not exceeding 10 inches in diameter, there was good competition amongst four exhibitors. Messrs. CYPHER & SON, however, had no difficulty in again securing the 1st prize with a choice set, of which the more noteworthy were Rondeletia speciosa major, Acalypha hispida, Ixora Duffii, I. coccinea, Allamanda Hendersonii, and Statice intermedia. 2nd, T. SUTTON TIMMS, Esq., Allerton, Liverpool (gr. Mr. B. Cromwell), who exhibited elegant plants of Alocasia Sanderiana, Anthurium Scherzerianum, fine specimens of Clerodendron falax, Ixora Williamsii, and Lapageria rosca-

low). Messrs. WARE showed smaller blooms, but they were fresh, and representative of the best shades of colours. The rich crimson flowers of the King Edward VII. variety were conspicuous, and equally beautiful were Miss Vance (buff orange), and Miss Laura Ashdown (very faint blush).

Begonias were shown by four growers in a class for six varieties of these plants, including three single and three double kinds. Much the finest specimens were exhibited by Messrs. BLACKMORE & LANGDON, Bath, the plants being very large. On one of the plants were counted 20 large blooms. 2nd, G. BURR, Esq., Shrewsbury (gr. Mr. A. Jones).

There were three exhibits of Caladiums in a class for six of these plants, the winner of the 1st prize being T. SUTTON TIMMS, Esq., Liverpool (gr. Mr. B. Cromwell). The varieties were

principally pale kinds, candidissima being very fine. We also noticed a good plant of *Baronne de Mamore* with reddish veining and green markings. 2nd, E. VAUGHTON, Esq., Handsworth (gr. Mr. C. Kelland).

The best Ferns were also shown by T. SUTTON TIMMIS, Esq. (gr. Mr. B. Cromwell), who had a magnificent specimen of *Goniophlebium subauriculatum*, the fronds being 9 to 10 feet in length. *Nephrolepis davallioides* and *N. exaltata todeaoides* were also finely shown by this exhibitor. 2nd, E. VAUGHTON, Esq. (gr. Mr. C. Kelland), who had two large tree Ferns at the back, his best plant being one of *Cibotium Schiedeii*.

Zonal Pelargoniums were well shown in a class for six double-flowered varieties, the best of three collections being exhibited by Mrs. R. TAYLOR, Abbey Foregate (gr. Mr. H. Clift). Not one of the plants was named. 2nd, Messrs. CLIFF & SONS, Abbey Foregate.

Mrs. TAYLOR also excelled in the similar class for single-flowered varieties, having a splendid collection of six varieties; 2nd, Messrs. CLIFF & SONS, with smaller plants.

The best Fuchsias were shown by Mr. J. TARRANT, Shrewsbury, who also excelled in the class for 12 *Gloxinias*.

There was a class for 12 plants suitable for table decoration. In almost every case the exhibits were largely of varieties of *Codiaeums*, but in the 1st prize group, shown by J. SUTTON TIMMIS, Esq. (gr. Mr. B. Cromwell), a *Dracæna*, *Pandanus* and *Cocos Palm* were included, in addition to some magnificent little *Codiaeums*. 2nd, T. HENSHAW, Esq., Roby, Liverpool (gr. Mr. T. George).

Several classes were open to Shropshire exhibitors only. One was for six stove and greenhouse plants, either flowering or ornamental-leaved kinds. In a good contest the 1st prize was secured by Lord HARLECH, Brogyntyn (gr. Mr. A. Jones). His best examples were *Clerodendron Balfouri* and *Eucharis grandiflora*. 2nd, Mr. FARRANT, Shrewsbury.

A collection of 12 miscellaneous plants in pots not exceeding 5 inches in diameter was best shown by Lord HARLECH (gr. Mr. A. Jones).

SWEET PEAS

The Society offered prizes for a collection of distinct varieties of Sweet Peas arranged in vases, and occupying a space of 4 feet by 3 feet 6 inches. There were 12 exhibitors, so that a keen contest resulted. The 1st prize was well won by P. YORKE, Esq., Erdig Park (gr. Mr. G. Aitken). Not one of his varieties was labelled, but there were many new kinds, in addition to older standard sorts; the 2nd prize was won by Dr. PHILLIPS, Malpas, with a splendid exhibit of notable varieties.

Prizes were offered by trade firms for exhibits of these flowers, and great competition resulted in every case.

Messrs. Baker's, Wolverhampton, offered prizes for three bunches, one each of the following kinds: Baker's Scarlet, Earl of Plymouth and Mrs. T. G. Baker. There were five contestants, and of these Mr. F. EDGE, Calcott, showed the best, and he was followed by Mr. T. JONES, Ruabon.

There was much greater competition in Mr. Henry Eckford's class for the best collection of 18 distinct varieties of Mr. Eckford's raising, the group to occupy a space of 6 feet by 3 feet 6 inches. It was unfortunate that one exhibitor transgressed the conditions. He showed a sport from Countess Spencer, and was thus disqualified, otherwise his name would undoubtedly have appeared amongst the chief prizewinners, for his flowers were equal to the best. The 1st prize was awarded to P. YORKE, Esq., Erdig Park, Wrexham, for excellent spikes of King Edward VII., Queen Victoria, Audrey Crier, Etta Dyke, Henry Eckford, Evelyn Hemus, Mid Blue, St. George, Minnie Christie, Mrs. M. A. Sinzer, Geo. Herbert, Bobby K., Helen Lewis, Othello, Asta Ohn, Elsie Herbert and Mrs. Routzahn. The 2nd prize was awarded to G. ROBERTSON, Esq., Wrexham (gr. Mr. E. Jones).

In Messrs. Webb's class for six bunches of Sweet Peas of distinct varieties there were 11 exhibitors. Mr. T. JONES, Ruabon, won the 1st prize with a collection of high merit, having

Helen Lewis, Prince of Asturias, Mrs. Henry Bell, Henry Eckford, Helen Pierce and Frank Dolby.

Mr. JONES also surpassed all others with his exhibit in Mr. Robert Bolton's class, having fine flowers of the varieties Zephyr, Elsie Herbert, Black Knight, Clara Curtis, John Ingman, and Asta Ohn. This class was contested by 17 growers.

OTHER CUT FLOWERS.

The best collection of Cactus or decorative Dahlias, or both, arranged on a table space having a frontage of 8 feet 6 inches, was shown by Messrs. KEYNES, WILLIAMS & Co., Salisbury. The exhibits of these Dahlias, by repeated practice on the part of those contributing them, are becoming more and more tasteful. No criticism was possible of Messrs. KEYNES, WILLIAMS & Co.'s 1st prize group, unless it were from the point of view that the rather liberal use of *Gypsophila* flowers tended to obscure the effect or individuality of the Dahlias, but this charac-

with berries and ornamental foliage, W. H. BANKS, Esq., Kingston (gr. Mr. G. Bamfield), won the 1st prize.

Some choice blooms were seen in the class for 24 blooms of show or fancy Dahlias, a keen competition between five growers resulting in Mr. J. SMELLIE, Busby, N.B., being placed 1st; the 2nd prize was awarded to Mr. WM. TRESEDER, Cardiff. In the smaller class for 12 varieties, Mr. T. JONES, Ruabon, had the best of four exhibits.

Gaillardias were best shown by F. BOUSKELL, Esq., Market Bosworth.

ROSES.—The best exhibit of 24 Roses of distinct varieties was put up by Mr. HUGH DICKSON, Belfast, but Messrs. A. DICKSON & SONS, who gained the 2nd prize, were not much inferior. These exhibitors reversed these positions in the class for 18 distinct varieties.

In a class for 18 blooms of Roses, open to amateur growers only, there were four exhibits. F. R. D. NUTTALL, Esq., Prescot (gr. J. W. Barker), won the 1st prize with a moderate lot,

THE SHREWSBURY SHOW.

FIG. 57.—PORTION OF FIRST PRIZE GROUP OF BEGONIAS EXHIBITED BY MESSRS. BLACKMORE AND LANGDON.

teristic was as much, or even more, observable in the 2nd prize group, from Mr. W. TRESEDER, Cardiff. It has to be remembered, too, that the Dahlias are very brilliant in their colouring, and they do not suffer greatly from the association of *Gypsophila*: indeed, the effect is improved, provided that its use is attended with discretion; 3rd, Mr. M. CAMPBELL, Nurseryman, Blantyre, Scotland.

Mr. H. PEERMAN, Nantwich, won the 1st prizes in the classes for 18 and 12 varieties of Cactus Dahlias respectively, being followed in the larger class by Mr. A. WADE, Bramley, Leeds.

Mr. SMELLIE also excelled in the class for 12 Cactus Dahlias. He showed Advance, Lucifer, Crepuscule, Ruby Greensted, Rainbow, Dreadnought, C. E. Wilkins, &c.; 2nd, Messrs. BOT-TOMLEY & BURTON, Elland.

In the class for 12 varieties shown in vases

including Fisher Holmes, Hugh Dickson, Joseph Hill, Caroline Testout, Jeannie Dickson, and Kilarney; 2nd, Mr. HINTON, Stafford. We noticed a fine bloom of A. K. Williams in this exhibit.

HARDY BORDER FLOWERS.—A first-rate class was one for a collection of hardy perennials (*Roses* excluded), arranged on a table space with a frontage of 10 feet 6 inches. The 1st prize was £10, the 2nd £7 10s., and the 3rd £5. The exhibits in this class formed a huge bank of colour in the fruit tent and faced the more dainty florists' arrangements of cut flowers. Messrs. GUNN & SONS, Olton, near Birmingham, won the 1st prize for an exhibit replete with the choicest varieties of hardy flowers. We were particularly impressed by a large bouquet of *Scabiosa caucasica perfecta*, which appeared unusually large and richly coloured in the individual flowers. The best *Phloxes*, *Liliums*,

Hemerocallis, Gaillardias, Papavers, and many other kinds were all represented in first-class specimens; 2nd, Messrs. ARTINDALE & SON, Nether Green, Sheffield (who obtained the 1st prize for 18 bunches); 3rd, Mr. J. GIBSON, Leeming Bar, Bedale.

Messrs. ARTINDALE & SON, Sheffield, secured the premier position for 18 bunches of hardy flowers, and they were followed by Mr. R. T. KENT, Llandaff. In the class for 12 bunches of hardy flowers F. BOUSKELL, Esq., Market Bosworth (gr. Mr. G. Hollis), was placed 1st, Mr. KENT again securing the 2nd prize. Twelve spikes of Gladioli were best shown by Mr. F. BUNN, Ledbury, and Mr. SMELLIE gained a similar award for 12 varieties of summer-flowering Chrysanthemums; 2nd, Mr. GEO. BOWNESS, Busby.

Some fine exhibits of annuals were seen in a class for 12 bunches of distinct kinds, and especially in the exhibit shown by R. T. KENT, Esq., Llandaff, to which the 1st prize was awarded. Sweet Sultan, Zinnias, Clarkia pulchella, Salpiglossis, Godetia, Celosia rubra, and Statice were shown best. Another excellent group was shown by the Rev. C. BROWN, Bedstone (gr. Mr. J. Lewis), his Salpiglossis and yellow Centaurea being very fine. The 2nd prize was well won by the Rev. E. BROWN. There were five other competitors.

CARNATIONS.

The best exhibit of Carnations and Picotees occupying a space of 6 feet by 4 feet was staged by Mr. C. H. HERBERT, Acock's Green, Birmingham; 2nd, Messrs. M. CAMPBELL & SON, High Blantyre; 3rd, Messrs. ARTINDALE & SON, Sheffield.

In a similar class, from which traders were excluded, E. ALCOCK, Esq., Blundellsands, Liverpool, showed best; whilst the 1st prize for a group of tree Carnations was won by Mr. C. F. WATERS, Balcombe.

Prizes were offered for 12 bunches of cut flowers of stove and greenhouse varieties, but not including Orchids. The 1st prize was easily secured by T. SUTTON TIMMIS, Esq. (gr. Mr. Cromwell), with Lapageria rosea and the white variety, Stephanotis, Gloriosa superba, Clerodendron fallax, Agapanthus umbellatus, &c.

DECORATIVE CLASSES.

BOUQUETS.

The best hand-basket of cut flowers was adjudged to be a basket of rather indifferent Roses shown by Mrs. ADA TOWNSEND, Worcester. We should certainly have awarded the prize to O. ROBINSON, Esq., Alderley Edge, who showed a beautiful arrangement, consisting of a very pretty pink and white Malmaison Carnation, with a few white Paneratium flowers placed low down amongst the greenery. A slight mistake was, however, made by this exhibitor in "decorating" the handle of the basket with lace and ribbon. Perhaps this mistake may explain the judges' award. Nevertheless, the Carnations were delightful. It should have been stated that Orchids were excluded from the class just described.

In a similar class, in which Orchids were permissible, the 1st prize was awarded to a very ambitious arrangement shown by O. ROBINSON, Esq., Alderley Edge (gr. Mr. J. Nixon); and for the 2nd prize Mr. W. J. GARNER, Altrincham and Hale, had an equally ambitious exhibit. Neither exhibit, however, was successful in presenting a proper colour scheme.

The best featherweight bouquet was shown by O. ROBINSON, Esq., and the best bouquet without qualification by Messrs. WOOD & EASTHAM, North Road, Preston. This latter consisted entirely of pink Carnations (probably Enchantress), with a few sprays of Asparagus, &c.

The 1st prize for a bride's bouquet was won by Mr. W. J. GARNER, Altrincham, for an arrangement of Odontoglossums and Cattleyas, as white as could be obtained with these flowers.

The biggest struggle in these classes, however, is that for the 1st prize in a class for one bride and two bridesmaids' bouquets. The coveted award was won by THE KING'S ACRE NURSERY CO., Hereford. This firm exhibited a bride's bouquet of Odontoglossums and Cattleyas (almost white), and the bridesmaids' bouquets were of pink Carnations and Lilies of the Valley.

Some comment was caused by the fact that this firm, not having engaged in numerous struggles of this exact nature previously, were able to excel such firms as Messrs. Perkins & Son, Coventry, and Messrs. Felton & Sons, Hanover Square. But these things are so much a matter of taste there is always room for new competitors.

The exhibits of decorated dinner tables were very numerous. A vase was offered as the 1st prize in a class open to ladies only, and this was won by Mrs. J. NIXON, Alderley Edge, with an arrangement composed mainly of Gloriosa superba; 2nd, Miss MARY ALLER, St. George's, who employed pink Roses and pink Carnations.

In another class for a table decoration, Sweet Peas only were allowed. A pleasing exhibit of orange and cream varieties, intermixed with grasses, Ferns, &c., in a silver epergne, staged by Miss JONES, Wem, was adjudged the best, Mrs. NIXON following with a pretty decoration formed of the Countess Spencer variety.

VEGETABLES.

There was less interest in the classes for vegetables this year, arising from the absence of the nurserymen's classes, for traders have in former

Runner Beans; the Earl of LATHOM, Ormskirky (gr. Mr. B. Ashton), was placed 3rd.

In another class, also for nine dishes, but in which less valuable prizes were offered, there were four entries. The 1st prize was awarded to H. T. TATHAM, Esq., Elstree (gr. Mr. Caiger), who had excellent pink Celery, good Leeks, Ailsa Craig Onions, Perfection Tomatos, Duke of Albany Peas, Punner Beans, Windsor Castle Potatos, Cauliflowers, and Carrots. The Misses HOWELL, Berriew (gr. Mr. E. Jones), was placed 2nd; and Sir F. G. HESKETH, Towcester (gr. Mr. Hallett), 3rd. In another class, also for nine dishes, but limited to growers in Salop only, the 1st prize was won by Lord TREVOR, Brynkynault.

SPECIAL COLLECTION CLASSES.—The prizes in this section were offered by Mr. E. MURRILL, Shrewsbury. The one for nine dishes brought three entries, the 1st prize falling to Mr. CAIGER, who staged a very good collection, Mr. T. SANDERSON, Whittington, being second. In the class for six dishes, limited to Salopian growers, Mr. SANDERSON was placed 1st.

SPECIAL SINGLE-DISH CLASSES.—Mr. Jackson, Hereford, offered prizes for five Cranston's Excelsior Onions. The 1st prize was taken by Lady DUCKWORTH-KING, Exeter (gr. Mr. Baker), whose bulbs were the finest in the show. Mr. W. R.

THE SHREWSBURY SHOW.

FIG. 58.—PORTION OF THE EXHIBIT OF VEGETABLES SHOWN BY THE HON. VICARY GIBBS.

years offered valuable cash prizes, whilst Messrs. Webb's classes were restricted to single dishes of specified varieties. The chief class for a collection of vegetables was the Society's for nine dishes, but there was no challenge prize. Thus the competition lacked the exciting interest which attached to the vegetable classes in the two preceding years. This section of the show owed much to the superb collection, not for competition, staged by the Hon VICARY GIBBS, Aldenham House, Elstree, Herts. (gr. Mr. E. Beckett).

The prizes in the Society's class for nine dishes were £10, £7, £4, and £2 respectively, but there were only three competitors. The 1st prize fell to Mr. J. HUNSON, of Leicester, who had good Cauliflowers, Leeks, Giant White Celery, Emperor Tomatos, Ailsa Craig Onions, Exhibition Runner Beans, Prizewinner Carrots, Stourbridge Marrow Peas, and Duke of York Potatos. The Duke of PORTLAND, Welbeck Abbey (gr. Mr. J. Gibson), was awarded the 2nd prize for superb Centenary Peas, fine Satisfaction Potatos, Prize-taker Leeks, fine pink Celery, Ailsa Craig Onions, Perfection Tomatos, Cauliflowers, Carrots, and

BAKER, Exeter, was placed 2nd. Messrs. Pritchard & Sons, Shrewsbury, offered prizes for six bulbs of their selected Champion Onion, the 1st prize being awarded to Mr. WESTON, Shawbury.

Messrs. Dickson & Robinson, Manchester, offered prizes in eight single-dish classes. In the class for two bunches of Moneymaker Tomato, 14 lots were staged. Mr. R. DAVIES, Bangor, was first with fine clusters.

In the class for one dish of Hercules Peas Mr. CAIGER was placed 1st. With one fruit of Manchester Melon, G. A. GIBBS, Esq., M.P., Bourton (gr. Mr. Wilkinson), was 1st. The best exhibit of Premier Onion came from the gardens of Captain HEYWOOD-LONSDALE, there being 12 lots staged. The classes for Matchless Scarlet model and Scarlet Perfection Carrots brought indifferent competition. Mr. B. ASHTON showed the best Leeks.

Messrs. Webb & Son, Wordsley, offered prizes in ten classes, beginning with Emperor Tomato. The Marquis of NORHAMPTON, Castle Ashby (gr. Mr. Searle), showed the best dish, and Mr. J. HUNSON the finest Stourbridge Marrow Peas. This exhibitor was also placed 1st in the class

for New Exhibition Runners. Mr. SEARLE was also placed 1st in the class for long Carrots and also for six short Carrots. Mr. HUDSON was to the fore with Selected Ailsa Craig Onion. Mr. ASHTON had the best Leeks, and Mr. SEARLE won the 1st prize in the class for Pink Perfection Celery. Mr. HUDSON was again placed 1st in the competition for Cauliflowers, and he showed the best brace of Cucumbers.

THE SOCIETY'S OTHER CLASSES.

The 1st prize for six dishes of Potatos was won by Mr. HALLETT, but his produce was in some cases wrongly named. Mr. HUDSON, who was placed 2nd, had excellent tubers of Satisfaction, Eclipse, Windsor Castle, Royal Kidney, and, strangely enough, both Duke of York and Midlothian Early; 3rd, Lady MARY HERBERT. Stythe Hall (gr. Mr. Birch). Mrs. HARDING, Huyton (gr. Mr. H. McFall), had the best dish of Tomatos out of 21 lots, and Col. GORDON-BENNETT (gr. Mr. Swann) the best brace of Cucumbers out of 12 couples. There were 26 dishes of Peas, Mr. ASHTON being 1st with Duke of Albany. Mr. HUDSON showed the best Dwarf French Beans, and Mr. A. J. KING, Stroud, the best Runner Beans out of 14 dishes, quite a wonderful sample. There were 19 exhibits of two Cauliflowers, the Misses HOWELL having the best. In the class for four stems of Celery, J. B. AKROYD, Esq. (gr. Mr. R. C. Townsen), was awarded the 1st prize, Captain HLYWOOD-LONSDALE had the finest Autumn-sown Onions, and Mr. SEARLE the best Carrots. There were 21 exhibits of Turnips, but no card was attached to the name of the 1st prize winner. The Spring Onions were all apparently raised under glass, Mr. S. J. BAKER having the best. There were 18 similar classes for the county of Salop only.

NON-COMPETITIVE EXHIBITS.

SILVER CUPS

were awarded to the four exhibits following:

Messrs. JONES & SON, Shrewsbury, arranged an imposing display of Sweet Peas immediately against the entrance to the large fruit marquee. Tall trumpet glasses were placed on the central stage, and around it were pillars which were also clad with Pea flowers, from which chains as festoons were decorated.

From THE KING'S ACRE NURSERY COMPANY, Hereford, came a first-rate group of pot fruit trees, including vines, Plums, Figs, Pears, and Apples. Some of these trees were cropped very heavily, but perhaps the most notable feature of the group consisted in an espalier tree of Sea Eagle Peach bearing 100 fruits (see fig. 59). The same firm exhibited a group of hardy flowers, including many varieties of perennial Phlox.

Messrs. ISAAC HOUSE & SON, Coombe Nurseries, Westbury-on-Trym, showed an extensive exhibit of hardy flowers. The two points of interest in this display were (1) a fine group of perennial Phloxes, and (2) the effect produced by numerous flowers of deep blue Delphinium. Messrs. HOUSE & SON also showed a few novelties in Sweet Peas.

In one of the recesses in the fruit tent, Messrs. HOBBIES, LTD., Dereham, Norfolk, arranged an exhibit of pot Roses. It almost reminded us of the best exhibits of the type to be seen at the Holland Park Shows! There were standard, pillar, and other forms of training well represented, the variety Lady Godiva appearing to good advantage as a weeping standard. Minnehaha was utilised to clothe one of the pillars supporting the tent.

GOLD MEDALS

were awarded to six exhibits as follows:

Messrs. DOBBIE & Co., Rothesay, made a grand display of Dahlias, which, as usual in recent years, were mostly represented in their Cactus form. Such varieties as the yellow Harold Peerman, the brilliant red Hilda Shoesmith, and C. E. Wilkins were grand. At the same time, the new Paony-flowered type was shown in a number of vases. One very showy variety was Geisha, of brilliant orange and yellow shades. There were Show and Pompon Dahlias, Sweet Peas, Pansies and Violas, making together a very fine exhibit.

Messrs. W. CUTBUSH & SON, Highgate, London, N., occupied their usual site in the fruit tent with a characteristic display of Carnations. There were many selected varieties in the group, but amongst the most interesting were two "Malmaison" varieties obtained by crossing this type with the perpetual-flowering or "tree" section. The result is said to give a perpetual-flowering "Malmaison" which may be had in blooms perfectly easily at Michaelmas. These two varieties, however, have partially lost a very agreeable quality, namely, perfume, which will probably be restored in future novelties.

Mr. ROBERT BOLTON, Warton, Carnforth, showed a group of Sweet Peas of great merit, having choice flowers of most of the newer and better kinds. A central arch with a basket of an orange-coloured variety on the summit added a pretty feature.

Messrs. SUTTON & SONS, Reading, had a large table space richly decorated with the numerous specialities of the firm. There were tempting-looking fruit of many varieties of Melon, also straight, faultless Cucumbers, fine Peas, Potatos, Tomatos, Marrows, Beans, &c. Interspersed with the food products were small groups of Legonia (tuberous and fibrous-rooted

varieties), Gloxinias, cut flowers of Sweet Peas, Carnations, Godetias, Liliums, Anemone, Asters, Marguerites, Stocks, and other kinds. The flowers were arranged in arches, and in various ways to produce the best effect.

Messrs. JAMES VEITCH & SONS, LTD., King's Road, Chelsea, made an imposing exhibit with fruit trees in pots. The group was arranged in one of the circular bays of the tent containing the groups of plants in the competitive classes. It embraced Peaches, Pears, Plums, Figs, Gooseberries, and Nectarines, all admirably shown, the plants in every instance being well cropped. A magnificent example of Thomas Rivers Peach dominated the centre, and another almost as large and equally well-fruited was of the Belle d'Espagne variety. Some smaller trees of Peach Peregrine were also noteworthy. The Fig trees were abundantly cropped, standard trees being remarkably fine. The best of the Plums were Jefferson, Rivers' Late Orange, and Reine Claude du Comte Hotham. The Gooseberries were shown as single, double, and treble cordons, the fruits being produced as thickly as the foliage.

By far the finest, as well as the most perfect collection of vegetables, was that staged by Mr. E. BECKETT (see fig. 58). No such collection, showing such superb quality, has ever previously been staged at this exhibition. It comprised 100 dishes and occupied a length of some 40 feet run of tabling. This had a high background on which were fixed many pyramids or groups of vegetables, and the table, 2 feet wide, was also entirely filled. In the group were white and red Celeries, various Cauliflowers, grand

Mr. EDWIN BURRELL, Shrewsbury, showed a collection of Rose blooms, but the flowers were smaller than usual and gave unmistakable evidence of the unfavourable character of the season.

Messrs. KELWAY & SON, Langport, Somerset, exhibited a large group of their beautiful varieties of Gladioli.

Messrs. CLIFRAN & SONS, Altrincham, had a huge collection covering a table and high background some 50 feet long, which included Celeries, Cabbages, Tomatos, Marrows, Leeks, Potatos, Beets, Carrots, Onions, Peas, Gourds, Long Pod, Runner, and Dwarf Beans, Turnips, and many other kinds in great profusion.

CERTIFICATES OF MERIT.

Messrs. BLACKMORE & LANGDON, Twerton Hill Nursery, Bath, showed tuberous-rooted Begonias, having double, single, and frilled varieties. The plants were excellent specimens in the richest shades of red, crimson, yellow, salmon, &c.

Messrs. ALEX. DICKSON & SONS, Newtownards, Ireland, staged an exhibit of Roses. The varieties were representative of most of the sections of this flower, but especially fine were Tea, Hybrid Tea, and Hybrid Perpetual varieties.

A large exhibit of Roses was presented by Messrs. W. & J. BROWN, Peterborough, and they also showed hardy flowers and a batch of Clematis of the large-flowered varieties.

Messrs. FULTON & SONS, Hanover Square, London, showed floral devices representing fine examples of this branch of the florists' art.

THE SHREWSBURY SHOW.

FIG. 59.—TREE OF SEA EAGLE PEACH EXHIBITED BY THE KING'S ACRE NURSERY COMPANY.

Leeks, Ailsa Craig and Record Onions, numerous dishes of Tomatos, many fine samples of Potatos, white and red Cabbages, Lettuces in great variety, white and yellow Turnips, Scarlet Perfection Carrots, dark red, long, and globe Beets, many very fine Peas, Cucumbers, Dwarf, Kidney, and Runner Beans, Parsnips, Radishes, Salads, and many other sorts.

SILVER MEDALS

were awarded to six exhibits:

Messrs. JOHN PEED & SONS, West Norwood, London, S.E., staged a semi-circular exhibit of Caladiums, having large, brightly-coloured specimens in variety. A magnificent plant of the green and red variety named John Peed occupied a conspicuous position. C. E. Dahl, rose, white and green, and Mme. J. R. Box were also well shown.

Messrs. E. WEBB & SONS, Wordsley, Stourbridge, set up a circular stand of fruit and flowers, with arches overhead furnished with Sweet Peas and entwined with Smilax. At the base were fine examples of vegetables, including Beans, Cucumbers, Potatos, Beet, Tomatos, Cauliflowers, &c., interspersed with Lilies, Hydrangeas, Spiraeas, Carnations, and Sweet Peas. The exhibit produced a highly decorative effect.

Messrs. BAKERS, Wolverhampton, staged a half-circular exhibit of hardy flowers, the central portion embracing a water-garden, in which Nymphaeas, Sagittaria japonica, Senecio clivorum, Peltandra virginica, and Rushes gave a realistic effect. At the back were Phloxes, Bamboos, Typha of species, Spiraeas, &c. The wings at either end were composed principally of border Phloxes interspersed with Lilies, Heucheras, Monarda, &c. Messrs. BAKERS also exhibited a group of Gladioli.

Mr. ALBERT MYERS, Sutton Lane Nurseries, Shrewsbury, showed a group of Zonal Pelargoniums in pots, and adjoining this were some artistic arrangements of cut flowers from the same type of Pelargonium. The cut flowers arranged in several methods with Gypsophila and sprays of Francoa ramosa were distinctly pretty.

Mr. HENRY ECKFORD, Wem, Shropshire, showed about 50 of the best varieties of Sweet Peas, including Nancy Perkins, which may be described as a "Spencer" form of Henry Eckford.

Messrs. ROBERT SYDENHAM, LTD., Tenby Street, Birmingham, showed a charming exhibit of Sweet Peas, arranged most tastefully in silver stands. The blooms were excellent, being large and bright in colour. They represented the best of the varieties in commerce.

Mr. THOS. W. DARLINGTON, Warton, Carnforth, staged a very fine exhibit of Sweet Peas, a series of arches decorated with these flowers and hung with baskets of the same being very pretty.

Messrs. JARMAN & Co., Chard, had a large exhibit of Sweet Peas and other flowers, in which numerous choice varieties of Centaurea were distinctly attractive. The same firm exhibited a collection of vegetables.

Messrs. WEBB & BRAND, Saffron Walden, showed Hollyhocks, having a charming selection of these flowers, the cultivation of which they make a speciality.

Messrs. DICKSONS, Chester, were amongst the best exhibitors of hardy flowers. They included two features of predominant interest. One of these was a group of the richly-marked flowers of Lillium auratum rubro vittatum, and another a number of flowers of Romneya Coulteri.

Messrs. SEAGRAVE & Co., Gleadless, near Sheffield, arranged with great taste collections of Violas and

MARKETS.

COVENT GARDEN, August 18.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

Cut Flowers, &c.: Average Wholesale Prices.

Table listing various cut flowers and their prices, including Asters, Carnations, Gladioli, and others.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing various cut foliage and their prices, including Adiantum, Agrostis, and others.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing various plants in pots and their prices, including Ampelopsis, Arabis, and others.

Fruit: Average Wholesale Prices.

Table listing various fruits and their prices, including Apples, Grapes, Lemons, and others.

Vegetables: Average Wholesale Prices.

Table listing various vegetables and their prices, including Artichokes, Beans, Cabbages, and others.

REMARKS.—English Plums are arriving in slightly increased quantities but not nearly up to the average of past years, and it is feared that it will only be a moderate season for this popular fruit. The supplies of home-grown Apples are also shorter than usual. Good samples of Ecklinville Seedling and Lord Somers sell freely. There is no improvement in the Grape trade, and Tomatoes are a little easier. Lisbon Grapes are being received in very good condition and are selling freely. Lemons continue to be in good demand, and prices are certain to advance. E. H. K., Covent Garden, Wednesday, August 18, 1909.

Potatoes.

Table listing various potato varieties and their prices, including Bedfords, Lincolns, and others.

REMARKS.—Trade is still very bad. Supplies are not quite so heavy, but many diseased tubers are still on the market, left from last week. Edward J. Newborn, Covent Garden and St. Pancras, August 18, 1909.

COVENT GARDEN FLOWER MARKET.

Many salesmen are away on their holiday, and several stands are unoccupied, whilst the growers are busy preparing for their winter and spring crops. After the experience of the past season it is difficult to suggest what may be in demand. As it is now time to commence preparing Zonal Pelargoniums, it may be suggested that Paul's is well taking the lead in the market as a scarlet variety, and is sold better than any other. West Brighton has a good soil well, whilst Savoy still finds favour as a good salmon-colored kind. Mrs. K. Campbell is one of the best, but the variety named after Lady Chesterton is also asked for. Of the pink kinds Mrs. Brown Potter and Mrs.

early-flowering border Chrysanthemums. The Chrysanthemums particularly were very attractive, arranged lightly as they were with sprays of Gypsophila in neat receptacles. There were also specimens of fancy Pansies (these on boards with paper collars) and show Dahlias.

Messrs. WILLIAM CONWAY & SONS, Halifax, showed a display of hardy flowers in mixed sorts.

JOHN FORBES, LTD., HAWICK, set up a large exhibit of border Phloxes, Antirrhinums, Pentstemons, Delphiniums, and Montbretias, with vases of Zonal Pelargoniums and Violas along the front. A considerable space was devoted to varieties of border Pinks, and a prominent position was afforded a stand filled with a crimson Dianthus labelled Napoleon III. The Pentstemons were a remarkably fine strain.

Messrs. GUNN & SONS, Olton, Warwickshire, showed border plants in variety. A feature was varieties of Phlox decussata; in addition we noticed fine bunches of Lilium auratum, L. speciosum, Aconitums, Helianthemum pumilum, Spiraeas, Lythrum, Veronicas, &c.

A group of Disa grandiflora and an exhibit of Carnations were staged by Mr. WM. ANGUS, Penicuik.

Messrs. HARKNESS & SON, Hitchin, showed improved varieties of Gaillardias, also a few other garden flowers. The Gaillardias were remarkably fine.

Mr. TOM B. DOBBS, Wolverhampton, showed rustic arches and pillars for Roses, also boxes, tables, vases, seats, &c., in rustic woodwork. The exhibit was enhanced with a few flowering plants, including blue-flowered Hydrangeas. This exhibit was arranged in the open.

Messrs. DICKSON & ROBINSON, Manchester, had a good collection of vegetables, their Money-maker Tomato and Premier Onions forming fine features. Associated with a floral trophy in the plant tent,

OTHER NON-COMPETITIVE EXHIBITS were those following:—

Messrs. PRITCHARD & SONS, Shrewsbury, made an exhibit of greenhouse flowering plants, with a border of decorative Ferns and small Codiadums at intervals. At the back were well-flowered plants of Hydrangea paniculata, and another feature was a row of the rose-coloured Verbena named after Miss Willmott.

Mr. H. N. ELLISON, West Bromwich, showed Ferns in variety. The plumose varieties of Nephrolepis exaltata were represented by well-grown specimens, and there were choice Gymnogrammas, Adiantums, Lastraeas, Pterises, Aspleniums, &c.

Messrs. HEWITT & CO., LTD., Solihull, also showed border flowers in variety, such kinds as Phloxes, Gaillardias, Chrysanthemum maximum, Gladioli, Centaureas, Campanulas, Pentstemons, Scabiosa caucasica, and Liliums being well represented. In addition to the hardy flowers, this firm arranged a small exhibit of Carnations and Roses in a groundwork of Adiantum Ferns.

Messrs. M. CAMPBELL & SON, High Blantyre, N.B., showed Dahlias, Calceolarias, Carnations, and Pansies.

Mr. W. L. PATTISON, Shrewsbury, showed varieties of Violas.

Mr. W. DEAL, Kelvedon, showed a small exhibit of Sweet Peas, which, although not large, was of good quality.

In the great fruit tent, Mr. HUGH ALDERSEY, Aldersey Hall, Chester, showed a small collection of Sweet Pea novelties, several of these being unnamed seedlings. The varieties named Tortoiseshell, with salmon-red coloured flower, and Romani Rauni, pink, were very promising.

An exhibit of Cactaceae plants was made by Miss S. S. THOMPSON, Handsworth.

Mr. JOHN SMELLIE, Pansy Gardens, Busby, showed Dahlias, early Chrysanthemums, Pansies, and Violas.

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending August 18.

The hottest day for nearly three years.—The recent spell of very warm weather which had lasted for nearly a fortnight came to an end on the 16th. During that period the temperature in the thermometer screen on four days exceeded 80°, and on the warmest of those days, which occurred during the past week, reached 85°—the highest reading in the shade recorded here since September 3, 1906, or for nearly three years. Owing to the cooler conditions of the last few days the ground temperatures are not now as high as they were in the early part of the week, but are still 2° warmer at 2 feet deep, and 1° warmer at 1 foot deep, than is seasonable. After a fortnight of hot and dry weather, a welcome fall of rain, amounting to nearly an inch, took place on the 17th. This heavy fall restarted the bare soil percolation gauge, through which no measurable quantity of rain-water had passed for 12 days, but has not as yet affected the gauge on which short grass is growing. The sun shone on an average for 3½ hours a day, or for more than two hours a day in excess of the usual duration in August. Calms and light airs have again prevailed during the week. The mean amount of moisture in the air at three o'clock in the afternoon was about seasonable. E. M., Berkhamsted, August 18, 1909.

GARDENING APPOINTMENTS.

[Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.]

MR. R. THATCHER, late of Thorpe Lubham Gardens, as Gardener to MARK FIFTH, Esq., Wiston Hall, Leicester, in succession to Mr. F. J. CLARK.

French are amongst the best. Constance, though its flowers are smaller, is appreciated, as it is very free in blooming. Of white varieties, Snowdrop and Albion find a ready sale. Last season good white Zonal Pelargoniums were rather scarce, but this may not be so next spring. White Zonal Pelargoniums are more in favour than they were a few years ago.

Of semi-doubles, King of Denmark has been rather over-planted during the past season, yet I find it still remains the most popular "salmon." Some buyers, however, prefer Mrs. Lawrence. F. V. Raspail needs no comment except to say that it is more extensively used for bedding than formerly. Hermone is the favourite white kind, and Ville de Poitiers is a good light scarlet variety. For market purposes it is not desirable to supersede old varieties by new ones unless these latter are distinct. Even improved varieties sell best under the old names, and to illustrate this fact I may instance that this spring I was required to procure an old variety which I found had gone out of cultivation, but I sent an improved variety of the same colour, and it gave great satisfaction.

Growers of ivy-leaved varieties will do well to keep chiefly to the older varieties, but there are several newer sorts which may be worthy of trial. Early propagation is a great advantage with this class of Pelargoniums. "Geranium" is still the market name for all Pelargoniums except those of the show or decorative section. These latter plants are likely to come into favour again.

The pink-flowered Spiraea have not sold quite so well as was anticipated, as the colour is rather disappointing, perhaps because many are seedlings. One grower suggested that it was in the culture that the colour was lost, but the plants of a large batch all grown under the same conditions vary much in colour, therefore that theory can hardly be accepted. *Hydrangea paniculata grandiflora* is remarkably well flowered, and other sorts appear to be well finished. One firm has already commenced marketing *Erica gracilis nivalis*; the plants are not large, but they are well flowered, the blooms being pure white. Asters in pots are very good. Supplies of *Verbenas* hold out, Miss Willott being the most prominent variety. *Campylopusia scopiella* in its several varieties has become quite a popular market plant. If it could be had in flower some weeks earlier it would be of much greater value. I think this might largely be done, by hanging the plants close to the glass, or by placing them on shelves. If several plants were grown on in each pot instead of stopping them they would come in earlier.

CUT FLOWERS.

It is scarcely necessary to record that trade is had, and added to this trouble the great heat makes it difficult to keep flowers fresh. Sweet Peas are still plentiful, but they are of little value. Carnations were never more plentiful, and good blooms of Mrs. T. W. Lawson are worth only 6d. per dozen; other sorts are proportionately cheap. Gladioli of various sorts are good. I never saw finer spikes of *G. Brenchleyensis*, but there is little demand for them. Trade in Lilies varies from day to day; generally their prices are low. *Geranias*, *Stephanotis*, *Richardias*, and *Tuberoses* are all plentiful. Good yellow *Chrysanthemums* are seen. Asters are abundant, and it is difficult to estimate their value. *Gypsophila paniculata* and *G. elegans* are seen in large quantities. *Statice* in several sorts are now at their best, and those who wish to keep these flowers during winter should purchase early, for they keep much better when not too far advanced. The *Echinops* and *Fringium amethystinum* are now at their best. A. H., Covent Garden, August 18, 1909.

** The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as Supplementary Illustrations in this Journal.

ANNUALS AT EXHIBITIONS: *Annual*. Your informant is perfectly correct in stating that Pentstemons and Antirrhinums are not, strictly speaking, annuals. Antirrhinums are frequently cultivated as annuals. They are raised from seed in spring, they flower during the same season, and the plants are destroyed in the autumn. But for purposes of exhibition, the definition of "annual" given in the "Royal Horticultural Society's Code of Rules

for Judging" is a convenient one, and should be adhered to. The clause reads as follows:—"Annuals are plants which, naturally, begin and end their growth, ripen seed, and die (irrespective of frosts) within 12 months."

APPLE TREE: A. B. The shoots received appear to have been badly attacked with the American blight or woolly aphid (*Schizoneura lanigera*). If the trees are of any considerable size, it will be well to defer applying a remedy until winter. In winter, when the trees are perfectly leafless, they may be sprayed with the following preparation:—1 lb. caustic soda, $\frac{3}{4}$ lb. carbonate potash, 10 ozs. soft soap, and 10 gallons of water, adding the soft soap last of all. The operator should wear leather gloves during the application. If you wish to apply a remedy at once, spray the trees with a weak solution of Calvert's carbolic soap, not exceeding 1 oz. of the soap to each gallon of water. This solution may be sprayed on to the trees at a temperature of 90 degrees.

ASTER DISEASE: J. M. From your description it would appear the plants are affected with the Aster disease, caused by *Erysiphe cichoracearum*. You will find an account of this disease in the issue for June 2, 1906, p. 355.

DISFIGURED LEAVES: L. M. Most of the leaves sent appear to have been attacked by what is known as the shot-hole fungus (*Cercospora circumscissata*). This fungus usually attacks what are commonly known as stone fruits, such as Plums, Appricots, Peaches, &c. It causes small, circular, brown patches on the leaves. These patches become dry, contract and fall away, leaving holes in the leaves just as if small shots had passed through them. Remedies include the spraying of the trees with the ammoniacal solution of copper carbonate. This is prepared by taking of copper carbonate 1 oz., carbonate of ammonia 5 oz., and water 16 gallons. Mix the carbonate of copper and the carbonate of ammonia, and dissolve them in about a quart of hot water. When thoroughly dissolved, add 16 gallons of cold water.

GRAPES: W. L., T. H. S., W. Y. M., and Puzled. The berries are affected with the fungus disease known as *Gleosporium ampelophagum*. The disease attacks the shoots, leaves, and fruits. Mr. Massee recommends that flowers of sulphur be dusted on the leaves and shoots at intervals of 10 days so long as the disease appears to be spreading. A small quantity of quicklime should be mixed with the sulphur on the second application, and the quantity of lime should be increased on every successive occasion until the proportions of lime and sulphur are nearly equal, always keeping just a little more sulphur than lime. Thoroughly wash the branches in winter with a solution of sulphate of iron. Any leaves, shoots, or fruits showing signs of disease should be removed and burned.

INFLORESCENCE OF STOCK: W. M. The term spike is often applied to any upright inflorescence, but botanically it is an elongated flower-stalk (peduncle) upon which the flowers are distributed in a sessile manner. At exhibitions, and particularly as applying to stocks, the term spike is generally understood to mean an entire inflorescence. If the plant is cut off at the ground level, the severed plant can hardly be called a spike. On the contrary, it may be branched, and therefore possess several distinct inflorescences.

MARGUERITE: A. L. E. The brown markings you describe are most likely caused by the leaf-mining insect common to this and other species of *Compositae*. Preventive measures include the spraying of the plants with *Quassia Extract* or other distasteful liquids, in order to prevent the females from depositing their eggs upon the leaves. Badly-affected leaves should be picked off and burned.

MARKET PLANTS: *Amateur*. You have rightly guessed the reasons for plants bought in the market so soon losing their older leaves. In some cases it is caused by the removal from excessive heat and in others by the discontinuance of liquid or other manures that they have previously received.

MARROW, &c.: A. W. T. The Marrow plant has suffered from the cold and wet weather. The Asters are attacked with the fungus disease. See the reply printed above to J. M.

NAMES OF FRUITS: S. W. The Gooseberries were smashed beyond recognition.—*Subscriber*. Please send Apple again in a few weeks' time. The specimen appears to be only about half-grown.

NAMES OF PLANTS: F. D. We cannot undertake to name varieties of *Fuchsia*.—*R. M.* The orange-coloured flower is a *Montbretia*. We cannot undertake to name varieties of *Roses*.—*Y. M.* *Helichrysum* (*Ozothamnus*) *rosmarinifolius*.—*Lilium*. *Lilium testaceum*.—*F. M.* 1. *Cistus ladaniferus*; 2. *Olearia Haastii*.—*E. S.* *Spiraea arifolia*.—*A. J. C.* 1. *Spiraea sorbifolia*; 2. *S. japonica*; 3. *S. Douglasii*; 4. *Selaginella africana*.—*W. F.* 1. *Neillia* (*Spiraea*) *putilliflora*; 2. *Spiraea discolor*.

NIGELLA HISPANICA: J. C. G. The organs you refer to are nectaries.

ORCHID: *Correspondent*. The Orchids appear to have been potted in unsuitable material and allowed to remain in the same pots for some years. Again, they look as if they have been exposed too freely to the sunshine, and the atmosphere of the house has been too dry. No. 1 is *Phaius grandifolius*, and we advise you to turn it out of the pot, wash the roots, and re-pot the plant in fibrous loam, peat and decayed leaves, using these materials in equal proportions. No. 2 is a *Cattleya*. The back pseudo-bulbs you send are useless, as all the growth-eyes, or buds, are destroyed. Probably the younger pseudo-bulbs of the plants may have good growth-buds. Take these younger pseudo-bulbs, three or four together, to form new plants, discarding the useless back portions. Pot them in peat and Sphagnum-moss, with a sprinkling of decayed leaves; or it would probably be better in your case to obtain *Osmunda* fibre, or specially-prepared compost, as advertised. No. 3 is *Cypripedium venustum*. It should be potted and treated as recommended for No. 1. Damaged leaves should be removed at once from any of the plants, as they can be of no use in re-establishing the plants, and are, moreover, very unsightly.

PEA: D. G. This is known as the purple-podded Pea. The seed, which is large, grey-green in colour, becomes brown when cooked, and is therefore of very little value for table purposes.

PLUMS: C. J. P. We do not recognise the variety. It is probably of local origin.

ROSES: *Briar*. The varieties *Dorothy Perkins* and *Lady Gay* are two of the best and most suitable varieties for budding on standards to train in the shape of an umbrella. They should be budded now, as the sap is running freely; therefore the bark is easy to detach from the wood. Insert the bud in each of the growths as near to the main stem as possible. Take care to rub off at once any buds starting behind the bud inserted, and cut off the briar shoot down to the bud as soon as the latter shows signs of growth.

RUNNER BEAN: C. A. We have failed to find any insects excepting aphides. We do not think these have caused the injury.

TOMATO: *Anxious*. The fruits are attacked by what is termed the black rot fungus (*Macrosporium solani*). Remove every fruit that exhibits evidence of the disease and burn it at once. Spray the plants occasionally with potassium sulphide, especially when they are setting their fruits. The potassium sulphide should be used at the strength of 1 oz. to 2½ gallons of water. Open the ventilator and renew the air of the house whenever the weather is favourable, being careful also to avoid having too much moisture in the atmosphere.

VINE LEAVES: T. C. We do not think the leaves are affected by fungus, the colouring merely indicating approach to maturity. There is, however, a trace of red spider. The presence of this pest has always the effect of destroying the green colour in the leaf.

BERLIN BOTANICAL GARDEN.

(See Supplementary Illustration.)

ON the first inspection of the Imperial Botanical Gardens at Dahlem, the visitor is impressed by the fact that they have been created in whole and in detail in a manner most suitable for teaching purposes. It is not possible, for various reasons, to compare the Dahlem Botanical Gardens with Kew. But the main reason is that, whereas, at Kew, successful efforts are made to combine the attractions of a pleasure garden with the educational features more strictly pertaining to a botanical garden, there is but one purpose at Dahlem, that of imparting instruction. For example, take the remarkable rockery. An ordinary rock-garden, not excepting the interesting rockeries at Kew and Edinburgh, is planted with selected Alpine species from various parts of the globe, the species chosen being such as are likely to succeed in the situation and to produce a showy effect. This is not the case at Dahlem. Rock-gardening of that nature is not attempted, but instead there is a magnificent scheme in which the mountain ranges of the earth are reproduced in miniature and, as far as circumstances allow, with their natural features formed of stone obtained from the region of each particular

range. Nor is this all. In order to make the lesson more complete, the mountains are planted with species peculiar to each range. The fact that the plant may be showy or not does not come into consideration. If it is a native of the Himalayas it will be found on no other portion of the rockery than that which represents the Himalayas. Similarly, a Swiss plant will be found on the Alps, and so on. It requires no imagination to appreciate the educational character of such a feature in a botanical garden. A student is able to form a correct idea of the physical character of the mountain he wishes to study, and he finds upon it more or less the same vegetation that he would see if he made the journey to the place itself. It will occur to the reader that under such a system it is impossible to make the rockeries of Dahlem attractive at all seasons. The winter in North Germany is very much more severe than in England. Hence a large number of species which would pass the winter safely out-of-doors in this country has to be removed indoors in the neighbourhood of Berlin. Then some of the mountains must needs be clothed with a tropical or sub-tropical vegetation. This necessitates a system of pot culture in order that the plants may be removed indoors for nearly half the year. In April, therefore, when the photographs represented in the Supplementary Illustration were taken, many of the more tender species had not yet been brought back to the rockeries for the summer season. The lower slopes of these mountain ranges are clothed with grass, shrubs, and trees, amongst which Larch, Spruce, Firs and Beech predominate, just as they grow in Nature. At higher elevations the plants become smaller, until on the top of the structure are found the tiniest species. The gardeners have to regulate the growths of the species in order to obtain proportion such as occurs in Nature. The Alpium, as it is termed, stretches from one side of the garden to the middle. Each mountain range stands out quite clearly from the rest, and each has been constructed as nearly as possible to scale. Interesting as the Alpium was on the occasion of our own visit, the effect was scarcely comparable with what it is in summer; therefore, anyone interested in Alpine plants or in Alpine construction, and who happens to be in North Germany during the latter season, should endeavour to visit these gardens.

An uncommon feature in the outdoor garden is a collection of trees planted and arranged as they are in a German forest, so that students may have, as it were, a section of such a forest for purposes of study. The soil of the gardens is rather too sandy for some of the Conifers, but others succeed well enough, and that they are likely to be well represented after a further period of growth may be seen from those shown in the larger of the illustrations. In considering the growth of the trees, it has to be remembered that these gardens were begun only 13 years ago. They were formed to take the place of the older garden situated at Schonberg. Upwards of £300,000 have already been spent upon them. The arrangements for heating the glass-houses are of the most extraordinary character. There are four boilers erected in a large machine house, each boiler being 18 metres long. In the coldest weather they consume as much as 15 tons of fuel in 24 hours. The boilers supply the steam which is led by steel pipes through the different groups of houses into small tanks of water, and, after the water has been thus heated, it circulates through pipes in the ordinary way. There is a tunnel 600 metres long leading from the boilers to the most distant point of heating. The boilers and the arrangements connected with them, including the regulation of temperature in the houses, are controlled by nine engineers.

The large building shown in the Supplement is the Palm house, which has a ground area of 1,800 square metres. The arrangement of the plants in the Palm house, as everywhere else in these gardens, is geographical. Most of the species are planted out in groups. In the centre of the house is a large lawn formed of Selaginella Kraussiana. The Selaginella grows rampant, and the effect is good, but remembering the expensive character of the heating arrangements, and the expensive construction of the house itself, the devotion of such an area to the cultivation of Selaginella strikes an Englishman as suggestive of wastefulness. Yet in Germany, such indoor gardening is not uncommon; an instance may be seen in the Palm garden at Frankfurt-on-the-Main. A large, lofty building adjoining the Palm house in the botanical garden contains Australian plants, chiefly of hard-wooded species. The Victoria regia house will probably be completed this season. It contains a large circular tank for the Victoria, and around it are all sorts of contrivances for the cultivation of miscellaneous aquatic plants. The construction of this house is of such a costly nature that it is difficult for a visitor to see exactly wherein the increased usefulness thus obtained can repay the large outlay. The Ariod house is a span-roofed building and adjoins the Palm house. In the centre is a pergola formed of an iron frame covered with corks and furnished with such plants as Philodendrons, Pothos, Monstera and Rhodospatha. This hot-house pergola was a new feature to us. Another house devoted to economic plants also contains a pergola. The Orchid house is 60 feet long by 20 feet wide. It contains tropical species, most of them represented by excellent specimens. Bromeliads, Ferns, Musas and various monocotyledonous plants are cultivated in other houses, the specimens, in most cases, being planted out in groups. Two large houses, filled with Cactaceae plants and other Succulents, represent probably the best collection in Europe. Nowhere have we seen succulent plants grown so perfectly as at Dahlem. The atmosphere around Berlin being exceedingly bright and warm in summer, most of the species are cultivated out-of-doors from June until September. Some of the winter species, when moved out in the middle of April, are placed in frames containing moderately warm hot-beds, but the plants remain uncovered at night. Ericas are grown in very great numbers and variety, and their condition is such as is seldom equalled even in the best collections. An exception has to be noted, however, in Erica Cavendishii, this species having proved intractable. The temperate house is 100 feet long, 60 feet wide and 50 feet high. It is curious to note that in winter this house contains such species as the common Holly, Cedar of Lebanon and Araucaria imbricata, the Berlin winter being too severe even for these plants. In connection with the Botanical Garden, there is a large, imposing building containing the herbarium, library and museum. Adjoining the garden is the State Horticultural School, which we had an opportunity of inspecting. The appointments of the school are of the most elaborate character, everything necessary for teaching the science of horticulture being thoroughly well represented. The students, moreover, enjoy the teaching facilities afforded by the garden. Even during a hurried inspection, it was evident that the Dahlem Gardens will rank amongst the most important botanical stations in Europe. Indeed, it will probably be unique amongst them all, for it has been designed by Dr. Engler from the beginning for a specific purpose. It is due to this fact that there are few incongruities and that every plant and group of plants have a teaching value. A more detailed description of the gardens, contributed by Mr. J. G. Watson, was published in our issues for May 23, 30, and June 6, 1908.

MECONOPSIS INTEGRIFOLIA AT TOTLEY HALL.

THE accompanying illustration (fig. 60) of a group of *Meconopsis integrifolia* grown by Mr. W. A. Milner at Totley Hall, Sheffield, should do much to encourage those who have hitherto failed in the cultivation of this beautiful species. It should also serve to dispel any doubts as to its complete hardiness and amenability to the British climate. Totley Hall is in the cold part of Sheffield, adjacent to the Derbyshire Hills, and at some 700 feet above sea level. The plants were raised entirely from seeds saved at Totley Hall. Mr. Milner's experience of this plant is that it is a comparatively free-seeding subject. As grown at Totley Hall this fine *Meconopsis* gives no more trouble than other plants requiring to be periodically raised from seeds. Mr. Milner has kindly furnished me with the following particulars. The seeds are gathered on a fine day, and kept on the shelf of an airy greenhouse for a week, when they are sown in a mixture of equal parts of peat, loam, and sand. The seed-pan is placed in an intermediate house and covered by a sheet of

NURSERY NOTES.

ANNUALS AT READING.

DESPITE the unfavourable character of the season, the visitor to the seed trial grounds of Messrs. Sutton & Sons, Reading, will find much to admire. It is naturally from the comparative point of view that the trials are most interesting.

Of the Sweet Pea alone there are several acres under trial, whilst, apart from the trials, the idea of improving this or that variety, either by selection or cross-breeding, is constantly present in the minds of the members of the firm. A noticeable feature of this crop is presented here by spring and autumn-sown seeds, the latter showing a marked superiority over the former in a variety of ways; notably in height, vigour, and freedom of flowering. In the autumn-sown section are to be seen vigorous examples, 7 feet or 8 feet in height, whose exceptional growth has already demanded a double staking, the plants having long ago overtopped the first placed sticks. A great gain, too, is the much earlier flowering of the portion so treated; the plants which commenced flowering in

of plants or varieties forming a colour scheme of varying shades. For example, pink, yellow, and salmon shades, white and pale blue, salmon-pink and pale blue, salmon-pink and crimson are some of the definite mixtures that afford either harmonies or contrasts, and which might form a useful basis for further extension in the same direction. In these and other ways Messrs. Sutton are doing their best to provide harmonious pictures for the garden in place of the indiscriminate mixtures of the past. Thus the same varieties may appear, but in a definite or regulated order that will satisfy good taste.

The trials of Stocks embrace Brompton, Ten-Week, Intermediate, winter-flowering, and other types. Undoubtedly the gem in the last-named set is the white flowered variety known as "All the Year Round," and which is literally perpetual-flowering. The plant is dwarf, bushy, strongly Clove-scented, having the glossy Wall-flower-like leaves so much appreciated. The plants carried from 16 to 20 spikes each, whilst the percentage of doubles was over 90. For culture in pots it is excellent, and for winter flowering unequalled. Christmas Pink, Yellow Prince, Queen of Mauves, and Beauty of Nice are others

FIG. 60.—MECONOPSIS INTEGRIFOLIA AT TOTLEY HALL GARDENS, SHEFFIELD.

glass darkened by brown paper. The seedlings appear in about three weeks, and, a few days later, the seed-pan is removed to a cold greenhouse. Later, when the rough leaves appear, the seedlings are pricked off and subsequently potted singly and kept in a cold greenhouse for the winter. They are then placed in a cold frame prior to being planted out in June.

Mr. Milner further adds that the above precautions are taken owing to the coldness of the district in which he resides. I would, however, impress upon those desirous of growing the plant the advantage of raising the seedlings in a warm greenhouse. Many sow the seeds and place them in a cold frame, and though apparently good at sowing time, none, or very few seedlings, survive, whilst the few that do live are weak and poor.

Mr. E. H. Wilson, who discovered the plant on the China-Tibetan borderland, informed me that, from his observations of the plant in its native home, he is of opinion that a more generous treatment than is usually given to plants of biennial duration is desirable, in order to encourage a greater development and luxuriance in the plants. *E. H. Jenkins.*

the latter part of May have continued in bloom without a break to the present time. Even now, indeed, there is apparent that superiority of growth and flowering which has characterised them throughout, and, doubtless, what is true of the behaviour of the plants in a season like the present would be so in a greater degree in a season of more sun-heat. To what an extent autumn sowing will prove generally useful is, naturally, a matter for experiment both with soils and varieties; whilst possibly, also, a good or bad seed harvest may to some extent exert an influence. What should be obvious and of the greatest importance to the private, as well as the commercial, gardener is the remarkable resources of the autumn-raised plant. Doubtless, its ultimate vigour and early and continuous flowering are but the natural outcome of many extra weeks of steady root development which, in the circumstances, is rendered possible. I cannot discuss in detail the merits of so great a variety of Sweet Peas, but mention must be made of that delightful variety Sutton's Queen, which in pink and cream affords such a pleasing combination of tints. Queen of Pinks is also a very charming variety. Very interesting, too, was a set

strongly recommended for flowering in winter. The spring bedding Stocks are invaluable to the gardener by reason of their hardy nature. These were literally hidden with spikes of double flowers; white, scarlet, yellow, blue, and pink being remarked. To obtain the best results from this group, the seeds should be sown in the open ground in July and August. The plants should be placed in their winter quarters early in autumn. To sow seeds of these late in autumn is to court failure, whilst to sow them in heat in winter or very early in spring is even worse. The perfect hardy nature of the plants is a great gain, and if afforded a long season of growth they are capable of making superb flowering examples. The East Lothians were well represented, the excellent bush-like habit producing a score or even 25 spikes per plant. East Lothian Pink was particularly fine; and only a little less good than All the Year Round was East Lothian White. Autumnal-flowering Stock is virtually of this class, with fine, bouquet-like habit, but rarely producing a central spike of bloom.

Poppies were showy and plentiful, and in the Shirley Poppies present improvements incline to

the elimination of the rose-pink shades and encouragement of those of salmon or apricot tints. As proving how minor changes in the Poppy are apt to create marked improvements in the flower, I was shown an improved Corn Poppy, having golden anthers instead of black, as in the type, the change thus wrought having a remarkable effect on the appearance of the flower as a whole.

Chrysanthemums Northern Star, Eastern Star, Morning Star, and Evening Star are a set of showy, free-flowering varieties for beds or borders that deserve to be widely grown. Gypsophila elegans, pink-flowered variety with dark stems, is a decided gain in these pretty annuals, while the miniature-flowered and low-growing Leptosiphon in many bright colours is valuable for edgings and borders, being as compact in habit as a Lobelia.

Gaillardias, perennial Marguerites, and other popular flowers were equally attractive. Speaking of the Marguerites, it may be said that such varieties as Mrs. Lowthian Bell and King Edward could be selected at a glance, the Shasta Daisy appearing to considerable disadvantage when compared with them. J.

NOTICES OF BOOKS.

A FOUR-ACRE HOLDING.

So much is written upon the prospects of small holdings representing everything in the most favourable light that it is quite refreshing to read a record of experience detailing with strict impartiality both failures and successes. This has been accomplished by Mr. Fred. A. Morton in a little book of 71 pages entitled *Winning a Living on Four Acres*.* It is practically a continuation of the work by the same author, *The Simple Life on Four Acres*, and gives the results of two years' further experience in country life. The author admits that his opinion or mental outlook has been modified, but insists that he is not beginning to regret his step from town to country life. "Such a regret is impossible. My whole thoughts nowadays have as their basis the belief that the country life is the only rational one." This is satisfactory, for the record is not very encouraging from a money-making point of view; in fact, it would be difficult to produce a book more calculated to damp the excessive enthusiasm of inexperienced beginners than that under notice.

Five years ago Mr. Morton gave up a post in the Civil Service and invested £117 in the purchase of four acres of "heavy, derelict, clay-land in Essex," erected a small house, stocked and cultivated his holding himself, and has ever since existed on a vegetarian diet and followed "the simple life," living chiefly out-of-doors. The details are given on p. 66 of the income for 1908, thus:—

		1908.
Garden	£5	14 0
Fowls	27	2 0
Bees	12	10 0
	£45	6 0

From these totals has to be deducted £3 18s. 6d. for tithes, rates, and dog tax, nothing being allowed for rent or interest on capital. On the other hand, no particulars are given respecting the cost of goats kept for their milk, nor the value of the latter.

It is obvious, as indeed the author points out, that if rent had been paid and deducted from the totals the net result would have borne a poor aspect. Readers seeking information on the subject of small holdings must be thankful to Mr. Morton for the frank admissions of failures which appear in the pages, and there are so many practical and thoughtful suggestions that the book is well worth the attention of all interested in an important subject.

* *Winning a Living on Four Acres*, by Fred A. Morton. (London: A. C. Fifield) Price 6d.

NEW OR NOTEWORTHY PLANTS.

CENTEMA BIFLORA, SCHINZ.

THIS species can hardly be called a good garden plant, but it nevertheless possesses an interest of its own. The plant, from which the illustration in fig. 61 has been prepared by Mr.

taller-growing species of *Dianthus*—having the swollen nodes and opposite leaves characteristic of that order. The flowers, which are of a dull shade of magenta, are borne in terminal spikes from 2 inches to 3 inches in length, and, like other members of the order, they retain their freshness for a considerable time. The plant thrives best in a warm, freely ventilated, intermediate house, and may be propagated either from seeds or cuttings.

Centema biflora was described by Schinz in *Engl. and Prantl. Naturl. Pflanzenfam.*, iii., 1a (1893), 107; also in *Engl. Bot. Jahrb.*, xxi. (1895), 135; by Clarke and Baker in *Wyer, Fl. Trop. Afr.*, vi., 56, as follows:—

Stem erect, 2 to 3 feet high, scabrid with tubercles on the ribs, leaves opposite, up to 3 inches long and ½ inch broad, pubescent, petioles in the large leaves ½ inch long, in the smaller leaves hardly any. Inflorescences terminal, pedunculate up to 2 inches long and ½ inch broad, very dense, with often ovoid heads ½ inch long on the same stem. Partial inflorescences with one or two fertile flowers, brown-reddish or red, sterile flowers with scanty, long, fine hairs on their back, the bracts ending in straight scabrid short spines. Staminal tube and sterile filaments of the genus; ovary ovoid, hairy, conic at the top.

Psilotrichum rubellum, Baker, *Kew Bull.*, 1897, is a synonym of the plant now figured. The species was collected by Welwitsch in Angola, also by Goetze in German East Africa.

FIG. 61.—CENTEMA BIFLORA: FLOWERS OF A DULL MAGENTA SHADE.

Worthington Smith, was presented to the Chelsea Physic Garden by Mr. J. Tabor, of Swanley College, who raised it from seeds received from West Africa. *Centema biflora* is a member of the *Amaranthaceae*, but when out of flower the plant has a strong resemblance to some of the species of *Caryophyllaceae*—especially to the

FOREIGN CORRESPONDENCE.

BAGGING GRAPES.

You recently alluded to the practice of bagging Grapes (see p. 396) by putting bags over the bunches to protect them out-doors from insects, birds, and to prevent dust from accumulating on them. This, I think, is a great aid to the growers of the fruit, as it is kept in perfect condition when so treated.

Here in the United States, the golden orioles and robins are very destructive to ripening Grapes. The orioles prefer the Grapes of the choicest quality, which are usually red varieties. Grapes when bagged colour up as perfectly as can be desired, and I think with a finer bloom than when not so covered.

As I look back to the trouble there used to be occasioned in some seasons at Longleaf in England by wasps, I think that in all private places the Grapes could be bagged with advantage, and the fruit could, in late vineries, be left on the vines in safety much longer than at present.

But some may say, "Yes, but it would take a long time to bag them." At Williamson, Ontario County, in this State, one grower last year bagged more than 220,000 bunches. The variety was The Niagara, a white Grape of second quality and somewhat "foxy." The bags were slipped up over the bunch and pinned on the top. I prefer tying the bag around the stem of the bunch, as then, if the Grapes are ripe, a moderate frost of 10° will not injure them in the least, as we have found in our own case. The bagged Niagara Grapes were kept and sent to New York City at Christmas time, and brought 10s. 5d. per lb. I think it paid to bag them, as the fine bloom made them more attractive and desirable. Some growers who bag their fruit cut off just one corner of the bags to allow water to drain off, which is a wise precaution.

I enclose sample of paper in bags to show its texture. These bags are the same as are used by grocers in packing their goods for customers.

I do not know whether it would be advisable to put other fruits into bags. It may be advisable to do so to save large, fine specimens for special purposes, for exhibitions and other occasions, and I think the bags should remain on until the fruits are wanted. John Charlton & Sons, Rochester, New York.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, ante, pp. 70-76.)
(Continued from page 128.)

7, ENGLAND, N.W.

LANCASHIRE.—The fruit crops in this district are much affected by the continued inclement state of the weather and by the low temperatures throughout the spring and early summer months. The Strawberry crops have been heavy, but the flavour is indifferent, through want of sunshine. Early and mid-season varieties of Apples are a good crop, and the skin of the fruit is very clean. The late varieties are not so plentiful. Insects have been unusually troublesome, especially in the small bush fruit trees. Loganberries are a good crop. The soil is rather retentive, resting on red sandstone rock. *B. Cromwell, Clevelley Gardens, Liverpool.*

— We only grow three or four kinds of Strawberries, such as Royal Sovereign, Sir Joseph Paxton, and Ruskin. The soil is rather a heavy loam, with fair amount of clay; very wet and cold. *T. Wyton, Abbeystead Gardens, near Lancaster.*

WESTMORELAND.—We had good prospects early in the season, but sharp frosts in May did a lot of damage. Our trees are fairly clean. A spraying of Cooper's V2 fluid was very effectual. Ours is a gravelly soil, requiring unusually liberal treatment. *W. A. Miller, Underley Gardens, Kirkby Lonsdale.*

— Cold east winds, with low night-temperatures during May and early June caused the Apple crop to suffer very much. All Plums on walls have set an enormous crop, and have to be severely thinned. Cherries, both sweet and Morellos, are also a good average crop, although a little late. Strawberries are later than usual, owing to the cold, sunless weather of early summer. The crop was a good average, although the fruits were not so fine as we generally have them. *F. Clarke, Louther Castle Gardens, Penrith.*

— The spring gave promise of good crops of fruit all round, as blossoms were produced very freely and the weather was favourable to setting. Owing to the prolonged drought in May and early June, and the continuance of abnormally cold weather, however, prospects are now not nearly so favourable. Strawberries failed to swell to any size; small fruits fell an easy prey to aphids, &c., making frequent spraying necessary. They are, however, with the exception of Black Currants, of good quality. *W. Anton, Brougham Hall Gardens, Penrith.*

— Taken on a whole, the general fruit crop in Westmoreland is quite up to the average as far as quantity and quality goes. But every kind of fruit is in an extremely backward state, and, despite the heavy rains we have experienced lately, most of the crops are badly infested with green fly and other insects. Peaches out-of-doors set a remarkably heavy crop, also small fruits, with the exception of Strawberries. Apples in the gardens here are the best crop we have had for four or five years. The soil is limestone. *W. Gibson, Levens Gardens.*

8, ENGLAND, S.W.

CORNWALL.—Although the Apple crop is over the average, it must be borne in mind that of late years the average crop has been a decidedly light one. In the spring the Apple trees, as well as other fruits, were smothered with blossom, and the fruit set in unusual numbers, but the cold, cutting winds caused large numbers to drop; yet sufficient remains to form a good crop, though I think it will be of moderate quality. Red Currants are plentiful and good, but Black Currants are poor and somewhat small. Strawberries promised well, but sharp frost on two nights destroyed the first fruits just as they commenced to swell; the late varieties are very fine. Gooseberries form the heaviest and best crop I have ever seen. Peaches are highly flavoured, and Pears promise to be good. *A. C. Bartlett, Pencarrow Gardens, Bodmin.*

DEVONSHIRE.—The fruit crops generally are very good. Black Currants are more plentiful than they have been for years past; the bushes in many parts were badly infested with the mite, but, thanks to the horticultural Press for giving publicity to the lime-and-sulphur remedy, in

several places where it was very bad it has, through perseverance, been stamped out. Strawberries have been very fine, and the crops in some districts enormous. Gooseberries have been sold at 1d. per quart and Strawberries at 1½d. per lb.! *G. Lock, Newcombes Gardens, Crediton.*

— Irrespective of kinds, there was an abundance of blossom on all fruit trees, especially Peaches, Nectarines, and Apples. Locally, the last are very blighted; the foliage having a burnt or scorched appearance. A good many of the fruits have a curled look and will probably drop; but I think there will be a fair crop. Plums

valent on the Peas and Potatos. *Geo. Baker, Membrand.*

GLOUCESTERSHIRE.—The fruit crops in this district are very satisfactory as a whole. The Apples are very free from scab. Pears suffered this season very much from the mildew all over the district, but the crop left is better than for several years past. The trees have been very clean and the leaves of a lovely colour. Plums, on the high ground, are a very heavy crop, particularly where the soil is light and on gravel, but on low ground with heavy clay soil they suffered from frosts. Small fruits are very plentiful. The birds did not seem to attack the buds as in

FIG. 62.—REMOVAL OF A LARGE PHOENIX PALM AT SAN FRANCISCO.

(See p. 149.)

look well, also Peaches. We have abundance of small fruits. The soil is sandy loam resting on old red sandstone. *Jas. Mayne, Bickton.*

— The fruit crops are good, but late. Apples are a very heavy crop. Most sorts require thinning, the fruits having set in close clusters. Pears are good, and represent an average crop. Cherries set well, also Plums, but many have fallen. Peaches set well upon the walls. There are some blistered shoots, owing to the nights having been cold with continuous fog. The six months' rainfall is less than 15 inches. Mildew is very pre-

vious years. *J. R. Tooley, Toddington Manor Gardens, Winchcombe.*

— Apples are nearly a failure here this year. The bloom was thin and weak; aphid and caterpillar are plentiful. There are some very good crops in the neighbourhood, and I find these on stronger land than our gardens. Peaches are good. An extraordinary lot of Gooseberries, Cherries and Plums are better here than usual, as also are Apricots. Strawberries, Raspberries and Currants are very satisfactory. Our soil is a friable mixture on the old

red sandstone. *John Banting, Tortworth Gardens, Falfield.*

— Our Apple crop has suffered much from the long-continued easterly winds, and the winter moth has injured many of the trees. We used grease bands, but I am afraid they were allowed to get too dry. Cherries on the walls are very bad with the black fly this year, and this pest requires constant attention to keep it under. *W. Keen, Bowden Hall Gardens, near Gloucester.*

— Apple trees bloomed abundantly, but the crop is rather a light one, owing to the Apple weevil. Pears are a fair crop; the cold nights, with the thermometer below freezing point each night from May 11 to 16, did not do much damage in this garden. Apricots, Peaches, Cherries and Plums are carrying good crops. Gooseberries and Red Currants are cropping abundantly. Strawberries are a good crop, but, owing to the wet season, are not up to the average in flavour. Our soil, resting upon limestone rock, requires deep cultivation. *F. C. Walton, Stanley Park Gardens, Stroud.*

— On the whole, we have a good crop of fruit. Strawberries were quite up to the average, but late in ripening owing to the cold, wet weather. Apples are an average crop. Trees grown on the Paradise stock are the most prolific, especially such kinds as Cox's Orange Pippin and Wyken Pippin. Manks Codlin, Annie Elizabeth, Warner's King, Stirling Castle, and Lane's Prince Albert are the best-bearing kinds in the orchards. Pears are an average crop. We are troubled much with the Pear midge. Apricots are the lightest crop. Many of the buds were killed in the winter by severe frost. Plums are an average crop. Bush fruit

from an attack of the Apple blossom weevil. Pears are an average crop and clean. Plums are under average, but the trees are healthy and the crop is doing well. Small fruits are generally very good, but black Currants suffered very much from attacks of fly. Our soil is sandy, subsoil red sandstone. *Thomas Spencer, Goodrich Court Gardens, Ross.*

MONMOUTHSHIRE.—Notwithstanding the abundant blossom on fruit trees, the crops are not so good as we anticipated. Many unsprayed Apple trees are almost denuded of foliage by the caterpillar. (Oak trees, also, have suffered in the same way.) Pears are good, the fruit clean and trees healthy. Plums failed to set in quantity owing to the frost and damp weather experienced when the trees were in flower. Peaches and Nectarines set well and required much thinning. All bush fruits are remarkably good, although aphids has been troublesome on Red Currants. Strawberries were an enormous crop, the fruit sound and of good flavour. *W. P. Wood, Llanfrecfa Grange Gardens, Caerleon.*

— Apples, when in bud, were promising. The cold weather and the blossom weevil, however, ruined the good prospects. Pears vary, the best crops being on bush trees placed on fairly high ground. Plums are a good crop where the trees have been kept clean by spraying. Peaches upon a west wall are heavy crops, the trees being clean and quite free of blister. We attribute this state of things to protecting the trees in spring with canvas blinds. All bush fruits carry heavy crops of good fruit; while the crops of Strawberries, though later than usual, were heavy and of good quality. *Thos. Coomber, The Hendre Gardens, Monmouth.*

caused some of the fruits to decay; the season has been a long one. Apricots are a heavy crop, necessitating much thinning, following a year almost blank. The staple soil is very shallow in some cases; when wet, very sticky, but quickly dries out; overlying the white lias; lower down it becomes a heavy clay. Where the stone has been drawn and the soil made up, good crops are produced. *Geo. H. Head, Kingsdon Manor Gardens, Taunton.*

— There was an excellent show of blossom on everything this spring, and, owing to the absence of frosts at the critical times, a good "set" was the result. The only drawback in this district has been a most persistent attack of fly on fruit trees and bushes of every description, Pears excepted, and a good deal of labour has been expended on spraying. Had it been possible to do more of it, still more satisfactory results would have been obtained. The weather has been so bad that growth was slow, the night temperatures being more like autumn than summer. *A. Shakelton, Forde Abbey, Chard.*

WORCESTERSHIRE.—The fruit crops, on the whole, are very good indeed, many of the varieties of Apples having set their fruits in bunches, consequently they will have to be freely thinned. Much of our success must be attributed to timely winter spraying, the "Woburn Winter Wash" having proved most effectual. We have also used concentrated alkali wash with excellent results. Bunyard's Blight Cure for American blight is excellent. Black Currants are healthy and good. Any badly mite-affected bushes were dug up and burned, and on all other bushes (many hundreds) the swollen buds were kept picked off and burned. Rivers' Early Prolific Plum has enormous crops. Soil, sandy loam overlying new red sandstone formation. *A. Young, Witley Court Gardens, Worcester.*

— The Apple crops are disappointing when contrasted with the quantity of healthy bloom, apparently due to adverse climatic conditions during the setting period, viz., hot scorching sun by day and frosty east wind by night, continuous and persistent. Pears are healthy and good, there being far less Pear midge this year than for years past. Stone fruits are very good crops generally, but trees have been attacked again and again with aphids of the most tenacious and virulent type, involving extreme measures with washing, spraying and dipping. The winter moth larvæ has also given considerable trouble, in spite of some grease-banding. We have much to learn yet, outside the laboratory, to successfully and certainly cope with insect pests under all conditions of climate. Strawberries have been heavy crops, but flavourless, owing to cold nights and absence of sunshine by day; many of the best fruit decayed prematurely through so much humidity. *William Crump, Madresfield Court Gardens, Malvern.*

(To be continued.)

FIG 63.—LARGE PALMS PACKED FOR REMOVAL AT SAN FRANCISCO.

is abundant, and Cherries, especially Morellos, a fine crop. The soil is clay, with subsoil of blue marly clay. *A. Chapman, Westonbirt Gardens, Tetbury.*

— There is a fair crop of most fruits, but Apricots suffered from the cold weather in March. Gooseberries are abundant. Currants promised well, but were badly attacked and blighted by aphids. Black Currants especially suffered, although in some gardens they are quite clean; in others all the leaves were destroyed. *Alfred E. T. Rogers, The Gardens, Sudeley Castle.*

— Gooseberries, Black and Red Currants, also Strawberries, are record crops. Peach trees have suffered from the leaf blister. The foliage of Apple trees is riddled with caterpillars. Early Pears have set better crops than later kinds, and are cleaner in the foliage than Apples. *W. H. Berry, Higham Court Gardens, Gloucester.*

HEREFORDSHIRE.—Some fruit trees are laden, others have practically no fruit on them. The drought and cold east winds were the causes of a quantity of fruit dropping. In the spring it looked like an extraordinary year for fruit. Peaches set their fruit well, and we have gathered thousands off a wall about 90 yards run. Strawberries were a huge crop. The same remark applies to Red, White and Black Currants, also Gooseberries. Apples are only just an average crop. *Thos. Watkins, Newport Hall Gardens, Eardisley, R.S.O.*

— The fruit crops generally are looking well, although below the average. Apples are a thin crop, and some varieties have suffered from fly very much more than others this season, also

— Apples in practically the whole of South Monmouthshire will be a very poor crop this season, especially in grass orchards. Aphids has been very troublesome in most districts, and very little is done in spraying the trees. Dwarf trees are somewhat better cropped, but not up to average. This is due to several varieties, such as Bismarck, Bramley's, Lane's and Newton Wonder, bearing very heavily last season. Pears are exceptionally free from aphids. The weather has been very cold, with little sunshine, and the rainfall has been below the average. *J. Basham, Bassaleg, Newport.*

SOMERSETSHIRE.—In this district the early promise of all kinds of fruit was good, but during May we had continued bright sunshine, followed by frost almost every night. June was a dull, wet, sunless month, and July has been very cold. Black and green fly have attacked almost every tree in the garden and caused much extra work in spraying. *G. Shawley, Halswell Park Gardens, Bridgwater.*

— The fruit crop this year is remarkably good, but Apple trees in the orchards are very much blighted, and many of the Apples are falling. The soil in this neighbourhood is of a heavy clay nature, and on a blue lias stone or limestone. *W. Hallett, Cossington, near Bridgwater.*

— The present season has been exceptionally bad for aphids of all kinds; complaints are heard on all sides. It has been a constant fight to keep trees clean. In many cases Apple trees are badly crippled. Raspberries did not make very good growth last season, and during the winter the canes were injured by the severe weather. Strawberries have been good, though the heavy rains

REMOVAL OF PALMS IN CALIFORNIA.

MR. H. E. HUNTINGTON has removed his collection of Palms from San Francisco to Los Robles, at San Gabriel, near Los Angeles, a distance of about 600 miles.

The Palms included two large specimens of *Phoenix canariensis*, each 30 feet in height. These are of some historic interest, having been a feature on Nob Hill for the past twenty years. They are relics of the "Big Fire" of 1906, at which time Mr. Huntington's magnificent residence was destroyed along with everything else in that district.

The fire stripped the Palms completely of all their leaves, leaving only the blackened stems, but in the three years which have elapsed fresh growth has been made and new well-developed crowns have appeared, as may be seen from the accompanying illustration (fig. 62).

The work of removing the Palms was done by the McRorie-McLaren Company, of this city. The task, owing to the great size of the plants, proved one of some difficulty. Each Palm, when boxed, weighed 13 tons, the boxes being 10 feet square and 4 feet deep. A special truck was commissioned, and a team of 10 horses was required in order to convey the plants to the railway station, where they were safely loaded each on a flat car. *Wm. M. M. Brown, Menlo Park, California.*

DENDROB'UM ACUMINATUM.

THIS handsome species (see fig. 64) was awarded a First-class Certificate at the meeting of the Royal Horticultural Society on the 17th inst., when it was exhibited by Messrs. Moore, Ltd., Rawdon, Leeds. Though it belongs to the dwarf section of *Dendrobium*, the flowers are not small, being more than 2 inches across; they are white delicately suffused with rose-pink. Its nearest ally is *D. Treacherianum*, a Bornean species. *D. acuminatum* is a native of the Philippine Islands.

The Week's Work.**THE FLOWER GARDEN.**

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardslee, Sussex.

Watering.—It is best to apply a mulch immediately after watering. During very hot weather such plants as Dahlias, Gladioli, Chrysanthemums, Violets and Sweet Peas require copious waterings, and to give water every alternate day is not too often. All climbers, including Roses, should, during dry weather, be watered often, and the foliage syringed, otherwise red spider will attack the plants. Plants in vases, pots and tubs, on terraces, &c., may require water several times daily. Small seedlings and plants in nurseries intended for autumn and spring bedding must not be neglected in this matter.

Hoeing.—Keep the hoe at work to destroy weeds, which should be uprooted before they produce their seeds, which some species do very quickly.

Ferns.—Though these plants are generally placed in shaded spots, they, nevertheless, require frequent watering, especially when planted near the base of large trees. These should have an abundance of moisture during dry weather, as Ferns are very impatient of drought. The watering is best done in the cool of the afternoon. Ferns growing by the sides of lakes or ponds need very little attention beyond keeping them clear of weeds and rubbish. *Hymenophyllum tunbridgensis* does well when fastened on a sandstone rock in the shade, but it needs to be kept moist and protected from the ravages of birds.

Roses.—When the rambler varieties have finished flowering it is a good plan to cut out nearly all the old wood that has flowered. This will enable the new growths to develop and ripen their shoots better. The surface soil about the roots should be stirred, a little fertiliser worked in, and the ground well watered. This will assist the plants to build up strong shoots for next season's flowering. A syringing occasionally with some insecticide will keep the foliage clean and destroy insect pest and mildew.

Bamboos.—These shrubs are sending up fresh canes, therefore a good soaking will benefit them considerably, and especially those that are planted in large beds with other shrubs. A gentle stream of water allowed to trickle over the roots for some hours will often recuperate a half-worn-out plant. Dryness at the roots is often the cause of the premature flowering of Bamboos. In the case of plants that are very dry, it is a good plan to make a little trench a few feet from the ball and fill this with water frequently till the whole is well soaked. The majority of varieties and species are throwing up extraordinarily strong shoots this season, and they will require help to mature them. All newly-planted shrubs of other species should be examined to ascertain if their roots lack moisture.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Winter Cucumbers.—A batch of plants should be raised now for supplying fruits throughout the winter months. A variety of good constitution must be selected for this cropping: one we find excellent for the purpose is "All the Year Round." Sow the seeds singly in 3-inch pots, in a mixture of loam and leaf-soil, which should be sufficiently moist for the seeds to germinate, as this will dispense with watering. As soon as the seedlings are through the soil, place them

near to the glass to encourage a sturdy growth. When they have rooted fairly well they should be repotted into 6-inch pots, again placing them near to the glass. In the meantime a house must be got in readiness for their planting, choosing a light structure and one that is exposed to the sun during the greater part of the day. Preparatory to planting, the glass and woodwork of the house should be thoroughly cleansed with hot water and the walls limewashed. The hot-bed on which the Cucumbers are planted should be made with half-

composed of turfy loam and leaf-mould. Allow them to grow steadily in a moist atmosphere and avoid excessive fire-heat, but rather make full use of the sun's heat by closing the structure early in the afternoon.

Early vinery.—The vines may now be partly pruned, shortening the shoots back to about one-third of their length. The lateral growths should also be cut away. If the borders are well drained, a good soaking with diluted liquid manure will assist the canes to swell their buds. Whenever opportunity offers cleanse the vines, and especially if mealy bug is present, with a mixture of strong, soft soapy water, to which a little sulphur has been added. Work the specific into the crevices with a stiff brush. Soft soap and sulphur mixture is an excellent remedy for all kinds of insect pests on vines.

Melons in frames.—Plants carrying fruits approaching maturity will need every assistance to ripen the latter perfectly. The fruits must be suspended so that they are only partially shaded by the foliage. Much care should be exercised in affording fresh air. When the fruits are ripening water must be withheld at the roots and the top of the frame left slightly and continuously open to keep the atmosphere dry, as much moisture in the air causes the fruits to crack.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

Heliotrope.—Plants in small pots should now be shifted into others 5 inches in diameter. Pot firmly and afterwards place the plants in a close frame for a few days, but when they have recovered from the disturbance at the roots, stand them in the open on a layer of ashes. They may remain in that position until September, when they should be placed in a warm, light house, in which they will flower.

Gardenia.—Plants which were pruned severely last spring should be assisted in maturing their shoots by allowing them plenty of room and ventilation. This will induce the plants to set their flower-buds. Young Gardenias which require larger pots should receive attention at an early date, so that they may be well established by the end of the autumn. A suitable potting soil is one composed of three parts loam, one of leaf-soil, with a little dried cow-dung and plenty of silver sand. The soil should be made firm in the pots, but care should be taken not to break the roots. Except for a short time after being repotted, Gardenias should be exposed to the sun's rays. During active growth they are best suited by a high temperature and a humid atmosphere. When the flower-buds are well set, the young shoots, which spring from their bases, should be pinched out, or the flower-buds may drop.

Primula.—After this date it will not be wise to remove the lights from the frames at nighttime, as there is a danger from heavy, cold rains. The lights may be tilted to admit fresh air. Except those of the latest batch, all the plants should now be in their flowering-pots. Well-rooted plants may receive occasional doses of soot-water, and be given a little artificial manure, which should be dusted over the surface of the soil.

Cyclamen.—As autumn-raised Cyclamens are generally the most satisfactory, seed should be sown about this time in well-drained pans of sandy soil. The seeds germinate best in an intermediate temperature, and the atmosphere of the house must contain a moderate amount of moisture.

Azalea.—These plants are forming their flower-buds and should receive some manurial assistance. Care in selecting the stimulant is very necessary: if liquid manure is used it should be weak and clear, and may be made from sheep's droppings soaked in water; should the liquid become puddled, the addition of a piece of unslaked lime will clarify it. The manure water may well be alternated with a light surface-dressing of some approved chemical manure. The plants should be heavily syringed twice daily in fine weather as a check against insect pests.

Camellia.—This plant also requires some assistance in building up the flower-buds. Whilst the plants in pots and tubs are still out-of-doors they should be thoroughly cleansed.

FIG. 64.—DENDROB'UM ACUMINATUM: FLOWERS WHITE, TINTED WITH ROSE-PINK.

decayed leaves and stable litter in equal parts, after the materials have been thrown in a heap and turned several times to allow the noxious gases to escape. A few inches of decayed leaves should be placed over the surface of the bed before the soil is applied. A lighter compost than that which was used for the summer crop will be necessary for this batch, as plants of medium growth withstand the dull, unless weather of winter best. When the plants are well rooted, plant them in small mounds of soil

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Resting Dendrobiums.—Many of the *Dendrobiums*, and especially those of the noble section, are now completing their growths. It will be necessary to examine them frequently, in order that those which have ceased growing and have their leaves at the extremities of the pseudo-bulbs fully expanded, may be removed to a cooler and drier atmosphere, where they will receive the benefit of extra light. They should be exposed gradually to full sunshine, in order to mature the newly-made growths. Beginners should bear in mind that, to retain a healthy and vigorous constitution, everything appertaining to the drying and resting of these plants must be gradual, also that it is necessary for the plants to make only one set of growths in a year, and that these growths must be thoroughly ripened. The plants will be perfectly safe for the next few weeks in a house where the night temperature is about 60°, but after that time they should be removed to a structure having a cooler and drier atmosphere, where they may be allowed plenty of fresh air. The night temperature, during the autumn months, should range between 60° and 50°, or, in very cold weather, 45°. If a house can be devoted entirely to such species as *D. Wardianum*, *D. crassinode*, *D. Findleyanum*, *D. melanodiscus*, *D. chryso-discus*, and *D. nobile* and its numerous hybrids, it will be easy to choose a position on one side for the plants that have completed their growths, where they will enjoy more light and air but less moisture. It will be easy to regulate the temperature in this house to the requirements of the *Dendrobiums*, and the valves of the hot-water pipes may be gradually turned off as the plants complete their season's growth. Do not withhold water entirely from the roots immediately the new pseudo-bulbs are completed, otherwise they may receive a check, and buds will start into growth which should remain dormant till after the flowering season. This treatment would also have the effect of checking the numerous young rootlets pushing out from the roots made at an earlier stage; which roots should be encouraged to grow for as long a time as possible, since they are of the utmost value to the plants. It is advisable to examine the plants daily, and immediately any sign of shrivelling in the pseudo-bulbs is detected, to give them a thorough watering, but this should not be repeated until the whole compost is quite dry. When the plants have become accustomed to the resting treatment and the pseudo-bulbs thoroughly hardened, many of the leaves will turn yellow, and, although unsightly, they must be allowed to remain until they fall away naturally. In the case of plants still in vigorous growth, a hot, moist atmosphere must be maintained. Let them be removed to the plant-stove and exposed gradually to sunshine both morning and afternoon in preparation for receiving the full benefit of the sun's rays later on. The splendid *D. Hookerianum* (*chryso-tis*) always proves more difficult to cultivate than many others. I have tried several kinds of composts and different temperatures, positions, &c., for this plant, but, until the last few years, failed to keep it alive for any length of time. However, since potting the plants in the new Orchid compost and affording them a *Cattleya*-house temperature—some suspended to the roof and others standing down among the *Cattleyas*—they have grown very freely and satisfactorily. At the present time plants of this species are producing their flowers. This beautiful *Dendrobium* should never be allowed to become dry at the roots.

Hot water system.—The present is a suitable time to overhaul the heating apparatus. The nights will soon become chilly, and many tender and valuable plants may be injured if the work is delayed. The boilers should be emptied and thoroughly cleansed of all sediment; loose joints and cracked hot-water pipes must be made good; all valves oiled; and the overflow and feed pipes put in good order. The fire-bars, the flues, including those over the boilers, and ash-pit doors should also receive attention. It is important that the chimneys be swept clean, and all accumulations of soot and rubbish at their base, as well as at the back of the boilers, must be cleared away. While this work is being done, the plants in the warmest houses should be kept rather drier than usual at the roots, and there should be a correspondingly less amount of moisture in the atmosphere than when fire-heat is employed.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Morello Cherries.—The Morello Cherry succeeds in almost any part of the garden. The trees thrive exceedingly well on walls having a northern aspect, and in such situations they are for the most part generally grown. In common with other varieties of Cherries, the Morello has borne a bountiful crop this season. The fruits may be thinned before they are perfectly ripe, and those gathered may be used for cooking, but for bottling and preserving generally they should be fully developed though not over ripe. After sufficient fruits have been gathered for preserving, the remainder may be left on the trees to be utilised as required. In ordinary seasons, Morello Cherries will hang for a considerable time after they are ripe. They should be closely watched, and at the first sign of shrivelling the remainder of the crop should be harvested without delay, or decay will soon set in. Trees in fruit require plenty of moisture at the roots; clear water being best at this stage. When the fruits have been picked, any necessary pruning should be done at once.

Pruning.—The Morello Cherry needs different pruning to the Sweet Cherry, and should be treated in this respect somewhat like the Peach and Nectarine. This consists of cutting out all the old fruiting wood that can be spared and of saving young shoots which will produce the best fruits next year. The main branches should not be interfered with unless any are unhealthy, in which case the branch or branches should be cut clean out and the space filled in with young shoots. The branches should be trained thinly apart to allow the young shoots to ripen and develop their fruit-buds. Little or no pruning will be necessary in the winter months, the principal work then will be to loosen and cleanse the trees. One advantage in pruning as soon as the fruit is cleared, and whilst the leaves are still on the trees, is that the operator will not be likely to tie in too much new growth. At least 6 inches of space should be left between the shoots. Thoroughly cleanse the trees and if necessary water them until the leaves fall.

General work.—Showery weather, following a dull fortnight, has caused weeds to spring up in great profusion. Keep the ditch hoe constantly at work in the fruit quarters, not waiting till the weeds are large and require hand-pulling, as this involves more than double the amount of labour. If the hoe is kept busy, the small weeds will shrivel up with the sun's heat, and give no further trouble.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Parsley.—Parsley is in great demand all the year round, and it is necessary but often difficult to maintain a constant supply. During the next fortnight or three weeks, two sowings should be made on a south border. The seed should be placed in shallow drills and a good dressing of soot applied before raking the soil over the seeds prior to giving a copious watering. As soon as the first rough leaf is made, a portion of the young plants should be pricked off into cold frames, the soil in which should be raised to within 1 foot of the glass. Make the soil very firm, and plant in rows at 9 to 10 inches apart, allowing a distance of 6 inches between the plants in the rows. It is a good plan to plant a row at the foot of the south side of a wall or building, where, during a mild winter, it will furnish a supply of fresh leaves. The seedlings in the seed-bed should be thinned 6 inches apart and the ground kept constantly hoed and frequently dusted with soot. Parsley from early sowings planted out in the spring require all the old foliage to be removed. Apply a light dressing of a reliable artificial manure and some fresh soot, stirring up the soil deeply with the draw hoe between the plants.

Celery.—Celery in all stages is now growing freely. This crop will require much attention and plenty of moisture to bring it to perfection. Carefully remove all the surplus side growths, and attend to the covering of the shoots for blanching. It is a mistake to attempt to blanch too much of each stem at one time. About every succeeding ten days a small portion of either brown paper or fine soil should be added, taking care that the

whole of the leaf-stalks are drawn tightly together and the soil placed firmly. Keep a sharp look-out for the Celery fly, and take steps to destroy the grubs before any serious damage is done.

Cauliflowers.—Late plantings of Cauliflowers should be made secure against strong winds. This can be done by placing a quantity of earth around each stem, well up to the heart, and making it thoroughly firm. Immediately the heads are formed, see that they are carefully protected from the light by placing leaves over them and tying up the outside foliage.

Mushrooms.—Continue to make up beds, choosing, in preference to the Mushroom house proper, quite a cool shed which is not too airy and where the atmosphere can be kept moist. Almost any building on the north side of a wall will be found suitable. Beds may also be made up in the open, but take care to elevate them slightly above the natural level, so that the materials do not become saturated with water. Make them ridge-shaped and place the manure together as firmly as possible. Insert the spawn when the heat is well on the decline, and apply a layer of soil from good fibrous loam to the depth of about an inch. Afterwards cover with a layer, about 1 foot in thickness, of good stable litter.

PUBLIC PARKS AND GARDENS.

By W. W. PETTIGREW, Superintendent of City Parks, Cardiff.

Band performances in public parks on Sundays.—The question as to how far a public body ought to cater for the amusement and recreation of the people on Sunday is one which involves many difficulties, and is a subject that cannot fail—in this country at least—to give rise to a good deal of controversy. That there is a growing tendency on the part of the public to relinquish the old-fashioned ideas as to the impropriety of playing games on Sunday may easily be proved by a visit to a golf course or tennis ground in almost any part of the country on the seventh day of the week. Many golf courses are thronged with players on Sunday, while tennis matches are not by any means uncommon on that day.

So far, I am not aware that either of these games is officially recognised or permitted on Sundays in any public parks in Britain, but such pastimes as bathing, boating and skating have for long been allowed in many public parks on the Sabbath, and recently, in the vicinity of London, it is alleged that football matches are permitted on that day. Although the demand for facilities for playing games on Sunday is not at present very pressing, it is undoubtedly increasing, and in respect to some games will probably have to be faced at no distant date.

With regard to the provision of music on Sundays—which may very reasonably be regarded as cognate to Sunday games, &c.—the demand has already become so great that many park authorities have acceded to it, and Sunday concerts in parks are common. Many people who would not for one moment advocate the introduction into this country of what is known as the "Continental Sunday," have been instrumental in bringing about the Sunday band performance in parks, under the impression that by so doing they were enabling the masses to have an opportunity of hearing good music, which on any other day of the week it would be quite impossible for them to enjoy. Theoretically, this is all well and good, but in practice it does not work out, for, generally speaking, the habitué of the Sunday band performance is the same individual who frequents the week night performances. As far as the convenience to the masses is concerned, it seems as if it would hardly matter whether there were bands in the parks on Sundays or not.

With regard to the ethical side of the question of Sunday games and amusements, park officials do not as a rule bother their heads, but the majority of them are certainly antagonistic on other grounds. In the first place, Sunday games and amusements mean the employment of additional Sunday labour, and the consequent interference with the legitimate rest of the staff. It also introduces a more or less rowdy element into the parks, which would not otherwise be present on Sunday. Under these circumstances, it is but natural that park officials would very much rather be without the Sunday band performance.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, AUGUST 31—Roy. Hort. Soc. Coms. meet. (Lecture at 8 p.m. by Mr. James Hudson, on "The Gardens by the Lake of Como").

WEDNESDAY, SEPTEMBER 1—Carlisle Fl. Sh. (2 days). Glasgow and W. of Scotland Soc. Exh. at Glasgow (2 days).

THURSDAY, SEPTEMBER 2—Nat. Dahlia S. c. Exh. at Crystal Palace (2 days).

SATURDAY, SEPTEMBER 4—Soc. Franç. d'Hort. de Londres meet.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—59.8°

ACTUAL TEMPERATURES:—LONDON.—Wednesday, August 25 (6 P.M.): Max. 67°; Min. 57°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, August 26 (10 A.M.): Bar. 30; Temp. 59°; Weather—Dull.

PROVINCES.—Wednesday, August 25: Max. 63° Oxford Min. 52° N.E. Coast of Scotland.

SALES FOR THE ENSUING WEEK.

MONDAY AND TUESDAY—Great Trade Sales of Dutch Bulbs, at 67 & 68, Cbeapside, London, E.C., by Protheroe & Morris, at 10.

WEDNESDAY, THURSDAY AND FRIDAY—Dutch Bulbs, at 67 & 68, Cbeapside, London, E.C., by Protheroe & Morris, at 10.30.

Intensive Cultivation and French Gardening.

Every form of intensive cultivation is now receiving increased attention, for one of the great problems of the time is to advance production so that larger quantities may compensate for lower prices. But it is not only by magnifying the crops from a given area that success may be secured; there is the question of improved quality, which also demands consideration as a factor in obtaining a favourable balance-sheet. Still another highly-important matter is connected with the need for getting crops of both fruit and vegetables as early as possible in their respective seasons. It is with especial reference to the last-mentioned consideration that the term "French gardening" has come into so much prominence in recent years, though it is too often erroneously employed as signifying intensive cultivation generally. We have long been familiar with the admirable work of our French confrères, whose industry and skill deserve all the praise which they receive. But there are two points which should not be overlooked. One is that their productions are peculiarly adapted to the requirements of their countrymen, and the other, that equally skilful intensive cultivation of a general character has been practised by British market-gardeners and even private gardeners, over a long period. The value of early produce has been

fully recognised, and frames, hand-lights, and hot-beds of manure, have been utilised, notwithstanding that present-day gardeners have become so used to hot-water heating that they were in danger of neglecting the advantages to be got from a good hot-bed. When failure has attended the efforts of our commercial gardeners, it has been much more frequently traceable to other causes than the lack of cultural ability. By all means let us learn the lessons to be derived from our neighbours' practice, but at the same time we must be just to our own growers; some of the sensational articles and pamphlets issued during the past year or two have almost ignored them.

In advocating the introduction of French methods, an important circumstance is commonly overlooked, namely, that the amount of fresh vegetables employed in Paris and other Continental cities, either for salads or in other ways, is enormously greater in proportion to the population than it is here. The custom and taste of the bulk of the populations are totally different, and the British public will need considerable education upon the lines adopted by Mr. Eustace Miles before our consumers will appreciate the early salads to the same extent as Continental folk. Further, to command large and general sales of such produce, the prices must be low; but that is exactly what the so-called "French gardener" in England cannot look forward to with any sense of satisfaction, for he has to meet the heavy expenses which, as even the most sanguine advocates of this system admit, are unavoidable.

As regards labour, the conditions are likewise very different in the two countries. The French market-gardener and his family work longer hours and live more sparingly than do those of the same class here, and a similar remark applies to ordinary labourers. The cost of production is, therefore, greater in England than in France; considerable changes will have to be effected before there is any approach to equalisation in this matter. When it comes to a question of exporting their produce, Continental growers combine more readily than home cultivators to consign it in bulk; hence lower rates of carriage are obtained in lieu of the ordinary prohibitive charges for small quantities.

Despite the difficulties and the mistakes that have already been made by inexperienced growers and by writers who have been somewhat in the position of "the blind leading the blind," the subject is worthy of careful attention by all concerned in the extension of the best forms of intensive cultivation. In the publication of a manual entitled *French Market Gardening*,* Mr. John Weathers has set himself the task of assisting those who wish to understand the principles upon which French market-gardeners cultivate their crops and conduct their business. The author is supported by an introduction from the pen of Mr. William Robinson, who has been for many years an advocate of French methods in gardening. The book comprises 227 pages, of which 65 pages are devoted to general details and the remainder to a description of "Special Cultures," in alphabetical order, with a calendar and good index. Mr. Weathers has done his work in a thoroughly practical manner and has

* *French Market Gardening*. (London: John Murray, 1909.)

produced a manual that is both interesting and useful. He has visited the French gardens and gained much valuable information from the growers themselves.

Statistics, estimates of expenses and returns, and numerous other details, are quoted freely and with striking effect. For example, we are told that around Paris there are 460,000 lights for frames, the largest number in one garden being 1,400 and the smallest number 60. Then as regards the bell-glasses or cloches—so typical of the French system—it is said there are between five and six millions, the largest number in one garden being 5,000 and the lowest 100. Reference is made to a statement by Courtois-Gérard, published in 1844, to the effect that 1,500 acres of land were then devoted to intensive cultivation in Paris, and that this area was cultivated by 1,125 growers. On the next page we are told that the acreage devoted to this purpose at the present time is 3,000 and that the number of growers is 1,300. It is true that most of the old gardens have been destroyed and cultivators have had to go further out from the city, just as has been the case around London, but it seems extraordinary that a period of 65 years should have resulted in an increase of only 175 growers. Again, on p. 6, Mr. Weathers says: "The produce of these market-gardeners is considered to be worth over half a million sterling yearly," which, according to the area given above, is equal to £166 per acre, yet on p. 26 the estimated annual receipts from two acres of French garden are given as £860, or £430 per acre. This astonishing discrepancy needs an explanation, especially as on p. 28 the author states: "So far as the figures for the produce are concerned, the estimates have been based on rather low average prices in the markets." It is wise to give a low estimate of returns in a work of this kind, but the author has apparently followed the same plan in the estimates of expenses, which rather counteracts the good arising from the former procedure. In fact, it is a question which is the more misleading—high estimates of results or low estimates of outlay.

Still, on the whole, there is little room for complaint of Mr. Weathers' accuracy. He has made out a case for French market gardening. There is no doubt that as an adjunct to British intensive cultivation methods the system may render profitable aid to home growers, but it must be applied intelligently and some of the details may need modification.

The Greening of Potatos.

The practice of exposing "seed" tubers of the Potato to light before planting is well known and widely practised, and all who have adopted it are aware of the advantages of this procedure.

Mr. George Masee, Assistant Keeper of Kew, has recently made experiments with a view to determining the reason for the superior results obtained by "greening," as this exposure to light is called. It is, of course, evident to everybody that the light-exposed tuber makes a slower, shorter, sturdier growth than that made by the tuber planted directly beneath the surface of the soil, and since the tuber-forming shoots arise

from low down on the stem, it is advantageous that the region which bears them should not be unduly elongated. The question which Mr. Masee set himself to solve was why does the shoot of the light-exposed tuber make such remarkably slower growth than that made by the dark-grown tuber?

From experiments carried out on recently-lifted tubers—some covered and some exposed to light—he finds that the loss of weight from August 25 to March 25 was, in the case of the uncovered tubers, about $\frac{3}{4}$ ounce; in the covered, $3\frac{1}{2}$ ounces; the loss in weight being due to the formation of shoots, which were rubbed off at frequent intervals.

In another experiment, one batch of tubers was left uncovered and another covered for two months. The loss of weight was determined and found to be considerably greater in the covered lot. Then both were covered till the end of the experiment, when it was found that the batch which had been exposed for two months to the light lost only $\frac{3}{4}$ ounce, and that which had been kept covered lost $3\frac{1}{4}$ ounces.

Hence Mr. Masee concludes that the greatest amount of benefit from "greening" will be derived when it is practised in the autumn immediately after lifting. He points out, moreover, that autumn "greening" will, by causing the formation of a thicker and more impervious skin, tend to check the ravages of winter rot in the stored tubers. A full account of Mr. Masee's interesting paper is given in a recent issue of the *Journal of the Board of Agriculture*.

ROYAL HORTICULTURAL SOCIETY.—The next meeting will be held at Vincent Square, Westminster, on Tuesday, August 31. A collection of Grapes will be exhibited from the Society's gardens at Wisley. Grapes will also be shown from the large vines at Hampton Court and Cumberland Lodge. There will also be exhibited on behalf of Professor SARGENT and the President and Fellows of Harvard University, Cambridge, Mass., U.S.A., a selection of photographs illustrating the flora, fauna and scenery of Central and Western China. These photographs, each of which is $8\frac{1}{2}$ by $6\frac{1}{2}$ inches, were taken by Mr. E. H. WILSON during his last (third) journey to China. Messrs. J. VEITCH & SONS will exhibit at the same time a collection representing some of Mr. WILSON's introductions whilst engaged in their service, from plants growing at their Coombe Wood nursery. At 3 o'clock a lecture on "The Gardens by the Lake of Como" will be delivered by Mr. JAS. HUDSON, V.M.H.

BRITISH GARDENERS' ASSOCIATION.—On Wednesday, September 1, at 6 p.m., a public meeting of gardeners will be held at the Alexandra Hotel, 186, Bath Street, Glasgow. The Editor of *The Scottish Gardener* will occupy the chair, and an address will be given by Mr. JOHN WEATHERS, general secretary. The Glasgow and West of Scotland Horticultural Society have agreed to allow members of the B.G.A. to visit the flower show at the reduced payment of 6d. each on showing their membership cards. On Thursday, September 2, another meeting will be held at the Y.M.C.A. Rooms, Carlisle, at 6 p.m. Mr. W. B. LITTLE will take the chair and Mr. WEATHERS will deliver an address.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—By permission of WALDORF ASTOR, Esq., the gardens at Cliveden will be open to the public on Thursday, September 16, in aid of the funds of this gardening charity.

NEW ENGLAND DAHLIA SOCIETY.—The second exhibition of this society will be held at the Horticultural Hall, Boston, Mass., on September 10, 11 and 12. The secretary informs us that the Dahlia prospects are splendid, and the exhibition is expected to eclipse anything of its kind ever undertaken in America. In connection with the show the society will issue a special number of the *Dahlia News*, containing articles by American, British, German and French contributors. The price is 10 cents. The secretary is Mr. MAURICE FULD, 5, Union Street, Boston, Mass., U.S.A.

NATIONAL DAHLIA SOCIETY.—The first exhibition will be held at the Crystal Palace on Thursday and Friday, September 2 and 3. Schedules and particulars may be obtained from Mr. E. F. HAWES, Royal Botanic Gardens, Regent's Park, N.W.

SMALL HOLDINGS SHOW AT EARL'S COURT.—This show of the products of small holdings in southern and eastern counties has begun to interest the Londoner, and quite a crowd collects about the miniature cottage, the dairy where butter is seen in the making, and the stable, cow-house, cart shed and vegetable exhibition booth. Although there is evidence on every side of the earnestness of the helpers of the movement, of their sincere wish to place the men who may have left the land in exchange for a miserable existence in over-crowded towns, the show here at Earl's Court has its Gilbertian aspect; for example, the miniature cottage garden, with its painted representation of two beehives, but never a bee, its all too tiny dairy and cottage that would scarcely admit a burly farmer at its doorway. But let these stage properties pass, the cow and calves were creditable specimens of their kind, if of dubious breed; the horse, which passed its days in examining the visitors from over the stable hatch, was a nice-looking beast. The haystack in the meadow was real new hay, was neatly thatched with straw, and weighed about 10 cwt. All these sights of country life were of never-ending interest to the visitor. In the vegetable show-booth produce was to be observed from Norfolk, Suffolk, Cambridgeshire, Essex, Wilts. and Bucks. of a surpassingly good quality, more especially the Potatos, of which many old varieties were remarked, as, for instance Myatt's Ashleaf, red-skinned Flourball, a nice eating tuber but very liable to be affected by the rot; Early Rose, white and red Hebrons, &c. Newer varieties were, however, more common and excellently grown. Carrots, the globular Egyptian and tapering-rooted Beetroots, Onions and the red and yellow-skinned Shallots were mostly very good specimens. Cabbages were not so good as we expected to see them, and they seemed to have suffered greatly from the butterfly caterpillar. Cauliflowers were seldom in good condition, and were mostly bad in colour, and had been cut too late to be good eating. We suppose that the major proportion of these culinary vegetables were produced in the field, and not in long-cultivated gardens and by men who are deficient in gardening skill. As time goes on, however, these are matters that will be greatly improved by the small holder as he increases in knowledge. The proprietors of *Lloyd's* newspaper deserve unstinted praise for their inauguration of this novel venture.

A DISEASE OF CINERARIAS.—In contributions from the Wisley Laboratory II. (*Journal of Royal Horticultural Society*, xxxiii., 1908), Mr. CHITTENDEN describes a new disease of Cinerarias caused by the fungus *Coleosporium senecionis*. The rust produces its uredo spores in September, and soon afterwards its resting or telento-spores.

GREENHOUSES AND UNDEVELOPED LAND.—In the House of Commons Mr. HAROLD COX asked the Chancellor of the Exchequer whether land upon which greenhouses had been built for market-garden purposes would be exempt from the undeveloped land tax; and, if so, whether that exemption would be confined to the actual area covered by the roofs of the greenhouses, or whether it would include the land occupied in conjunction with the greenhouses and used for carrying on the same business? Mr. HOBHOUSE stated there will be no such exemption.

"BRITISH FERN GAZETTE."—The first number of this journal, which will contain a series of articles on the varietal forms of our native Ferns, will be issued in September. It will be conducted under the auspices of the British Pteridological Society, and Mr. CHAS. DRUERY, V.M.H., will act as editor. Parts will be issued quarterly; the annual subscription is 5s. Mr. DRUERY's address is Stanwixbank, Shaa Road, Acton, W., who would be pleased to furnish particulars.

THE FLORA OF THE CONGO.—We learn from *La Tribune Horticole* (iv., No. 161, July 24, 1909) that the Minister for the Colonies (Belgium) has requested M. MARCEL LAURENT, of the Botanical Garden at Brussels, to investigate the flora of the Congo.

THE LARCH FLY.—At the sixth annual meeting of the association held in the New School of Forestry at Oxford, on July 13 to 15, Dr. C. GORDON HEWITT gave an account of his investigations on the large Larch Saw-fly, *Nematus erichsoni*. From Dr. HEWITT's observations, it appears that the natural enemies of the fly are increasing in numbers and include parasitic ichneumons, a small vole and a parasitic fungus—a species of *Cordyceps* which attacks the pupa stage. Notwithstanding this increase in the organisms which prey on it, the Larch-fly is increasing and, according to Dr. HEWITT, is likely to continue to be a very serious pest.

THE BRUSSELS EXHIBITION, 1910.—With respect to the paragraph printed in the issue for August 14 (p. 115), we have received a letter from Mons. HEURSEL DE MEESTER, Librarian to the Société Royale d'Agriculture et de Botanique de Gand, stating that the Council of the Ghent Society has not come to any decision on the matter of participating in the exhibitions which will be held at Brussels next year. He states, however, that owing to the co-operation that exists between the Belgian Horticultural Societies, a very large number of Ghent nurserymen will exhibit at Brussels. The previous communication on this subject was sent us by the authorities at Brussels, who appeared to be under the impression that the Ghent Society would continue the centenary celebrations commenced last year. Mons. DE MEESTER states that the Ghent Society is engaged in the reconstruction of its famous 17th century gardens in connection with the next quinquennial exhibition to be held in 1915.

POISONING ATTRIBUTED TO FRUIT OF PRUNUS PISSARDII.—In the issue of *Die Gartenwelt* for July 31, it is stated that a six year old child was taken ill after eating of the fruits of this tree, but recovered after a short time. The doctor who attended believed that the illness was due to the fruit. When cooked with a suitable quantity of sugar the fruits are not unpalatable. Eaten in the raw state they are sour and flavourless, and their high degree of acidity affects the digestive organs in the same manner as do other unripe Plums, more especially when water is taken at the same time, and the digestive juices thus diluted and weakened.

THE POTATO CROP.—The following summary on the Potato crop has been received from the Board of Agriculture and Fisheries. The returns are concerned mainly with crops grown for market purposes:—England, East.—Reports describe the crop as having grown vigorously, and it is feared in some cases too rankly. In many localities there are signs of blight in the haulms, and the tubers are slightly affected, but at present the crop is free from any serious attack. In some parts of Cambridge, Suffolk and Essex the yield is stated to be deficient, but generally it is expected to exceed the average. England, North-east.—A strong growth of Potatoes is reported, and at present serious disease is not general. A Lincolnshire estimator states that 'the crops ran to haulm excessively, and after a few days' sunshine and heat, decay set in. Second earlies are considerably blighted, and the later varieties will fare the best.' Still, satisfactory yields of tubers are looked for in this division. England, South-east.—Reports on the crop are generally favourable, the growth being vigorous and healthy as a rule. In a few districts blight has appeared, but the August sunshine has prevented it spreading. An over-average yield is anticipated generally, prospects being best in Surrey. England, East Midland.—The crop has grown vigorously, and is generally very satisfactory, the fine weather of the present month hav-

every prospect of a satisfactory yield of tubers throughout the division. Wales.—Potatoes have shown a strong and healthy growth, and are practically free from disease. All estimates of the yield place it at average or more, prospects being rather better in the southern than in the northern half of the country. Scotland, East.—A vigorous and healthy crop is reported, the weather conditions since mid-July having been favourable. On some hard lands in Perthshire the crop is said to be deficient, and the yield may be poor in parts of Fifeshire, but generally the return promises to be higher than usual. Scotland, West.—The weather has favoured the crop during the last month, and a strong growth with practically no disease has resulted. Some estimators remark that early varieties have lifted well. The yield promises to be over average."

BLACK SCAB DISEASE OF POTATOS.—We are requested by the Board of Agriculture and Fisheries to remind Potato growers that it is their duty under the Destructive Insects and Pests Order of 1903 to report all outbreaks of warty disease or black scab (*Chrysophlyctis endobiotica*) (see *Gardeners' Chronicle*, July 31, p. 79), on their premises to the Board. The penalty for failing to report the disease is £10. Certain British Colonies now require, with every consignment of Potatoes exported to them from this country, a certificate from the Board to the effect that the Potatoes have been grown in

FIG. 65.—GROUP OF *DISA GRANDIFLORA* EXHIBITED BY MRS. BISCHOFFSHEIM AT THE MEETING OF THE ROYAL HORTICULTURAL SOCIETY ON AUGUST 17.

(See p. 136 ante.)

ing proved very beneficial. The crop appears to be as promising here as in any part of England; practically no disease is reported, and good yields are expected. England, West Midland.—There is a strong growth of haulm, and every prospect of an over-average yield of tubers. The crop is generally free from disease, but reports from parts of Wiltshire and Hereford state that 'earlies' have been more or less affected. Heavy crops appear probable in Shropshire and Worcester. England, South-west.—The Potato crop has come on well, benefiting from the sunny weather, but frequent mention is made of the appearance of disease, which has, in some instances, seriously affected the haulms. In a few localities the yield may be poor, but generally the crop promises to exceed the average. England, North.—The haulms have grown vigorously and come into bloom well, while disease is absent. About an average yield is indicated in Northumberland, but elsewhere the crop will probably be heavier. England, North-west.—The hot sunshine of the first two weeks of August has been beneficial in quickening the growth of the crop and preventing serious prevalence of blight. Here and there the 'earlies' appear slightly affected. There is

a district not infected with this disease. Exporters who require further information can obtain it on application at the offices of the Board, 4, Whitehall Place, London, S.W.

THE HOP PROSPECTS.—According to the Board of Agriculture and Fisheries, the Hops in Kent have been subject to persistent attacks by aphids, and where continual washing has not been carried on there may be no Hops to pick. It is thought by some estimators that the quality may be good if fine weather continues, but a low yield is expected, one estimator even speaking of the crop in his district as the smallest since 1882. In Surrey, Sussex and Hants the continued cold and damp weather of July has made the outlook bad, the aphid attacks having been exceptionally severe. Reports from Worcestershire show that the unceasing attacks of blight have necessitated a persistent washing, but an improvement with the August sunshine is reported. In Hereford many yards are said to be a failure. One estimator in this county forecasts an average yield for his district of $3\frac{1}{2}$ to 4 cwt. per acre, with an outside limit of 5 to 8 cwt. on best soils where the crop has been well washed.

LAW NOTES.

FAILURE OF A FRUIT MERCHANT.

At the London Bankruptcy Court on Friday last, the first meeting of creditors was held under the failure of Mr. John Idiens, formerly a director of John Idiens & Son, Ltd., fruit and coal merchants. The debtor stated that the company was formed in 1900, and was a reconstruction of the original company of J. Idiens & Son, Ltd. In his capacity as director, he guaranteed payment of certain of the company's accounts to the amount of £1,500. In April last the company was in difficulties, and a receiver was appointed on behalf of the debenture holders. Certain of the creditors issued writs, and having obtained judgments, the debtor filed his petition in bankruptcy. Debtor was interested in a patent for cement block making machinery, which he sold for £750. He guaranteed the payment of the purchase of premises at Cheltenham, where the business was to be carried on, the business was dropped, the premises were sold off by auction, and, as the result of litigation, judgment was given against him last July for £1,100 and costs. The debtor attributes his position to the loss of that action and to his liability on the guarantees given on behalf of John Idiens & Son, Ltd. The total liabilities amount, roughly, to £14,700, and the deficiency to £8,999. No offer was submitted on the debtor's behalf, and the case remained in the hands of the official receiver to be wound up in the ordinary course of bankruptcy.

THE HAMPTON COURT VINE.

WHETHER a merit or a demerit, it has been the lot of this fine old vine to have been more often the subject of newspaper paragraphs than any other vine in the world. Happily, the veteran, with its 141 years of existence, bears the notoriety with indifference. But nothing, so long as it exists, will ever daunt the irrepressible energy of the autumn newspaper paragraphists in pressing the vine into copy, or, which is of much greater interest, of damping in any way the intense anxiety of the public, no matter of what nationality, to see this ancient worthy vine, which the people of Great Britain at least regards as a great national asset. If anyone doubt the existence of this interest, he has but to take his stand near the viney on any ordinary day or special holiday, and count the visitors by thousands, all flocking religiously to pay homage to the veteran which ranks to them as the oldest and most remarkable Grape producer of the kingdom. It need be, therefore, no matter for surprise that the care and culture of this ancient vine necessitates or creates material interest and anxiety. Were it to die, the fact would be known throughout the civilised world, and myriads would mourn its loss. His gracious Majesty King Edward may be its legal owner, Mr. A. Mackellar, of Frogmore, the vine's actual custodian, and Mr. Jack, under whose immediate personal care it has been for close on 27 years, may claim it specially; but the British people idolise the old vine so much that they claim it as their own. It is interesting to learn that letters relating to it and asking for information concerning its history and welfare come to Hampton Court from all parts of the globe. What a record is all this for one old, yet so illustrious a vegetable unit! Not many years ago, when the tree had to exist as best it could in its old, cramped house, with tens of thousands of people annually treading the hard, flagged floor beneath it, and raising clouds of dust to coat its leaves and fruit, it was no matter for surprise if it manifested painful evidence of old age and exhaustion. Most happily its downward progress was arrested in time. Under good advice, his Majesty sanctioned the removal of the old house, and its replacement by one loftier, lighter and larger, the removal of the floor flagging and ancient brick flues, the replacement of these offensive features by good loamy soil, and some manurial attributes, and also some severe thinning of wood, all of which, under Mr. Mackellar's wise direction, were so successfully carried out that not a shoot or bud suffered. The vine was replaced on to its new supports, and its roots received every encouragement to find food and nourishment in the new soil environment. To-day the success of all this liberal treatment is most abundantly manifested. But a few years ago the poor annual growths could barely produce from 6 oz. to 8 oz. bunches, and these coloured badly, and were, indeed, a poor sample. Now the vine is carrying bunches weighing from 2 lbs. to 2½ lbs. at least, perhaps even heavier, the berries of full size, black as Sloes, perfectly free from dust, and worthy now to be indeed the dessert of a king. Myriads of young Black Hamburgh vines to-day cannot show such capital sample bunches as now hang in the Hampton Court viney. Wood growth and leafage are first-rate also. That so remarkable a renovation or re-suscitation should have happened to a vine of such great age is, indeed, remarkable; for it must be understood that wherever its roots may be, they could not be lifted, as those of younger vines may be. That new roots are rapidly developing within the floor of the house itself is the belief of its custodians. Open trellises are laid where needed, hence the soil is not anywhere hard trodden. At the present moment, the floor is coated with some 2 inches thickness of well-trodden manure from the park paddocks, and, as this gradually decomposes, it will doubtless furnish valuable food next year. It may be re-

membered that the stem of the vine near the ground is 5 feet in circumference; but, old as it is, its bark is clean and of as robust health as it is possible for any vine to show. That at such a remarkable age it should be found possible to so wonderfully restore to almost youth and health this national vine is, indeed, matter for warm congratulation. It is just possible that a few bunches from the vine may be exhibited at Vincent Square on Tuesday next. A. D.

FORESTRY.

PIONEERS IN FORESTRY.

THE unprecedented interest which has been exhibited in the publication of the report on afforestation must, in one aspect, be regarded as simply a culmination of what has exercised the minds of many for a period, the length of which can hardly be estimated with certainty. The care of woods and the making of laws regulating the planting and tending of forest trees occupied the attention of kings and their counsellors in very early times. True it is that these laws were seldom enforced, and only here and there was due care taken of existing woods, while the laws which were thought sufficient to ensure an unbroken supply of timber would be deemed insufficient in these days. In Queen Elizabeth's reign several forestry laws were made, and it is about this period that the earliest writings on forestry of which we have record were published; though it must be conceded that these early British writers laid the works of Continental authors under considerable contribution. Olivier des Serres, indeed, exhibits, in the *Théâtre d'Agriculture*, an extensive knowledge of forestry which we discover later writers in England to have carefully studied. Lawson, a Yorkshire squire, gives a picture of the state of forestry 300 years ago which is as black as could be painted. Yet if we are to credit Blith and Evelyn, there were landed proprietors who managed their woods with much wisdom and with great advantage to themselves; the father of the last-named being one of those enlightened people who cut and replanted systematically. He blamed the governing classes during the Commonwealth for wantonly destroying trees; but against Evelyn's assertion must be placed the undoubted fact that Cromwell encouraged tree planting, and that Blith, a Republican officer, effected not a little by his individual labours. It is fairly clear that in Charles I.'s time planting progressed more steadily than it had ever done previously, and not improbably the days of the usurpation saw only a renewal of that policy. In Charles II.'s reign there was a continuance of it, largely, no doubt, on account of Evelyn's *Sylva*, which, it should be observed, was not so much the expression of the views and the experiences of an individual as the gathering together of the knowledge of the country at large on this matter, a point which he himself freely admits. Evelyn was, perhaps, the earliest to observe the disadvantage of planting woods with trees several years of age, though there is a hesitation to condemn the custom outright. The method of sowing Acorns and Chestnuts in furrows is very like that pursued on the Continent at the present day. Evelyn saw clearly that wood for profit must be planted on ground of little value agriculturally, and was aware that even the Oak, which was the chief timber tree of the period, was by no means particular as to soil. What strikes one is the small esteem in which he holds Conifers. The Scots Fir was known to him only through some young plants which he had raised from seeds sent him by Lord Argyll, who seems to have been a better forester than an ornithologist, if we are to judge from the laughable episode of Evelyn's turtle doves which he took for owls!

Contributory aids to tree planting on a large scale were the magnificent schemes introduced by Le Nôtre in the laying out of grounds. London followed on the same lines, and, accepting Switzer as authoritative, every important place in England was dominated by him or his partner, Wise. Cooke, who was associated for a while with London, held similar views, and wrote a somewhat popular work on forestry, but much inferior to that of Evelyn, who continued to be the accepted authority for a very long period.

Tree planting in Scotland was carried out on much the same lines as had obtained in England previous to the adoption of the above-mentioned methods, till about the year 1700, when, or shortly after, a new era in forestry commenced, and, instead of planting a few acres in close proximity to his dwelling, the Scottish laird made large levies on outfield, moor, and bog, and planted hundreds of acres. The sixth Earl of Haddington and his countess were admittedly the pioneers in this great work; but their example was rapidly followed by many others, thus demonstrating the existence of a general desire to engage in schemes of estate improvement. This nobleman gave, in a short treatise, the results of his experience to a limited circle of friends, and, in a letter to his grandson, some additional facts, which show that forestry was engaged in not merely as a means to produce timber, but also as a kind of landscape gardening. This letter was written in 1733, and describes the laying out of a wilderness with 14 walks radiating from a circle, each one with its peculiar termination. It also tells how a large piece of barren sand close to the sea was successfully furnished with healthy trees, and explains how a wood was laid out, one or more centres being chosen, and from these wide and straight drives were extended in every direction, besides narrow walks, which were curved or serpentine, and here and there open lawns. < But the great value of these two treatises consisted in the clear and succinct directions they gave on raising, planting and pruning trees, some of the methods being such as might well be adopted at the present day. To some extent Lord Haddington broke away from the old practice in cultivating the land previous to planting; but one gathers that he had a decided liking for deep cultivation notwithstanding. To large plants he had a decided objection, and not only Conifers, but hardwoods were planted when quite small. His system of drawing the roots of two-year-old Firs through a solution of soil and water previous to planting is well worth imitation for spring planting, and, as compared with the digging out of large holes, which, previous to his time, was customary, with the absolute necessity of applying water to establish the trees, the advantages of the former method are, obviously, immense. Another important fact was discovered—but he gives Lady Haddington the credit for this—in the admirable way trees thrive to the very limits of the land on the sea-shore, and he confirmed the proposition that Evelyn had made that Oaks and other timber trees are not particular as to soil so long as it is not shallow—many acres having been planted in sand, in which they grew with vigour. The first-mentioned of these treatises was published in book form in the year 1756, again in 1760, 1765, and in 1766, and forms part of a collection of works on rural economy. Its title is *A Short Treatise on Forest Trees*. The other was published in 1761, and is entitled *A Treatise on the Manner of Raising Forest Trees*. It is embellished with an engraving showing the method of fencing, and it is curious that this engraving varies in different copies. It is padded to book proportions with two essays by Buffon. Till the commencement of the last century these exhaust the original works on forestry, though the subject is treated in not a few books, and Boucher, in 1775, published his work on trees in which there is a reversion to planting over large specimens. B.

THE SWEET PEA SEASON.

THIS has been—in British gardens at least—a record year for the Sweet Pea. During the last three weeks (I write from Kilmalden Manse, N.B., on August 23) atmospheric conditions have been supremely favourable to the floral development of the finest and most fragrant of annuals.

Many of the older varieties of the Sweet Pea are rapidly disappearing, before the advent of newer and larger creations. This is inevitable, so long as we have so many earnest hybridists working assiduously to surpass the achievements of their predecessors, with finer results. Scarlet Gem, for example, has been practically superseded by Queen Alexandra, which is brighter in colour and somewhat larger in size. Though Dorothy Eckford has not yet been vanquished and driven from her throne as queen of the pure whites by Etta Dyke, yet there is, through the inordinate worship of crenulation, some danger of this. I have heard it sometimes asserted that Dorothy, though a splendid Sweet Pea, has almost too much substance, and is not refined in aspect when compared with her great rival, which, while equally commanding in dimensions, has more of a silken or silvery appearance. I have both varieties in my garden this year, and though I am greatly attached to Dorothy Eckford, and have assigned her the most picturesque situations (in one instance flowering exquisitely through the branches of *Magnolia Watsonii*, in another aspect revealing her snowy whiteness amid the long leaves of an *Ailanthus*), I cannot altogether deny the truth of this affirmation. But Dorothy Eckford is so reliable, and, at the same time, so grandly ornamental, as to be, under any conditions of "crenulated" evolution, quite indispensable.

Among the most valuable of the modern waved varieties are Helen Lewis, sometimes termed the Orange Countess (Spencer); The King, an immensely large and luminous derivative from King Edward VII.; Mrs. A. Ireland, a very beautiful Sweet Pea, somewhat akin to Florence Morse Spencer; Mrs. Henry Bell and Evelyn Hemus, highly-endowed sisters, with a margin of pink on the creamy petals, which is richly effective; Mrs. Bantzahn, which I regard as considerably less distinctive and a beautiful reversion from these towards the original type (the Countess Spencer); Asta Ohn, the grandest of all the waved lavender forms, from far California; Mrs. Harcastle Sykes, of tender pink hue, closely affiliated to Queen Victoria; The Marquis, a glorious heliotrope flower of great fascination; John Ingman, deep rose-carmine in complexion, and imposing in dimensions; Nora Unwin, an exquisitely refined, pure white; and the peerless Etta Dyke, already characterised.

Of varieties that have not yet been "Spencerised" are Dobbie's Mid-Blue, and the most fascinating in its singular beauty of all American introductions, viz., Helen Pierce, of which the former, as I have already learned from observation, requires a fine environment for its adequate effect. This also is essential to the full artistic effectiveness of my Parma Violet-coloured Eckfordian namesake (at present being crossed with the Countess Spencer in California by Mr. Henry Ohn), which requires to be planted between scarlet and white.

During last winter I had the pleasure of receiving from Mr. Lester Morse, of the Santa Clara Nurseries, San Francisco, a number of un-named Spencerian hybrids, which I gave to my friend, Mr. David A. McClew, factor on the Logan estates in this parish and one of the most successful Sweet Pea cultivators within the range of my acquaintance. Almost every seed of these Californian hybrids germinated with him at Chapel-Rossan, and, while the floral results are in every instance highly interesting, several of them are extremely beautiful, and may be regarded as decided acquisitions. Their colours range from deepest heliotrope and palest lavender to purest white. *David R. Williamson, August 23.*

PROTEAS.

It is notorious that the Cape Peninsula possesses one of the richest floras in the world, including many plants both interesting and beautiful. Among these none can excel or surpass the various species of *Protea*. Of ancient lineage, the genus *Protea* comprises 60 species, the majority of which are distributed throughout South Africa, extending towards Central Africa and adjoining territories. Many of these plants live in regions where long, dry summers are prevalent, and as they are neither succulent nor bulbous, their xerophytic habit is shown in their leaves. These meet the necessity of reducing transpiration in a variety of ways, for instance, by the reduction of the leaf surface or by a thickening of the cuticle; whilst others present the edges of their leaves to the sun's rays. To this endless variety of form the genus owes its name, in allusion to the sea-god Proteus (of the Grecian mythology), who delighted in constant change of form. The species occurring on the peninsula number 10, and their chief beauty lies not in the flowers, but in the coriaceous, imbricate bracts which surround them.

PROTEA SPECIOSA, a handsome shrublet attaining a height of 3 to 4 feet, bearing obovate leaves 3 to 4 inches in length of a glossy green and firm texture, occurs on Table Mountain at elevations of 2-3,000 feet, and is comparatively rare. The flower-heads are large and somewhat cone-like, 4 to 6 inches long, 3 to 4 inches in diameter, the scales being of a pale, fleshy mauve, incurved and bearded, with brownish hairs at the apices.

P. SCOLYMUS, one of the smallest of the genus, abounds on the sandy stretches in the vicinity of Cape Town, and is easily distinguished from its congeners by its dwarfer habit, never exceeding 3 feet, with lanceolate, linear leaves 2 to 4 inches long and flower-heads 1 to 2 inches in diameter, and, when expanded, of a pleasing yellow, whilst the surrounding bracts are obtuse and ferruginous.

P. MELLIFERA.—The Sugar bush of the natives—so called on account of the flowers containing a large quantity of nectar, which is duly appreciated by the juvenile flower-gatherers—in company with *Protea lepidocarpon* and *P. incompta*, clothes the hill and mountain sides in such profusion and quantity as to completely exclude the dwarfer vegetation which at some former period existed there. Of handsome appearance, this 6 to 8-foot shrub, when flowering, excites the admiration of all those who seek the pleasures of a mountain stroll. The colour of the flower-heads vary greatly, the acuminate bracts are sometimes white or pale lemon-yellow, becoming gradually of a vivid crimson-red at the apex. Their appearance is greatly enhanced by their transparency and shininess, due to the innumerable honey-glands which dot the surfaces of their tissues.

P. GRANDIFLORA, the Waage-boom of the Colonist, is a small tree 8 to 12 feet, the wood of which furnishes excellent fuel, and hence is eagerly sought. It has a rather straggly habit, the lower branches being perfectly bare, whilst the glaucous leaves are borne in clusters in the axils of which the flower-heads eventually appear. These, when expanded, average 3 to 5 inches in diameter, and in this case the bracts are insignificant, the numerous white stamens forming the conspicuous features of this plant.

P. CYNAROIDES, appropriately termed the "Pride of the Cape," resembles *P. speciosa* somewhat in appearance, though the flower-heads are by far the largest in the whole genus, measuring at times 6 to 8 inches across. The bracts are acuminate, externally of a pale, fleshy pink, whilst internally of a creamy colour. The leaves add greatly to the charm of this species, being uniform-round and of a rich green, whereas the petioles are favoured with a rosy colour. Flowering amongst a chaos of *Staavia*s, *Brunias*, *Ericas*, *Cliffortias*, and other vegetation peculiar to the Cape, this noble plant and its congener offer a

picture well compensating for the arduousness of a Table Mountain climb. *P. cynaroides* provides a striking example of the extent to which a plant varies when grown at different altitudes or when cultivated under different conditions. This *Protea* occurs also on the so-called flats, lying at altitudes of 50 to 100 feet above the sea level. The flats are of a very sandy nature, approaching the sea sand in colour and remarkably deficient in humus. Here this plant becomes acaulescent; the flowers, if any, are poor, nor do the leaves attain the size and consistency of their more fortunate companions. As illustrating its differentiation in cultivation, I may mention that, when on a visit to the Royal Gardens, Kew, that splendid institution of which every Englishman is justly proud, I saw in the temperate house a plant which struck me as being vaguely familiar, and on glancing at its label I read *P. cynaroides*. Surely, said I to myself, this plant inclining to a scandent habit and bearing narrow, lanceolate leaves is not our robust 2 to 4-foot friend at the Cape? But yes, after a closer inspection I was able to detect the resemblance, though not without some misgivings. This was not the only case, for, amongst the succulents, similar cases were noted, notably *Euphorbia Caput-Meduse*.

P. CALOCEPHALA has been reported from the Cape Peninsula, but is doubtless now extinct, for in my wanderings I have never come across it within the limits of this region. In habit it favours *P. mellifera*, as also in the flower-heads, the bracts being more obtuse and ciliated on the margins and possessing a remarkable range of colours from pale creams to dark purples.

P. ACAULIS, the stemless *Protea*, as the specific name denotes, consists of three to five spatulate leaves 3 to 6 inches in length and 1 to 2 inches broad in clusters, amongst which the sessile hemispherical head, 1 to 2 inches in diameter, appears. Its colour is of a dingy yellow, and has therefore little of beauty to commend itself to the cultivator.

P. LEPIDOCARPON is a shrub resembling *P. calcephala*, bearing lanceolate leaves 3 to 5 inches long and $\frac{1}{2}$ inch broad, the inflorescences having a peculiar charm of their own. The bracts are brownish at the base, gradually merging to a dark, velvety black at the incurving apex, forming a fluffy, hairy ring, so conspicuous a feature of this notable species.

P. INCOMPTA, a peculiar and most desirable species, is somewhat smaller in size than that aforementioned, but with broader foliage. Both the longer growths and leaves are thinly pilose. In this instance the bracts surrounding the flowers are sappy green, eventually changing to a snowy-white tomentum at the apex.

P. COCCINEA is a shrub which is rarely met with, and hence is practically unknown to cultivators. In growth and leaves it resembles the preceding species, the inflorescences partaking of the form of *P. speciosa*, but smaller and of an exceptionally attractive scarlet colour.

Notwithstanding their great claims to attractiveness and beauty, these plants, as well as their allies, such as *Leucadendron argenteum*, *L. decorum*, *L. ascendens*, *L. floridum*, &c., *Leucospermum*, *Serruria*, *Brabejum* species, and others too numerous to mention, have not received the attention and merit they unquestionably deserve. Many have been introduced to cultivation, but are now rarely met with, and the question arises, why is this? Is it due to the unfavourable climatic conditions prevailing in this none-too-sunny isle, or to a wrong composition of soil, or to fungal diseases? The first question must be answered in the negative, for are there not excellent specimens in cultivation of plants which grow side by side in their natural habitat with the representatives of the Order Proteaceae, viz., *Agathosma rugosa*, *Coleonema alba*, &c.? The plants flourish in the most varying soils, and, as before cited, the same species is often found growing in white sand, with scarcely a touch of leaf-soil and in other

localities in a composition resembling English loam, though not so tenacious, broken slate and a liberal dash of gravel. The third question concerns the only disappointing feature of the plants of this Order, that is their tendency to die suddenly in the midst of their glory from no apparent cause whatsoever. It is this peculiarity which makes the cultivation of *Leucadendron argenteum* (the Silver Tree) extremely difficult. Such cases of sudden death have occurred in the gardens of Cape Town, where several plants, 15 to 20 feet in height, in excellent condition and planted in different positions, have succumbed one after the other within a week. In my opinion, this may be due to the mycelium of some fungus attacking the tissues of their roots—a problem the solution of which awaits the pathologist. Proteas require the conditions of a well-ventilated greenhouse with full exposure to sunlight, but during the summer they should be placed out-of-doors. Most of them thrive only in well-drained, sandy peat, and they are induced to flower freely by allowing them to become pot-bound after they have grown to the required size. Their propagation is effected by

PRUNUS PISSARDII FRUITING.—I am sending a fruit of *Prunus Pissardii*, from a standard tree growing in an exposed position in this garden. The tree was planted four years ago in a stiff clayey loam, and has been pruned at the same time and in the same manner as Plums, but not as generally practised after flowering. *John Edwards, The Gardens, Sylfaen Hall, Welshpool.*

BEGONIA "RUST"—If your correspondent Mr. H. Wood (see p. 106) will fumigate his Begonias with the solid dry cake Al fumigating compound at intervals of about 10 days for a few times he will entirely rid his plants of the Begonia mite. *J. Pitts, Pett Place Gardens, Charing, Kent.*

PRIMULAS FOR THE WILD GARDEN (see p. 122). Though it is true with Primulas seeding themselves, that they are apt to produce a crowd of seedlings which some persons may think require thinning, yet if left entirely alone the effect will be natural and wild to an extent which no art can rival. There is a wild garden near here where *P. japonica* has seeded itself in the water of the ditch draining the bog garden, the flowers producing a mass of colour which must be seen to

herewith photographs of a street of Pear trees. We need not point out to you what a feature such a street is during the spring, and, with your correspondent, should like to see such planting more general in this country. So far, we have had very little trouble through damage; our first street was planted four years ago. Arbor Day has proved a great success here. *First Garden City, Limited, Letchworth, Herts.*

A VILLAGE GARDEN COMPETITION.—I was pleased to read Mr. Wright's remarks on this subject on p. 134. C. J. Fletcher, Esq., of Dale Park, near Arundel, has offered prizes to persons on his estate having the best-kept gardens for several years past. These are not judged on quite the same lines as those at Old Warden Park. The general appearance as a whole is first regarded. This year the judging was on August 19. Some of the gardens were remarkable for the profusion of bloom, cultivation of vegetables and absence of weeds; indeed, they could not well be improved upon. *A. Gooden, Burton Park Gardens, near Petworth.*

CALANDRINIA CHROMANTHA.—I am altogether disappointed with the flowers of the new annual *Calandrinia chromantha*. Though numerous and pale rose-coloured, the flowers hardly open, and are so tiny, not exceeding the size of a pin's head, that they make no effect at all, even in a bed filled with freely-branching plants. The first flowers to open are already setting their small yellow fruits which, if produced in quantity, may be pretty. I am also anxiously expecting the flowering of the rampant-growing, annual creeper from the Himalayas (*Dicentra torulosa*) sent out last year by Messrs. Vilmorin. It is now growing all over the plant at the rate of an inch and a half a day. *W. E. Gumbleton, Belgrove, Queenstown, Ireland.*

APHIS AND GALLS.—Recently, while pruning Lombardy Poplars, I noticed numbers of galls formed on the ribs and petioles of the leaves. From a distance the trees appear to be bearing rose-coloured fruits. Apparently only the galls that are green and those in process of formation contain the mites. When a gall is vacated by the mite, a colony of aphid immediately takes possession, using the interior of the sac-shaped gall as a breeding chamber. I have no doubt that when the leaf falls many aphid are preserved alive by remaining snugly ensconced through winter's cold until they emerge again in spring. *L. Simms, Arundale Road, Palmer's Green, N.* [The purse-gall of the Poplar is caused entirely by the aphid, *Pemphigus bursarius*. The mature females or stem-mothers vacate the galls in late summer, survive our winters' frost and cold, and on the return of spring start fresh colonies in the same kind of situations as their progenitors. The acarids seen were either Inquilines or the larval stage of the aphid.—Eds.]

FIG. 66.—SAXIFRAGA BURSERIANA "GLORIA": FLOWERS WHITE.

cuttings of the half-ripened wood inserted in sandy peat under a bell-glass, or by imported seeds; though the seeds, for the most part, are generally infertile.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

"SWEET PEA STREAK."—This disease has been very prevalent this season, and as it has appeared on plants growing in all kinds of soils and under various conditions of culture, I think it may be propagated in the seed like the Tomato disease. I suggest that the seeds be steeped for a short time before sowing in sulphate of copper. The remedy is used at seed sowing with success for smut in Wheat. *George Bunyard, The Royal Nurseries, Maidstone.*

CULINARY PEAS.—Mr. Francis (p. 108) mentions a few good varieties of Peas, but he has left out one of the very best, namely, "Criterion." Here, at Laverstoke Gardens, are several rows of this variety, which for continuous bearing, heavy cropping, and flavour is ahead of all other kinds I know. *N. Kneller, Home Farm, Laverstoke, Hants.*

be realised. On a dry, marly bank nearly 100 yards long, plants of the common *Polyanthus* have seeded, the seedlings appearing in hundreds all over the bank, the edge of the path, and the neighbouring grass. Some have appeared amongst such plants as *Iris pumila*, and give to their surroundings the appearance of a wild bank, or a bit of a mountain-side. *Basil Levett, Wychnor Park, Burton-on-Trent.*

APPLE DEWSON OR DEWTSOON.—May not the correct name of this Apple (see p. 130) be *Hambleton Deux ans*, a large, late variety? About 30 years ago, a correspondent, writing in the *Journal of Horticulture*, stated that while travelling in Dorset he was impressed with a great crop of Apples, and enquiring the name of the variety, was told it was "Duson." This, after much searching, he found to be the Apple named above. *S. Jones, Chase Side Cottage, Everley Park Road, Winchmore Hill, N.* [We have received several other communications which confirm the opinion expressed by Mr. Jones.—Eds.]

FRUIT TREES IN STREETS.—We were interested in Mr. Boelter's note in the issue for August 14, p. 118, with reference to fruit trees in streets and the institution of an Arbor Day. We have celebrated our second annual Arbor Day, and we have also four streets planted with fruit trees. We send you

SAXIFRAGA BURSERIANA "GLORIA."

This is the largest flowered of the many beautiful varieties of the species, which comes from the Eastern Alps of Europe. It was exhibited at the meeting of the Royal Horticultural Society, March 19, 1907, by the Craven Nursery Co., and was given an Award of Merit by the Floral Committee. Hitherto, *S. burseriana* major was the largest form of this popular rock plant, which often is in flower in February. The older variety has much shorter stems than the one under notice, but in both the sharp-pointed, glaucous leaves forming tiny rosettes in dense tufts attain to a larger development than any of their congeners. The typical *S. burseriana* comes into flower in March, and has rather smaller flowers and rosettes of leaves; the latest of all to flower—in April—is the variety *macrantha*, which has still smaller rosettes of leaves. These varieties of *Saxifraga* are liable to have the beauty of their flowers marred by rains and inclement weather of the early months of the year, for which reason glass should be placed over the plants when coming into bloom. Excellent results may be obtained by growing this *Saxifraga* in a pan in a cold frame. A compost of very gritty loam is suitable for this species, and the pots should be provided with abundant material for drainage. *W. L.*

IBERIS GIBRALTARICA.

NOWHERE is this Iberis seen to such perfection as in its native home on "The Rock" of Gibraltar. Looking out from the pierced holes in the "galleries," which formerly guarded the north front, one gazes down a sheer perpendicular precipice of many hundreds of feet. Growing at various elevations out of the face of the living cliff, apparently without a particle of soil in their vicinity, are numbers of splendid plants of *Iberis gibraltarica*, many of them over 3 feet across and sheets of flower. The sight of these plants remains an abiding remembrance, and furnishes a hint of how it should be grown in our own country—in a perpendicular position and in a compost consisting chiefly of stones. It may sometimes be seen doing fairly well in ordinary loam in a flat border, but never exhibits such perfect health as when grown among stones placed one above the other or at a very acute angle. The plant here illustrated (fig. 67) is exceptionally fine, being 4 feet across and smothered with flowers. It is growing among rough stones at the edge of a path, and is planted in grit mixed with small stones. A position where it may hang over an upright rock or bank is preferable, both on the score of appearance and for the health of the plant. Seedlings are better than specimens struck from cuttings, and are more likely to succeed if planted in as small a state as possible. Seedlings an inch in height, if set in upright crevices between rocks, soon grow away, and flower profusely the next year. In a perpendicular cutting through a stony bank about 50 seedlings under an inch in height were planted. They were set in among the stones, about a foot from the top of the cutting, grew vigorously from the very first, and made a very pretty picture when in full flower. Plants sometimes die after blooming, but they can be easily replaced. This *Iberis* is certainly the finest of the perennial Candytufts, its lilac-mauve flowers being often as much as 3 inches across. It cannot be considered absolutely hardy, except in the south-west; but in the colder districts it proves a good greenhouse subject, and may be kept in a frame until it comes into flower. Other perennials of this family are *I. correaefolia*, *I. Pruiti*, *I. saxatilis*, *I. semperflorens*, *I. sempervirens*, and *I. Tenoreana*. *Wyndham Fitzherbert.*

SOCIETIES.**ROYAL HORTICULTURAL.****Scientific Committee.**

AUGUST 17.—*Present:* Mr. E. A. Bowles, M.A., F.L.S. (in the chair); Messrs. J. T. Bennett-Poe, J. Douglas, L. Crawshaw, J. Frazer, G. Gordon, A. Rolfe, G. Saunders, and F. J. Chittenden (hon. secretary).

Variation in seedling Carnations.—Mr. J. DOUGLAS, V.M.H., showed numerous flowers of seedling tree Carnations raised from seed saved from self-coloured varieties. He pointed out that among them were several singles in the proportion of about 12 per cent. of the whole, but the greatest peculiarity lay in the large number of striped flowers which were produced. The parents were white, pink, or red, but among the progeny was one with yellow flowers striped with purple.

Proliferation in Campanula.—Mr. BOWLES showed specimens of *C. persicifolia* with axial proliferation, a number of green foliage leaves growing from the centre of the flower. Some of the shoots, which were from the garden of Mrs. TROTTER, Hill House, Wormley, also showed fasciation.

Gerbera not flowering.—Heads of *Gerbera* were received, the sender thinking they were from a plant of *Gerbera Jamesonii* which had failed to produce flowers before seeding, but the heads were from *G. Kunzeana*, a plant from the Himalayan region, which does not open its flower-heads to any extent.

Potato with aerial tubers.—From Mr. BEVAN, of East Finchley, came Potato stems bearing

tubers in the axils of the foliage leaves, a condition of things which frequently follows from injury to the soft bast tissues preventing the downward flow of food from the leaves.

Double Sweet Peas.—Mrs. A. P. RIGBY, of Pentre Mawr, Trefnant, N. Wales, sent several flowers of Sweet Peas having two or three standards instead of but one. The variation had occurred last year, and seed had been produced from the flowers, which had this year given rise to a proportion of plants bearing double flowers. Other varieties than the first-named had also produced double flowers this year.

Wheat-ear Carnation.—From Mr. B. NASH, of The Gardens, Oakleigh, Cheam, came specimens of the Wheat-ear Carnation, which, instead of flowers, bears a long series of bracts repeated again and again.

East African Sandal Wood.—Mr. F. H. SEED, of the Agricultural Department, Mombasa,

British Alpine plants.—Mr. J. FRASER, F.L.S., showed a flowering plant of *Saxifraga cernua*. The plant bore six flowers and some buds. It was 7 inches high and had 10 stems arising from the base. It had been collected at the top of Ben Lawers, and is very rarely seen in cultivation. Numerous bulbils were borne in the axils of the stem leaves, and it is by these the plant is propagated. He also showed *Draba rupestris* flowering for the second time this year, and flowering specimens of *Salix Arbuscula herbacea* (flowering for the second time this year), and *Alchemilla alpina*, the latter having flowered continuously since May.

DUMFRIESHIRE AND GALLOWAY HORTICULTURAL.

AUGUST 14.—The annual show of this society was held in Cresswell Park, Dumfries, on this

FIG. 67.—A FINE CLUMP OF *IBERIS GIBRALTARICA*.

British East Africa, sent seed of the East African Sandal Wood tree (*Brachylaena* sp.), called by the natives "Muhugu." "The seed," writes Mr. SEED, "is as light as Thistle-down. The natives reported that this tree did not produce seed, but it was found that the Thistle-down lightness of the seed caused it to be caught on the tops of the long native grass and undergrowth. The Forestry Department has now arrested this loss by clearing the ground around the trees, so that the seed will reach the earth. The tree is considerably larger than the Indian Sandal.

"One square piece and two small plants were sent to be valued in Bombay Market during the year 1908, and an order was received from a merchant there offering half-a-guinea a cubic foot."

date. There was a good attendance at the opening ceremony, which was performed by Lady M'Taggart Stewart, Southwick.

The exhibition, as a whole, was an advance on its predecessors, with the exception of the one held to celebrate the jubilee of the society. A new competition this year was for the Malcolm Dunn Memorial Medal, presented, with a sum of money, by the Dunn Memorial Trustees. It was offered for a collection of vegetables, and was open to growers in the three south-western counties of Scotland. Four persons competed, the vegetables being of excellent quality considering the backward season. The medal was awarded to Mr. J. M. Stewart (gardener to J. NEILSON, Esq., Mollance, Castle Douglas), who gained 35 points; the 2nd prize was won by Mr. R.

MIDDLETON, Kirkcudbright, who totalled 30 points.

The Dumfries Town Council offered a Challenge Cup for the best table of plants, and this, also, was won by Mr. STEWART, his keenest competitor being Mr. R. A. GRIGOR (gardener to T. RANKIN, Esq., Dalswinton), who gained the 2nd prize.

The Sweet Pea classes were well contested, and the exhibits included many fine collections. The leading competition was one for 12 groups, the 1st prize including a Silver Cup, given by Messrs. James Service & Sons, Dumfries. Close competition prevailed, but the judges awarded the cup to Colonel GORDON, of Threave, Castle Douglas (gr. Mr. James Duff); 2nd, Mr. R. A. GRIGOR.

Exhibits of Roses were good, although not numerous. Messrs. T. SMITH & SON, Nurserymen, Stranraer, secured the leading prize in the open class, having fine blooms.

Exhibits of other cut flowers were generally good, with the exception of Asters. The principal prize-winners in the gardeners' and open classes were Mr. J. WILSON, Summerville Gardens, Dumfries; Mr. R. A. GRIGOR; Mr. J. HENDERSON, Elmbank Gardens, Dumfries; Mr. C. MURRAY (gardener to H. KESWICK, Esq., Cowhill); Mr. W. ANDERSON, Collin; Mr. D. WHITE-LAW, Lochbarbriggs; Mr. B. RUTHERFORD, Glenlair Gardens, and Messrs. J. and W. TWEEDIE, Monswald.

Pot plants showed an improvement upon those exhibited last year, and the principal winners for these were: Mr. R. A. GRIGOR, Mr. C. MURRAY, Mr. J. M. STEWART, Mr. J. WILSON, and Mr. D. J. MAXWELL.

Fruit was not largely represented, but some good dishes were staged. Mr. J. M. STEWART was awarded the 1st prize in the class for a collection of six kinds; 2nd, Mr. B. RUTHERFORD, Glenlair. Other prize-winners in the fruit classes were: Mr. JAS. DUFF, Mr. R. A. GRIGOR and Mr. W. SCOTT.

The leading prize-winners in the vegetable classes were: Mr. J. M. STEWART, Mr. J. MORRISON, Mr. W. SCOTT, Mr. R. A. GRIGOR, Mr. J. HENDERSON and Mr. J. DUFF.

The secretarial arrangements were again under the care of Mr. R. G. Mann.

HEMEL HEMPSTEAD HORTICULTURAL.

AUGUST 18.—This Society celebrated its jubilee on the above date by an exhibition which, in point of size and excellence, surpassed all its 49 predecessors. The show was again held in the picturesque Bury grounds. Only fine weather was needed for an all-round record success. Unfortunately, the weather was unfavourable, and so much rain had fallen that it was at first deemed advisable to postpone the sports which had been arranged. However, the weather was more settled as the afternoon approached, so that it was ultimately found possible to carry out the programme.

The exhibits were staged in three large marquees, and a high standard of excellence was maintained in each of the sections. A special and pleasing feature of the exhibition were the numerous non-competitive exhibits which practically occupied the whole of one marquee. Amongst these were two groups of hothouse plants, exhibited by Mr. T. NORTON LONGMAN, Sheidish (gr. Mr. G. BIFFOWS), and Mr. F. P. COLLIVER (gr. Mr. T. PIGG), respectively. Near these groups were two others staged for competition by the Mayor, Mr. J. R. DRAKE (gr. Mr. Barker), and Mr. J. KERR (gr. Mr. Avery). Each of these groups displayed much taste. Mr. KERR secured the premier prize and the 2nd award was given to Mr. DRAKE. The former group included *Dracaenas*, *Hydrangeas*, *Fraxinea ramosa*, *Celosias*, *Catadiams*, *Acalyphas*, *Lilios*, and *Crotoms*, with a magnificent Palm at the rear. Similar plants figured in the Mayor's group; a large Palm was used as a background, and an appropriate border was made with *Adiantum*. Mr. W. FODEN staged a beautiful collection of flowers and floral designs as an honorary exhibit. Mr. DENBAR staged a large number of Ferns and Palms in another portion of the marquee. Messrs. H. LANE & SON, Berkhamsted, staged amongst the honorary exhibits a collection of Roses, and also a varied collection of shrubs. Mrs. DENISON, Little Gaddesden (gr. Mr. A. G. Gentle), exhibited a collection of Sweet Peas. Other honorary exhibitors were

Messrs. BARRIE & BROWN, London; Messrs. G. & W. H. BURGH, Peterborough; Messrs. H. GLEESON & CO., Watford; and Messrs. CUTBUSH & SONS, of Barnet and Highgate, the latter firm making a speciality of Roses. The entries in the ladies' classes were not quite up to the average, but the judges specially mentioned a basket of Sweet Peas, exhibited by Mrs. SUMMERFIELD, for the beauty of its arrangement. Mrs. H. JENNINGS secured the premier award in the table decorations with an artistic arrangement of *Gloriosa superba* and *Allamanda*, relieved with *Asparagus Fern* and trails of *Smilax*. There was a fair number of entries in the amateur and subscribers' classes, much improvement, in point of numbers, being made in the classes for cut flowers. In the class for 12 vases of hardy flowers, Dr. THOMPSON's exhibit was the best, but he was disqualified through his vases exceeding the 3-inch limit. Mr. T. N. LONGMAN, Mr. J. KERR, Mr. F. P. COLLIVER, and Mr. R. H. COMYNS exhibited some very fine fruit, whilst the Right Hon. T. F. HALSLEY (gr. Mr. Folkes) secured numerous 1st prizes for many notable collections of vegetables, Mr. KERR being placed 2nd to him in the majority of the classes. The entries in the cottagers' section had trebled those of last year, and in some of the classes there were nearly a score of competitors. Good quality was maintained in the whole of this section. The competition in the classes for collections of vegetables from the different parishes in the district was very keen, and the champion prize was won by Mr. GURNEY, of Apsley.

ROYAL HORTICULTURAL OF ABERDEEN.

AUGUST 19, 20 and 21.—The annual show of this society was held on these dates in the Duthie Public Park, Aberdeen. The entries numbered about 1,600—about the same as last year. The quality of the exhibits, despite the unfavourable weather of early summer, was very good. The secretary, Mr. J. B. Remett, Advocate, Aberdeen, and the committee are to be congratulated on the success of the exhibition. Unfortunately, the weather on the concluding day was unfavourable, and this greatly militated against the financial returns of what was one of the most brilliantly successful of the 85 shows held under the auspices of the society.

POT PLANTS.

The display in this section was exceedingly rich and varied. In the class for a table of stove or greenhouse plants and cut flowers, arranged for effect, measuring 8 feet by 6 feet, the 1st prize was taken by THOMAS OGILVIE, Esq., of Kepplestone (gr. Mr. A. Douglas). In the centre of the table was a large *Fuchsia*, and this was flanked with *Liliums*, whilst rich colouring was lent by *Coleus* and *Celosias* (Coxcombs); *Roses* and *Sweet Peas* in vases adding to the effect. The border was composed of *Gloxinias* and *Lobelias*, interspersed with *Adiantum Ferns*. The best specimen plant in flower was shown by Mrs. J. O. MACQUEEN, Fae-me-well, Aberdeenshire (gr. Mr. John Yule), who showed a magnificent *Begonia* of the fibrous-rooted section, whilst a finely-blossomed *Hydrangea* shown by the same exhibitor received the 2nd prize. Specimen foliage plants were well shown, Mr. JOHN ELDER, Norwood Gardens, Aberdeenshire, gained the 1st prize, which included a Silver Medal, for a fine plant of *Cordyline australis*. Ferns were finely shown, and were much admired. The best four Ferns, dissimilar, were shown by Mr. ALEXANDER BREBNER, Dalhousie. Mr. ALEX. DUNCAN, Rubislaw Den House, won the premier prize in the class for six Ferns of three distinct species, in pots not exceeding six inches.

Exhibits of Zonal Geraniums made a superb display, and for these plants Mr. J. W. BRECHIN, Ardoe Gardens, Aberdeenshire, gained both the 1st and the 2nd prizes. The same exhibitor also excelled in the class for *Liliums* with a choice specimen of *Lilium auratum*. Other prominent prize-winners in the classes for plants included Mr. JOHN PETRIE, Crathes Castle Gardens; Mr. A. GLEESPIE, Aberdeen; and J. ANDERSON, Aberdeen.

CUT FLOWERS.

The large marquee devoted to cut flowers was the outstanding feature of the show. The entries, some 600 in number, was probably never excelled at an Aberdeen show. Sweet Peas were

displayed in an exquisite condition, and the variety and delicacy of their colours enhanced in no small measure the attractiveness of the show. Mrs. DENBAR-DENBAR, of Seapark, Forres (gr. Mr. John A. Grigor), won in the principal class for Sweet Peas with a superb exhibit. Mr. JOHN PETRIE, Crathes Castle Gardens, won the 1st prize for 16 bunches of Sweet Peas, of distinct varieties, including King Edward VII., Mrs. Rontzahn, Queen Victoria Spencer, Apple Blossom Spencer, Mrs. Sauerby Spencer, and Asta Ohn. Mr. J. D. CROZIER, Duff House, followed closely, but his blooms were not so large, nor was his arrangement so good as in the 1st group; nevertheless, it was a very fine exhibit.

Roses were well shown. A local firm, Messrs. J. COCKER & SONS, won the Silver Challenge Cup offered for the best exhibit of 36 blooms. It was a magnificent display, and especially good was the variety Frau Karl Druschki. 2nd, Messrs. ADAM & CRAIGMILE, Aberdeen; and this firm secured the 1st prize for 24 Tea Roses. In the professional gardeners' class, Mr. JAMES JAMIESON, Udney, carried off the Silver Medal in the class for 12 blooms, and Mr. W. COUTTS, Ellon, gained a similar award for 12 Tea Roses.

There was a fine show of Dahlias, Mr. J. W. BRECHIN, Ardoe, won the medal for the best group of Pompon varieties, and Mr. JAMIESON, Udney, carried off the trophy in the class for the Cactus variety.

The best collection of 20 varieties of cut flowers, and five foliage bedding plants, including annuals, was shown by Mr. ALEX. DOUGLAS, Kepplestone House; Mr. WILLIAM SCORGIE, Springhill, being a good 2nd.

Gladioli exhibited by Mr. JAMIESON, Tillery, Udney, were extremely well-grown, and easily won the 1st prize offered for these flowers. Exhibits of Asters and Marigolds were of good average quality, Mr. J. W. BRECHIN, Ardoe, Bellhelvie, and Mr. JOHN GRIEVE, Woodside, taking the leading honours for these flowers. Carnations and Picotees were finely exhibited by Mr. ALEX. RENNIE, Easter Skene, Aberdeenshire. Pansies, both show and fancy, and Violas were very good, the chief honours for them falling to J. & D. MACKENZIE, Buxburn, and Mr. WILLIAM SCORGIE, Springhill. In the decorative classes, Mr. A. CUMMING, Granitehill, was a prominent prize-winner. Mr. JOHN GRIGOR, Forres, showed the best of hand bouquets (Roses) and the best bride's bouquet. Mr. STRACHAN, Botanic Gardens, Aberdeen, was placed 1st for a basket of flowers.

The competitions in this section open to florists and nurserymen formed, as usual, a distinguishing feature of the show. Mr. ALEX. BURNS and Mr. A. J. BURNS, Newmarket, Aberdeen, father and son, carried off all the honours for hand bouquets. In the class for floral designs they were also placed 1st, 2nd and 3rd with their several entries, made up chiefly of *Lilium Harrisii*, *Pantratum*, *Lapagerias*, *Stephanotis*, and *White Roses*, with *Asparagus* as foliage. Messrs. D. & W. CROLL, Dundee, secured the 1st prize for a shower bouquet, and they were closely followed by Mr. ALEX. BURNS. Messrs. ADAM & CRAIGMILE, Fernielea, Aberdeen, gained chief place for Tea or Noisette Roses, with splendid specimens, and their wreath was also placed 1st; 2nd and 3rd places being taken in the latter competition by Mr. ALEX. BURNS.

FRUIT.

In this division there was a very fine display. The best collection of hardy fruits was shown by Mr. GRIGOR, Seapark Gardens, Forres, his exhibit being composed of Governor Wood Cherries, Moor Park Apricot, Whittham's Industry Gooseberries, Demaston's Superb Gage, Clipper's Favourite Pear, and Peasgood's Non-such Apples. The Apricots were the best fruits. Strawberries were well shown, there being capital specimens of that fine and exquisitely-flavoured variety Aberdeen Favourite, one of the best dessert Strawberries. Mr. GEORGE McLENNAN, Fetteresso Castle, Kincardineshire, carried off the premier honours for these. Mr. PETRIE, Crathes Castle Gardens, led in the class for Cherries. Mr. BRECHIN, Ardoe, showed the best Raspberries, taking 1st and 2nd prizes for this fruit. Gooseberries formed the outstanding feature in this division, being splendidly shown. Mr. HARBEN, Tullichelton, Perthshire, was well to the fore with dishes of Leydler, Langley Beauty, Telegraph, and Lord Derby. Mr. GRIGOR, Seapark, had the best Gooseberries of yellow kinds, and Mr.

PETRIE was a good 1st for red Gooseberries. In the class for Black Currants, the parish minister of Methlick (Rev. C. GORDON MACKENZIE) led with superb specimens. For Red Currants, Mr. HARPER, Tulliebelton, was an easy 1st.

Grapes, although not extensively shown, were of excellent quality. The Countess of ABERDEEN, Haddo House (gr. Mr. McKinnon), led handsomely in the class for two bunches of Grapes, one each of a white and a black variety, with fine specimens of Muscat of Alexandria and Muscat of Hamburg. Mr. MCKINNON was also 1st for a single bunch of a white Grape with Muscat of Alexandria. Mr. J. PETRIE took both the 1st and 3rd places for Black Grapes, and he won also 1st and 2nd honours for Melons, with fair specimens. Apples, considering the season, are naturally late, but Mr. GRIGOR, Seapark, Forres, scored finely for culinary varieties, whilst Mr. H. B. SMITH, Burdshaugh, Forres, led in the dessert class. Pears were best shown by Mr. W. SCORIE, Springhill, and Mr. GRIGOR, Seapark, whilst in the classes for Plums and Tomatos, Mr. GRIGOR led easily.

VEGETABLES.

The best collection of vegetables in the professional classes was staged by Mr. DOUGLAS, Kepplestone House, Mr. SCORIE, Springhill, winning the 2nd prize. Potatos were an attractive feature in this division, the leading exhibitors of these being Mr. WILLIAM COUTTS, Ellon; Mr. ALEX. BREBNER, Dalbeity; Mr. J. FERGUSON, Linton House, Cluny; Mr. GRIGOR, Seapark, Forres; and Mr. WILLIAM LAWSON, Oakbank, Aberdeen. Turnips were best shown by Mr. LAWSON, and Beetroot by Mr. JAMIESON, Tillyry, Udney.

The amateur classes were well represented in all the divisions. Mr. GEORGE MAITLAND, Great Northern Road, Woodside, won the Silver Cup for the best table of greenhouse plants in this section.

NON-COMPETITIVE EXHIBITS.

Messrs. JAMES COCKER & SONS, showed Roses and hardy perennials; Mr. M. H. SINCLAIR had a brilliant display of Water Lilies, Sweet Peas and herbaceous plants; Mr. JAMES ROBERTSON, Hadden Street, staged a large collection of herbaceous plants and hardy annuals, also 60 varieties of named Gladioli; Mr. ALEX. BURNS, Newmarket, exhibited white Heather in pots and made into wreaths, the latter adorned with Gordon tartan ribbon. Other exhibitors were Messrs. BEN. REID & Co., Guild Street, Mr. McHARDY, Guild Street, and Messrs. W. SMITH & SONS.

SHOW AT LE TOUQUET PARIS-PLAGE.

AUGUST 21.—The international horticultural show was opened on the above date at Le Touquet Paris-Plage, near Boulogne-sur-Mer. The show was organised by the Société Générale du Touquet, and was under the patronage of the National Horticultural Society of France and the local Horticultural Society of Abbeville. The Count d'Applaincourt was president of the exhibition.

Although international in name, there were, so far as exhibitors were concerned, no foreigners present, and the main body of the show was made up of exhibits from the well-known French nurserymen.

Messrs. VILMORIN, ANDRIEU ET CIE had by far the most imposing and effective display, both in the open and under cover. They had two very large grass lawns, upon which were arranged a series of flower-beds of various shapes and sizes. The same firm had also at the far end of the exhibition grounds several ornamental flower-beds filled with various subjects, and under cover a very large collection of Gladioli. In the same building as the Gladioli was a large collection of cut blooms of Cactus Dahlias exhibited by Messrs. DEBUISSON-FOUBERT.

Roses were not numerous, but a local firm, Messrs. MOREL BROS., staged a neat, although not large, collection.

In the open ground were several interesting collections of flowers. One staged by M. GRAVEREAU consisted of a great variety of Gladioli, occupying four or five long-shaped beds.

The well-known exhibitor, M. FÉBARD, had several beds filled with Begonia gracilis rose, Dahlias, Begonia Bertinii, Datura arborea fl. alba, and other seasonable flowers.

M. COMPOINT, the well-known cultivator of Asparagus, sent a collection of plants and cut Asparagus in bundles.

The gardener of the town of Abbeville made an imposing display in three large beds. They were principally composed of large standard Fuchsias in great variety, with Zonal Pelargonium Decorator covering the bed, and a double-row edging of Cineraria maritima and Iresine (Achyranthes) Triomphe. Another was varied by the addition of tuberous-rooted Begonias.

M. CANTRELLE had a long, triangular bed prettily furnished with single and double large-flowered Begonias.

Messrs. CAYEUX & LE CLERC were prominent exhibitors. They furnished several beds of varied form with Dahlias and Cannas.

Ornamental shrubs and foliage plants were well shown, there being several exhibits of considerable dimensions. The chief of these came from Messrs. CROUX ET FILS and Messrs. MOSER, of Versailles.

M. G. BOUCHER filled a long border with Privets in varieties.

THE SOCIÉTÉ GÉNÉRALE DU TOUQUET PARIS-PLAGE (gr. M. Bougibault) had an excellent display set up in a large bed artistically arranged. It consisted of a border Vandyke in shape and composed of a double row of Pyrethrum laciniatum and Achyranthes brilliantissima, the intervening spaces being filled with tuberous-rooted Begonias. Here and there at regular intervals were planted clumps of Sweet Peas trained to wire supports.

Messrs. DEBUISSON-FOUBERT, who are famous as Chrysanthemum growers, arranged in a hollow square a series of borders intersected at intervals by paths. There were Zonal Pelargoniums in full flower, the majority being French varieties, but little known on our side of the Channel, with the sole exception perhaps of Paul Crampel, which was in capital form. Ivy Pelargoniums were also freely used in the various borders, with Anthemis Perfection, Lantana Gavotte, L. Imperatrice Eugénie, Anthemis floribunda, Lantana Eole, Ageratum Triomphe de Filibeaucourt, Michaelmas Daisies, &c. Salvia Zuchter Zwerg of a dazzling crimson hue was arranged as an inner edging. There were also numerous fine plants of Chrysanthemum maximum Etoile d'Anvers.

M. AUG. NONIN, of Paris, arranged in circular beds, cut out in the grass, Dahlias, Begonias, Salvias, and other flowers.

The well-known Begonia cultivator, M. BILLARD, set up one of his interesting collections of large-flowered tuberous Begonias.

The Grand Prix d'Honneur was awarded to Messrs. VILMORIN, ANDRIEU ET CIE. M. DEBRIE was awarded a Prix d'Honneur for a beautiful table decoration set up in his usual form. M. GUERIN was awarded a Gold Medal for greenhouse plants, and most of the other exhibitors named were awarded works of art, gold, silver-gilt, and silver medals. The arrangements and laying out of the grounds were entrusted to M. Henry Martinet.

STIRLING AND DISTRICT HORTICULTURAL.

THE last excursion of the season took place on the 14th inst., when Dunfermline was visited. The principal objective was Pittencrieff Park and its surroundings. The Abbey, the "Glen," with its rockery that cost £6,000, the large park with its wealth of trees and shrubs, the experimental fruit garden, the glass structures, the flower gardens and flower borders were all visited. The visitors were entertained by the Dunfermline Carnegie Trust.

The meetings will be resumed on the second Tuesday in September, that occasion being "Hospital Night," when contributions of flowers will be sent to the various hospitals in Stirling and the district.

Obituary.

PETER E. KAY.—We regret to record the death, from heart failure, of the well-known and highly esteemed nurseryman, Mr. Peter Kay, of Clagmar Vineries, Church End, Finchley. The deceased, who was 56 years of age, passed all his life at Finchley, where he built up the large business which is now a limited liability company. Mr. Kay long ago achieved a wide reputation as a successful cultivator of Grapes for

market, his produce being among the finest ever sent to Covent Garden. He was one of the first to take up the cultivation of the Canon Hall variety of Muscat, to the growing of which he devoted special attention. In addition to Grapes he grew Tomatos and Cucumbers on a large scale for market, and his keen insight into what is required by the public was shown in his selecting the Comet variety of Tomato for his stock.

Mr. Peter Kay was among the group of distinguished horticulturists who received in the year of its foundation, 1897, the Victoria Medal of Honour in Horticulture.

The funeral took place on Wednesday, August 25. The service at St. Paul's, Finchley, was attended by the general manager, Mr. Thos. Allen, and the oldest employes of the firm, Messrs. J. Smith, G. Lawford, W. Shorten, W. Castle, F. Saltmarsh, R. Webb, J. Osborne, and others: the length of whose service with the firm ranges from 12 to 30 years. A beautiful wreath of Lilies, Orchids and White Heather was sent by the employes, upwards of 60 of whom followed the remains to the grave in Marylebone Cemetery, East Finchley. Mr. Peter Kay leaves a widow, two sons, and two daughters.

ANSWERS TO CORRESPONDENTS.

BUDDLEIA VARABILIS VEITCHIANA: W. B. This plant was found by Mr. E. H. Wilson when collecting plants for Messrs. James Veitch & Sons, Ltd., in China, during this collector's first trip to that country.

FERTILISATION OF PEA: C. S. Each ovule is fertilised by a separate pollen tube. The abortion of individual seeds may be due to the failure of pollen-tubes to reach certain of the ovules.

GRAPES DISEASED: C. W. S. The berries are affected with "spot" disease, so often described in these columns. (See reply to W. L. and others in the last issue, p. 144.)—J. H. and Reader. The berries are affected with Grape rot (Glœosporium fructigenum). Burn all diseased berries and spray the vines with some approved fungicide, such as Bordeaux mixture or potassium sulphide.—W. W. The berries were packed without sufficient care, and were in a condition of pulp when we received them. They showed traces of rot disease; see reply to J. H. and Reader above.

NAMES OF FRUITS: W. T. B. Apple Red Joanet (syn. Juneating).—B., Watford. Apple Irish Peach.

NAMES OF PLANTS: E. S. Hackness. Spiraea arifolia. (Please send fresh specimens of the Pears for examination.)—Lady D. Clerodendron fallax.—H. B. Olearia Haastii.

NECTARINE SHRIVELLED: W. F. P. The skin of the fruit has been injured by the sun's rays. This has caused the shrivelling, and afterwards the damaged part of the fruit has been attacked by the common mildew. The Peach leaves are affected with the "shot hole" fungus. (See reply to L. M. in the last issue, p. 144.) The vine leaves are free from disease. They have been damaged by drops of water focussing the sun's rays so as to burn the tissue. The Carnations should be sprayed with quassia extract.

PLUMS: B. R. Davis. The skins have been scorched by excessive sun-heat, and, following this condition, there is slow decay.

POTATOS DISEASED: W. J. K. The tubers are badly affected with "wart disease." See an article, with illustrations, on this subject in the issue for July 31, p. 79. A note on this disease also appears on p. 154.

PUPILS IN GARDENING: C. H. M. Insert an advertisement in the horticultural Press, or in such papers as *The Field* and *Country Life*. We cannot advise you as to terms.

TOMATOS DISCOLOURED: Subscriber and A. R. The hard, yellowish patches in Tomatos are to be attributed to a lack of potash in the soil. Supply a manure containing this element.

MR. WILSON'S EXPEDITIONS TO CHINA.

TO the long list of botanical explorers which is given in Bretschneider's exhaustive *History of the European Botanical Discoveries in China*, published in 1898, the name of Mr. E. H. Wilson must now be added. Wilson started on his first plant-collecting expedition in China some 10 years ago, and, as he is just about to proceed to the United States of America to overhaul the specimens collected on his third journey, the present affords an opportune time for reviewing the work which he has accomplished during the past decade.

For many years previous to Wilson's first trip, China had attracted the attention of Messrs. Veitch as a possible field for plant collecting, but unfavourable conditions had prevented projected expeditions from being carried out. In 1879 Charles Maries, whilst travelling in the East for the firm of Veitch, had reached as far inland as Ichang, but returned without having accomplished much. It was due to the writings of Dr. Augustine Henry and to his rich collections of dried plants that interest in the subject was revived. This resulted in Wilson being sent by the late Mr. James H. Veitch to collect plants in China on behalf of his firm.

Wilson's first journey, commenced in 1899, was to Szemao in Yunnan and to Ichang, Central China. From the last-named locality, which is situated about 1,000 miles from the mouth of the Yangtze Kiang, numerous plants of horticultural value were introduced. A second journey, commenced in 1903, was to

the Chino-Tibetan frontier, about 1,000 miles west of Ichang, a region rich in Alpine plants and hardy trees and shrubs.

In December, 1906, a third trip was commenced, this time on behalf of Professor Sargent, of the Arnold Arboretum, Boston, U.S.A. For the most part, the routes previously mentioned were retraced, but other interesting localities were also visited. On this expedition a most valuable collection of photographs illustrating the scenery, flora, and native industries of Western China was obtained; a selection of which, comprising about 100 photographs, was shown at the meeting of the Royal Horticultural Society on Tuesday last. The first two journeys formed the subject of an interesting series of articles from Wilson's pen which appeared in the *Gardeners' Chronicle* for 1905, Vols. xxxvii. and xxxviii., under the heading "Leaves from My Chinese Notebook." During the last trip some interesting letters were addressed to Professor Sargent, to whose courtesy readers of the *Gardeners' Chronicle* are indebted for their publication.

A large number of plants introduced through Wilson have been figured and described in the *Botanical Magazine* and in the horticultural Press, particularly in these pages. A review of these introductions will show to what extent horticulture has been benefited by Wilson's journeys.

Among herbaceous plants many of the species are already widely known and promise to be permanent. Two important additions to the genus *Astilbe* are *A. Davidii* (1) and *A. Grandis* (2); the former with rich rosy purple, the latter with pure white, flowers. Both have elegant, tufted foliage, are of robust habit, and succeed well in the open border, especially in moist situations. *Aconitum Wilsonii*, a strong-growing species with pale blue flowers, and *A. Hemsleyanum*, remarkable for its climbing stems, are two interesting *Aconites* suitable for the border, as is also *Artemisia lactiflora* (3), a new species of Wormwood with erect stems clothed with elegant dark-green leaves and terminal panicles of creamy-white, sweet-scented flowers.

A handsome perennial, which unfortunately is not quite hardy, is *Rehmannia angulata* (4), which produces numerous flowers resembling in size and form those of *Incarvillea Delavayi*. It is best treated as a cool greenhouse subject, but it also succeeds well if planted out during the summer months. Several improved forms, obtained by selection, have already appeared. In *Geranium platyanthum* (5) we have an addition to the hardy *Storksbills*, which produces large rose-colored flowers throughout the summer months.

For moist situations the new *Rodgersia asculifolia* and *R. pinnata alba* (6) have proved valuable plants, attractive both when in leaf and in flower. Where plenty of room has been given them, either by the margins of lakes or in the wild garden, the new species of *Senecio* have proved very striking subjects. *Senecio clivorum* (7) has rich orange-yellow flowers, resembling miniature Sunflowers, freely produced in branching corymbs

well above bold, heart-shaped leaves. A bed of this species near the Pagoda at Kew was particularly attractive last summer. To a different section of the genus belong *Senecio Veitchianus* (8) and *S. Wilsonianus* (9), which produce their small, but numerous, yellow flowers along the upper half of tall, erect scapes, which attain to a height of from 3 to 5 feet and have a setting of large heart-shaped leaves on long petioles. A new species of *Thalictrum* which promises well is *T. diptero-carpum* (10), a species from Western China, recently put into commerce. It has graceful, loose panicles of rose-purple flowers, borne on stems 4 to 5 feet high. As it appears to succeed well on poor soil in sunny situations, it will no doubt be largely grown in the future.

A very important class of garden plants at the present time consists of those suitable for rock-gardens, and to this many of the recent Chinese introductions belong. Perhaps the most important of these is *Meconopsis integrifolia* (11), the yellow-flowered Tibetan Poppy, to obtain seeds of which was the principal object of Wilson's second expedition. Unfortunately, the culture of this magnificent Alpine is not generally understood, and in consequence it has yet to be seen in this country in the same luxuriance as that with which it grows in its native home. Well-grown examples were exhibited by Messrs. Veitch during 1904 and 1905 at the R.H.S. fortnightly meetings, some of them bearing nine large flowers; but the plant often bears double this number in its native habitat.

Other species of this fine genus introduced through Wilson are *Meconopsis punicea* (12), a scarlet-flowered species; *M. Henrici*, with smaller flowers, rich purple in colour with yellow anthers; and *M. sinuata* var. *Prattii*, with steely-blue flowers.

Another important Alpine family represented by numerous species are the Chinese Primroses. A large number have been introduced, but unfortunately many are of biennial character, and, owing to their failure to produce seed after flowering, have been lost. The most distinct in point of colour is *Primula Cockburniana* (13), a biennial species which has orange-scarlet flowers in whorls on erect scapes. It is of easy culture and has now found its way into many collections. Belonging to the same section of the genus, but more robust in habit, is *P. pulverulenta* (14), a perennial resembling *P. japonica*, but with larger flowers of a richer colour and flower-stems covered with a white meal—a most distinct and decorative feature. At the recent Temple Show Messrs. Veitch exhibited a number of hybrids derived from crosses between these two species. They are distinguished by the varietal names "Unique" and "Unique Improved" and show characters which indicate the influence of both parents. One of the hybrids is particularly interesting in that it closely resembles *P. Cockburniana* in appearance, but is perennial in character. Other Chinese Primulas which cannot here be mentioned in detail, but which are also valuable as rock-garden plants, are

P. cognata (15), *P. deflexa*, *P. nivalis* var. *farinosa*, *P. orbicularis* (16), *P. vittata* (17), *P. sibirica chinensis* (18), and *P. Veitchii* (19).

The Chinese Fumeworts are also charming rock-garden plants, the largest species being *Corydalis thalictrifolia*, which has glaucous green leaves and racemes of pale yellow flowers. It requires a sheltered situation, and is perhaps best seen under glass. The smaller-flowered *C. cheilanthisfolia* (20) has delicate, fern-like foliage and is perfectly hardy. *Corydalis Wilsoni* (23) and *C. tomentosa* are smaller species with attractive glaucous foliage and rich yellow flowers, but are rather tender and need protection out-of-doors.

Hardy terrestrial Orchids have received a welcome addition in *Cypripedium tibeticum* (21), the Lady's Slipper of Tibet. It is allied to *C. macranthum* but has larger flowers, which are remarkable for the large purple-flowered pouch. Of the beautiful Chinese Lilies, *Lilium Henryi* and *L. sutchuanense*, large quantities of bulbs were sent home, and the new species *L. myriophyllum* (24) was introduced. This last-named Lily is remarkable for its large, trumpet-shaped, white flowers and narrow leaves, thickly disposed on the stem.

Many of the ornamental trees and shrubs which have been introduced to gardens in this country from Japan are really of Chinese origin, and Wilson's researches have shown, by the number of fine plants he has secured, that this source of supply is by no means exhausted.

The most notable of the trees introduced is probably *Davidia involucrata* (22), of which large quantities of seeds, as well as living plants, were sent home. So far, it has failed to flower in this country: but in the arboretum of M. M. de Vilmorin, at Les Barres, a plant produced flowers for the first time in 1906. The flowers themselves of this plant are not conspicuous, the showy part being the two large bracts which subtend each inflorescence. When fully developed, the bracts are pure white, and, being larger than the leaves, are very conspicuous. Seeds of a variety having hairy leaves were also secured, and from them plants have been raised. *Herman Spooner*.

(To be continued.)

HYBRID CALLA.

FIG. 68 represents an inflorescence of a hybrid Calla raised from a cross between *C. Rehmanni* (female) and *C. Elliottiana* by Dr. A. Ragionieri, of Castello, near Florence, Italy. The specimen figured is curious in that it shows a tri-lobed spathe. The tuber which bore the inflorescence was itself bilobed, and, when divided into halves, each halved tuber produced trilobed spathes. It will be noticed that the shoot bearing the inflorescence is somewhat twisted and also deeply and doubly grooved (A in fig. 68), as though indicating that the abnormal condition responsible for the monstrous lobed spathe is general throughout the plant and expresses itself by the lobing of tuber, flower-stalk and spathe. It is highly probable that the malformation will prove to be hereditary, though whether the flowers of the abnormal inflorescence are fertile or not remains to be discovered. The colour of the spathe is pure white tinged before opening with rose-violet, which colour later gives place to cream.

NURSERY NOTES.

W. LEARMONT & SON, DUMFRIES.

THERE are several well-known nursery firms around Dumfries devoting much attention to the propagation of forest trees and shrubs, for which the climate of the district is highly favourable. The business of Messrs. William Learmont & Son, Larchfield, has been established for many years, and, under the management of Mr. John Learmont, is increasing rapidly. A recent visit to the nursery afforded the opportunity of making the following notes. The land on which the nursery is situated embraces about 65 acres. It is elevated ground, lying to the south-east of the town of Dumfries, and, sloping to the east, is fully exposed, so that the trees and shrubs grow hardily and withstand the climate of very cold districts. As a result of this and of the methods of cultivation, the stock is in splendid condition.

Although the writer has visited many nurseries, he has seen only some two or three which can compare with Larchfield with respect to

Forest trees are raised on a large scale, and many millions of young trees are to be seen in their various stages. It is a policy of the firm to avoid keeping these too long, and the plants are all either of a suitable size for planting, or intermediate between that and the seedling stage. There are great breadths of Larch and other forest trees in all stages of young growth, and generally looking well. The Japanese Larch being in demand, Messrs. Learmont grow a large number of this tree.

The firm makes a speciality of young specimen trees for town and park planting. These are all trained to stakes from an early stage to secure straight stems and symmetrical growth. Elms, Limes, Ashes, Planes, and other trees are carefully reared in this manner.

Trained fruit trees, Apples, Pears, Plums, &c., are also grown in large numbers, and are trained for planting against walls or as espaliers. Dwarf and standard fruit trees are also grown in quantity.

There are large plantations of Gooseberries, Currants, Raspberries, Loganberries, &c., as

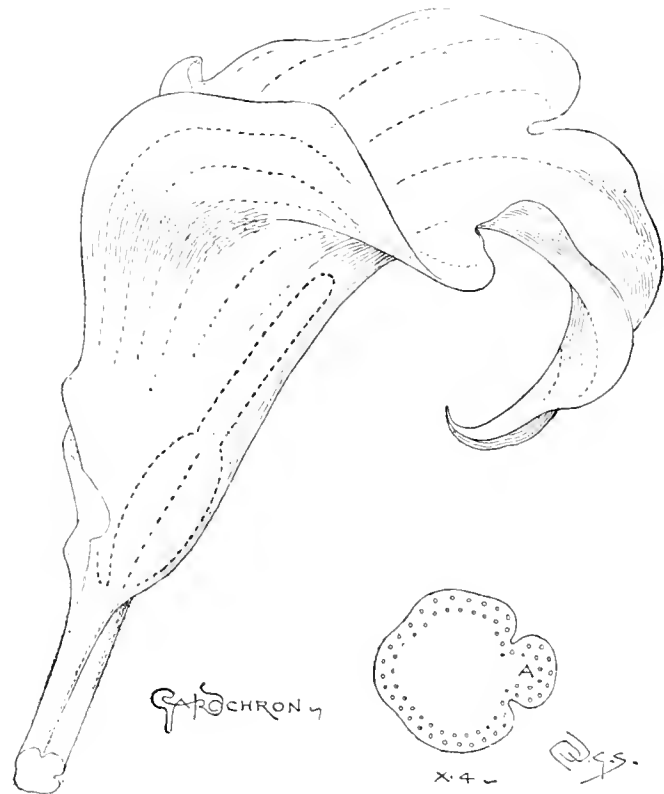

FIG. 68.—HYBRID CALLA WITH LOBED SPATHE.

cleanliness and order. Thus, although the Black Currant mite abounds in some parts of the district, it is, thanks to the preventive methods employed, absent from Larchfield.

Many thousands of Roses are propagated and sold annually, and a visit to the quarters which they occupy showed that the stock is not only large but in capital order. Hybrid Perpetual varieties are cultivated extensively, and also Hybrid Teas. Tea Roses are well represented, and the manager, Mr. Hunter, is of the same opinion as the writer, viz., that they do even better in Scotland than in the south. Few fail, even in these exposed nurseries. China Roses are also grown on a large scale, although these Roses are not increasing in favour in Scotland to the same degree as in other parts. Climbing, dwarf Polyantha, and all other classes of Roses are represented, the exception being the species, for which there is little demand.

well as of Strawberries. The stock comprises a full selection of the best varieties for market and private use. All have been carefully tested, and an ingenious method of separation reduces to a minimum the risk of error in supplying a particular variety.

Ornamental shrubs find a large place in the nurseries, both for the garden, the shrubbery, and the covert. Hollies are extensively cultivated; also Spiræas, Berberises, Azaleas, Rhododendrons, Lilacs, Olearias, Weigelas, Brooms, Hydrangeas, Heaths, and many more; whilst large breadths of Thorns, including the ornamental flowering varieties, are met with at Larchfield.

Vigorous, sturdy growth is what is aimed at in the Larchfield nurseries, and this seems to be secured by the soil, climate, and methods of propagation and cultivation. *S. Arnott*.

RANUNCULUS NYSSANUS.

LITTLE is apparently known of this *Ranunculus*, as it is not mentioned in Johnson's or Nicholson's *Dictionary of Gardening*, and in the supplement to the latter work all that is said of it is that it is "a showy plant." It is a handsome member of the Buttercup family, growing to a height of about 18 inches and bearing quantities of blossom, each flower being 2 inches across, and of brightly-polished yellow. The flowers are not so large as those of *R. cortusifolius*, which is also a taller grower, but the plant is very free flowering and absolutely hardy. It is, apparently, of the easiest possible culture, and indifferent to the character of the soil, for it may be seen in the best of health under very varying conditions, growing as vigorously in poor soil as in a rich compost. It increases very rapidly, a little plant forming a clump 2 feet or more across in a few years. A good-sized colony has a very bright effect in the border in the early days of May. *Wyndham Fitzherbert.*

THE CULTURE OF LILIES.

IN the interesting note on this subject by the Rev. David Williamson in the issue of the 21st ult., the question is asked, whether *L. Washingtonianum* and *L. rubellum* are ever likely to be permanently established in this country? While the answer may safely be given in the negative so far as the general run of gardening folk is concerned, there is no reason why anyone specially interested in the culture of Lilies should not succeed in growing and keeping both species.

As a preliminary to success, it is essential that the bulbs should be grown in this country from seed, and that is as true of one species as of the other.

For some reason or other, the typical *L. Washingtonianum* of the Sierras resents being lifted even more than most Lilies, and, when transported, almost invariably succumbs to that mystifying complaint "soft rot," with the result that out of a batch received from California it is rare to find more than a small percentage of sound bulbs, the number of which is likely to be still further reduced after the bulbs have been in the ground a few months.

Assuming that seed has been procured from one direction or another, and that the resulting bulbs are ready to be put out, it is as well that they should be planted deeply in a loose, sandy, alluvial soil, possibly best described as a loamy soil, so free that one can work on it in wet or dry weather without doing any harm. Generally speaking, a mixture of three barrowfuls of sweet loam to one of sifted leaf-soil, one and a half of coarse sand or grit, and half of very fine charcoal may be relied upon to produce a suitable compost.

Provided that the soil is suitable and sufficiently deep, the position does not appear to matter much, though shelter from blustering winds is desirable. In this country the sun is so often absent that full exposure seems to do more good than harm, provided the ground in which the Lilies are growing is well covered with low shrubs such as *Vaccinium*, *Andromeda*, or *Epimedium*.

Proper drainage of the soil is absolutely essential for the successful culture of this bulb, and it can hardly be too sharp, whilst in dry seasons water should be afforded from time to time both under and over the bulb. During the growing period the Lily abhors lime, and not a trace should be allowed in the ground.

The Oregon variety of *L. Washingtonianum*, known as *purpureum*, is far more easy of cultivation in Britain from imported bulbs than is the type. The bulbs are heavier and more solid than those of the latter; and, travelling much better, may generally be found to arrive in sufficiently sound condition to ensure a modest proportion of bloom a couple of years after planting, with increasing growth as the years go by; pro-

vided, of course, the conditions are satisfactory. *Rubescens* is another variety also easier of cultivation than the type, and equally beautiful. In this country it does not seem to grow so strongly as the variety *purpureum*, and is in point of fact altogether a more tender plant. The flowers are deliciously fragrant, more so indeed than those of any other Lily except *L. auratum*.

When the flowers open they are usually a creamy colour with purple dots; after a couple of days the purple spreads gradually till the creamy ground gives place to a lovely plum colour, which grows deeper and deeper till the flower dies down.

Of *L. rubellum* it may reasonably be said that it is almost hopeless to expect any permanent result from imported bulbs, even though the parcel post has reduced the time of transit from

shaded places, under trees and shrubs, coming up through the grasses just as do *L. auratum*, *L. Japonicum* (Krameri), and most of the other Japanese species. Strange though it may sound, the soil in which it grows is a rather stiff reddish clay, with thorough natural drainage.

The bulbs exported by the nurserymen are collected in the mountains and grown on for a year or so in half-shaded positions on the hill-sides, between the rows in tea plantations that afford them the shelter and shade which appear to be so absolutely necessary to their existence in Japan.

It must be remembered, however, that the Japanese summer is tropical, and that fact alone may account for the undoubted difficulties there are in the culture of the majority of Japanese Lilies in this climate. One is frequently recommended to plant these bulbs in half-shaded

[Photograph by Wyndham Fitzherbert.]

FIG. 69.—*RANUNCULUS NYSSANUS*: FLOWERS YELLOW.

Yokohama to London via the Trans-Siberian railway to well within a month.

The deplorable custom pursued by the Japanese of cutting off the roots of bulbs prior to packing is one that only Lilies having far more power of recuperation than has *L. rubellum* can be expected to stand. Whilst sound bulbs of this plant can usually be relied upon to bloom during their first year, it is seldom they do so afterwards; an examination of the bulbs revealing the fact that what little heart is left in the general mass of rotting scales is in possession of myriads of "skip-jacks" intent on finishing off what life may still be left. There is all the more reason, therefore, for raising the bulbs from seed, and as to this there is no difficulty.

L. rubellum comes from the Province of Iwashiro, the northern part of the main islands of Japan, and, according to Mr. Alfred Unger, than whom no living being knows more of the Lilies of Japan, it grows there in half-

places; but it is a great question whether all the sun we get as a rule in Britain is half enough for most of these plants. In hot countries it might perhaps be as well to plant them in some position where they receive a certain degree of shade between 12 mid-day and 2 o'clock, but, with this possible exception, it seems very much open to question whether a fully-exposed position is not the best; any attempt in the direction of imitating the natural soil of the country from which they come would surely be fatal in this country.

Home-raised seedlings of *L. rubellum* may readily be grown on in very much the same soil and under the same conditions as apply in the case of *L. Washingtonianum*; except that, in the case of the former bulb, there should be rather more leaf-soil, and, if possible, even sharper drainage.

By flowering a few imported bulbs in frames, seed may readily be obtained and ripened, but

care must be taken to fertilise the blooms. In planting, the bulb should be surrounded with clean sand, and it is important that this should not be thrown in carelessly, but carefully packed under, around, and over the bulb. It does not appear necessary to plant this bulb very deeply. The winter in the Province of Iwashiro, whence it comes, is very severe, and the ground is often frozen to the level at which the bulbs are found.

In Japan the Lily blooms in May, and the bulbs are ready for export in July; but, for some reason or other, they are seldom offered by dealers in this country before Christmas. Anyone interested in the subject, however, can arrange for the bulbs to arrive by the middle of September by using the Japanese parcel post. The sooner the bulbs are in the earth the better; for, if properly managed, the flowers may be expected even a little before those of *L. Hansoni*, except in such a season as that now drawing to a close: *L. auratum* being in flower side by side with *L. Chalcedonicum*.

In dealing with Lilies, as with many other plants, no hard and fast rule as to culture can be laid down. All the cultivator can do is to indicate generally the lines on which particular kinds have become what may fairly be described as established, and with that reservation, it may be said that, provided soil conditions are suitable, and artificial watering is available when needful, both the Lilies under notice can be grown well in this country. A.

FOREIGN CORRESPONDENCE.

ELISENA LONGIPETALA.

As Mr. W. Botting Hemsley invites correspondence (p. 90) on the subject of *Elisena longipetala*, I think he will be interested in reading the article on John Rudbeck in vol. xxx. of *Rees' Cyclopadia*, in which reference is made to vol. ii. of *Campi Elysii*, which can be found in the Linnean, Banksian, and Sherardian libraries.

I am inclined to think that the name *Elisena* was after Rudbeck's work above mentioned (*Flysii—Elisena*).

In vol. xxvi. of the same *Rees' Cyclopadia* he will find under "Pancratium" much information and valuable references which possibly may throw some light on the subject.

As this cyclopadia is now an old and obsolete work, I suppose few people consult it; but I have always found it very useful as a work of reference. To quote only one instance: there is a description of *Static arborea*, a plant I lately rediscovered after it had been lost for 20 years; and although the article is a century old, I do not think any modern botanists mention it. *George V. Perez, Puerto Orotava, Teneriffe.*

TOWN PLANTING.

THE AILANTHUS (TREE OF HEAVEN).

AILANTHUS GLANDULOSA flourishes in many a London street; indeed, next to the Plane, it is, perhaps, the most commonly-cultivated tree both in urban and suburban districts of the metropolis. By reason of its rich green, spreading foliage, the *Ailanthus* is a great favourite, the leaves, in many cases, reaching to a length of fully 2 feet. This tree has been planted largely in many Continental cities. In some of the most smoke-infested parts of London, as in the Lambeth Borough Recreation Ground, and throughout the East End, the *Ailanthus* does remarkably well, and grows with a vigour that is excelled by no other species; while the noble specimens in Bloomsbury and other public squares testify to its capacity for withstanding the impurities of a town atmosphere. The greenish-white, inconspicuous flowers are freely produced, and are succeeded by innumerable fruits resembling the keys of the Ash, but of a reddish-brown colour, which imparts to the tree a hue that, unfortunately, is seldom seen in this country. A. D. Webster

NOTICES OF BOOKS.

* THE BALANCE OF NATURE AND MODERN CONDITIONS OF CULTIVATION.

THE author claims in the preface that "the object of the present volume is to treat of the chief wild and semi-wild vertebrates . . . found in the British Isles in relation to the cultivation of crops. . . . These embrace the garden, allotment, small holding, farm and estate—its woods, commons, moors, mountain tracts and the waters of all to the foreshore of the sea." And, further, that "the cultures adopted are gardening, farming, foresting, sporting and fishing." In the medley of subjects which the author discusses within the pages of this work there is very little that pertains to the "Balance of Nature" in its strictest sense, and absolutely nothing with regard to the "modern conditions of cultivation," excepting the short, historical sketch given in the introduction; so that the title affords little or no indication as to the contents of the volume. Those portions of the book which deal with the "Insectivorous and Harmless" mammals, birds, &c., are, on the whole, very good, and the author is to be congratulated on bringing together so much useful information; but a great deal of the text is rendered almost unintelligible by the bewildering repetition of facts and the dubiousness of many of his statements. A few examples will suffice. Under the headings "Useful and Partly Injurious" (*bis*, pp. 37 and 156), we are reminded

What effect, may we ask, would such wholesale slaughter have on the "Balance of Nature"? It is stated that the female robin is distinguished from the male by "having the breast of a duller yellowish-brown colour!" and that "the primary wing feathers of the jay are of a brilliant blue marked out by bands of black." [The italics are not the author's.] We would point out also that the *Limicola* is not a family but an order; that the *Colymbidae* does not include the little grebe, and that the close relationship of *Cinclus* is not with the ant thrushes of the Neotropical region or with the *Turdidae* either. There are also some orthographical mistakes, such as *Colouba*, *Sylviadae*, &c., which may be printers' errors.

Much useful information is given in the latter portion of the work regarding the means of destroying ground game, rats and other farm vermin. Indeed, nearly the whole of Chapters VII.-XI. should form a useful compendium to the gamekeeper and the vermin catcher, as almost every conceivable form of trap is figured and described. In addition, there are also many valuable hints on the protection of seeds, fruits, trees, &c., from the ravages of birds and mammals. This, so far as it goes, is excellent; but all lovers of birds will agree that there is no justification whatever for giving an illustrated account of the cruel and shameful method of destroying birds (the sparrowhawk and the kingfisher are particularly mentioned) by means of the illegal pole-trap. This and other similar traps for the destruction of birds should be relegated to the museum of antiquities. We also discountenance the use of poisoned grain, the ground clap-net, or any other of the methods recommended which in any way tends to the indiscriminate destruction of birds.

Of the 271 figures given in the text, a few only are passable, the majority being the most ancient caricatures we have seen in a recent work, reminding us very forcibly of the quaint pictures dating back to the 16th century.

OXALIS ADENOPHYLLA.

THIS attractive species is the Chilean counterpart of the beautiful *O. enneaphylla*, which is a native of the Falkland Islands. The glaucous foliage is similar in both plants, although the leaflets are more numerous in the Chilean species. The principal difference between them lies in the root-stock, which, in *O. adenophylla*, is large and bulb-like and covered with a strong fibrous coat, while that of *O. enneaphylla* is smaller, scaly, and without the fibre that is so prominent a feature in the other. In *O. enneaphylla* the large, white flowers are produced singly on short stalks, reaching just above the foliage, while in the subject of our illustration the flowers are produced two or three on each stalk, and are rose-coloured with a purple base. *O. adenophylla* was collected near San Martin at an elevation of 6,000 feet by Mr. H. J. Elwes, who presented a plant to Kew in 1902. It flowered in May, 1905, and was figured in the *Botanical Magazine*, t. 8054. So far, it has been grown in pans in a cold frame with a northern aspect, and has increased freely under that treatment, but it will probably prove as hardy in the open as *O. enneaphylla*. Plants at Kew have been planted out in a half-shaded position in the rock-garden to test their hardiness during the coming winter. At that season the leaves die down, leaving only the fibre-covered root-stock showing its apex just above ground. A mixture of loam and leaf-soil with plenty of sharp sand is used as a rooting medium, the pans being plunged in ashes to their rims. The illustration (fig. 70) is reproduced from a photograph of a plant in the Alpine house at Kew in May, when a succession of flowers was produced for some four or five weeks. When in flower, plenty of light is needed, for the flowers do not open to any extent on dull days. As a pot plant it makes an excellent companion to *O. enneaphylla* and thrives under similar conditions. W. I.

[Photograph by W. Irving.]

FIG. 70.—OXALIS ADENOPHYLLA: FLOWERS ROSE-COLOURED WITH A PURPLE BASE.

that the redbreast is "regarded generally as entirely harmless," but because it takes occasional toll of Red Currants and ripe Grapes, he advocates, as an alternative to closely-netted ventilators, the cruel method of trapping these birds, and goes so far as to give a diagram of the trap baited with a Grape.

The song thrush "charms alike in town and country with its sweet song"; and its usefulness as an insect and slug destroyer is recapitulated; but, for its fruit-eating propensities, the suppressive measures advocated are trapping; "the common rat-trap (two figures given) . . . is excellent, a partly-ripe Strawberry being secured by its stalk to the table." He adds also that "a gross of traps would be required per acre," at a cost of about £10. "In these traps, seen to early and late, probably 3,000 birds may be destroyed in a season." And in relating his own experience the author says, "We have had recourse to trapping, a couple of dozen traps properly worked 'making-end' of 500 birds in a season." The author is not content with this, but suggests that possibly Britons may acquire a taste for thrush shooting as in Belgium and elsewhere on the Continent of Europe, so that fruit growers may thus recoup themselves by killing the birds and disposing of them as food.

* *The Balance of Nature and Modern Conditions of Cultivation*: A practical manual of animal foes and friends for the country gentleman, the farmer, the forester, the gardener, and the sportsman, by George Abbey. With 150 diagrammatical drawings. (London: George Routledge & Sons, Limited, New York: E. P. Dutton & Co.) 1909. Price 7s. 6d. nett.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, ante, pp. 70-76.)

(Concluded from page 149.)

WALES.

DENBIGHSHIRE.—The cold weather of January, February, and the early part of March delayed the blossoming of fruit trees so that they escaped the usual spring frosts. With the exception of three very exposed trees all are carrying good crops. Apples, Apricots, Peaches, and Nectarines are very plentiful, whilst Pears are a good average crop. Severe frosts each night from May 1 to May 22 damaged the Strawberry blossom, and this, followed by heavy rains during the last week in June, caused this crop to be one of the worst for some years. *J. Martin, Bryn Esyn Gardens, Wrexham.*

—The fruit crops, with the exception of Pears, are very satisfactory in these gardens. What has been lost in quantity is compensated for by quality, and we have been saved much labour in thinning the fruits. Insect pests have been very plentiful; but with repeated winter sprayings we have not suffered so much from this cause as others who have neglected to spray their trees. Our soil needs much cultivation, but it pays for working. *George Aitkens, Erddig Park Gardens, Wrexham.*

—The fruit crops in these gardens are very satisfactory. Most varieties of Apple trees have set good crops, whilst Plums are much above the average for this district, and small fruits are plentiful. The soil in these gardens is a stiff clay, overlying a subsoil of clay. *J. A. Jones, Chirk Castle Gardens, Ruabon.*

FLINTSHIRE.—Caterpillars have been very plentiful, the foliage of some trees having the appearance as though riddled with shot; even the Oak trees are half-denuded of foliage. Aphis has also appeared in abundance, and now we are promised a plague of wasps. Apricots are a heavy crop, and the same remark applies to Gooseberries. *J. Barnard, Mostyn Hall Gardens, Mostyn.*

GLAMORGANSHIRE.—The fruit crops in this district are above the average. All small fruits and Strawberries were very heavy crops, but Strawberries were quite 10 days later in ripening than last year, and both the flavour and the colour of the berries were inferior, owing, no doubt, to the lack of sunshine and exceptionally cold nights. Peaches and Nectarines are wonderfully good and the trees clean. Apples and Pears are an average crop. Plums are under an average quantity, and the young growths have been badly affected with fly. Cherries are the heaviest crop I remember in this district. *R. Milner, Margam Park Gardens, Port Talbot.*

—The Apple crop generally in this district is very light. On a west wall we have Cordon trees of Allington Pippin and Cox's Orange Pippin carrying heavy crops of fine fruit, whilst King of the Pippins and Allington Pippin on pyramids are also good; with these exceptions, Apples are few. Pears are a light crop and Plums a failure. Peaches and Nectarines are excellent: the best crops for many years. All the trees are laden with fine fruits and the growths are very clean and free from blight. Cherries also are plentiful and of fine quality. Bush fruits are excellent. Strawberries were an average crop of fine fruits. The soil here is a rather heavy loam on a rocky subsoil. *C. T. Warrington, Penllergar Gardens, Swansea.*

MERIONETHSHIRE.—The fruit crops in this part are generally good, but 6° frost on April 7 spoiled the Plum and Pear crops. Aphis is very numerous all round this year. Black Currants are almost a failure, but other bush fruits are in abundance, especially Gooseberries. A very hot, dry May was followed by a wet, cold June. Our soil is a fairly light loam with a gravel subsoil, and, consequently, our crops soon feel the effects of drought. *John S. Higgins, Rhŷg Gardens, Corwen.*

MONTGOMERYSHIRE.—The first part of the season was very wet, and this was followed by a long spell of east winds and drought, which caused a tremendous amount of blight to appear, especially in exposed positions; consequently, on trees in open positions there are light crops, but

heavy crops are the rule in sheltered places. Small fruits have cropped heavily, with the exception of Black Currants, which are infested with blight. Plums have suffered, although not so severely, from the same cause. *J. Lambert, Powis Castle Gardens.*

PEMBROKESHIRE.—Apples are a very heavy crop in this district, as also are Plums and Damsons; in fact, the trees are much overcropped. But Pears are a very scanty crop generally. We have a good number of Pear trees on walls on the Quince stock with only a fruit here and there. They blossomed late, owing to March being very cold, and I have always observed that if Pear trees bloom very late they never set their fruits well. *Geo. Griffin, Sobeck Park Gardens, Haverfordwest.*

—This is the most remarkable season for fruit that I remember, it being exceedingly abundant and of good quality. Apple trees are laden with their fruits. Pears set well after an abundance of bloom and are satisfactory. All Plum trees are bearing heavy crops of good quality fruits. Peaches are exceedingly good, although aphid was very troublesome on the trees early in the season. Sweet Cherries are carrying a heavy crop of good fruit. Strawberries were abundant and of good quality. Givon's Late Prolific furnished a late supply of large, highly-flavoured berries. Gooseberries are plentiful and good. Raspberries, Red and Black Currants are all plentiful and of good quality. Aphis of most kinds have been troublesome on fruit trees, and the shoots are not so clean and free-growing as last year. The soil in this district is generally a light loam, resting on slate stone. *W. A. Baldwin, Clyntiew Gardens, Boncath.*

RADNORSHIRE.—The Apple crop is small, owing to frost appearing when the trees were in flower, and the same applies to a few of the later-flowering Pears. Where the trees were sheltered by walls, &c., there is a heavy crop. In fact, the fruits have required thinning. Insect pests have been very troublesome on all fruit trees, especially in the case of Black Currants. Gooseberries and Red Currants are the heaviest crops for several years. *J. MacCormack, Maesluch Gardens, Glasbury, Hereford.*

—Strawberries have been an excellent crop, being very little injured by late frosts. The berries were large and swelled quickly. We have a large crop of Gooseberries, Red Currants and Raspberries. Apples are much above the average in quantity where spraying was practised, but blight has been very troublesome, and crops will be poor where this has been neglected. Saw-fly on Gooseberries and Currants gave much trouble. This district is the home of the wild Strawberry and Raspberry, and the soil, although poor, suits both these fruits when properly grown. *C. M. Nilson, Knighton.*

—The present season is a most remarkable one for fruits of all kinds in this part, which is not considered a good fruit district. The trees in private gardens, as well as orchards, are well laden. The soil is a fairly good loam, some of it resting on a gravelly and some on a deep yellowish subsoil with a mixture of clay in places. *Wilson Palliser, The Gardens, Norton Manor, Norton, R.S.O.*

9, IRELAND, N.

DUBLIN.—The fruit crop in this district is a good average one. All bush fruits and Strawberries bore splendid crops, and the quality was good. Stone fruit generally promise well. The soil is a stiff loam on a hard calcareous subsoil. The greater part of this district is about 60 to 100 feet above sea level. *A. Campbell, St. Anne's Gardens, Clontarf.*

MEATH.—Fruit growing has been dying out in this district for the last 5 or 10 years. There has been much trouble with the Gooseberry-mildew. Most growers did not take steps in time to grapple with this disease, but followed the Department of Agriculture's advice as to spraying the bushes, and after wasting their money on this the officials ordered the bushes to be destroyed. One grower spent over £100 on spraying according to the Department's advice. *Michael McKown, Julianstown, Drogheda.*

—The Gooseberry crop is the best we have had for years; young Apple trees have done

very well, and there is a good crop of all other kinds of fruit in this district. The rains just came in time to make the Strawberry crop a success. The late frost in April did little or no harm, as all kinds of fruit trees were late in flowering this season. We have 3 feet of black soil resting on clay. Pear trees do not fruit well in the open but succeed well on walls. *J. B. Pow, Dunsany Castle Gardens.*

TYRONE.—The fruit crops are the most satisfactory that we have had for some years. Apples are uneven, some trees being very heavily cropped and others but lightly, these being mainly early dessert varieties. Pears are the heaviest crop I have seen here. Cherries are not largely grown in this district, but all that have come under my notice are carrying good crops. Small fruits are all good. The season has been remarkable for low average night temperatures, although no severe frosts were recorded. The month of May was very bright, with a deficiency of rainfall causing many Plums to drop, and reducing an enormous set of fruit to a fair average crop. Our soil is a very heavy, cold clay—deficient in lime. All fruits are very late, our first Strawberries from outside were gathered on July 5. *Fred. W. Walker, Sion House Gardens, Sion Mills.*

WEST MEATH.—The fruit crops in this district are the best I have seen for many years. Apples, Plums, Gooseberries and Strawberries are carrying generous crops. Pear trees, with the exception of those planted on a southern aspect, are carrying very satisfactory crops. Our soil is mostly of a heavy nature, and very shallow in places; the subsoil is yellow clay. *George Bogie, Pakenham Hall Gardens, Castle Pollard.*

10, IRELAND, S.

ATHLONE.—The Strawberry crop turned out fairly well, considering the fact that all the earliest berries were destroyed by severe frosts about the end of May. We grow only Leader, Royal Sovereign, and Latest of All. The Gooseberry crop is the largest I have ever seen. Plums and Pears suffered by the late frosts, but not to any considerable extent. *J. Murray, Moydrum Castle, Athlone.*

KILDARE.—Strawberries, also Pears and Plums in the open, suffered from the severe frost on May 14, but taken all round the fruit crops are very satisfactory. *Frank Bedford, Straffan House Gardens.*

WATERFORD.—Generally, there are good average fruit crops in this district. Trees in the lower-lying parts suffered somewhat from the continuous frost in the first fortnight of May. Our soil varies from a light sandy loam to a stiff retentive clay. *David Crombie, Curraghmore Gardens, Portlaoise.*

CHANNEL ISLANDS AND ISLE OF MAN.

GUERNSEY.—We had a very good show of bloom and a good set of fruits, but a large number of Pears dropped during June. No doubt this was owing to the unfavourable weather we had subsequent to their setting. This has been anything but a warm summer, and it is quite surprising that fruit has done so well. *Chas. Smith & Son, Caledonia Nursery, Guernsey.*

JERSEY.—Most kinds of fruits promised well, but after the fruit was well set, we were visited by a severe hail-storm, which damaged it nearly all. Holes were made in the fruit by the hail almost as though shots had been fired into the trees. It may or may not develop and grow out of it, but I am afraid not. Of Strawberries, the Royal Sovereign is the variety chiefly grown, also the Monarch. These two sorts do splendidly here. *T. Sharman, Imperial Nursery, St. Heliers.*

ISLE OF MAN.—All fruit trees promised well for good crops until May 15, when we experienced 10° of frost. Pears were just setting and Apples coming into bloom. The flowers were blackened right through. Strawberries promised well until the same date, when the early flowers were spoiled, and owing to cold east winds later blooms did not set well. Gooseberries and Currants are abundant and good, and we have a big crop of Loganberries. *James English, Brunswick Road Nurseries, Douglas.*

ANTIRRHINUM SEMPERVIRENS.

THE creeping Snapdragons are very pretty plants for the rock-garden, especially if allowed to drape a perpendicular ledge with their foliage and flowers. *A. Asarina* was introduced into this country as long ago as 1699, so that it has been in cultivation with us for over 200 years. It is a native of the South of France, and has been described as an annual and a greenhouse plant. We now know it to be without doubt a hardy perennial in light soils, but apt to die off in heavy ground. The plant has a peculiar habit, its long, trailing stems rambling to a distance of 6 feet or more when it is in good soil, and the grey foliage is so arranged that, in the twilight, the long stems have the appearance of snakes with large scales. The flowers are yellowish-white, nearly the size of those of the common Snapdragon, and are produced all along the stems. Seedlings often appear around the parent plants. *A. glutinosum*, a Spanish plant, was introduced into England 17 years ago. It is said to grow freely in the great walls of the Alhambra at Granada, and is

through the summer and autumn. Its habit of growth is not so trailing as that of the other Antirrhinums, and it spreads more evenly. The flowers are white with a pink veining on the upper petal. The plant shown is growing behind a large, perpendicular stone about 2 feet in height, and has entirely draped this to the ground level, while it has covered the rock for a width of 2 feet 6 inches with a wealth of foliage and flower. *Wyndham Fitzherbert.*

The Week's Work.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Pineapples.—Suckers of the varieties Smooth Cayenne and Charlotte Rothschild should be detached and potted if they are becoming large, as they not only exhaust the plants, but themselves become drawn and weak. When potted, plunge them in a moderately warm hot-bed, where they will quickly form roots if a close and moist atmosphere is maintained, and the glass shaded during the bright weather. Young

afternoon, when the house is closed and charged with moisture, the thermometer may be allowed to rise to 100°; the bottom heat must not be allowed to decline below 80°. The plants being well rooted, stimulants may be given in increased strength.

Strawberries in pots.—Sunshine and freely moving air are necessary to ripen the crowns before the end of autumn; therefore the plants must not be crowded. Cut off all runners and all side growths. Turn the pots round occasionally to prevent the roots from growing through the pots into the gravel or ashes. When the plants are fairly well rooted, some weak liquid manure may be given, and this may be increased in strength as the plants develop more roots. Syringe the foliage occasionally with some specific to ward off mildew.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Potatos.—Seldom have I known the Potato crop to appear more promising in this district; disease so far has not affected it seriously, but no time should be lost in lifting the tubers, for should cold, showery weather set in, a large percentage of the tubers may become diseased. Choose fine weather for the work, and where the facilities exist, place the tubers in sheds. Then, after a week or two, sort them prior to placing them in the open. I sprinkle freshly-slaked lime over them as they are put in the clamps, as this dries up any affected tubers which may have been overlooked, act as a general sweetener, and improves the flavour. Burn every particle of the old haulm, and should the soil be deficient in lime, apply a good coating of this substance over the surface.

Cabbage.—Plants from the earliest sowings will now be ready for planting. Apply a good dressing of farmyard manure to the soil, trench or dig it deeply, and plant in rows at from 18 to 20 inches apart, allowing 1 foot between the plants in the rows. Make the soil firm, and then water thoroughly. Where slugs abound, place a few finely-sifted cinder-ashes around each plant.

Coleworts.—The soil about these should be flat hoed frequently to promote a free, succulent growth. Any spare plants may still be put out on a south border, allowing them a distance of 12 inches apart each way.

Coultiflowers.—Seeds should be sown in finely-prepared soil on a south border to raise plants for wintering in cold frames for furnishing an early supply next year. The true stock of the old Walcheren is still one of the best varieties for sowing at this season. Magnum Bonum is also excellent, and, where room can be found, Autumn or Early Giant should be included.

Spinach.—This plant does much better when allowed plenty of room, and there should be a distance of 3 or 4 inches between each plant. Apply frequent dressings of soot, and keep the surface soil constantly stirred. Continue to sow at intervals of about 10 days in various parts of the garden for winter and spring supplies.

Carrots.—The main crop of this vegetable should now be lifted and stored. Great care should be taken not to place the roots in too large a bulk, or they will become heated and damaged. Late sowings in frames should be thinned sufficiently to prevent overcrowding. As small Carrots are generally very acceptable, the plants may be thinned as required. Where young Carrots are in request throughout the winter, make another sowing in a slightly-heated pit, selecting one of the stump-rooted, quick-maturing varieties for the purpose.

Endive.—Continue to transplant seedlings from late sowing, choosing a south border. Tie the leaves, when they are dry, of any which are ready for blanching.

Onions.—Lose no time in harvesting, for nothing will be gained by allowing them to remain longer in the open. Sow, each fortnight, small quantities of seed in boxes, and rear them in a cold frame for use as a salad.

Radishes should be sown in small quantities frequently during the next four weeks. Radishes may also be sown in cold frames.

FIG. 71.—ANTIRRHINUM SEMPERVIRENS: FLOWERS YELLOWISH-WHITE.

at its best as a wall plant. In dry walls this little Snapdragon finds a congenial home and bears its white flowers profusely through the summer and autumn. It has long, trailing stems thickly set with small, alternate and velvet-smooth leaves, grey with the silky hairs that cover both upper and under surfaces. The whole plant is somewhat sticky to the touch, as its name implies. It is rather tender, and has a habit of dying out in some gardens, but it can be treated with success as a half-hardy annual. *A. sempervirens*, the subject of the accompanying illustration, is apparently a rare plant, as it is not mentioned either in *Nicholson's Dictionary of Gardening* or in the century supplement of that work, and I have just consulted a hundred volumes of the horticultural Press without finding any allusion to it. It is, however, to my mind, distinctly superior to the two creeping Snapdragons already mentioned, as it does not die out in the way they so often do; but remains in perfect health year after year. It is at its best in May, but continues to bloom

plants that require repotting should be attended to without delay, so that the roots may develop in the new soil before the dull weather sets in. Syringe them twice daily during fine weather, and keep the house close and moist. Plants intended for winter fruiting should be treated more liberally in regard to feeding when they have passed the flowering stage. Guano-water and liquid manure are both excellent stimulants for Pines when applied with discretion. If the plants are growing in pots, some rich material placed around the base of the stems will encourage fresh roots to develop and assist the fruits to swell.

Queen Pines.—The season has not been favourable for plants which will be required for fruiting next year; it will be wise, therefore, to assist them in every way, and every opportunity should be taken during fine weather of confining as much sun-heat as possible in the house, by closing the ventilators early in the afternoon, after syringing the plants and damping all the bare spaces around. Ventilate the house with great care during stormy weather, for on no account must the plants be subjected to a chill through cold draughts. A minimum temperature of 70° should be maintained, but during the

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODGE, Bart., Leonardlee, Sussex.

Propagating.—No time should be lost in commencing the work of propagating all kinds of bedding plants. Plants raised from cuttings have a better chance of surviving through the winter when they have plenty of roots. For this reason Pelargoniums, Irisnes, Alternantheras, and similar plants should be rooted before the autumn.

Roses.—Cuttings of half-ripened shoots about 9 inches long should be inserted at this time. Those of the more tender varieties should be placed under frames or handlights, but those of the hardier sections may be put in small trenches made on a sheltered border. All kinds of Rambler Roses grow extremely well on their own roots, and such plants are preferable to those propagated in any other way. Good plants may be had from cuttings in two years. The cuttings should be lightly shaded from strong sunshine and protected in the winter by a thick coating of wood-ashes over their roots.

Shrubs.—Many species of shrubs may be propagated at this season. Select half-ripened, healthy shoots and make the cuttings from 7 inches to 9 inches long. Mix a quantity of decayed leaves and old potting mould with the soil, tread the ground firm, and then make a small trench with the spade. When the cuttings are inserted make the ground about them very firm. Cuttings of Camellia, Olearia, Ribes, Skimmia, Philadelphus, Hydrangea, Genista, Cistus, Escallonia, Deutzia, and Buddleia may be easily rooted in this manner, and, if left for a year, then transplanted the following autumn, will develop into useful plants the following season. It may be necessary to protect the cuttings in frosty weather, and this may be done by simply placing a little dry bracken over them and removing it again as soon as the frost disappears. Continue to prune any shrubs that require their shoots shortened: most flowering shrubs require some pruning after their flowering period, if only to get rid of the old seed vessels. Others may require pruning for preserving their shape or keeping them within bounds. Place a mark to any that are to be shifted, and especially to the deciduous varieties, for, when the foliage has fallen, the plants may not appear to be crowded.

Dahlias.—These will now require much attention, especially in the matters of staking, tying, and thinning or disbudding the shoots. During dry weather afford them copious waterings, sometimes giving liquid manure. Set traps to catch earwigs, or these pests will soon disfigure the blooms. Seedlings should be selected as they flower, and the worthless varieties marked for destruction later.

Agapanthus.—Plants in bloom should receive copious supplies of water, and, occasionally, a little fertiliser and soot-water. The Agapanthus forms a fine plant for growing in tubs to place on terraces: the foliage is very stately.

Clerodendron trichotomum.—The plants are now developing their scarlet and white bracts, and should receive manurial assistance in the form of manure water.

Helleborus (Christmas Roses).—Plants in positions exposed to direct sunshine should have plentiful supplies of water to enable them to tip up the crowns.

Tecoma grandiflora.—Plants on south walls are showing the flower-buds in profusion. Assist their expansion by liberal supplies of water or liquid manure. This plant requires very warm weather to bring its flowers to perfection.

PLANTS UNDER GLASS.

By A. C. BARFLETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

Bulbs.—To obtain a succession of bulbous flowers after the Roman Hyacinths and Polyanthus Narcissi are finished, batches of Dutch Hyacinths, various Tulips, such as Duc van Thol, Belle Alliance, Cottage Maid, La Reine, and Vermilion Brilliant, with Crocuses in different colours, should be potted without delay. The potting soil should consist of equal parts loam and leaf-soil, with plenty of sand added. As in the case of the bulbs that are already potted, the receptacles should be placed on ashes in the open

and covered with the same material until about an inch of growth has been made. Small batches of these plants should be potted about once a fortnight for succession until the time arrives for potting the main batch; shortly, Narcissi and Scilla may be included.

Retarded plants.—Crowns of Lily of the Valley, which have been subjected to the cold treatment, are especially suited for supplying flowers as late as the end of December. The crowns are now sold very cheaply, but unless there are proper conveniences for keeping them, it is best to order small quantities as they are required. Astilbe (Spirea) is another flowering plant that forces well; the pink-flowered varieties should be included.

Hyacinths in glasses.—To be successful with these plants it is necessary that the glasses containing the bulbs be kept in a cool, dark situation until the receptacles are fairly well filled with roots. Although the bulbs should not be exposed to the light, they must not be kept in a damp, stagnant atmosphere, but in some place where the surroundings are comparatively dry. As a rule it will be found that the single-flowered varieties are the most suitable for this method of cultivation. Place a few pieces of charcoal in the glasses and nearly fill them with water so that the bulbs just touch the water. Examine them from time to time and replace occasionally any water that is lost by evaporation. Should the water become foul, wash the glasses and refill them with fresh rain-water.

Richardia africana.—The plants growing in trenches should be chopped around their roots with a spade so that when, a week or so later, they are lifted and potted, they will not suffer such a check as otherwise would be the case. For a few days after being potted the plants should be kept close and be well syringed.

Salvias.—Plants intended for flowering in the greenhouse, and which, for the summer, have been planted out-of-doors, should now be carefully lifted and potted into pots of a convenient size. After the plants have been potted give them a good watering and keep them close and shaded from sunshine, syringing the foliage twice daily until the root action has recommenced.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Perpetual-fruiting Strawberries.—These plants require more attention than is usually accorded to the summer-fruited varieties; they should receive a dressing of some artificial manure, after which a copious watering should be given to wash the constituents of the manure into the soil. When this has been done, dust the ground about the plants with a mixture of equal parts soot and slacked lime to keep down slugs. Place some clean wheat straw along the rows to prevent the fruits from becoming splashed with soil. At the time the fruits are ripening the weather is usually very damp, either from rains or heavy night dews, and if the berries are allowed to lie directly on the damp straw, there is a great danger of them rotting before they ripen. Many of the best fruits are spoiled in this way: but it can be largely prevented by supporting the trusses of fruit with little forked pieces of stick, or wire supports, sold by the horticultural sundries-man for the purpose. When handling the trusses to place the supports in position, superfluous fruits may be removed, and thinning well repays the trouble it entails. If very cold and damp weather sets in, the plants may be protected by lights placed over them, or even handlights: but, whatever is used, take care to allow a constant circulation of fresh air about the plants at all times. St. Joseph, St. Antoine de Padou, and Laxton's Perpetual are three of the most reliable Strawberries for late supplies.

Wasps.—Notwithstanding the cold and wet of spring and early summer, wasps are very numerous. They are destructive of all kinds of fruit, and every effort should be made to locate their nests and destroy them. Their haunts should be marked in the daytime, so that the work of destroying them may be done after sunset, when most of the wasps will have returned to their nests. Soak cotton wool in cyanide of potassium dissolved in water, and place this in

the mouths of the holes containing the nests. The cyanide is a deadly poison, and should be kept under lock and key. We generally use tar-water from the gasworks, as it is safe for the operator and very effectual, nor are the fumes so noticeable in application as gas-tar, which is often used. The old rule in gardens of paying the staff one penny each for all queen wasps killed in the spring had much to recommend it, and should be more generally practised.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TRAYLOR LAWRENCE, Bart., Bifford, Surrey.

Sobralias.—These Orchids, though possessing large Cattleya-like blooms, are not general favourites. The principal objections to them are that the individual blooms, having no stalks, are of little value as cut flowers, and that they last fresh for a few days only. The plants, when well established, afford a long succession of handsome flowers, and a representative collection of the various species and hybrids finds some of the members in flower over a period of five or six months. Among the best from a decorative point of view are *S. macrantha*, *S. m. alba* (pure white), *S. Lucasiana*, *S. xantholeuca*, *S. Lilastrum*, *S. Warszewiczii*, *S. Holdfordii*, *S. Sanderiana*, *S. albo-violacea*, *S. x Amesia*, *S. Lowii*, *S. Lindenii*, *S. Veitchii*, *S. Colmaniae*, *S. Wiganie*, and the rare *S. Ruckeri*. All the above are strong-rooting plants, and, as they are now developing their new growths, they need plenty of water at their roots. Should a plant need a larger pot, or an unwieldy specimen require dividing, the rooting medium should be allowed to become rather dry for a few days prior to the operation. Because of their strong-growing habit, Sobralias require a considerable amount of pot room, and plenty of clean crocks for drainage purposes. They thrive best in a compost consisting of fibrous loam and Osmunda fibre in equal parts, with a small quantity of Sphagnum-moss. The Osmunda and Sphagnum should be divided into moderately small pieces so that it will incorporate well with the loam. Add plenty of small crocks to these materials, and mix them well together. In potting, keep the base of the plant below the rim of the receptacle, and pot them similar to greenhouse plants. For some time afterwards watering must be done with great care: but when the plants are well established, and growth is vigorous, they will require an abundance of moisture. A light position in almost any house having an intermediate temperature will suit Sobralias throughout the year.

Lalia purpurata and *L. tenebrosa.*—Plants of *Lalia purpurata* and *L. tenebrosa* should be examined to ascertain if they require increased root room, as by this time the new breaks will have grown a few inches, and will soon commence to produce young roots. Old plants that require rejuvenating should also be seen to, removing all worn-out and leafless back pseudo-bulbs; two or three pseudo-bulbs behind each leading growth will be sufficient. Previous to potting, remove as much of the old soil as is possible without injuring the roots, and use pots sufficiently large to accommodate them for two seasons. When repotting young, well-rooted plants into larger pots, the soil in front of the leading growths, if in good condition, need not be disturbed, it being sufficient to remove the old compost where the back pseudo-bulbs have been cut off. By this method, some of the plants may be placed into similar pots to those they have hitherto occupied. Fill the pots to about one quarter of their depth with clean crocks: pot firmly, and, for a compost, use Osmunda and Polypodium fibre in equal parts, with plenty of small crocks added to keep the mixture porous.

Lalio-Cattleya elegans.—Plants of this natural hybrid will be sending up the flower-spikes from the apices of the current season's growths. At this stage the shoots are tender, and decay soon sets in if the plant is kept too wet at the roots, especially when the night temperature is low. Growth will be completed just after the fading of the flowers, and if the plant is repotted at that time, the new roots which are emitted from the base of the flowering growth will appreciate the fresh potting mixture. The same material as advised for *L. purpurata* will suit this plant. It will be advisable to water the plants less frequently, and to gradually afford them an increased amount of light and fresh air.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants to name, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Appointments for September.

- SATURDAY, SEPTEMBER 4—
Soc. Franç. d'Hort. de Londres meet.
- WEDNESDAY, SEPTEMBER 8—
Roy. Caledonian Hort. Soc. Centenary Exh. at Waverley Market, Edinburgh (2 days).
- MONDAY, SEPTEMBER 13—
United Hort. Ben. and Prov. Soc. Com. meet.
- TUESDAY, SEPTEMBER 14—
Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. Edward A. Buryard on the "Physiology of Pruning"). British Gardeners' Assoc. Ex. Council meet.
- THURSDAY, SEPTEMBER 16—
Nat. Rose Soc. Autumn Exh. at Hort. Hall, Westminster.
- MONDAY, SEPTEMBER 20—
Nat. Chrys. Soc. Executive and Floral Coms. meet. at Essex Hall, Strand.
- TUESDAY, SEPTEMBER 21—
Nat. Dahlia Soc. late Exh. at Roy. Bot. Gardens, Regent's Park (2 days). Edinburgh Autumn Holiday.
- TUESDAY, SEPTEMBER 22—
Roy. Hort. Soc. Coms. meet. (Masters' Memorial Lecture on the "Production of Varieties," by Prof. Hugo de Vries at 3 p.m.).
- WEDNESDAY, SEPTEMBER 29—
Michaelmas Day. Quarter Day.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—59°.

ACTUAL TEMPERATURES:—
LONDON.—Wednesday, September 1 (6 P.M.): Max. 59°. Min. 45°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, September 2 (10 A.M.): Bar. 29.9; Temp. 59; Weather—Dull.

PROVINCES.—Wednesday, September 1: Max. 56° Iceland S.W. coast; Min. 48° Lincoln.

SALES FOR THE ENSUING WEEK.

- MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—
Dutch Bulbs, in all varieties, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.
- WEDNESDAY—
Thousands of Roman Hyacinths, Narcissus, Chionodoxa, Amaryllis, &c., Azorean Lilies, Amaryllis, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 5.
- FRIDAY—
Choice Imported and Established Orchids in variety. Orchids in flower and bud, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

Bordeaux Mixture. The results of a very complete and elaborate investigation into the use of Bordeaux mixture for spraying orchard trees, &c., are published in the *Bulletin* of the Agricultural Experiment Station (University of Illinois). The introduction to the *Bulletin* gives an excellent historical account of the origin of the use of copper sulphate as a fungicide. Readers of the *Gardeners' Chronicle* will be interested to learn that, so long ago as 1861, Mr. W. F. Radclyffe published in these pages an account of his discovery on the value of this fungicide. Reasoning from a knowledge of the fact that "solution of vitriol was a sure remedy for smutty Wheat seed," Mr. Radclyffe "applied, with a watering pot, to Rose bushes affected with mildew, a solution of 2 ounces of blue vitriol to a stable bucket of cold water. The receipt signally succeeded, and the Geants are perfectly cleaned of the mildew."

The credit for the discovery of the beneficial action of copper sulphate and lime together rests, however, with Millardet, who

has himself placed on record how, on the outbreak of mildew in France in 1878, he set himself to study the *Peronospora* in the hope of finding a weak point in its development that would permit of its being mastered. In 1882 he observed in certain vineyards of Medoc that the vines along the roadside still bore leaves, whereas, everywhere else, the leaves had fallen. On enquiry of the manager he learned that it was the custom to cover the leaves with copper sulphate and lime in order to deter passers-by from pilfering. From this accidental observation and Millardet's acumen the discovery of the spray-material of most general use was made.

The *Bulletin* gives also a useful account of the old and new formulæ, showing that, as originally prepared, Bordeaux mixture was far stronger than is now the case, and recording how the present 4-4-50 formula (4 lbs. copper sulphate, 4 lbs. of lime, and 50 gallons of water) came to be generally adopted in most parts of America. As its use has been extended to scab, curl and brown-rot, so the tendency has grown to reduce yet further the strength of the mixture. The author, Mr. Charles S. Crandall, is careful to point out, however, that strength of the mixture is only one of the factors which contribute to success in its use: purity of materials, time of application, and prevailing weather-conditions are other factors of equal importance. After an account of the mode of preparation, the chemistry of Bordeaux mixture is discussed, and in the course of the discussion it is admitted that much remains obscure as to the form which the copper takes and as to the precise way in which it acts.

A very full consideration is given to the damaging effect which Bordeaux mixture may have on foliage, particularly in producing brown spotting (burning) and yellowing of leaves. Mr. Crandall's experiments lead him to conclude that though at times the injury is due to carelessness in making the mixture, nevertheless injury sometimes follows when a perfect mixture is applied. He concludes that Bordeaux mixture most nearly approximates to the ideal spray, but that its harmlessness (with respect to damage of foliage) cannot be absolutely depended upon. Though weather-conditions do not appear to be responsible for the yellowing which sometimes follows the use of Bordeaux mixture, there seems to be no doubt that rain following on the application is the chief factor in producing brown-spots or burning.

The
Darwin
Exhibition
at
South
Kensington.

The authorities of the Natural History Museum at South Kensington have placed the section of the public interested in natural history under a deep debt of gratitude. It is doubtful whether any other great museum can vie with the Natural History Museum in general attractiveness. A visit to most museums may be vastly instructive to the specialist, but it is certainly a weariness to the uninitiated. The specimens may be imposing, and even beautiful; but, exposed in severely systematic order, or, as is sometimes the case, in no order whatever, the adult visitor does not know where to begin nor how soon to end with them. At South Kensington

a very different system has been adopted with conspicuous success. The chief cases tell some story in natural history. Aided by brief descriptive notices, the layman may arrive at a sound understanding of the meaning of such terms as natural selection, sexual selection, species, varieties and the like, in a pleasant and yet thoroughly business-like manner.

Now, in addition to the permanent cases, there has been opened a special series of exhibits serving as a memorial of Darwin's life and work. Though the prime object of this Darwin exhibition is to illustrate the main argument of his great work *The Origin of Species*, the objects themselves are individually of such interest that the visitor who is more concerned with the man than with his achievements may spend a profitable hour in their inspection. The guide-book, prepared by Dr. W. G. Ridewood, serves as an admirable aid to the study and appreciation of the exhibit. If the history of a nation is the history of its great men, then, in no better way, can the present generation learn something of the progress of thought in the latter part of the last century than by studying such an exhibition as that displayed at South Kensington. As he passes in review the 300 separate exhibits, the visitor sees the life of our greatest naturalist re-lived before his eyes. Among the manuscripts he finds, for example, one which marked the turning-point in Darwin's career and, hence also, an epoch in natural science; that in which Darwin replies to his father's objections to his joining in the voyage of the "Beagle." He may also see the extraordinary care and labour which the great naturalist bestowed on his writings; manuscripts corrected and re-corrected time after time before the unwilling words could be induced to express the writer's great ideas. We ourselves having, in our student days, been privileged to use some of the books which Darwin himself used and annotated, were profoundly impressed by the way in which he devoted his attention to the matters which ordinary mortals would have passed by: a testimony to the truth of the saying that the only sure sign of genius is that it does not follow the beaten track.

Though it is true that everyone with a garden has the best museum ready-made; nevertheless, it is true also that, without some guide to observation, the living museum remains of comparatively small value. A visit to the Darwin memorial exhibition will prove not only instructive in itself, but a great stimulus to all who have access to Nature, in country or in garden, to observe natural phenomena for themselves.

OUR SUPPLEMENTARY ILLUSTRATION shows flowering plants of *Lilium rubellum* raised from home-saved seed. Although it is now 11 years since this beautiful Japanese Lily was first flowered in England, it seldom grows satisfactory in this country, and, were it not for the fact that bulbs are imported annually from Japan, this Lily would be seldom met with. Growers can, however, raise their own seedlings. At Kew plants from seed are found to grow well and to flower more freely than those from imported bulbs, most of which only last for two or three years. Several of the specimens depicted in the illustration flowered in their third year. They are now six years old, and have improved each successive season. *L. rubellum* belongs to the Edulium or Beauvii

group, and is closely allied to *L. Krameri*, from which it differs in having broader leaves and smaller, richer, pink flowers. It is found wild in the Northern Nippon district of Japan, and is the earliest Japanese Lily to flower in this country, being at its best from the last week in May to the third week in June, which season of flowering is slightly in advance of that of *L. elegans* and its varieties. In the *Botanical Magazine*, tab. 7634, the stems are described as slender: this term, however, can scarcely be applied to the plants shown in the illustration, for they are 18 inches to 2 feet in height, and 1 inch to 1½ inches in circumference. Several of the plants are carrying three or four flowers on one stem, some have five, whilst one has as many as six flowers, all of which are open together. The original account describes the leaves as 2 to 3 inches in length, but several of the Kew plants had leaves 3 to 4 inches long and 1½ inches wide. The perianth is funnel-shaped, 5 inches in length, and about 4 inches in diameter, the three inner segments 1½ inch broad, the three outer ones 1 inch broad. The colour of the blooms varies from pale rose to rose-pink. The seeds should be sown as soon as they are ripe, when they will be found to germinate quicker than if kept until the spring of the following year. *L. rubellum* succeeds best in a well-drained soil composed of sandy loam and peat: if the latter is not available, leaf-mould may be used. Being a stem-rooting Lily, the bulbs should be planted 3 to 4 inches deep.

THE CHAMPION FRUIT-TABLE CLASS AT SHREWSBURY.—In our report of this show (see p. 137), it was remarked that, contrary to the practice which obtained in former years, the pointing in the exhibits in this class was not shown to the public. A correspondent has since addressed a letter to us on this subject in which he strongly complains of the discontinuance of the pointing last year and this year. Owing partly to the important position our correspondent has filled for many years past at Shrewsbury, both as exhibitor and judge, we addressed an enquiry to the Shrewsbury secretaries as to the responsibility of the judges in this matter. In reply we are informed that the society had no intention of publishing the points, nor was it stated in the schedule that they would be published. It is regarded as scarcely possible to do so in the time allotted for judging before the opening of the show, especially as the 30 individual dishes of fruit are not specified in the schedule, and are not similar in kind. It is further suggested that the judges may still have the pointing book in their possession, in which case there is no reason why the pointing should not be published. We think that efforts should again be made to publish the pointing in this class directly the judging is finished, for there is no doubt it would greatly increase the interest in the competition. Our correspondent also states that there appeared general dissatisfaction with the awards of the 2nd, 3rd and 4th prizes, but this is a matter that cannot be satisfactorily discussed in these columns.

FRENCH GARDENING.—In a lecture to the Fellows of the Royal Horticultural Society on the subject of French Gardening (*J. R. H. S.*, xxxv., Part 1, July, 1909), Mr. C. D. MACKAY pointed out that from February to April there are sent every day from France to London 4,000 to 5,000 crates of Lettuce, 500 crates of small early Carrots, 100 crates of Asparagus, 100 crates of long French Turnips, and 50 crates of Celeriac. Mr. MACKAY, who advocates strongly the wider adoption of the French method of intensive cultivation, provided in his lecture a number of facts, the consideration of which is well worth the while of all concerned in market work.

PROPOSED NEW PARK FOR ABERDEEN.—It is proposed to acquire from the Aberdeen Land Association some 24½ acres of ground in the west-end of the city, for the purpose of laying it out as a public park. The sum asked and agreed to by the Links and Parks Committee of the Town Council amounts to £9,800 at £400 per acre. The works in connection with the park, including walls, laying out the grounds, gate lodge, and provision of outlays for street making, are estimated to cost £8,200, making a total estimated cost of £18,000. It is suggested that the Council should also acquire 14 acres 3 roods of land contiguous to the proposed park, and to be used for feuing purposes, at the same price, namely, £410 per acre—£5,900. Details would amount to £946, making a total outlay of £6,846. The return to be derived from this area from feuars is estimated at £12,605, showing a balance over the purchase price in favour of the city treasury of £5,757. In the meantime plans are to be prepared showing the position and extent of the different sites, and circulated among the members of the City Council.

A GARDEN SUBURB FOR BRISTOL.—The project for providing a garden suburb for Bristol shows prospects of early realisation. The company formed to take up land at Shirehampton for the experiment has placed its prospectus before the public with success. The allotment letters have been posted, and the minimum subscription upon which the directors were prepared to go to allotment has been exceeded. The company has been formed to acquire from Mr. PHILIP NAPIER MILES about 26½ acres of land situated close to the Shirehampton railway station. The site is within the area supplied by the Bristol Water Works Company, and gas and electricity are also available. The property will be laid out with wide roads and good open spaces, and as the area of the house plots, with a few exceptions, will not be less than 340 square yards or thereabouts, a good garden is assured to each house. The directors propose to provide houses for all classes, and it is part of the scheme to erect houses for which a rent of 6s. or 6s. 6d. per week can be accepted, and also larger houses which will, it is anticipated, command as much as 10s. per week.—*Times*.

POTATO SCAB.—The method of treating scabbed seed Potatoes with formaline before sowing has been recommended frequently. According to the results of experiments carried out by Mr. W. J. MORSE (*Report of Experiment Station, Maine, U.S.A.*, 1907), the method is eminently successful. Potatoes soaked for two hours in a solution of ½ pint formaline to 15 gallons of water, and used subsequently as seed, gave a crop of which less than 1 per cent. consisted of scabbed Potatoes; whilst the percentage of diseased tubers obtained by planting untreated tubers was over 5 per cent. Mr. MORSE has also tried formaldehyde gas instead of the liquid, and finds it very efficacious. The gas is generated by pouring formaldehyde over potassium permanganate placed in tin trays. The room is closed, and the tubers are exposed to the vapour for 24 to 48 hours. For a space of 1,000 cubic feet 23 ounces of potassium permanganate and 3 pints of formaline are required. Where Potatoes are stored in large quantities, in places that can be closed in, it might be well worth trying this formaline gas method once or twice during the time of storage as a preventive not only of scab but also of rot.

HELIANTHUS.—The Helianthus which has been much advertised recently as making enormous growth and serving as food for beast and man, is identified by P. GRAEBER in a leaflet issued by the Botanical Gardens and Museums of Berlin as *Helianthus macrophylla*.

RUBBER PLANTS.—It is perhaps not so widely known as it deserves to be that the members of the Kew staff, both the practical and the botanical, have been for some years past engaged on questions relating to rubber plants. The late Director, Sir WILLIAM THISELTON-DYER began many years ago an investigation of the species of *Landolphia* and other genera of Apocynaceae, but pressure of other work prevented him from continuing his studies in this direction. Mr. W. WATSON, the Curator, has, moreover, always been interested in raising seedlings of rubber plants of reputed good quality for distribution to the Colonies and India. At the herbarium, Mr. W. BOTTING HEMSLEY and his successor, Dr. OTTO STAFF, have been engaged on the purely botanical discrimination of genera and species, and the results of their labours have appeared from time to time in the *Kew Bulletin* and HOOKER'S *Icones Plantarum*. The former has devoted himself mainly to the American rubber plants and the latter more particularly to those of the Old World. The last part of the 29th volume of the *Icones Plantarum* (plates 2,876-2,900) contains figures and a full botanical description of *Manihot dichotoma*, reputed to yield a rubber superior to that of *M. Glaziovii* and of species of the genus *Sapindus*, including a number previously undescribed, the account constituting a continuation of Mr. HEMSLEY'S review of the American species of the genus. The excellent plates by Miss MATILDA SMITH were all prepared from authenticated specimens, mostly preserved at Kew, but some at the British Museum, others at Berlin and Paris, kindly lent for the purpose by the authorities of the several establishments. Collectors' and contributors' reports on the quality of the rubber of a number of the species are given, and also references to the literature of the commercial side, but there is no attempt to discuss the relative commercial values of the various species.

APPOINTMENT OF AN ENTOMOLOGICAL RESEARCH COMMITTEE.—A committee has been appointed by the Earl of CREWE to carry out investigations in economic entomology, with special reference to Africa. The work of the committee will be directed to the discovery of the relations which exist between insects and disease in man, animals and economic plants. Among the members of the committee are Lieutenant-Colonel PRAIN, C.I.E., Mr. R. NEWSTEAD, of Liverpool, and Mr. F. V. THEOBALD. Trained entomologists are to be sent, one to the east side, another to the west of Tropical Africa, in order to encourage official and other residents to collect and observe noxious insects, and to give instruction in the use of scientific methods. Collections are to be made, and the scientific results obtained in various parts of Africa are to be published from time to time by the committee.

IMPORTATION OF POTATOS INTO THE TRANSVAAL.—The Transvaal Government *Gazette* for June 11 contains a Government notice to the effect that, on and after September 1, 1909, no person shall introduce into the Transvaal from outside South Africa any consignment of Potatoes, unless accompanied by a certificate from the consigner stating fully in what country and district of that country the Potatoes were grown, and also a certificate from the Board of Agriculture of the country in which the Potatoes were grown to the effect that the disease known as "wart disease" or "black scab" has not been declared to exist in the district from which the Potatoes came. Any consignments not accompanied by such certificates will be liable to be seized and destroyed by the Department of Agriculture.

THE CENTENARY SHOW OF THE ROYAL CALEDONIAN HORTICULTURAL SOCIETY.—On December 5 next this society will enter on the second century of its existence. In order to signalise the event a great exhibition of fruits, flowers and vegetables will be held in the Waverley Market, Edinburgh, on September 8 and 9. A large number of the leading trade growers will exhibit, and it is anticipated that the competitive classes will be well filled. The members of the nursery trade in Edinburgh offer a Silver Centenary Cup of the value of 18 guineas, in addition to a monetary prize offered by the society, for a collection of cut flowers. Other cups of the same value are offered in the fruit and vegetable sections, and these in addition to the 50-guinea challenge trophy for eight bunches of Grapes, presented by Mr. MASSIE in 1904. The present holder of the trophy, Mr. KIRK, Norwood, Alloa, has won it twice, while Messrs. GOODACRE, BEISANT, and LUNT have each won it once. Another prize which should attract competitors is the HUGH DICKSON memorial prize, consisting of a Silver Cup, of the value of 15 guineas, for 24 Rose blooms.

PUBLICATIONS RECEIVED.—*Report of the Botanical and Forestry Department, Hongkong, for the year 1908.* (Hongkong: Noronha & Co., Government Printers.)—*A Pure-Line Method in Corn Breeding*, by Dr. George Harrison Shull. Reprinted from American Breeders' Association.—*The "Presence and Absence" Hypothesis*, by Dr. George Harrison Shull. Reprinted from *The American Naturalist*.

ARRANGEMENT OF BEDDING PLANTS.

The different combinations possible in the arrangement of bedding plants are well-nigh inexhaustible. Nothing in connection with the management of a flower garden gives more room for consideration or choice. Common observation shows that, whilst many plants of only average merit, from the decorative point of view, are made to appear most charming by tasteful association with other plants, some of the showiest and best lose much of their effectiveness owing to their being misplaced or ill-assorted with others which do not harmonise with them.

We print below a list of the beds and their occupants as arranged this summer in Belgrove Gardens, county Cork. Mr. Gumbleton cultivates an exceedingly large collection of the choicest annual, biennial and perennial plants, and takes the greatest personal interest in their grouping in the numerous flower-beds at Belgrove. The list may, therefore, possess interest to those who, in the management of public parks or large private flower gardens, are called upon to furnish fresh schemes of flower-bedding from year to year.

CONTENTS OF 42 BEDS IN BELGROVE GARDENS.

1. Six choice named Delphiniums, edged with a double row of *Dimorphotheca aurantiaca*.
2. Thirty tall Lobelias, in five varieties; *Coreopsis* King of Tom Thumbs, edged with dwarf variegated *Nasturtium Elstree Midget*.
3. Hybrid *Montbretias* and *Bidens pilosa*.
4. Eleven plants of *Salvia splendens* "Fireball" and 27 plants of the double white Ten-week Stock "Bismarck," edged with *Tropæolum fimbriatum Isola Bella*.
5. *Tagetes* Legion of Honour, to replace 44 Pansies, which failed from attacks of wireworm; the bed edged with *Viscaria aculata candida* (new variety).
6. *Dahlia lignea*, *Linaria dalmatica*, *Glaucium Fischeri*, *Argemone grandiflora*, *Symphandra Hofmanni* and *S. osetica*, *Alyssum spinosum roseum*, *Lychnis cognata*, *Campanula amabilis*, *C. hetonicaefolia* and *C. michauxioides*.
7. Seventy *Gladiolus Princeps* and three *Gladiolus Evolution* (blue variety).

8. Pillar of *Rose Dorothy Perkins*; *Tropæolum polyphyllum Leichtlinii* at the base.

9. *Coreopsis*, dark brown, in centre; new variety *Tiger Star*, double row, around it.

10. *Gillia coronopifolia* and *G. aggregata*, with new single *Petunia "Norma"* (blue and white) as a carpet.

11. *Richardia Elliottiana*, carpeted with *Eschscholtzia nana hybrida "Diana."*

12. New annual *Calandrinia chromantha*, with rose-coloured flowers followed by orange-yellow coloured fruits.

13. *Campanula primulefolia*.

14. *Lobelia cardinalis "Firefly."*

15. Perennial *Phloxes*, edged with *Inulas*, *Roylei*, *glandulosa superba*, *fimbriata* and *speciosissima*.

16. *Crinum Powellii album*.

17. Herbageous *Pæonies*, in 12 varieties.

18. Early-blooming *Cosmos*, in three colours, edged with *Nemesia "Crimson King."*

19. *Salvia splendens* *Victor Emanuel* and "Fireball," with four named *Eschscholtzias*—*Mikado*, *Dainty Queen*, *Carmine King*, *Intus rosea*.

20. New *Brachycome iberidifolia* *Blue Star*, edged with *Coreopsis* King of Tom Thumbs.

21. Scarlet semi-double *Begonia Lafayette*, edged with double *Lobelia Kathleen Mallard*, and carpeted with *Mesembryanthemum cordifolium variegatum*

22. Twenty-two choice double *Cactus Dahlias*.

23. *Anchusa capensis* and *A. furcata*.

24. *Helichrysum monstrosum* *flor. pleno*.

25. *Crococsmia* species, *Achillea* *Crimson Queen*, *Alyssum sinuatum*, and *Anemone japonica*.

26. Pompon double *Dahlias*.

27. *Impatiens Oliveri*, surrounded by 30 of different shades of *I. Holstii*, and carpeted with *Mesembryanthemum cordifolium variegatum*; edged *Gazania splendens variegata*.

28. *Dimorphotheca aurantiaca* (101 plants): (the brightest bed in the garden.)

29. *Carter's Nemesia grandiflora*, edged with 40 plants of the dwarf *Nemesia Orange Prince*.

30. *Begonia Martiana grandiflora*, with double row of *Godetia Sunset* and *Crimson Glow* on each side.

31. All the best forms of *Chrysanthemum leucanthemum* or *Ox-eyed Daisy*.

32. Same as bed 4, substituted *Salvia Victor Emanuel* for "Fireball" and *Nasturtium Isola Bella* omitting.

33. Nine choice named *Tigridias*, of which the *Giant* and *Rosy Giant* were the largest and best.

34. White variety of *Impatiens Holstii*, with new *I. H. Leignitzia* surrounded by new double *Eschscholtzia*.

35. Thirty choice named *Violas*, surrounded by *Nemesia Blue Gem*. The *Violas* failed for same cause as in No. 5.

36. *Clarkia flor. pleno* in two colours, *Brilliant* and *maculata*.

37. *Nemesia Dobbie's Triumph*.

38. Forms of *Anemone japonica*.

39. Named varieties of *Campanula persicifolia*. (These go out of bloom so soon that they are no good for summer bedding.)

40. Named varieties of *Papaver orientale*.

41. *Campanula persicifolia Moerheimii*.

No. 23, being now out of flower, has been replaced by *Lobelia cardinalis "Firefly."*

No. 40, *Poppies* having ceased to bloom, have been replaced by *Tagetes Croix de la Legion d'Honneur*.

CONTENTS OF 22 SMALL ROUND BEDS IN BELGROVE GARDENS.

1. *Geranium Lowii* or *anemonefolium*.
2. *Dahlia colletterette Maurice Rivoire*.
3. *Aster flor. pleno Beauty of Colwall*. (First double *Michaelmas Daisy*.)
4. *Dahlia coronata*, edged with blue *Lobelia*.
5. *Dahlia odorata Bruantii*, edged with *Dianthus Comte de Kerchove* (a fine double-flowered, striped *Indian Pink*).
6. *Dahlia Etoile Poitevine*.

7. *Dahlia odorata Bruantii*, edged with *Antirrhinum calycinum* (a good old Portuguese plant seldom met with).

8. *Dahlia lignea*, edged with blue *Lobelia*.

9. *Dahlia colletterette "G. Bruant,"* edged with *Viscaria* and variegated-leaved *Tropæolum*.

10. *Dahlia pæonia germania* (sweet-scented).

11. *Dahlia M. G. Bruant*, with four seedling *Tweedia cœrulissima*.

12 and 13. *Dahlia Twentieth Century* (single).

14. *Hemerocallis fulvida flor. pleno*.

15. *Salvia dichroa* (large specimen), a very handsome, tall-growing species.

16. *Lupinus polyphyllus roseus*

17. *Lilium speciosum Henryii*.

18. *Incarvillea grandiflora* or *Fargesii* and *Tunica saxifraga flor. pleno*.

19. Pillar of *Rose Lady Gay*.

20. Pillar of *Rose Perle des Neiges* and *Lathyrus panonicus Smithii*.

21. Pillar of *Rose Hiawatha*.

22. *Montanoa mollissima* (interesting free-blooming, white-flowered Composite shrub), with the rare *Impatiens amphorata* at foot.

NOTES FROM A "FRENCH" GARDEN.

We are now cutting our last batch of Cauliflowers, which has been grown as an intercrop amongst the Melons on the old manure beds. The heads are not very large, this defect being due to the damp weather before they commenced to develop.

Celery has done remarkably well this season. We are now blanching the variety "Winter Green," as we shall soon require the room the plants occupy. The crop of Celeriac is ready for marketing.

The Carrots sown in the middle of July are well forward and will be ready for pulling in late September; they will require copious waterings at least three times weekly.

This season has been very favourable to the growth of Cardoons; although there is still four weeks for them to complete their growth they are now larger than in an ordinary summer. The plants have had no manure water; they are planted in holes previously filled with well-decayed manure.

The curled and Batavian Endives planted in the middle of August are growing well. The ground should be hoed twice during September to prevent weeds growing during October and November.

We are now preparing the ground for transplanting the Onions sown last month. After having dug and levelled the bed, it is mulched with a layer of well-rotted manure. From 4,000 to 4,500 Onions occupy a full-sized bed, which measures 65 feet by 11 feet.

Early next week we shall prick off under cloches the young Lettuces sown the last days of August, placing 30 plants under each cloche. The ground is well watered before Lettuces are planted, and the cloches are shaded during bright days.

The young Oxheart Cabbages have just germinated through the soil; the ground will be kept moist, and every effort made to obtain strong plants early in October. The land on which they will be set in November should be dug and manured heavily as early as possible.

A dry and well-sheltered spot should be selected for the crop of Lettuces for next spring; the ground when available should be well dug and lightly manured. Where the mildew has been prevalent in former years it will be advisable to water the ground with sulphate of copper, using one part of the copper salt to 1,000 parts of water as a preventive.

We shall sow next week in frames the first Cauliflowers for next season's earliest crop. The variety "Driancourt" will be planted on hot-beds and in the open, but where Cauliflowers are wanted early in May the *Early London* or *Little Salomon* will be found useful *P. Aquatics*.

THE ROSARY.

CULTURAL NOTES FOR SEPTEMBER.

As the Rose season, generally, is very late, there is still a good opportunity for intending purchasers to visit the nurseries for the purpose of selecting plants for autumn delivery. Many of the late-flowering Hybrid Perpetual Roses, and also Hybrid Teas, are now in their best condition of growth and flowering. Although Roses were late in starting into growth, their condition is now all that can be desired, and, with a continuation of the present fine weather, the growths should be thoroughly matured and in a condition to withstand the cold weather of winter. Much harm is often occasioned by leaving too great a number of shoots, especially weakly ones, in the head of the plant. The shoots should be well thinned, as the aim of the grower should be to obtain strength and maturity of growth. These conditions cannot be fulfilled, unless ample space is allowed the top shoots of the plants so that air can circulate freely.

flowering period of Roses from May till well on to Christmas. Finish the repotting of established Roses intended for forcing in winter: some that were freshly potted last year will probably only require top-dressing. Take out about 2 inches of the old soil, make good the drainage, and replace the soil by a mixture of sandy loam and bonemeal. When repotting is necessary, shake away most of the old soil, and, if the roots are in a healthy condition, put the plants into a pot one size larger. If the roots are stunted, remove the old soil from about them, replace with fresh compost, using pots of the same size as before. The Tea, China, Noisette and N. Tea Roses may be dealt with first, following with the earliest varieties of the Hybrid and Perpetual sections. All these Roses may be stood outside on a bed of ashes for a month. After one thorough soaking, apply water sparingly till the plants are re-established. Give the shoots an occasional syringing. The potting loam and manure should be stacked in layers some months before use, so that the manure becomes thoroughly decayed and incorporates well

Roses in borders under glass which were given a top-dressing of cow manure and an abundance of water are making good growths, and promise to furnish a fine crop of flowers, especially the Tea, Hybrid Tea and China varieties. Plenty of ventilation both night and day should be given through this month on all favourable occasions. *J. D. G.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

PIONEERS IN FORESTRY (see p. 155).—An early author who deserves the greatest consideration is John Manwood, who wrote *A Treatise of the Lawes of the Forest*, "wherein is declared not onely those Lawes, as they are now in force, but also the originall and beginning of Forests; and what a Forest is in his owne proper nature, and wherein the same doth differ from a Chase, a Parke, or a Warren, with all such things as are incident, or belonging thereunto, with their

FIG. 72.—EXHIBIT OF FRUIT, FLOWERS, AND VEGETABLES AT THE SHREWSBURY SHOW FOR WHICH MESSRS. SUTTON AND SONS WERE AWARDED A GOLD MEDAL. (See ante p. 142.)

Failures in budding can still be made good by the insertion of fresh buds, as the sap is still flowing actively. For late budding the Ruga and Boursant stocks are to be recommended, specially for working vigorous climbers of the Tea and Noisette family. The budding should be completed as early in the month as possible. When the earliest-budded plants have "taken," the ties should be loosened, but not removed altogether, and the shoots on the standard Briar shortened to about 6 or 8 inches. During dry weather the hoe should be kept constantly at work amongst the beds and borders, as this largely prevents evaporation of the moisture which rises from below. A good surface mulch is even better for conserving the moisture in the soil, and it is best applied after a copious watering. By a system of early and late propagation, growing the plants in pots that are plunged during the summer months, and also by judiciously stopping the shoots of planted-out Roses, with a light house and without any attempt at forcing, it is possible to maintain and extend the

with the soil. For Roses of the Tea family, some sandy grit or leaf-mould should be added to the compost, which should be well mixed at least one month before it is used. Firm potting is necessary for Roses, and a potting stick should be employed. Leave a space of about half an inch below the rim of the pot for holding water. Pot Roses propagated during winter and spring, and plunged outside, are now crowded with flower-buds, especially the Hybrid Teas. A portion of the stock should be brought under cover by the end of the month, since the flowers develop a better colour under glass, and also to protect them from the autumn gales. Before housing the plants, they should be well cleansed from insect pests and mildew, both of which have increased of late. There is no better remedy for these pests than a solution of soft soap and tobacco. Syringe the plants at a temperature of 95°, adding to each gallon of the above solution, and keeping well stirred, a wineglassful of paraffin. Apply the wash during the evening, and syringe with clean water the following morning.

several proper terms of Art." Also a *Treatise of the Pouraltee*, "declaring what Pouraltee is, how the same first began, what a Pouraltee man may do, how he may hunt and use his owne Pouraltee, how far he may pursue and follow after his chase . . . Collected as well out of the Common Lawes and Statutes of the Land and out of the Assizes of Pickering and Lancaster. London: Printed by Thomas Wight and Bonham Norton, 1598." *Donald McDonald, Clerve House, Boxley Heath, Kent.*

TWO GOOD LATE STRAWBERRIES.—Of recent introduction are Leader and Givon's Late Prolific. At this season of the year, when new beds are being made, intending planters will do well to give them a trial. In these gardens the variety Leader exhibits good growing qualities, and is quite as early in fruiting as Royal Sovereign. It produces very large fruits, some of which measure $7\frac{3}{4}$ inches in circumference. The colour of the berry is a dark scarlet, the flesh is firm, and the flavour excellent. Blackbirds made their way through the net into the bed containing both Leader and Royal Sovereign, devoured the fruits of the former, and left untouched

those of the latter variety. The compact habit of growth is a great point in its favour, as the plants may be placed close together. In Givon's Late Prolific we have another fine late Strawberry. It is quite a fortnight later here in coming into bearing than the maincrop varieties. The plants are vigorous, and bear heavy crops of large, crimson-coloured fruits, which are excellent in flavour. The plantation is made on a border facing north, and we are still gathering nice fruits of this excellent variety (August 18). Our soil is somewhat heavy, and well suited for Strawberry culture. W. H. Y., *Rotherfield Park, Hants.*

NEW GARDEN FEATURES.—In making a new kitchen garden in 1904, my client said she would prefer to have something out of the common. Nearly at the top of the ground selected was a grand Beech tree, and I made a long archway of iron uprights with strained wires every 18 inches—8 feet wide at base and 7 feet from the soil—with a central grass path 6 feet wide. Upon this I placed alternate pairs of single, double, and treble cordon Pears and Apples, broken occasionally with gridiron trees. These have now met at the top and form a grand, cool corridor some 85 yards long, so placed that from the mansion the view is down the centre and ends with the Beech, round which is a rustic seat. The beauty of this erection when the trees are in blossom is most striking, and it is again interesting and useful when the trees are in fruit. Highly-coloured varieties of Apples were selected for planting, again starting from the Beech and leading away at an angle towards the rockery dell. A similar arch of 80 yards was made of Cobnuts and Filberts. These, selected with long spurred shoots, soon covered in the entire arch, and have borne freely, being pruned on the spur system. The foliage is large and of a deep cool green, making a most delightful walk on a hot day. The two "Pleached alleys" take away the formality of a kitchen garden, combine utility with beauty, and were much appreciated both by my client and by the present owner. I venture, therefore, to suggest such structures to any who are laying out fresh places or who would welcome new features in their present gardens. The ground plan of this kitchen garden was an obtuse triangle, and on the mansion side there is a long curving walk backed by espalier trees, set well back to allow long lines of annual flowers for summer display and for cutting. Walls were objected to. *Geo. Bunyard, Maidstone, August 2, 1909.*

THE WONDERBERRY OR SUNBERRY (see fig. 75).—We have six plants fruiting in 8-inch pots, each plant more than a yard across, and completely covered with berries about the size of large Marrowfat Peas. The fruits hang in clusters of seven and eight berries together. Several of the bunches are ripening and quite black. We have about 100 plants planted out-of-doors in an enclosed fruit plantation. The seed was obtained last February from New York. *Jas. Rogers, Langton Gardens, Blandford.*

PLANTS FOR HEDGES IN SEA-SIDE GARDENS.

—The writer of the valuable article on plants suitable for the formation of hedges omitted to mention two plants which, according to my experience, are admirable for the formation of hedges in gardens with poor, sandy soil, particularly near the sea. The plants in question are a species of a chenopodiaceous plant (an Atriplex) known locally, in the part of Brittany from which I write, as "Agnis Cactis" and Gorse. The former plant grows in the readiest possible manner from cuttings, and makes extraordinarily rapid growth. Such cuttings struck in a garden three years ago have now formed dense but spreading bushes 5 feet high. A hedge of this plant, with its silver-grey foliage, is very beautiful, and, resisting as it does the damaging effects of sea winds, may be grown close to the shore. It, however, lacks the quality which, of course, Gorse possesses to an extraordinary degree, that of impenetrability. Gorse (*Ulex europæus*) grown from seed produces a fine hedge in three or four years. It may be cut back hard and, if required, maintained in a formal shape. Nothing on earth is more beautiful than a Gorse hedge in spring, as travellers in Brittany, passing through miles of road lined on either side by Gorse bushes 10 or more feet high, can testify. These natural hedges supply the Breton with kindling and also

to some extent with winter food for cattle. It is the practice to cut the Gorse every three years. As I write, I look out on the result of an experiment of planting a mixed hedge of the two plants—the "Agnis Cactis" and Gorse. Several years after planting, the hedge, which is but a few yards from the shore, was to all appearances a Gorse hedge; now, some eight years after planting, the latter plant is being smothered by the former; no doubt because the light requirements of the more slow-growing Gorse are high. *P.*

SWEET PEAS IN POTS.—This is one of the most pleasing methods of growing these flowers, which make splendid subjects for the decoration of verandahs, open porches, and glass corridors, keeping up a succession of their flowers in these positions for six weeks. Seeds may be sown the first week in January. Place eight seeds around the edge of a 5-inch pot filled with moderately light soil. Cover the seeds with half an inch of soil, afford water, and place the pans in a cool greenhouse. No further watering will be required until germination takes place,

FIG. 73.—THE WONDERBERRY.

which usually occupies a fortnight. If mice are troublesome place a square of glass over each pot at night-time. As soon as the seedlings are through the soil, afford fresh air on all favourable occasions, and expose the plants well to the light. When they are 4 to 5 inches high they should be transferred to their flowering-pots, the most serviceable size being those 10 inches in diameter. The soil for this potting should consist of good loam four parts, leaf-soil one part, decayed manure one part, and a little bonemeal, with enough sand to make the whole porous. Pot firmly and tie the shoots to thin stakes. About the first week in May they should be stood out-of-doors in a sheltered position, but guard against damage by east winds. Four 6-foot stakes or canes should be inserted around each pot. The roots must never be allowed to become dry; on hot days especially they will require constant attention in this matter. Stimulants may be given, after the first flowers are open, in the form of weak soft-water and the soakings from cow-dung, these being alternated with water. Varieties suitable for the purpose are Dorothy Eckford,

Lady Grisell Hamilton, Duke of Westminster, Jeannie Gordon, Countess Spencer, Coccinea, King Edward VII., and Queen Alexandra. *H. Arnold, Carron Hall Gardens, Carron.*

ENTOMOLOGICAL RESEARCH.—I was pleased to read the announcement of the appointment of an Entomological Research Committee; but my pleasure was somewhat dimmed on discovering that the committee was to carry out its investigations chiefly with reference to South Africa. I am well aware of the need for enquiry into the part played by insects in the propagation of such tropical diseases as sleeping sickness. I am glad that an organised effort is to be made to add to our knowledge; but I repeat that I should have been more pleased if I had discovered that our own country had also been included in the region to be investigated. Noxious insects whose depredations cost the agricultural and horticultural community huge sums are not unknown here. Scattered scientific observations, some of considerable value, are made from time to time by independent workers; but anything like a well-planned

attack upon these pests is lacking. In saying this, I am not reflecting on the work of our various institutions, such as the Board of Agriculture and our universities. I am merely drawing attention to the plain fact that the home country is neglected in comparison with distant parts of the Empire. A small committee, with a definite programme, appointed to deal practically with economic entomology, should prove of the utmost service to the horticultural community. *P.*

CALANDRINIA CHROMANTHA.—I have, since writing the note which appeared in your last issue on p. 157 about this most disappointing plant, discovered that it is only a very old West Indian plant, which has been reintroduced under a new name by a German nurseryman. Its original name was, and still is, *Talinum patens*, and it is figured under this name (with the panicle Purslane as an English equivalent) on plate 253 of the fourth volume of Andrew's *Botanist's Repository*, an old book published in the year 1800. It is greatly flattered in the coloured plate, the

flowers being depicted as fully and flatly open, of the size of about a threepenny piece, and of a pretty bright pink colour. Although coming from the West Indies, I am informed that it lived out-of-doors through last winter at the Glasnevin Botanic Gardens near Dublin, where plants of it planted out last summer at the foot of a wall are now in flower. W. E. Gumbleton.

SOCIETIES.

ROYAL HORTICULTURAL.

AUGUST 31.—There was much that was interesting at the meeting held on Tuesday last, and the exhibition generally was rather above the average for the time of the year. The outstanding feature was the remarkable and unique collection of photographs taken by Mr. E. H. WILSON on his last expedition to China in the service of Harvard University, U.S.A. Both Mr. WILSON and Mr. E. J. WALLIS, who prepared the photographs from the negatives, are to be congratulated on their efforts. Arranged close by the pictures was a selection of some of Mr. WILSON'S introductions whilst in the service of Messrs. Jas. Veitch & Sons, from plants growing in the Coombe Wood Nursery of this firm. There were also fine exhibits of Dahlias, Montbretias, Gladioli, Phloxes, and other seasonal garden flowers. Orchids were represented by several good exhibits. In the fruit and vegetable section, there were two excellent groups of fruiting trees in pots, one of which received the high award of a Gold Medal. The exhibits of Grapes from the Society's gardens at Wisley, and the Black Hamburgs from the old vine at Hampton Court attracted much attention. It was freely remarked that these latter were equal in quality to any seen at the foremost exhibitions. No novelties were granted awards by this Committee; but the FLORAL COMMITTEE conferred three Awards of Merit, whilst the ORCHID COMMITTEE granted two Awards of Merit, two Botanical Certificates and one Certificate of Appreciation.

At the 3 o'clock meeting in the Lecture Room, an address was given by Mr. James Hudson, V.M.H., on "The Gardens by the Lake of Como."

Floral Committee.

Present: W. Marshall, Esq. (Chairman), and Messrs. C. T. Drury, H. B. May, A. Kingsmill, J. Green, G. Reuthe, W. Howe, J. Jennings, C. Blick, R. W. Wallace, A. Turner, Chas. E. Pearson, Wm. Cuthbertson, E. H. Jenkins, and W. J. James.

One of the most interesting exhibits was the series of about 12 dozen photographs illustrating the flora, fauna and scenery of Central and Western China taken by Mr. E. H. WILSON, when collecting in China for Harvard University, 1907-9. The photographs had been developed and printed by Mr. E. J. Wallis, Kew. Among the more interesting were the following:—*Primula sinensis*; fruiting sprays and fruits of *Actinidia chinensis*; a grove of the somewhat columnar-looking *Populus euphratica*, the trees, about 100 feet in height, are growing outside the city of Taitien-lu, with a snow peak of 23,000 feet high showing in the far distance; *Paulownia imperialis* and a large truss of flowers separately displayed. The tree was very freely flowered, though taller and less spreading than some we have seen in favoured parts at home; pictures of *Bambusa vulgaris* and *Phyllostachys nigra*, by the Min River, were charming, as was also that of *Nelumbium speciosum*; *Rodgersia aesculifolia*, with its foamy white inflorescences, was particularly good, as also were *Primula Veitchii*, *Hydrangea vestita*, fields of the Opium Poppy, *Lilium Sutchuanense*, a magnificent colony of *Cypripedium tibeticum*, *Davidia involucrata* freely covered with the whitish bracts; *Ficus insectoria* 50 feet high and 15 feet in girth, *Osmanthus fragrans*, *Cunninghamia sinensis*, forming pure forests on red sandstone; a trunk of the giant *Pterocarya stenoptera* 90 feet by 20 feet, and *Keteleeria Davidiana*. (Gold Medal.)

Messrs. JAMES VEITCH & SONS, LTD., Chelsea, displayed a collection of new plants from Central and Western China, in which, among many others, were noted the very remarkable *Ilex Pernyi*, *I. Fargesii*, the latter as unlike a Holly as is possible; *Veratrum Wilsonii*, with

creamy-coloured flowers; *Davidia involucrata*, *Cotoneaster rugosa Henryi*, with axillary clusters of fruits on horizontally-disposed branches; *Viburnum Henryi*, *V. rhytidophyllum*, *Populus lasiocarpa*, a very handsome-leaved species, with red foot-stalks and veins; *Berberis Gaignepainii*, the very handsome *Tilia Oliveri*, an autumn or August-flowering form of *Clematis montana* named *Wilsonii*; *C. Armandi*, an evergreen species with white, axillary flowers produced in clusters; *Eleutherococcus leucorrhizus*, and *E. Henryi*, distinct-looking and perfectly hardy plants, having roundish heads of starchy-white blossoms and fruit clusters that greatly resemble those of the Ivy. Messrs. VEITCH also showed varieties of *Javanico-jasminiflorum Rhododendrons*. (Silver-gilt Flora Medal.)

Messrs. H. B. MAY & SONS, Edmonton, exhibited *Bonvardias*, *Carnations*, *Veronicas* and other plants arranged with Ferns in a most effective manner, all the plants representing excellent culture. (Silver Banksian Medal.)

Mr. L. R. RUSSELL, Richmond, brought a very fine exhibit of *Clematis* in well-flowered plants, particularly noticeable being *C. integrifolia Durandii* with intensely blue-coloured flowers, Mr. G. Jackman (white), *Lady Northcliffe* (blue), *Mme. E. Andre* (reddish), *Marcel Moser*; *Jackmanii rubra* (very fine), and *Snow White*. Mr. RUSSELL also exhibited a group of *Celosias* in many distinct shades of colour. (Silver Flora Medal.)

Messrs. WALLACE & CO., Colchester, displayed an admirable exhibit of the newer varieties of *Montbretias*. The more noticeable were those labelled *Prometheus*, *Hereward*, *King Edmund*, *Norvic*, *Pageant*, *Lord Nelson* and *Geo. Davison*. Messrs. WALLACE also displayed fine spikes of *Lilium Henryi*, and a delightful series of *Gladiolus* hybrids, those of the *G. primulinus* group having rose-pink, yellow and cream flowers. (Silver-gilt Flora Medal.)

Mr. AMOS PERRY, Hardy Plant Farms, Enfield, showed hardy flowers, including many choice Lilies; also *Lychnis grandiflora*, *Eryngiums*, *Kniphofias*, *Pentstemons*, *Phloxes* and other seasonal flowers. A basket of the *Belladonna Lily* was remarkably fine. (Silver Banksian Medal.)

Herbaceous Phloxes were well shown by Messrs. GUNN & SONS, Olton, near Birmingham. The collection was of a most representative character. This firm also showed *Viola cornuta purpurea*. (Silver Banksian Medal.)

Hardy flowers were shown by Mr. G. REUTHE, Keston, Kent, the double form of *Erica vulgaris* and the showy, red-flowered *E. v. Alportii* being remarked. (Silver Banksian Medal.)

Select Alpines and an exhibit of rockwork, together with a big bank of *Artemisia lactiflora*, were the more prominent subjects in a group exhibited by Messrs. F. S. WARE, LTD., Feltham.

Messrs. HARKNESS & SON, Hitchin, displayed a showy group of seedling Gladioli in a great variety of colours; also a select exhibit of *Roses*, the intensely-coloured and fragrant flowered variety named *Victor Hugo* being excellent. *Edin Meyer*, a lovely apricot tone, and the well-known *Mme. Abel Chatenay* were also good. (Silver-gilt Banksian Medal.)

Hardy plants were also shown by Mr. F. BRAUZER, Caterham, including *Phloxes*, early-flowering *Chrysanthemums*, *Pentstemons*, &c.

Messrs. J. PEED & SONS, West Norwood, showed a considerable variety of hardy cut flowers, among which were many good *Phloxes*.

Begonia blooms in single, double, crested and fringed varieties were admirably displayed by Mr. A. LE. GWILLIM, New Eltham, Kent.

Messrs. CARTER, PAGE & CO., London Wall, occupied the entire space at the western end of the hall with an exhibit of *Cactus*, single and Pompon Dahlias, arranging the numerous varieties with skill and taste in baskets and bamboo stands. The variety *Dainty* in salmon-rose and yellow was singularly beautiful, and attracted much attention. Trails of *Asparagus*, and also small-leaved *Ampelopsis*, were employed with *Kochia* here and there as relief, with good effect. (Silver-gilt Flora Medal.)

A fine table of hardy plants and herbaceous Phloxes was put up by Mr. F. EAMES, Frome, Somerset. The Phloxes were particularly showy and well arranged. (Silver Flora Medal.)

Sweet Peas of exceptional merit were shown by Messrs. DOBBIE & CO., Rothesay. The collection including the *Marquis*, Mrs. Hugh Dickson (pink), *Clara Curtis* (cream), *St. George*, and

many more equally beautiful kinds. (Silver Banksian Medal.)

M. W. PEITZER, Stuttgart, showed hybrid Gladioli in variety.

A large assortment of *Montbretias* was displayed by S. MORRIS, Esq., Thetford (gr. Mr. G. Henley). The collection contained most of the leading varieties in commerce, and also a new variety named *George Henley*. (See Awards.) (Silver-gilt Banksian Medal.)

Messrs. W. H. ROGERS & SON, LTD., Southampton, exhibited a fine scarlet *Pelargonium* named *James I. Hamilton*.

Messrs. BARR & SONS, Covent Garden, displayed a large assortment of *Phloxes*, Gladioli, *Kniphofias*, and other seasonal plants. *Veronica subsessilis* was noticed in capital condition. (Silver Banksian Medal.)

Messrs. KELWAY & SON, Langport, Somerset, displayed an exceedingly fine collection of Gladioli. A few of the more striking and distinct kinds were *Alice Wood* (yellow), *Glory of Somerset* (crimson), *Kelway's Triumph* (crimson), *Coronation* (pink), *Lady Warwick* (white), *Black Meg* (dark crimson), *Lady Inchiquin* (scarlet), and *Mrs. E. Field* (white). (Silver Flora Medal.)

Messrs. WM. WELLS & CO., Merstham, brought *Phloxes*, *Pentstemons*, and early-flowering *Chrysanthemums*. *Leslie* is a pleasing yellow *Chrysanthemum* flowering at this season.

Messrs. J. CHEAL & SONS, Crawley, showed single and *Cactus Dahlias* in variety, also an assortment of cut shrubs and herbaceous plants in very considerable numbers.

AWARDS OF MERIT.

Montbretia Pageant.—A handsome variety, the plants attaining to nearly 4 feet in height and bearing much-branched inflorescences. The shapely flowers are of a clear orange shade, a ring of crimson encircling the base of the segments internally. The plant is apparently of vigorous growth. From Colonel PETRE, Westwick, near Norwich (gr. Mr. Davison).

Montbretia George Henley.—A very beautiful and distinct variety with large open flowers of pale apricot orange colour borne on an erect spike. The habits of both growth and flowering are free. Exhibited by Mr. S. MORRIS, Thetford (gr. Mr. G. Henley).

Gentiana ornata.—A new species of *Gentiana* exhibited under the above name and collected by Mr. E. H. WILSON at an altitude of 12,000 to 13,000 feet in China at Szechuan-Kansu, where acres of it were growing in company with *Mecoposia punicea*. The plant is about 3 inches in height, of stoloniferous habit, and bears linear glabrous leaves, each about 2 inches long. The intense, deep blue funnel-shaped flowers are 1½ inch across. This beautiful and distinct plant was exhibited by Messrs. VEITCH & SONS, Chelsea.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair), and Messrs. Jas. O'Brien (hon. sec.), Harry J. Veitch, de B. Crawshaw, Gurney Wilson, Stuart Low, W. Cobb, H. Little, W. P. Bound, A. Dye, W. Boxall, C. H. Curtis, J. Charlesworth, J. Forster Alcock, H. G. Alexander, F. J. Hanbury, W. H. White, W. H. Hatcher, A. A. McBean, H. Ballantine, H. A. Tracy, and W. Bolton.

Lt.-Colonel G. L. HOFFORD, C.I.E., C.V.O., Westonbirt (gr. Mr. H. G. Alexander) staged a select group of hybrid Orchids raised at Westonbirt, for which a Silver Flora Medal was awarded, a Cultural Commendation being given Mr. H. G. ALEXANDER for the excellent culture of the plants. A grand specimen of *Laelio-Cattleya Golden Oriole* "Westonbirt variety" secured an Award of Merit. Among other notable plants were *Brasso-Cattleya Digbyano-Warneri magnifica*, a grand rose-tinted flower with a small purple blotch on the finely-fringed lip; *Cattleya Euphrasia* "Westonbirt variety" with two spikes of six flowers each; *C. fulvescens* with seven flowers; *Sophracattleya Dame*; the beautiful *Laelio-Cattleya Lustre* "Westonbirt variety," having large rose-coloured flowers with a deep ruby purple lip; and a very richly coloured form of *L.C. Berthe Fournier*.

Sir TREVOR LAWRENCE, Bart., K.C.V.O., Burford (gr. Mr. W. H. White), showed the very rare *Zygopetalum* (*Warszewiczella*) *Lindonii* with pure white flowers having violet coloured lines

on the lip, and the singular little *Listrostachys forcipata* which received a Botanical Certificate.

Sir JEREMIAH COLMAN, Bart., Gatton Park (gr. Mr. Collier), showed an interesting selection of rare species, including the dwarf, orange-scarlet *Laelia monophylla* with 11 flowers; *Epidendrum* (*Nanodes*) *Matthewsii* with nine blooms; *Bulbophyllum guttulatum* with four flower-spikes; a charming little clump of *Masdevallia nidifica* and the cream-white *Dendrobium ciliatum annamense*.

R. G. THWAITES, Esq., Chessington, Christchurch Road, Streatham (gr. Mr. J. M. Black), exhibited the new *Sophracattleya Blackii* (*S. grandiflora* × *C. Hardyana*). (See awards.) Also a selection of *Cattleya Adula*, several plants of *Odontioda Thwaitesii*, and a plant of *Sophracattleya Warnhamiensis atro-purpurea*, with bright ruby crimson flowers with Cowslip yellow base to the lip.

H. S. GOODSON, Esq., Fairlaw, Putney (gr. Mr. G. E. Day), was awarded a Silver Flora Medal for an effective group in which was seen great variety. Among those noted were the handsome *Laelio-Cattleya St. Gothard*; *L.-C. Blethcheyensis* Othello, a fine dark form of *L.-C. Chloë* Goodson's variety; *Cattleya Adula* Goodson's variety, and *C. Adula Bronze Wing*, two very dissimilar forms of this pretty cross between *C. bicolor* and *C. Hardyana*. *Odontoglossum crispum Herbertii* has a finely blotched flower; *Cyripedium* H. S. Goodson, a large though not very showy hybrid, and various interesting species were also shown.

MESSRS. CHARLESWORTH & CO., Haywards Heath, were awarded a Silver Flora Medal for a group. We noticed the handsome *Odontoglossum crispum xanthotis Charlesworthii* with large and finely-formed pure white flower having distinct clear yellow markings; a splendid example of *Zygotetium* × *Roebingianum* with waxlike white flowers heavily blotched with rose and violet; the rare *Miltonia Schroderiana*; good examples of *Cycnoches maculatum*; *Lycaste Skinneri alba*; *Oncidium ornithorhynchum album*, with several graceful spikes of white flowers; *Odontoglossum Eleanor* and other hybrid *Odontoglossums*; varieties of *Laelio-Cattleya Elva*, *Cattleya F. W. Wigan*, *C. Mrs. Pitt*, *C. Venus*, and *C. Rhoda*; and, amongst other hybrids, a well-flowered plant of *Cologyne Brymeriana*.

MESSRS. SANDER & SON, St. Albans, staged an extensive group, to which a Silver Flora Medal was awarded. The large and fragrant *Angraecum infundibulare*, *A. Chaillanum*, with a finely-developed spray of white flowers; a few plants of the rose-tinted *Dendrobium regium*, *Sophracattleya lata*, some pretty hybrid *Cattleyas*, including *C. Wavriniana*, and various hybrid *Cyripediums*, among which were two of the yellow *C. Rossettii*, are some of the more interesting plants in this exhibit.

MESSRS. STUART LOW & CO., Royal Nurseries, Bush Hill Park, secured a Silver Banksian Medal for a very praiseworthy group, all the plants being well grown and finely flowered. There were two forms of *Cycnoches maculatum* with fine racemes of its singularly-formed flowers, *Cattleya Gaskelliana alba*, *Dendrobium formosum giganteum*, *Oncidium lanceanum*, *O. oblongatum*, *Bulbophyllum Godseffianum*, and various *Odontoglossums*. The hybrids included *Cyripedium Wm. Lloyd magnificum*, a very fine claret-tinted flower; *C. T. B. Haywood*, *Cattleya Harold var. Hildegarda*, varieties of *C. Adula*, *C. Atalanta*, *C. Pittiana*, *C. fulvescens*, and others.

F. LOWENADLER, Esq., Badgemore, Henley-on-Thames (gr. Mr. Hatton), showed a good example of the pink-tinted *Dendrobium acuminatum*, which was illustrated in the last issue of *The Gardeners' Chronicle*, p. 150, fig. 64.

Baron Sir H. SCHRODER, The Dell, Egham (gr. Mr. Ballantine), showed a small group of hybrid *Cyripediums* raised at The Dell. The exhibit included fine forms of *C. Maudie*, *C. A. de Laresse*, *C. Watsonianum*, and the new *C. John Clark* (*Harrisianum superbum* × *Fairrieanum*), a dark-coloured hybrid, showing some of the characters of *C. Harrisianum superbum*, both in form and colour.

MESSRS. WM. BULL & SONS, Chelsea, staged a number of hybrid *Cattleyas*.

Mr. H. A. TRACY, Twickenham, showed a remarkably fine form of *Anguloa uniflora* imported from Peru, and probably identical with that on which Ruiz and Pavon founded the genus; it was far superior to the smaller and more angular form generally seen in cultivation. The flower

was ivory-white of wax-like substance, the labellum spotted with red in the interior.

ARTHUR BURE, Esq., Lynwood, Udney Park, Teddington, showed a distinctly-coloured form of *Laelio-Cattleya eximia* (*L. purpurata* × *C. Warneri*).

Mr. EDWARD V. LOW, Orchid Nursery, Vale Bridge, Haywards Heath, sent two good plants of the clear white *Cattleya Gaskelliana alba*, the one with four and the other with six flowers. This exhibitor also showed *Bulbophyllum grandiflorum*.

AWARDS.

AWARD OF MERIT.

Laelio-Cattleya Golden Oriole Westonbirt variety (L.-C. Charlesworthii × *C. Dowiana aurea*).—A beautiful form of this variable, but always handsome, hybrid raised at Westonbirt. The flowers are large and elegantly formed, the sepals and petals of a bright chrome-yellow colour, the well-expanded lip ruby-red veined with gold from the base to the centre. Two other forms were also shown. (Shown by Col. HOLFORD.)

Sophracattleya Blackii (S. grandiflora × *C. Hardyana*), from R. G. THWAITES, Esq., Streatham (gr. Mr. J. M. Black).—A fine hybrid of dwarf habit, and having comparatively large flowers, nearest to *S.-C. Doris*, but of a bright scarlet colour tinged with cherry-red, the base of the lip being chrome-yellow.

BOTANICAL CERTIFICATE.

Dendrobium muricatum, from F. W. MOORE, Esq., Royal Botanic Gardens, Glasnevin, Dublin. A very remarkable species from New Caledonia. In habit the plant resembles some of the species of *Eria*, having dwarf, conical pseudobulbs, each bearing a single fleshy leaf. The inflorescence is about 8 inches long, and springs from near to the apex of the pseudo-bulb, bearing on its outer half a raceme of 15 flowers, each 1 inch in breadth. The sepals and narrower petals are cream-white marked with brownish-purple. The narrow lip is crimped on the front half; the colour is purple at the base and yellow in front.

Listrostachys forcipata, from Sir TREVOR LAWRENCE (gr. Mr. W. H. White).—A singular dwarf species from the Cameroons, with erect, fleshy, semi-terete leaves and short, erect spikes bearing 8 to 10 very singularly-formed, silver-white flowers, the spurs of which are enlarged at the apex.

CERTIFICATE OF APPRECIATION.

Odontioda Graiviana (Odontoglossum Rossii majus × *Cochlioda Noezliana*), from Monsieur H. GRAIRE, Amiens.—An interesting hybrid, with the growth of *O. Rossii majus*. The plant bore a spike of several flowers comparable in size and colour to some of the forms of *O. Bradshawia*. The sepals and petals were obscurely blotched and tinged with salmon-red, the lip being bluish-white, with a yellow callus, behind which are some dark lines.

Fruit and Vegetable Committee.

Present: A. H. Pearson, Esq. (in the Chair); and Messrs. J. Cheal, J. Harrison, E. Beckett, Alex. Dean, W. Pope, H. Parr, J. Vert, H. Markham, J. Willard, J. Davis, J. Lyne, G. Reynolds, G. Hobday, J. Jaques, O. Thomas, C. Foster, G. Wythes, H. S. Rivers, and S. T. Wright (secretary).

The most prominent exhibit before the Committee was a large group of fruit trees in pots shown by THE KING'S ACRE NURSERIES, Hereford. There were some six dozen trees in all. In the centre was a fine flat-trained tree, 6½ feet by 3½ feet, of Thomas Rivers Peach, carrying 60 good fruits. Behind it and beside were tall trees of Peaches Dr. Hogg, Dymond, Sea Eagle, Late Devonian and Violette Hâtive; also Nectarines Rivers Orange, Pineapple and Byron. The Plum trees included Jefferson and Cœ's Golden Drop, both heavily cropped; also both flat-trained and standard vines, the varieties being Madresfield Court, Muscat of Alexandria, Black Hamburg, Foster's Seedling, Melton Constable, Black Alicante and others. At the sides were numerous Pear trees bearing fine fruits, including Triomphe de Vienne, Pitmaston Duchess, Conference, Louis Bonne, Beurré Bachelier and Beurré Diel. On the other side were equally fine Apple trees, including Jas. Grieve, Emperor

Alexander, Peasgood's Nonesuch, The Queen, Gloria Mundi, Cobham, Worcester Pearmain, King of Tompkins' County, Washington, Gascoyne's Scarlet and Baumann's Reimette. The exhibit also contained numerous Figs, chiefly of Brown Turkey, Negro Largo and Black Ischia varieties. The collection was a superb one, and representative of the highest culture in pot fruit trees. (Gold Medal.)

MESSRS. T. RIVERS & SONS, Sawbridgeworth, set up on the opposite side of the hall a group of some 50 pot trees. Peaches included The Nectarine, Dymond, Violette Hâtive, Prince of Wales, Golden Rathripe and Sea Eagle. Nectarines were represented by Pineapple, Goldoni and Humboldt. Of Plums there were Monarch, Golden Transparent, Admiral, Reine Claude de Bayay, Decaisne, Curlew, Grand Duke and Pond's Seedling. Apples included Lady Sudeley, Cox's Orange Pippin and Gascoyne's Scarlet. Very pretty were fruits of the Dartmouth and Red Siberian Crabs. The group also contained numerous Fig trees. In front were baskets containing superb Apples of Ribston Pippin and Cox's Orange Pippin; also Peasgood's Nonesuch. There were also gathered fruits of Peregrine Peaches and a few Plums. (Silver-gilt Knightian Medal.)

From the Society's Gardens, Wisley, came 23 varieties of Grapes in pairs, 46 bunches in all. The black kinds were Madresfield Court, Gros Maroc, Diamond Jubilee, Lady Hastings, Muscat Hamburg, Appley Towers, Black Monukka, Black Prince and Alnwick Seedling. The white kinds embraced excellent bunches of Cannon Hall Muscat, Bowood Muscat, Diamant Traube, Muscat of Hungary, both these having small bunches; Duchess of Buccleuch, White Nice, Chasselas Napoleon, Golden Queen, White Frontignan, Foster's Seedling and Mrs. Pearson, the last-mentioned being specially good. Red Grapes were represented by Muscat Champion and Grizzly Frontignan, both of high flavour. The exhibit was educational and attracted much attention.

Of exceptional interest was a collection of 12 bunches of Grapes cut from the old vine at Hampton Court Palace (see p. 155 in our last issue). That such really superb bunches, so massive, having such fine berries, and so finely coloured—as black as Sloes—should have been grown on a vine 141 years old called forth expressions of wonder and of admiration. It is indeed doubtful whether any young Black Hamburg vines in the kingdom have this year produced finer or more perfect bunches. The 12 bunches averaged 3 lbs. each in weight. Exhibited by his MAJESTY THE KING (gr. Mr. A. Mackellar). (Hogg Memorial Medal.)

H. SIMPSON, Esq., Holmwood, Putney Hill (gr. Mr. F. S. Carter), sent a collection of rather small and generally unripe Melons grown without artificial heat.

MESSRS. SPOONER & SONS, Hounslow, staged a collection of hardy fruits, including culinary Apples Grenadier, Lord Grosvenor, Potts's Seedling, Stirling Castle, Gold Medal, Lord Suffield and others; and, of dessert kinds, Carlisle Castle, Mr. Gladstone, Langley Pippin, Worcester Pearmain, Williams's Favourite, Lady Sudeley and Red Astrachan. They also showed Plums Early Transparent, Belgian Purple, Prince of Wales and Curlew; and of Pears Beacon and Beurré Gifford; also Morello Cherries and Loganberries. (Silver Banksian Medal.)

Six dishes of very fine Pears were shown by Sir MARK COLLETT, Sevenoaks, Kent, (gr. Mr. Nicholls), the varieties being Beurré Mortillet, Mme. Trevy, Gansel's Bergamot, Souvenir du Congrès, Triomphe de Vienne and Margaret Marrillat. (Silver Knightian Medal.)

A few seedling Potatoes and Apples were placed before the Committee, but none exhibited any special merit. The chief novelty was a striped Gooseberry, a seedling from the well-known Warrington variety.

COMPETITIVE CLASSES.

There were no exhibits in the class for four dishes of Peaches, and E. MOCATTA, Esq., Woburn Place, Addlestone (gr. Mr. T. Stevenson), was the only exhibitor in the class for two dishes of these fruits, showing medium-sized samples of Royal George and Rivers Early. The 1st prize was awarded. The same exhibitor was the only competitor in the class for four dishes of Nectarines, having Rivers Orange, Pine Apple, Humboldt and Elruge. The 1st

prize was again awarded. In the class for six dishes of Plums, Lord HOWARD DE WALDEN, Audley End (gr. Mr. J. Vert), was placed 1st with excellent samples of Rivers Late Orange, Golden Transparent, Jefferson, President, Pond's Seedling and Reine Claude Comte Althan. C. COOMBE, Esq., Cobham, Surrey (gr. Mr. A. Tidy), was awarded the 2nd prize, having, amongst others, fine fruits of Lawson's Golden Gage, Jefferson, Washington and Kirke's.

In the class for three dishes of Plums, Viscount ENFIELD, Wrotham Park, Barnet (gr. Mr. H. Markham), the only exhibitor, won the 1st prize. The varieties were Victoria, Washington and Belle de Septembre.

STIRLING HORTICULTURAL.

AUGUST 26, 27.—This society, instituted in 1812, held its annual show on these dates in the Albert Halls, Stirling. The amateurs' classes for cut flowers were eliminated this year, and because of this the number of entries was not so large as usual. In all other respects the show was a decided success. Exhibits of pot plants were superior to those of last year. Messrs. J. K. MESTON, Springbank, Stirling, and H. GRAY, Park Terrace, Stirling, were the most successful exhibitors in the classes for foliage and flowering plants respectively.

Although cut flowers were not so numerous, those shown were of good quality, especially Dahlias, Carnations, Gladioli, Pansies and Violas. There was good competition in this section, 12 different competitors taking 1st prizes in the respective classes.

Vegetables were well shown. Mr. SHAW, Boquhan, Kippen, easily surpassed all other competitors in the class for a collection, his produce being the best seen at a Stirling show.

Fruit was exhibited finely, all kinds being well represented. Mr. BLACKLOCK, Blairdrummond, led in both the classes for a collection of fruits, Madresfield Court Grapes being excellent. Mr. TROTTER, Carbrook, Larbert, led in the class for four bunches of Grapes; he showed excellent bunches of Muscat Hamburg.

Mrs. ROBERTSON, Gargunnoch, and Messrs. GRAY, SHAW & TROTTER were successful exhibitors in the decorative classes.

NON-COMPETITIVE EXHIBITS.

Messrs. WM. DRUMMOND & SONS, Stirling, showed Roses and Sweet Peas; Mr. JOHN CRAIG, Stirling, exhibited table plants, including Codiaeums (Crotons), Palms, Dracaenas, &c., also Tomatos; Mr. M. CHAPMAN, Torbrex Nursery, showed herbaceous and Alpine plants; Mr. JAS. McARA, Crieff, exhibited 100 varieties of Roses.

THE NATIONAL VEGETABLE.

AUGUST 31.—At a meeting of the committee of this newly-formed society, held at the Windsor Hotel, Westminster, on the above date, Messrs. W. Poupart (Twickenham), G. Hobday (Romford) and C. Foster (Sutton Place Experimental Farm) all reported that the early Cabbage seeds received from 19 firms, and comprising some 46 named varieties, had in every case made exceptionally good growth, the plants from the first sowing being now ready for planting on to the respective trial grounds. It is hoped next spring to make a joint exhibit of these Cabbages at one of the R.H.S. meetings. It was agreed to issue 2,000 copies of a circular addressed to all interested in vegetable culture, appealing for membership and subscriptions. Copies of this circular, when ready, can be had on application to the secretary, Mr. E. G. Quick, Kelmiscott, Harrow View, Wealdstone, Harrow. A strong desire was expressed that an exhibition of vegetables should be held next autumn in the Horticultural Hall, Westminster, provided that a suitable date can be arranged.

Obituary.

GEORGE HORRELL.—The death of Mr. George Horrell occurred on August 23, at the Gardens, Mount Henry, Portlington, Queen's County, Ireland. He commenced his gardening career at Mount Henry, serving under his father, whom he succeeded as steward and gardener at Mount Henry in 1888. Next he went to Moore Abbey,

Monasterevan, then in the care of Mr. Bailey Wadds. Afterwards he entered the services of Lord Windsor, Lord Annally and others, finally taking charge of Mount Henry, as stated above. The cause of death was heart failure, his age being 53 years. The funeral, which took place in the parish church of Lea, was attended by the employees from the farm and gardens at Castle Henry. Six of his old staff carried his remains to the graveyard, and 20 others from the estate formed a procession in front of the coffin. The high esteem in which Mr. Horrell was held was shown by the attendance of several hundred friends and neighbours at the funeral.

* * * The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as Supplementary Illustrations in this Journal.

AMERICAN BLIGHT ON APPLE TREES: Reader

The following details are from the leaflet issued by the Board of Agriculture and Fisheries on the subject: "The woolly aphid injures the trees by causing swellings and excrescences upon them, and by drawing away the sap. The irritation caused by their beaks in the tender tissue of the shoots causes an abnormal growth of cells, which ends in the large 'canker-like' patches in which the blight more or less shelters. Similar growths are formed on the roots. These rugosities are often taken for true 'canker,' but, on examination, the presence or absence of white wool will at once decide the question. This blight is especially prevalent in neglected orchards, where the trees are set close together, and have their trunks and boughs covered with lichens and moss, and where rank grasses grow below. These points should all receive attention and be remedied at once. The vegetal encumbrances can be removed by washing the orchards during the winter with caustic alkali wash. This wash is composed of 10 lbs. of caustic soda, 10 lbs. of carbonate of potash, and 100 gallons of water, to which two or three pounds of soft soap are added to make the wash adhere more readily to the trees. This is by far the best method of cleansing the trees, and at the same time it destroys many hibernating insects. Another plan likely to do good is to whitewash the trunks of the trees. Before this is done all the rough bark must be scraped off, so that a smooth surface is made to take the wash. The best 'paint' to use is one made of soft soap and lime, as follows: 1 lb. of soft soap, 1 gallon of lime, and a small quantity of size, mixed with just sufficient warm water to form a thick whitewash. In destroying this insect during the summer and when it is on the young wood, washing, to be effectual, should be commenced directly the first traces of the white wool appear. Ordinary soft soap and quassia wash may be used, but paraffin emulsion has been found best for this attack. With regard to the attack on the roots, the best plan is to use bisulphide of carbon. This is injected into the soil in four places about 2 feet away from the trunk of the tree. One fluid ounce of bisulphide of carbon is sufficient for a good-sized tree, injected into the soil so as not to come into actual contact with the roots. Kainit hoed in the soil about the roots has also been found efficacious in Canada."

ASPERS DISEASED: J. B. & J. H. E. The plants are attacked by a fungus—Erysiphe cichoracearum. The plants and soil should be sprayed every five days until the disease is checked with a solution of permanganate of potash diluted with water to a pale rose colour.

BEGONIA LEAVES DECAYING: C. L. There is no disease present in your plants. The trouble has been caused by excess of moisture. Use care in watering and keep the atmosphere of the house drier, allowing a little ventilation so that the air about the plants does not remain stagnant.

BROAD BEANS: Fungoid. The failure of your Beans is not to be attributed to what you de-

scribe as a fungus-like growth on the roots. These are nodules which contain bacteria that fix the free nitrogen of the atmosphere and bring it in a condition available for assimilation by the plants. The trouble must be looked for in some other direction.

CAMELLIAS FOR A COOL CONSERVATORY: Camellia.

Any or all of the under-mentioned varieties of Camellia will answer your requirements as regards size, form and colour of flowers and free-growing and free-flowering habit of the plants. C. H. Hovey, flowers large, dark red; trimbriata, bright, scarlet-crimson; Lady Campbell, brilliant red; alba plena, flowers large, well formed and, as the name implies, double white, an old favourite and still one of the best all-round varieties; candidissima, a good white, fine form—a late flowering variety; Baronne de Bleichroder, pink, with bright red stripes; Staryi, pink, well imbricated and regular in form; Comte de Paris, salmon-pink, edged with white; Chandleri elegans, large light rose-coloured flowers, which are generally mottled with white, and are very showy, and Donkelaarri, flowers large, semi-double, rich crimson, marbled with white—a grand old variety. If the plate from which the roof of your three-quarter span conservatory proceed is of sufficient height from the ground-line to admit of the door being fixed in the centre of the upright glass front, it would be an advantage, as then a continuous border inside the house could be formed in the shape of a horseshoe; the pathway entering at the heel from the door. If the soil and drainage are not good, it will be advisable to remove the former to the depth of 2 feet, then put over the excavated space a layer 6 inches deep of brickbats or clinkers, broken fine on the top, for drainage, and cover these with thin turves, grass-side downwards, to prevent the soil getting into and choking the drainage. This done, fill up the excavation with a compost consisting of the best available sandy loam and peat in proportion of four parts of the former and one part of the latter. If the plants are pot-bound, it will be advisable to slightly disentangle the roots by the aid of a pointed stick before planting, spreading the liberated roots out all round with an inclination downwards in planting, and make the soil quite firm about the roots in doing so. Do not bury the stems of the plants more than 1 inch deeper in the soil than they were in the pots, and give a good watering to settle the soil immediately after planting. Maintain a rather moist and close atmosphere for a few weeks afterwards in order to promote fresh growth in root and branch by syringing the plants overhead with clean water morning and afternoon on sunny days. March will be the best month to plant, as your house is not heated.

CARNATIONS: G. H. T. We do not undertake to name varieties of Carnations. From the small specimen you send it is apparently a strong-growing tree variety.—*T. J.* The flower was withered when we received it, and we were therefore unable to judge of its merits. Next season send examples to one of the meetings of the Royal Horticultural Society for the consideration of the Floral Committee.

COLLECTION OF FRUIT: J. S. You do not appear to have ascertained whether your exhibit was disqualified or not. You should first ascertain if this was so, and the reason. The Papaw Carica Papaya and the Water Melon Citrullus vulgaris would be admissible according to the terms of the schedule, which only asks for a tray of six varieties of fruit. The exception to these because they are foreign fruits cannot stand (1) because such are not excluded in the schedule, and (2) they are in the same category as the Grapes and Nectarines, neither of which is a native of this country. The schedule, like many other regulations of local flower shows, has been worded with insufficient care. If Peaches, Nectarines, Apples, &c., were required the word "kind" should be used. Royal George, Peregrine, Alexander, &c., are "varieties."

EPHYMATIC ORCHIDS AND THEIR NUTRITION: J. L. QUESTION: For a plant to grow I have always understood from my biological studies that it must be supplied (usually by its roots or by some other organ which fulfils the function of roots) with, besides water and air, calcium,

potassium, magnesium, iron, nitrogen, sulphur and phosphorus. Now, I am informed by Orchid growers that this is not correct as far as the epiphytic forms are concerned. These plants are, or can be, reared from seeds through the seedling stage, and kept alive as mature plants on plain water and air alone. I can understand mature plants living for a time on the stored food in their bulbs like the camel on its hump or hibernating animals on their fat. Will you kindly explain where I am wrong? ANSWER.—Your biology is perfectly right, and any one who has told you that a plant, epiphytic or other, may be reared from the seedling to the adult stage on water and air only, has made a mistake. A superficial examination of epiphytic Orchids, growing either in their natural situations on the branches of trees, or on blocks of wood or cork in hot-houses, would lead to the conclusion that such plants are able to live without the mineral substances which you mention. More careful examination will show, however, that this is not the case; and that they take up in solution in the water, which is absorbed by their roots or other structures, the mineral salts without which they cannot grow. Dust and debris, in conjunction with the decayed remains of algae and fungi, collecting in the crevices, are other sources whence the mineral substances are derived.

GUMMING IN CUCUMBERS: *Constant Reader.* If you will send examples of the affected fruits we will endeavour to assist you.

HEATING FORCING PLANT HOUSES: *H. B.* Judging from your sketch plan, No. 1 house has four rows of 4-inch pipes—two flows and two returns placed one above the other about 2 feet apart inside the enclosed bed on the left-hand side, we presume, for supplying bottom heat, and four rows—the two flows being placed upon the two returns close together on the floor line on the right side of solid bed. We should advise you to fix two rows of these, one above the other (for the sake of room), upon the solid bed and close up to division wall with a throttle valve in the top flow to regulate the circulation of hot water; the pipes returning by the pathway close up to the bed and nearly on a level with the top of same and supported by 4½-inch brickwork. Thus placed, a better and more equal distribution of heat will be obtained in the house. If the bed on the left is only meant for open staging, it would be better to have all the pipes fixed flatwise—two flows and two returns—about 6 inches below the top of staging, fixing a throttle valve in the Y pipe connecting the two flows with the main flow in order to regulate the heat. Should the side walls of the house be a dead level, or nearly so, it will be necessary to allow a rise of about 1 inch in every 20 run of piping in order to insure a good circulation of hot water in the house. On the other hand, should the ground on which the houses are built rise a foot or more in the length of structures, all that is necessary is to fix the pipes at the same distance from the wall plate the entire length of the house. The eight 4-inch pipes shown in No. 1 house and arranged as suggested will afford an amply sufficient temperature for the forcing of bulbs, &c., the heating apparatus being set and stoked properly. The connections (A, A) in No. 1 house, between the main and branch 4-inch pipes, appear to be made with a single 2-inch pipe. This is quite wrong; a 4-inch connection should certainly be used. We should advise you to have six 4-inch hot-water pipes in No. 2 house—two flows fixed one above the other, as they appear to be now, on the top of staging on either side and close up to the parting wall, returning through a chair syphon alongside the pathway and close up to and on a level with the staging.

LAW OF CHANCES AND MENDELISM: *W. J. M.* Your surmise is correct. The ordinary 3:1 (1D:2DR:1R) ratio in F_2 is, on Mendelian hypothesis, the result of the chance mating of D and R male cells of the pollen grains with D and R female (egg) cells. The average result of such mating can, of course, be predicted mathematically, and is in accordance with the results obtained by experiment. (See Bateson's *Mendelian Heredity*.)

LIMING LAND: *T. A. B.* We cannot undertake to analyse your soil. The ground may contain sufficient lime; but, in any case, apply a light

dressing of this material, and repeat it, if necessary, later. Two or three tons per acre may be applied. You should obtain the pamphlet on the subject of liming from the Board of Agriculture and Fisheries, 4, Whitehall Place, London. Copies are given free, and the application need not be stamped.

MELONS: *F. E. G.* We cannot account for your Melons having the flavour of chloroform. When the crop is finished, remove the old soil to a distant part of the garden and thoroughly cleanse all parts of the frame before starting afresh.

NAMES OF PLANTS: *E. W. and G. G.* Hibiscus Syriacus.—*W. F.* 1, Helichrysum (Ozothamnus) rosmarinifolius; 2, Tamarix gallica; 3, Artemisia Abrotanum.—*F. G.* Hæmanthus punicus.—*W. T. & Co.* Spirea Douglasii.—*W. D.* 1, Lyora coccinea; 2, I. coccinea var.; 3, Eucryphia pinnatifolia; 4, Tabernaemontana coronaria fl. pl. Solidago is usually considered the national flower of America.—*A. B.* 1, Scirpus cernuus (Isoplepis gracilis); 2, Acer palmatum; 3, Strobilanthus Dyerianus; 4, send when in flower; 5, Geum chilense; 6, Isoloma birsuta; 7, Phyllanthus niveosus; 8, Senecio cineraria; 9, not found; 10, Geum coccineum; 11, Pentstemon barbatus; 12, Heuchera (garden hybrid); 13, Pentstemon argyrophylla var. atrosanguinea fl. pl.—*W. B. H.* 1, Clematis diversifolia; 2, Thalictrum minus.—*A. Hallman.* 1, Sutherlandia frutescens (not hardy); 2, Inula thapsoides.—*T. V.* 1, Cattleya superba; 2, Disa Veitchii; 3, Brassia verrucosa.—*F. W. B., Cheshire.* Liriope striata (Ophiopogon); 2, Euphorbia jaquiniflora; 3, Begonia subpeltata maculata; 4, Begonia Louise Chretien; 5, Fittonia argyoneura.—*J. F. M.* 1, Veronica salicifolia; 2, V. speciosa var.—*W. B.* 1, Rhamnus Frangula; 2, Cornus alba var. Spaethii; 3, Cornus Mas variegata; 4, Acer species, probably A. hyrcanum; 5, Reseda Luteola; 6, Anaphalis margaritacea.—*W. B.* Senecio Jacobæa (Ragwort).—*G. M.* Begonia radicans.—*F. M.* 1, Pteris aquilina; 2, Adiantum formosum; 3, Pteris cretica; 4, Asplenium lucidum.—*R. O. H.* 1, Oncidium incurvum; 2, Brassia verrucosa; 3, Stelis muscifera; 4, Pleurothallis macroblepharis; 5, Cattleya intermedia.—*C. G.* Gladiolus gracilis.—*Forman.* 1, Epidendrum cochleatum; 2, Dendrobium sanguinolentum.—*G. H. D.* 1, Nerium Oleander, double variety; 2, Asclepias curassavica; 3, Hypericum Androsæum; 4, Melittis melissophyllum (Balm).

NECTARINE PRINCE OF WALES: *C. Y.* The probable cause of the splitting of the fruits of your Prince of Wales Nectarine when approaching the ripening period is a check of some kind: perhaps dryness at the roots, coupled with an atmosphere surcharged with moisture at the same time. You say the roots are confined to a border 14 feet long, 2½ feet deep, the same width, properly made, and having a concrete bottom, and that the main flow hot-water pipe comes through the back wall (against which the tree in question is growing), about 4 feet from the main stem, and returns in front of same at a distance therefrom of 2½ feet. You further state that this tree, planted four years ago, makes a weakly growth, and yet that the border is properly made. These combined circumstances go to strengthen our opinion that dryness at the roots is the cause of the trouble complained of. There is no reason whatever why trees growing in borders of the above-mentioned dimensions, provided that they consisted of a suitable compost, and were well-drained, should not annually yield heavy crops of fine fruit. The condition of the fruits of your Humboldt Nectarine may likely enough be attributed to the same cause that is responsible for the cracking of the fruits of the Prince of Wales Nectarine, as the trees are growing against the same wall and under like conditions; or the rusty condition of the fruits might be the result of strong sunshine following a period of sunless days, coupled with lack of sufficient moisture at the same time in the soil in which the roots are growing. Red spider and thrips sometimes disfigure the epidermis of choice fruits.

PARSLEY TURNING BROWN: *A. M.* The roots are injured by eelworms. Gas-lime applied to the soil is the only certain remedy for this pest.

PEACHES FOR NAMING: *F. C.* We cannot undertake to name Peaches or Nectarines unless samples of the foliage are sent. The glands on the leaves are the most valuable clues to determining a variety, whilst the shape of leaf and appearance of wood are other factors which assist.

PEACH LEAVES: *W. R.* The foliage is affected with the Shot-hole fungus, and red spider is also present in quantities. This latter pest may be kept in check by frequent syringings of clear water. Not much is known about the Shot-hole fungus, but Mr. Massee recommends spraying with ammoniacal solution of copper carbonate, the first time just when the leaves are expanding, and repeating at intervals. Bordeaux mixture should not be used for Peach or Almond, as the leaves, and even young shoots, are injured by dilute solutions of this specific.

ROSE BURRS: *C. W.* The burrs are common on plants of *R. canina*, the wild dog Rose. They are galls caused by *Rhodites rosa*. In country districts the galls are termed Robins pincushion.

SPANISH CHESTNUT: *G. P.* According to Loudon, in his *Arboretum et Fruticetum*, the Sweet Chestnut, *Castanea vesca*, is generally said to have been brought to Europe by the Greeks from Sardinia, in Asia Minor, about 504 B.C. Loudon adds: In Britain the Sweet Chestnut is by some considered to be indigenous; but, notwithstanding the great age of some specimens, it appears to us more than probable that they have all been planted. This doubt is noticed by Ray and Evelyn, and was warmly taken up by Daines Barrington, about the middle of the last century; and the discussions which took place between that gentleman, M. Ducarel, and some others, will be found in the *Philosophical Transactions*, vols. lix. and lxi.; and in the *Gentleman's Magazine* for 1766. (See p. 25.) In the *English Flora*, the Chestnut is stated to be "found in woods; and it appears to be wild in the south and west of England." It has been planted in Scotland, and sometimes ripens a few fruit in the warmest districts of East Lothian. It grows vigorously in Ireland, but never ripens fruit there. In Scandinavia it is unknown. It is apparently wild in some parts of France, and still more so in Spain and Italy; though it is most probable that it was originally planted in these countries by the Romans. It abounds in the neighbourhood of Nice, and in the kingdom of Naples. It is particularly abundant on the Apennines, especially at Valombrosa, and also between Florence and Bologna.

STREPTOCARPUS HYBRIDS: *W. T.* We cannot find any evidences of your Streptocarpus having been crossed with a Gloxinia. Although you may have pollinated Streptocarpus flowers with pollen from a Gloxinia, it does not necessarily follow that the cross was effective. Unless you took proper steps to emasculate the blooms of the Streptocarpus they would, in all probability, be self-fertilised, this notwithstanding your applying pollen from the Gloxinia, which was, in all probability, impotent. The fact that white Streptocarpus threw coloured flowers is of interest, though as far as we know the colour heredity in this plant has not been investigated.

THE WONDERBERRY: *A. H. L.* It is a mistake to pack fruits and flowers directly in cotton-wool. In the case of fruits, it adheres to and disfigures them, whilst it is so absorbent of moisture that flowers soon wither when packed in it. With respect to your enquiry as to the fruits being edible, we have never tasted these berries, nor were those you forwarded sufficiently attractive for us to make experiments. You will find an article on the subject in our issue for March 27, 1909, p. 204, and an illustration on p. 172, fig. 73, in this issue.

TOMATO: *K. & B.* The fruit is attacked by a fungus, *Macrosporium tomato*. Burn all the diseased fruits.

NURSERIES AND GARDENS IN NORMANDY.

IN connection with a tour organised by a trade journal, I recently had the pleasure of visiting a few of the largest nurseries in Normandy.

Before commencing the tour of the nurseries proper, I made a visit to the Botanic Garden at Caen. I was by no means impressed with what I saw. Although there was a nice piece of carpet-bedding on a grassy slope, and a few good trees in the grounds, the aspect of the botanic garden proper was depressing indeed. Imagine a series of long, narrow beds about one metre in width filled with all kinds of weeds and unkempt plants arranged according to their botanical families, and the intervening pathways a prey to weeds and untidiness. Trees, shrubs, and herbs are mixed up incongruously, and there seems to be no attempt whatever at cultivation. The great pride of the garden, indeed, appears to be centred in the labels. Large, oblong, with white enamelled faces, and standing on iron legs 2 to 3 feet high, these labels almost blinded one in the dazzling sun. One of the

features of the gardens consists in veteran specimens of Palms, Callistemons, Myrtles, Pomegranates, Oranges, Acacias, Eucalypti, &c., grown in large wooden tubs almost as ancient as the plants themselves, and sadly needing repairs and paint. I was pleased with a very fine specimen of the Hottentot Cherry (*Cassine Mauracenia*), an evergreen shrub with thick, fleshy leaves, the under surfaces of which are of a soft brown in the young state. Though, as will be gathered from what has been said already, the Jardin des Plantes is disappointing, nevertheless it would require but a small amount of attention to make it interesting.

CAEN.

I was interested to discover in Caen some small allotment gardens. Compared with our own, however, they are very poor, and I think, if I may judge from this example, that the British artisan would easily hold his own at allotment gardening against his French neighbour.

In Caen the only nursery of any importance is that of MM. Vételier, Son & Co. They have large tracts of land devoted to ornamental trees, shrubs and Conifers, and they also do a big business with florists' flowers; such plants as Fuchsias, Cannas, Zonal Pelargoniums, Begonias, Lilliums, Lobelias, &c., being grown in large quantities, in addition to Palms and Erythras in the home nurseries. About two miles away, another large nursery is devoted to stocks of Apples, Pears, Plums, &c., and, as befitting the great cider industry of Calvados, an enormous number of Cider Apples are grown each year.

One of the most interesting features of the Mondeville district of Caen is the large area devoted to "French" gardening or intensive cultivation. Although the surrounding fields and gardens were parched up by the almost tropical sun, the gardens of the intensive cultivators looked like refreshing oases in the desert with their beautifully-arranged and enticing crops of Lettuces, Endive, Melons, &c.

USSY.

The next centre visited was Ussy, reached by train via Coulboeuf and Falaise. At Falaise I had the pleasure of meeting M. Locard and his son, who own a very interesting little nursery in which many subjects useful for a retail trade are grown. Driving from Falaise to Ussy, I found the latter place to contain about 900 acres of nurseries, one almost on top of the other. They are situated chiefly in spots where water is available during the summer months. Streams run from top to bottom of the nurseries in straight lines, and are so arranged that water is easily secured for the tender seedlings grown in the adjoining beds. Some of the principal nurseries visited at Ussy were those of MM. James & Son, the oldest, established in 1800, Pierre Sebire & Sons, established in 1860, Levavasseur & Sons, Colombe-Lenault-Huet, Engène Briou, &c. The nurseries are all constructed on similar lines. They are divided into beds about 4½ feet wide, and 30 to 40 feet long, with a narrow pathway, about 1 foot wide, between each. There are also broad roadways here and there where necessary, but it is easy to see that very little ground is wasted. In

these nursery beds all the most popular kinds of trees and shrubs, Conifers, fruit-tree stocks, and Rose stocks (of Canina and Manetti principally) are raised from seeds, cuttings, layers, grafts, or buds. There were seedlings of Oak, Beech, Birch, Conifer, Holly, Cherry, Maple, Corylus, Mountain Ash, Barberries, Crataegus, Ash, Cotoneaster—in fact, every tree and shrub that is useful for the park, garden, or forest. The seed-beds are extremely interesting, and show how well and how carefully the seeds are sown, to judge by the regularity of their germination. The first and second year-transplanted beds show plants of a larger growth, and it is rare that any particular group of plants remains in the nursery beyond the third or fourth year. At one place—that of MM. Colombe-Lenault-Huet—I was impressed with some fine specimens of the variegated Tulip tree (*Liriodendron tulipifera variegata*). It is worked on stocks of the common green Tulip tree, which is raised in all the nurseries almost by the million. The variegated form is so pleasing in appearance and colour that it deserves to become highly popular, and would no doubt thrive in the British Islands. All the nurseries are models of cleanliness and tidiness, and particular mention may be made of MM. Pierre Sebire & Sons and MM. James & Sons, the latter business being picturesquely situated in a fertile valley surrounded with well-wooded, undulating hills.

One peculiarity I noticed in connection with the young Oaks: they were nearly all affected badly with mildew, but it was stated they grew out of this condition in a few years. This is doubtful, as hundreds of older trees were noticed in the hedges away from the nurseries to be similarly affected. It is possible, indeed, that the uncultivated Oaks are responsible for the trouble in the nurseries.

ANGERS.

Falaise was left at midday, on August 11, in tropical weather, the thermometer registering about 90° in the shade, and Angers was reached in the evening. Passing southwards, the principal crops noticeable were Wheat, Oats, Beetroot, Mangolds, and Hemp, and after passing a place called Sablé, the white-wine region was entered—the variety Chasselas de Fontainebleau being the variety of vine chiefly grown. On the next day, the weather being hotter than ever, the nurseries of MM. F. Delaunay, Victor Détriché, Chas. Détriché, Chedane & Pajotin, and Vincent Le Breton—all in Angers and district—were visited. In passing through the streets a noticeable feature was the fine standards of Magnolia grandiflora, used in the same way as Plane trees in London. Here and there also, scrambling over a wall, could be seen a wealth of orange, yellow and red tubular flowers of Bignonia (or Tecoma) grandiflora—a sight not likely to be seen in many parts of the United Kingdom.

The nurseries at Angers are arranged on somewhat similar lines to those at Ussy. Trees and shrubs are cultivated in the early stages, but there is a good deal more variety and floral material noticeable. *Acanthaceae* dealbata the Silver Wattle, or Mimosa, of the London florists is grown by Mr. Delaunay in thousands, as are also such Roses as Mme. Levavasseur and Hermosa.

In M. Victor Détriché's nursery I noticed a fine specimen of *Maclura aurantiaca* var. *inermis* in fruit, each fruit being green, as large as an Orange, and with a wrinkled skin. A fine specimen of *Diospyros virginiana*, with half-ripened fruit, also attracted attention. *Trachelospermum jasminoides* was met with nearly everywhere, flowering freely and growing as easily as the Periwinkle does with us. At M. Chas. Détriché's place, *Rhus semialata*, owing to its ornamental appearance and winged leaf-stalks, was immediately noticed, and should be popular for sub-tropical bedding purposes in this country.

Amongst these open-air nurseries it was interesting to come across one containing a few glasshouses. The establishment of M. Fargeton, although not so extensive as the others, was nevertheless interesting for the cultures of *Gloxinias*, *Bouvardias*, *Cannas*, &c., of which he makes specialities. The *Gloxinias* were particularly fine.

NEW OR NOTEWORTHY PLANTS.

*GENTIANA VEITCHIORUM, HEMSL.

At least three different species of *Gentiana* have been, and perhaps are still, in cultivation under the name *ornata*, originally given by Wallich to a Himalayan species, which reaches almost the upper limits of phanerogamic vegetation in that region. About the year 1880 a *Gentiana* was cultivated in the Edinburgh Botanic Garden bearing this name, and was figured in the *Botanical Magazine*, pl. 6514, as such; but, as was pointed out by W. I. (Walter Irving) in the *Gardeners' Chronicle*, 1906, vol. xl., p. 182, the plant represented is not the true *G. ornata* of Wallich. What it really is, is uncertain, and the history of its introduction into cultivation is apparently not on record. In 1883, the *Gardeners' Chronicle* published (vol. ii., p. 396, fig.

Now comes a third *Gentiana*, to which the name *ornata* has been attached. The species in question was exhibited by Messrs. James Veitch & Sons at the meeting of the Royal Horticultural Society on August 31, and received an Award of Merit. The history of it is as follows. In August, 1906, Messrs. Veitch sent a plant of it to Kew for name, with the information that it was raised from seed collected by Mr. E. H. Wilson near Tatienu, Western China, at an elevation of 12,000 feet. It was identified with dried specimens collected by Père Soulié in the same region and described by Franchet (*Bull. Soc. Bot. France*, vol. xliii., p. 493), and named *Gentiana ornata* var. *obtusifolia*. With all the material before me, I have no hesitation in accepting the identification; but I cannot agree in leaving it as a variety of *G. ornata*. Considering the large number of described Chinese species of which I have seen no authenticated specimens, there is some risk of duplication in proposing another, but that is the only course open under the circumstances.

G. Veitchiorum is a larger, more robust plant than *G. ornata*, with relatively broad, obtuse leaves, larger flowers, with broader corolla-lobes, and very broad, toothed folds between them. The flowers are of an intense blue with light longitudinal bands on the outside. W. Botting Henley.

MR. WILSON'S EXPEDITIONS TO CHINA.

(Concluded from page 162.)

AMONGST flowering shrubs the forms of *Buddleia variabilis* distinguished by the varietal names "*Veitchiana*," "*magnifica*," and "*Wilsonii*" are well worth the appreciation they have met with. They are much finer than the type species which they have now practically superseded. The racemes of purple flowers produced by "*Veitchiana*" sometimes reach a length of 18 inches; the flowers of "*magnifica*," which appear later, are larger and of a darker colour, whilst those of "*Wilsonii*" are of a distinct and deeper shade. Of robust habit and easy culture, there are few gardens where they would fail to succeed. Not the least important of the flowering shrubs recently introduced are the many fine forms of *Deutzia discolor*. The variety known as "*major*" has larger flowers than the type, and "*Veitchii*" has similar blooms, richly tinted with deep rose. In both forms the flowers are freely produced along the whole length of the preceding year's growths. Other new species of this valuable genus are *Deutzia Wilsonii* (25), *D. reflexa*, *D. globosa*, and *D. mollis*.

The species of Chinese *Rhododendrons* form a group of important garden subjects. In a wild state they vary in habit from small trees to dwarf heather-like plants, according to the altitude at which they are found. The flowers of our present garden varieties already possess a wide range of colour, but amongst the new introductions will probably be found new forms and colours, which will serve as material from which the hybridist will evolve distinct races. At present the majority of the seedling plants are too young to flower, but in *Rhododendron intricatum* (26), and *R. Souliei* (27), which have already been exhibited, we have examples of the types we may expect to see in future years. The first-named is an example of the small Alpine species of dwarf habit, densely covered with small flowers of a bluish-purple shade; *Rhododendron Souliei* is a larger plant, with trusses of rich rose-coloured flowers of fair size.

FIG. 74.—GENTIANA VEITCHIORUM, HEMSL. (A NEW SPECIES): FLOWERS BLUE.

In the nurseries of M. Vincent Le Breton and others, it was noted that raffia was not used for budding the stocks of Roses or any other plants, although sometimes employed for fruit trees. Woollen thread—worsted—appeared to be much more popular, and even the leaves of *Sparganium ramosum*, after being cut a year and placed in water, were considered a superior material to raffia for tying buds. Raffia is, however, almost universally used when grafting standard trees. Other nurseries well worth visiting at Angers were those of MM. André & Louis Leroy, who, in addition to fine stocks of Roses and fruit trees, ornamental trees, shrubs, and Conifers, also deal in Oranges, Azaleas, Musas, Skimmias, Fuchsias, Hydrangeas, &c. Another very interesting nursery was that of M. Hilaire-Bechet, devoted principally to bulbous and tuberous-rooted plants, *Cannas* forming a special feature, many new varieties of these plants being raised every year. J. Weathers.

(To be concluded.)

60) an excellent illustration, reproduced in fig. 75, of the genuine *G. ornata* of Wallich, from specimens grown in the Wisley garden of the late Mr. Wilson. Turning to that, I find that it is a slender trailing plant with narrow, very acute leaves and very acute corolla lobes, with narrow folds between. A coloured figure of the same species was given in the *Botanical Magazine* for 1907, pl. 8140. Comparing the flowers actually figured in the *Magazine* with the type of Wallich's species in the Kew Herbarium, I think there is no doubt that it was correctly identified. Mr. J. Hutchinson, who contributed the description of that figure, suggests that the plant figured in the *Botanical Magazine*, pl. 6514, is *G. nipponica*, but I have not time to follow up this suggestion.

* *Gentiana Veitchiorum*, Hemsl.—Nova species ex affinitate *G. ornata*, Wall. a qua differt foliis latioribus obtusis, calycis lobis subfoveatis vix acutis, corollae amplioris lobis latis obtusiusculis et plicis inter lobos latis denticulatis. *G. ornata*, var. *obtusifolia*, Franch.—Sinae occidentalis incolae, legit E. H. Wilson.

The Chinese *Viburnums* are represented by several species of horticultural value; such, for example, are *V. rhytidophyllum* (28), which has very large, rough leaves and corymbs of cream-coloured flowers, and the smaller *V. utile* (29), which produces numerous heads of pure white flowers and has neat foliage of a bright glossy green.

In *Ilex Pernyi* (30) we have a small-leaved compact-growing Holly of very attractive appearance, which, when recently exhibited at the Horticultural Hall, gained a First-Class Certificate. A similar award was made to the dwarf *Berberis Wilsonae* (31), which, when covered with its attractive coral-red fruits, is a very decorative subject. Other hardy shrubs worthy of mention are the new species of *Cotoneaster*, notably *C. appianata* and *C. humifusa*, the former excellent for a wall and the latter for clothing banks or rockwork; the numerous species of *Rubus*, of which *R. bambusarum* (32), *R. flagelliflorus*, *R. innominatus* (33), and *R. lasiostylus* have already

unfortunate that the beautiful *Jasminum primulinum* (34) has not proved perfectly hardy; otherwise it would have been a most valuable addition to this group. Except in favoured situations, it is best grown in a cool greenhouse, where it produces freely its semi-double, rich yellow flowers in early spring.

The hardy ornamental vines, which have been introduced as a result of Wilson's journeys, have proved excellent subjects for pergolas. The most distinct are perhaps *Vitis Henryana* and *V. armata Veitchii*; the former has compound, five-foliolate leaves with silvery veining, the latter prickly stems and large, simple leaves, which assume in autumn a rich colouration. Other species of this genus are *Vitis Thomsonii*, *V. leucoides*, *V. megalophylla*, *V. flexuosa Wilsonii*, and *V. repens*, all of which have their distinctive features to recommend them and are well worthy of cultivation if room can be found for them. Mention should also here be made

seen how greatly we are indebted to Messrs. Veitch for their enterprise, and to Mr. Wilson, on whose knowledge, energy, and tact so much depended. *Herman Spooner.*

VARIATIONS AMONGST ORCHID SEEDLINGS.

SOME years ago much discussion took place on the variations amongst imported species of Orchids. Many of the blotched varieties of *Odontoglossum crispum* were regarded as of hybrid origin; why such a contention should have been held I have always been at a loss to understand. Those concerned with the raising of seedling Orchids cannot fail to have been struck with the marvellous results that have been obtained from the same seed-pod, and especially in the case of the so-called primary crosses of *Odontoglossums*. When a white and a finely blotched kind are used as parents the progeny includes a fair number having white and blotched flowers. Cross two of the finest blotched varieties and the result is a larger

FIG. 75.—GENTIANA ORNATA (WALLICH). (See p. 178.)

been sent out, and *Sarcococca ruscifolia*, which attracted much attention when recently exhibited. In the large genus *Rosa* it is difficult to find a new species which is really distinct; yet such a term may with justice be applied to *Rosa Moyesii* and *R. Willmottii* (35); the former has rich red flowers of much substance, the latter flowers of a unique shade of rosy-pink, profusely borne.

Plants suitable for walls, poles, or pergolas have several valuable additions amongst the new Chinese introductions. Probably the most popular is *Clematis montana rubens*, which this season has been particularly fine, and will, no doubt, improve as the plants get larger and older. It resembles the type in hardness and freedom of flower, but differs in having deep rose-coloured blooms. It is

of *Actinidia chinensis* (36), a handsome climber with bold foliage and buff-yellow flowers of large size, which are followed by edible fruit the size of a Walnut. Some plants bear male flowers only, others produce perfect flowers which are followed by fruit. To produce flower the plant appears to require a poor soil, otherwise it produces strong, sappy growths and luxuriant foliage only.

The new Chinese Conifers collected by Wilson were described by the late Dr. Masters in these pages. At present the plants are too small to permit of judgment of their suitability for planting in this country. The handsome *Labocedrus macrolepis* (37) is unfortunately not quite hardy, and is, therefore, only suitable for favoured localities, but *Pinus Armandii* (38) appears to withstand the winters unharmed.

From the foregoing sketch, which by no means embraces the whole subject, it will be

proportion of white or albino forms than is the case where a white and a blotched form are used as parents. I have instanced *Odontoglossums*, but these observations are found to be true in the case of other genera of Orchids. Take, for example, the so-called albinos of the *Cypripediums*. All of these, when fertilized with their own pollen, produce offsprings true to the albino characteristics of the parent plant. Yet two albinos of distinct species are crossed, the hybrids, with but one exception, have coloured flowers, or such as would have been produced had normal coloured types of such species been used. The late Mr. Norman Cookson and myself crossed the following albino *Cypripediums*. In each instance the crosses were made both ways:—*C. bellatulum album* × *C. Lawrenceanum Hycanum*, *C. bellatulum album* × *C. callosum Sanderae*, *C. bellatulum album* × *C. insigne Sanderae*, *C. Lawrenceanum Hycanum* × *C. insigne Sanderae*, *C. callosum Sanderae* × *C. insigne Sanderae*. With the exception of *C. Maudiae* (*C. callosum Sanderae* × *C. Lawrenceanum Hycanum*) all the seedlings reverted to the normal coloured type. Many of the albino

Cattleyas may also be quoted as examples of reversions in their offsprings to the coloured forms. The one consistent producer of albino offsprings, when intercrossed with the white varieties of other species, appears to be the white *C. Mossie Wageneri*.

Passing from the species to the intercrossing of the best spotted and barred varieties of the hybrids, we get some very remarkable results. The accompanying illustration (see fig. 76) represents five flowers of *Odontoglossum* × *percultum* all raised from the same pod of seeds, and is the result of intercrossing *O.* × *Rolfeae* Oakwood variety (*Harryana* × *Pescatorei*) with the pollen of *O.* × *Ardentissimum* Cooksoniae (*O. crispum* × *O. Pescatorei*). The offspring thus consist of one-half *O. Pescatorei* and one-fourth each of *T. crispum* and *O. Harryanum*. There were a number of absolutely spotless forms, as seen in the lower left-hand corner of the illustration, and many others, linking up the different steps, until *O.* × *percultum* Cookson's var., which is represented in the centre of the photograph, was obtained. The flowers of this variety have a peculiar shade of slaty or bluish purple. Looking at these results from a raiser's point of view, there can be no doubt that the best varieties are found among the secondary hybrids.

From the scientific point of view, the results of the secondary crosses cannot fail to be instructive in their bearing on the laws of inheritance, and where records have been faithfully kept no doubt the lessons derived will ultimately lead to a workable formula that will determine, more or less, the exact results that are possible at the time of cross-fertilization. *H. J. Chapman, Oakwood, Wylam.*

THE UPRIGHT-FLOWERED LILIES.

THE upright-flowered Lilies, whose blooms are more or less cup-shaped, form a well-marked group. Some of the members are especially valuable for garden decoration, because their cultural requirements are comparatively simple. Most of them may be purchased cheaply, and they flower well the first season after planting. Ordinary garden soil is suited to several members of the section; indeed, one species, *Lilium croceum*, known popularly as the Orange Lily, forms a conspicuous feature in many cottage gardens. The type corresponds with the sub-genus *Iso-lirion* of Mr. Baker; the best known and most useful for garden purposes are as follow:—

LILIAM BULBIFERUM.—This species occurs more or less plentifully throughout a considerable part of Central Europe. Although so well known, it is less often met with in cultivation than some of its immediate allies. It reaches, as a rule, a height of from 2 to 3 feet, and is sometimes confounded with one or other of the forms usually classed as varieties of *L. dauricum*, but which are often grown in nurseries under the collective title of *Lilium umbellatum*. *L. bulbiferum* is distinguished from such varieties by the less crowded head of deep orange-red blossoms, and also by the small bulbils being produced in the axils of the leaves. The species flowers in June, and is essentially a plant for the open border. The flowers when expanded retain their brightness of colouring for a longer period than most other Lilies.

LILIAM CONCOLOR.—A small but charming Lily inhabiting the northern part of Asia and extending into Japan. The bulbs are small, and develop slender stems, which reach a height of 1 foot or 13 inches. Early in July the stems are terminated by one to three erect, star-like flowers, about a couple of inches across and bright-scarlet in colour. In the variety *Coridion* the flowers are bright yellow. There is also another form—*pulchellum*—rather more vigorous than the type and

with reddish-crimson blossoms. The flowers of *Lilium concolor* are of an unusually thick, wax-like nature. The plant is sometimes known as *Lilium sinicum*. A cool, fairly-drained soil, lightened if necessary by peat, leaf-mould, and sand suits *L. concolor* well. From its lowly stature it is suited for planting in the cooler parts of the rock-garden.

LILIAM CROCEUM.—When planted in ordinary garden soil and allowed to remain undisturbed, this Lily soon forms a dense mass or clump. Under favourable conditions it reaches a height of from 4 feet to 5 feet. The leaves are narrow, dark-green in colour, and very numerous; the flowers are disposed in a loose, pyramidal-shaped raceme. Individually they are broadly funnel-shaped and of a bright reddish-orange colour. There is a variety known as *Chaixii*, that flowers somewhat earlier than the type, and is also of lesser stature, whilst the flower-heads are more compact. This Lily is grown in some Dutch nurseries under the specific name of *aurantiacum*.

LILIAM ELEGANS OR THUNBERGIANUM.—This Lily must be regarded as the most variable of all the members of the genus, for the colour of the flowers ranges from the clear lemon-yellow of the variety *Alice Wilson* to the rich blackish-crimson of *Horsmannii* or *hematochromum*, which is now, I am afraid, lost to cultivation. Collectively, these varieties of *L. elegans* form a charming group of dwarf-growing plants, some being little more than 6 inches high, although the more vigorous may attain to a height of 2 feet. Having regard to the small size of the bulb and the lowly stature of the plant, the flowers may be considered large. Apart from their value for planting amongst dwarf shrubs, these varieties of *L. elegans* succeed well under pot culture, and they are then valuable for the embellishment of the greenhouse or conservatory. The flowering season is variable, for, while the earliest sometimes bloom towards the end of May, most of them are at their best in June. A few, however, open in July and even as late as August. A selection of

FIG. 76.—VARIETIES OF *ODONTOGLOSSUM* × *PERCULTUM*, RAISED FROM THE SEEDS OF ONE POD.

LILIAM DAURICUM.—The typical form of the Dahurian Lily is not extensively cultivated, but there are a number of hybrids which are sometimes called by the same name. By others these garden forms are referred to as *Lilium umbellatum*, but this name, though expressive of the compact umbels in which the flowers are borne, is not recognised by botanists. In the production of this *umbellatum* group it is very probable that, in addition to *L. dauricum*, two other species—*L. bulbiferum* and *L. croceum*—have played a part. Among the best of these garden varieties are *grandiflorum* (orange-red), *erectum* (red, flushed with orange, the segments being very broad), *incomparabile* (dark scarlet red, the richest coloured of all), and *Cloth of Gold* (rich orange-yellow). These varieties are all good garden Lilies, and will succeed under the same conditions as does *Lilium croceum*. They are a bright feature in the flower-border during the month of June, and in some instances the flowering period extends into July.

The best varieties includes:—*Alice Wilson*, a very dwarf form with lemon-yellow flowers, a rare variety; *alutaceum*, yellowish-apricot, grown by some of the Dutch nurserymen under the varietal name of *Kikak*; *atrosanguineum*, dark red; *Batemannie*, bright apricot, the plant grows 2 feet high and flowers at the end of July and in August; *bicolor*, yellow flamed red, a flimsy flower, but very beautiful; *flore plena* or *staminosum*, some of the stamens are transformed into petals, thus forming a double flower; *Horsmannii*, already referred to; *marmoratum aureum*, yellow, thickly dotted with red; *Orange Queen*, rich orange-buff; *Prince of Orange*, a robust yet dwarf form, with buff-coloured flowers; *Van Houttei*, rich crimson, very fine; *venustum*, clear orange, a late bloomer; and *Wilsonii*, apricot-yellow, spotted with purple. *Lilium elegans* is a native of Japan, and considerable numbers of bulbs are received from that country during the winter months.

LILIAM PHILADELPHICUM.—This delightful Lily is, with the exception of the nearly allied *Lilium*

Catesbei, the only one of the Isolirion group native of the New World. It is widely distributed in North America, where it occurs principally in open woods. Under cultivation it needs a totally different treatment from any of the preceding, for it will thrive only in a cool, moist soil containing a liberal proportion of vegetable matter such as peat and leaf-mould. Conditions favourable to the hardy *Cypripediums* and *Trilliums* are exactly suitable to this Lily. The bulbs are small, and the slender stems, which reach a height of 1 foot to 2 feet, are clothed with narrow leaves, arranged, for the most part, in regular whorls. The flowers are sometimes borne singly, although two to five are often found in an umbel. They are about 3 inches across, the segments being of an orange-red colour marked with yellow at the base and freely spotted with purplish-crimson towards the centre of the flower. The segments are peculiarly stalked, which feature gives to the bloom an appearance uncommon among Lilies. W.

SAXIFRAGA GERANIODES.

THIS Saxifrage (see fig. 77) belongs to a small section, comprising four species, of the mossy group, in which the members are all more robust in habit and coarser in foliage than those usually grown in gardens. The largest of the four is *S. aquatica*, which is found in the Pyrenees growing on the banks of the mountain streams. It develops large patches of fleshy leaves, three-to-five-partite, in rosettes, while the stems grow from 12 inches to 18 inches in height, and bear corymbs of large, white flowers. Compared with those of the *cæspitosa* or *muscoides* group, this species is somewhat ragged in habit, and is hardly worth a place in the small rock garden. *S. geranioides* is also a native of the Pyrenees, where it is found growing on shady rocks. The growth is more compact than in *S. aquatica*, and the plant does not require so much moisture. It makes an excellent pot plant for the Alpine house, and is readily grown from seed, which ripens freely, and it may also be propagated by division. The stems are somewhat woody at the base, while the upper part and leaves are covered with viscid hairs. The white flowers remain in good condition for a considerable time. *S. pedatifida*, from Southern France, is rather smaller in habit than either of the above-described species, and has five-to-seven-cleft leaves, with narrower, more deeply divided segments. The remaining species, *S. pedemontana*, comes from the Piedmont, where it grows on high rocks. It forms closer mats of foliage, and the stems bearing the corymbs of white flowers are not so leafy as those of the other species. W. I.

*** THE GENUS EREMURUS.**

UNDER the brief title given below, which may be translated *A Critical Review of the Genus Eremurus*, Mrs. Fedtschenko has presented the world with a most comprehensive and thorough monograph of this favourite and striking liliaceous genus. Much confusion has prevailed regarding the identity and limits of the species, and an authoritative guide is most welcome. The talented authoress, who is well known to London botanists, is a botanist, cultivator, and explorer, having thrice visited Russian Turkestan, the centre of the greatest concentration of the species of *Eremurus*. Widow of A. O. Fedtschenko, she spent the years 1868 to 1871 in that interesting country with her late husband, who perished in 1873 in a violent storm on the Col du Géant, Mont Blanc, whither he had gone to investigate the glaciers for purposes of comparison with those of Turkestan. Since then, in 1897 and in 1901, Mrs. Fedtschenko has made further extensive journeys in company with her

son, Mr. Boris Fedtschenko, now attached to the Imperial Herbarium at St. Petersburg.

These visits afforded her opportunities for studying at least half of the known species of *Eremurus* under natural conditions, and she has 13 species, besides a number of varieties, under cultivation in her own garden at Moshaisk. In addition to these advantages, she has been able to examine most of the herbarium specimens of importance in defining the species. This has enabled her to elucidate obscure points and eliminate the confusion in nomenclature.

Mrs. Fedtschenko's monograph is a real treasury of information—historical, bibliographical, geographical, biological and cultural. With the exception of the purely descriptive part, which is in Latin, German is the language used; fortunately, not Russian. Following an exposition of the characters employed in the discrimination of the species is a highly interesting chronological epitome of the progress of discovery and record of species. Then comes the tabulated distribution of the 20 species recognised by the authoress†, from which we learn that the genus ranges from the Crimea and the Caucasus eastward to Western China. The whole area is divided into 26 districts, of which 6 to 20 are within Russian Turkestan. Thirteen species occur in 19, the Pamir district, and the number rapidly decreases, both eastward and

[Photograph by W. Irving.]
FIG. 77.—SAXIFRAGA GERANIODES:
FLOWERS WHITE.

westward, one reaching the Crimea, and one, a local one, inhabits the extreme west of China.

There is one point on which Mrs. Fedtschenko expresses no opinion, and that is on the differential characters of *Eremurus* as a genus, and its affinities. But there is little to be said, except that *Eremurus* (as many other adopted genera of the Liliaceæ) differs from its nearest allies in habit rather than floral structure, and it is otherwise hardly distinguishable from *Anthericum*. After the description of the genus, there is a definition of the four sections into which it is divided, followed by a key to the species, which is so useful that a translation will be given below. As an example of the method of treating the species, *E. robustus* may be cited. Reference to first publication and moderately short Latin description, followed by six pages of references to literature, in each case giving the name employed by the writer, and the nature of the communication, whether descriptive or nomenclatorial. Then comes a list of published figures, 27 in number, and a list of the herbaria in which specimens have been seen. Then three pages of localities in which the species has been found, with all the particulars furnished by the various

collectors' labels. Next comes a note on the uses of the species. From the roots of *E. robustus* a kind of glue is prepared, and they may also be eaten. W. Komarow, who has actually eaten them, states that, boiled, they taste somewhat like asparagus.

Two pages are devoted to cultivation, and nearly five to the literature of the subject, of which this is a specimen: O. O. Wrigley, at Bridge Hall, Bury, Lancashire. *E. Elwesianus*; scape 9 feet 6 inches; raceme 4 feet 8 inches. *Gard. Chron.*, 1902, 2, p. 42. These references extend from 1870, when *E. robustus* was introduced by the Fedtschenkos, to 1906.

The plates are reproductions of pen-and-ink sketches of a diagrammatic nature, but embodying the characteristic features of the species. As to the maps illustrating the distribution of the genus and the species, they are perhaps the least satisfactory part of the work, the few place-names being in Russian written characters, and the longitude is calculated from Moscow; but such full geographical details are given in the text that this is of relatively little importance. W. Botting Hemsley.

EREMURUS.

Definitions of the sections and key to the species translated from the Latin in Mrs. Olga Fedtschenko's monograph.

Section I.—*Eremurus*. Leaves of the perianth three-nerved, eventually rolled back. Filaments usually long.

E. spectabilis, turkestanicus, altaicus, Korshinskii and sogdianus.

Section II.—*Ammolirion*. Leaves of the perianth three to five-nerved. Perianth narrowly tubular, bell-shaped; leaves scarcely rolled back. Filaments short, scarcely exceeding the perianth.

E. iberiensis and *comosus*.

Section III.—*Trochanthus*. Leaves of the perianth one-nerved, eventually converging inwards. Bracts very narrow, not fringed.

E. stenophyllus, *Olge* and *chinensis*.

Section IV.—*Hemmingia*. Leaves of the perianth one-nerved, at length converging. Bracts linear or lanceolate, fringed.

E. robustus, *Aitchisonii*, *himalaicus*, *Kaufmannii*, *Griffithii*, *persicus*, *Alberti*, *lactiflorus*, *anisopterus*, *bucharicus* and *luteus*.

KEY TO THE SPECIES OF EREMURUS.

- 1. Capsule transversely wrinkled...*E. spectabilis*
- Capsule smooth 2
- 2. Leaves hairy 3
- Leaves glabrous or fringed on the margin 5
- 3. Perianth brown-red, narrow, tubular, bell-shaped, about ½ inch long, bracts broad, white *E. comosus*
- Perianth broadly bell-shaped, about ¾ inch long 4
- 4. Leaves clothed with short, straight hairs. Perianth pale rose ... *E. persicus*
- Leaves clothed with longer, deflexed hairs. Perianth white, with yellow centre *E. Kaufmannii*
- 5. Leaves narrow, triquetrous, less than ¾ inch broad 6
- Leaves ¾ to 1½ inch broad, distinctly keeled 13
- 6. Bracts naked 7
- Bracts fringed 9
- 7. Perianth golden-yellow ... *E. stenophyllus*
- Perianth pink or rarely white 8
- 8. Roots spindle-shaped. Leaves of the perianth narrower *E. chinensis*
- Roots cylindrical. Leaves of the perianth broader *E. Olge*
- 9. Leaves of the perianth 5-12ths to 7-12ths inch long 10
- Leaves of the perianth 7-12ths to 8-12ths inch long 11
- 10. Perianth narrowly tubular, bell-shaped, dirty red. Pedicels erect *E. iberiensis*
- Perianth broadly bell-shaped, yellow-green outside, whitish within. Pedicels long, spreading *E. sogdianus*

† *Eremurus: Kritische Uebersicht der Gattung*. Von Olga Fedtschenko. *Mémoires de l'Académie Impériale des Sciences de St. Petersburg*, Série 8, vol. xxi (4, No. 8, Quarto; pp. 210, with 24 plates. (St. Petersburg) 1909.

† The numbers in this table do not quite correspond to those affixed to the descriptions in the body of the work, where an additional species is admitted and a new one described at the end.

11. Capsule globose, large, thick-walled.
Perianth pale rose *E. anisopteris*
— Capsule more or less ovate 12
12. Capsule ovate-globose, narrowed at the
base. Perianth white *E. bucharica*
— Capsule oval. Perianth yellow ... *E. luteus*
13. Perianth 6-12ths to 7-12ths inch long ... 14
— Perianth 8-12ths to 10-12ths inch long 16
14. Pedicels thickened upwards, indistinctly
jointed. Perianth white, greenish
outside. Filaments nearly black, an-
thers linear, red *E. turkestanicus*
— Pedicels slender, distinctly jointed at the
top 15
15. Perianth orange-red *E. Korshinskii*
— Perianth ochre-yellow or brown red
..... *E. altaicus*
16. Scape about 3 feet high 17
— Scape 3½ to 9 feet or more high 19
17. Perianth whitish *E. lactiflorus*
— Perianth red. Bracts very long *E. Alberti*
18. Perianth snow-white *E. himalaicus*
— Perianth red or pale red *E. robustus*

E. schiwanus O. Fedtsch., a new species described in the addenda is allied to *E. robustus* and *E. himalaicus*, differing from both in the leaves being clothed with downy hairs. *W. B. H.*

[Mme. Fedtschenko requests us to announce that she would be glad to exchange species of *Eremurus* with readers of the *Gardeners' Chronicle*. She particularly wishes to obtain plants, seeds or dried specimens from Afghanistan, Baluchistan, India and China. In return she offers seeds or plants of those she has under cultivation, or, rather, of such as she has to spare. These include an undescribed variety, which she calls *Eremurus altaicus multiflorus*, which is much finer than the type, the scape bearing as many as 700 flowers. Mme. Fedtschenko has the following species and varieties in her own garden at Ogino, Moshansk, Gouvernement of Moskau, Russia:—*E. spectabilis* and var. *marginatus*; *E. altaicus* and var. *palidus* and var. *fuscus*; *E. turkestanicus* (Regel 1875 nos. of 1880); *E. indiensis*; *E. sogdianus*; *E. himalaicus*; *E. Olge*; *E. robustus* and var. *palidus* and var. *Elwesii*; *E. stenophyllus* and var. *præcox*; *E. lactiflorus*; *E. Kaufmannii*; *E. Warei*; and *E. isabellinus* (hybrid).—*Ens.*]

CULTURAL MEMORANDA.

CLEFT GRAFTING OF CLIANTHUS DAMPIERI

CLIANTHUS Dampieri, a grand flowering shrub, indigenous to South Australia and New Zealand and known to the white inhabitants as the Desert Pea, is not much grown in this country, owing to the belief that it is difficult of cultivation. This is not so, however, in regard to grafted plants, which are satisfied by ordinary greenhouse treatment in this country, and with a sheltered spot out of doors in the mildest parts of Cornwall and South and West Ireland. The plant is propagated from seeds, which should be sown between sheets of moist blotting paper, or, better still, of felt. The best time to graft is when the seed has germinated and the shoot is visible between the cotyledons. As stock for the grafts *Clianthus puniceus* should be raised from cuttings or seeds, preferably from the latter, which may be sown a fortnight earlier than those of *C. Dampieri*. When tall stems are required for the latter, the stocks should be reserved for one, two, or three years, that is, till they are of the desired height, before the grafting is carried out. In the case of newly-raised seedlings of *C. puniceus*, the young plants are potted in thumbs, in a mixture of loam and silver sand, and when two to three normal leaves have formed, they are topped and cleft grafted with the wedge-shaped scions of *C. Dampieri*, on which the cotyledons are retained. The grafted plants are provided with suitable ligatures, and placed under cloches or hand-lights on a floor of finely-broken coke, coarse sand, or coal ashes, which must be kept very moist. After a few days ventilation should be afforded, and in 10 to 12 days the cloches or hand-lights may be removed. The temperature at this stage should not exceed 60° Fahr. In about three weeks the grafted plants may require to be repotted, and at the same time the

shoots which the stock may have pushed forth should be removed. The chief difficulties now overcome, growth will be rapid, and the plants will need several repottings, and, in order to produce a bushy habit, the stem must be stopped at the tenth or twelfth leaf, which will retard the flowering by about three weeks, but there will be greater floriferousness later, as every side shoot will produce a raceme of flowers from the leaf axils. During the summer it is advisable to keep the young plants in a garden frame or pit, in the full sunshine, only making use of the lights in very wet or windy weather. The plants, if they pass the winter in the greenhouse without the loss of the points of the lateral shoots, will begin to show for flower in March. *F. M.*

The Week's Work.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Peaches.—The fruits are ripening very slowly, and it will be advisable to remove a few of the leaves or to tie back any shoots that intercept the sun's rays. The foliage should be syringed in the afternoons of warm days to ward off red spider and other insect pests; but when the fruits commence to ripen syringing should be discontinued. See that the roots have a sufficiency of moisture; trees planted close to high walls in warm situations need moisture very frequently. Wh never water is applied, it should be given copiously. In the case of trees that are carrying large crops of fruits, a dressing of artificial manure, alternated with farmyard liquid manure, will be of benefit. The artificial manure should be washed into the soil, and it is therefore best to apply it before watering. The liquid manure should be properly diluted before it is given. Attend to the gathering of the fruits as they ripen, and when they are picked store them in the fruit room until they are required. For a succession throughout the season the following varieties are recommended: Duchess of Cornwall, Early Alexander, Amsden June, Alexandra Noblesse, Grosse Mignonne, Goshawk, Bellegarde, Violette Hâtive, Dymond, Barrington, Thomas Rivers and Sea Eagle.

Nectarines.—The remarks as to watering, &c., apply equally to Nectarines. For a succession of these fruits the following varieties should be planted: Early Rivers', Rivers' Early Orange, Darwin Spencer, Stanwick Elruge, Lord Napier, Pineapple and Victoria.

Pears.—These fruits are developing rapidly, and especially those on wall trees. The best fruit should be supported by tying a piece of matting around the stalk and fastening it to the trellis or branch. If this precaution is not taken, the fruits of large varieties, such as Utmoston Duchess and Souvenir du Congrès, will be likely to drop because of their weight even before they are mature. The fruits should be exposed to the sun as much as possible, in order to develop the colour and flavour. Afford water and manurial stimulants wherever necessary, giving extra attention in this matter to late fruiting varieties. Keep the hoe constantly at work in the fruit plantations. Should wasps attack the fruits, the latter must be protected by wasp-proof netting, but do not cover up the fruits unless absolutely necessary, as it prevents them colouring.

THE KITCHEN GARDEN.

By E. BLEFELT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Portable frames.—These are generally termed cold frames and are indispensable to the kitchen gardener, being, in my opinion, much more useful than brick pits. If sufficient of these were provided in gardens we should hear much less of the so-called "French" system of gardening. I have for years used and advocated the use of these frames. Just double the number of frames to the number of lights should be provided, and they should all be of a standard size. Better results may be obtained with these frames than from any number of cloches. Our system is to build up one large bed according to the size required, with leaves and manure, half of which should be taken out every year and renewed. The old manure and leaves not only form splendid

material for manurial purposes, but also for the growing of crops which do not require bottom heat through the winter and spring. Steps should now be taken to arrange the frames on that portion of the hot-bed which is to remain. The soil should be made up fairly close to the glass, leaving sufficient room only for the development of the various crops. Lettuces, late Endive, Parsley, Cauliflowers, and Spinach—providing these are likely to fail outside—may all be grown in these frames. The soil in all cases should be freed from wireworm and put together moderately dry. The glass should be thoroughly washed, as the plants will need all the light possible.

Beetroot.—This crop has made remarkable progress during the past few weeks, and there is a danger, if the roots are allowed to remain too long in the ground, that they will become too large for table use. Medium-sized Beetroot should always be chosen in preference to coarser ones. Beetroot may be pulled any time when large enough, and, if carefully stored, will last in excellent condition all through the winter months. Care should be taken not to break the end of the main root; the leaves should be twisted off with the hand and not cut.

French Beans.—A sowing should be made in 7-inch pots. Germinate the seeds in a gentle heat, and when the seedlings are through the soil arrange the pots on shelves quite close to the glass in a cool house. Syringe the under side of the foliage twice daily with tepid water. Ne plus Ultra is a capital variety for sowing at this season.

Capsicums and Chillies.—These should be removed from cold frames to a house having an intermediate temperature.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Renovating Peach trees.—The present is a suitable time to attend to those trees which have yielded unsatisfactory crops during the first season. If the soil of the border is sour, remove as much of it as possible and replace with fresh loam. Open out a trench at the end of the border about 3 feet wide and as deep as the drainage material. Carefully fork the soil from among the roots, gradually working towards the tree. See that the roots are not injured and cover them with damp mats. Should the roots be growing in both inside and outside borders, the whole of the inside border should be replaced. When the soil has been removed, make sure the drains are in working order; should the subsoil be cold and heavy a layer of cement should be placed over it to prevent the roots growing into it. A layer about 9 inches or a foot in thickness of brickbats, placed evenly in the bottom of the trench, will provide suitable drainage. Over this place a layer of turves, grass side downwards. The size of the new border must depend on the amount of roots, but do not make it too large; rather leave room for adding fresh soil later. Very strong roots may be shortened back, and those that are damaged severed with a clean cut, but preserve as many fibrous roots as possible. A good compost consists of calcareous loam, mixed with plenty of old brick rubble and burnt garden refuse. Should the loam be excessively rich, it may be toned down by adding a quantity of common garden soil. Unless the soil is very poor, no manure should be included. Place the roots in layers towards the surface of the border and make the soil quite firm by treading. When finished give sufficient water to soak the border through. Shade the trees for a week or two and spray them two or three times each day. Do not allow cold draughts from the front ventilators.

Lifting Fruit trees.—Young trees which have made extra strong growth should be lifted, as this is the best way to bring them into a proper fruiting condition. The soil should be in a moist condition, but not too wet, before the work is commenced. Dig out a trench a few feet from the trees and fork some of the soil from about the roots till the ball is small enough to be lifted, but preserve as much soil as is possible about the fibrous roots to prevent a check. Cut back all strong-growing roots and those that grow downwards. When replanting the trees, take care not to place them too deeply, always allowing a few inches for the soil to settle down.

PLANTS UNDER GLASS.

By A. C. BARKLETT, Gardener to Mrs. Ford, Pencarrow, Cornwall.

Bouvardia.—The plants which have been grown out-of-doors during the summer should now be carefully lifted and potted. Before commencing the work see that the soil about the roots is thoroughly moistened. As the potting is proceeded with, carefully remove the surface soil from the roots and see that each ball of soil rests firmly on its base in the pot. Use the smallest pots that will accommodate the root-mass, and press the fresh soil firmly; the compost should consist of a mixture of loam, leaf-soil, and sand. The plants should be kept shaded and be frequently syringed until they have recovered from the disturbance at the roots; afterwards place them, together with the pot-grown plants, in the house where they will flower. As a rule it is not advisable to repot Bouvardias after this date. They flower best in relatively small pots; food can be afforded when they are well-rooted in the shape of concentrated manures. Where Bouvardias are grown solely for supplying cut flowers, good results, with less labour, are obtained by planting them in prepared beds in an intermediate house. Red spider, green fly, and mealy bug are the chief enemies of the Bouvardia. The first-named may easily be combated by moisture, fumigations easily dispose of the aphid, and mealy bug may be killed by methylated spirit applied with a small brush.

Souvenir de la Malmaison Carnations.—The layered shoots are now well rooted and ready for potting. It will be wise to sever them from the parent plants a few days previous to performing this work. Care must be exercised in lifting and potting the young plants so that no injury accrues to their roots. The pots must be well provided with material for drainage, so as to allow a perfectly free passage of water. A suitable compost is three parts loam, one each of decayed manure and leaf-soil, with some sand added, the quantity of the last-named being regulated by the texture of the loam. Extreme care must be exercised in watering these plants, and during the winter watering, whenever possible, should be performed on the mornings of fine days. Although these Carnations require greenhouse treatment during the winter months, an abundance of fresh air should be afforded them whenever the external conditions permit.

Liliums.—Directly bulbs are received from the nurseryman they should be potted, as there is a risk of them deteriorating if they are kept out of the soil for any great length of time. To obtain flowers of *Lilium longiflorum* Harrisii at Christmas, potting early in autumn is imperative. A good potting medium is composed of loam and peat in equal quantities, with the addition of some leaf soil and sharp sand. The bulbs should be placed low down in the pots, leaving ample space for future top-dressing. Should the presence of disease be suspected, a little powdered charcoal should be shaken amongst the scales of the bulbs. After being potted, they should be plunged out-of-doors in cocoanut fibre or ashes, where the later varieties may remain until spring.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Masdevallia.—The Masdevallias have showy and curious flowers, and the various species bloom throughout all seasons of the year. At the present time the following are in flower:—*M. deorsa*, *M. nidifica*, *M. vilifera*, *M. anchorifera*, *M. maculata*, *M. infracta*, *M. Schlimii*, *M. tridens*, *M. calura*, *M. Ajax*, *M. campyloglossa*, *M. Jessie Wimm*, and *M. muscosa*. No species excites greater curiosity and interest than the last-named by reason of the extraordinary sensitiveness of its trap-like labellum. Other dwarf-growing varieties are *M. Wageneriana*, *M. Estradae*, *M. melanopus*, *M. floribunda*, *M. picturata*, *M. O'Brieniana*, *M. Arminii*, *M. hieroglyphica*, *M. triadactylites*, *M. imocharis*, *M. Gairiana*, *M. caudata*, *M. Schuttleworthii*, *M. Comandiana*, *M. rosea*, *M. Stella*, *M. Gelemiana*, *M. Shutyryana*, var. *Chamberlainiana*, *M. simulata*, *M. Schroderiana*, and *M. polysticta*. These should all be placed in a position well up to the roof glass either suspended or stood on an elevated stage. Contrasting greatly both in flowers and growth with those already mentioned are *M. macrura*, *M. Trochilus*,

M. elephanticeps, *M. Persterna*, *M. Gargantua*, *M. Epihippium*, *M. coriacea*, and *M. x Curlei*. *M. macrura* is the giant of them all, having leaves more resembling those of a Cattleya than a Masdevallia, with flowers also of large size, the petals being of a distinct and pleasing colour. Species and hybrids characterised by brilliantly coloured flowers include *M. coccinea*, which embraces the many distinct varieties of the *M. Barryana* section, also *M. amabilis*, *M. Veitchiana*, *M. ignea*, *M. coccinea* var. *Lindenii*, *M. x Chelsoni*, *M. Barleana*, *M. splendida*, *M. x Heathii*, and the yellow *M. Davisii*, which is distinct from all the others. Plants of this last and of *M. Veitchiana* are liable to deteriorate if allowed to flower out of season, therefore, if any flower-spikes appear during the winter months, they should be pinched out. The present is the most suitable time to thoroughly overhaul the plants, because it is now that they make the greatest number of roots, and the cool moist weather of autumn is favourable to their speedy reestablishment. Large healthy specimens that may be required for exhibition purposes next season should not be disturbed unnecessarily now, otherwise they may fail to bloom satisfactorily later. Large plants that have become shabby by losing their centre leaves may be divided into suitable clumps, placing these in the centre of the pot, or they may be potted singly. As regards the small or dwarf-growing forms, many, if the soil is in a good condition and they have sufficient space for further development, will need no root disturbance. If, however, the compost is sour the plants should be repotted at once. When in a healthy condition, Masdevallias are vigorous rooting plants, and require a good amount of space, but if roots are few it is safer to err on the side of affording small pots rather than large ones, because the larger the bulk of soil the longer does it take to dry after being watered.

Potting.—The pots should be about half filled with clean crocks, and over which should be placed some rough Sphagnum moss and some of the potting material. The latter should consist of Osunda fibre, Polypodium fibre and Sphagnum-moss in equal parts, with plenty of small crocks. Keep the crown of the plant on a level with the rim of the pot, and work the compost carefully among the roots, potting each plant with moderate firmness. The critical time with Masdevallias is immediately after repotting, any excess of moisture at the root or in the atmosphere at that time generally results in loss of leaves and roots. For a few weeks, water must be carefully given, and the atmosphere of the house kept fairly moist, but when the new roots have entered the fresh compost the quantity of water may be gradually increased, and, as colder weather comes on, the humidity of the air slightly reduced. Grow the plants in the cool house, and to prevent black marks on the foliage do not allow a temperature lower than 45°. A winter night-temperature of 50° is best, with an increase of several degrees by day, but during very cold weather, and when much fire-heat is necessary, the lower temperature is preferable.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir Edmund G. Loder, Bart., Leonardslce, Sussex.

Cyclamen.—Prepare the soil for the planting of the corms, which should be placed in warm nooks and sheltered corners: they are especially effective under trees. From the middle to the end of September is the best time for planting spring-flowering hardy Cyclamen. Those of the autumn-flowering section, including *C. europeum*—both the red and white-flowered varieties—and *C. neapolitanum*, are now showing their flower-buds. They are charming little plants. Their principal requirements are a well-drained soil, a warm position, and an abundance of water during dry weather.

Hyacinthus candicans.—In order that the flowering season of this stately plant may be prolonged, it is necessary to provide the roots with copious supplies of liquid nourishment and to cut off all the old flower spikes.

Silene acaulis and *S. alpina*.—The dead flowers should be removed, or they will develop seeds which will furnish a crop of seedlings next spring where they are not required.

Colchicum.—The soil around these should be cleared and freed from rubbish or weeds, and a

little soot and Clay's fertiliser worked into the soil with a hand fork. This will assist the development of the flowers, which will soon be produced. One of the best for garden purposes is *C. autumnale album plenum*. *C. Pezaisnei* and *C. giganteum* are other fine autumn-flowering varieties.

Chrysanthemum maximum.—If the old inflorescences are cut off, a second crop of flowers will appear. King Edward, Queen Alexandra, and Mrs. Caroline Lothian Bell are some of the best varieties, the last-named producing very large flowers.

Michalmas Daisies.—Place neat stakes to these plants to train them in position and to secure them from damage by the wind. A selection of the best kinds includes *H. J. Cutbush*, *Rosy Morn*, *Surprise*, *ericoides*, *Hon. Edith Gibbs*, *Ophir*, *Grace Darling*, *Admiration*, *Fascination*, *Amellus bessarabicus*, and *Darkness*. These flowers brighten up the borders till frost cuts them down, and in addition they are most useful for cutting purposes.

Berberidopsis corallina.—This plant on a north-east wall is flowering splendidly. The flowers are of a coral-red shade and are produced freely. It is very impatient of dryness at the roots.

Caryopteris Mastacanthus.—This autumn-flowering shrub is sometimes considered tender, but it has withstood 24° of frost in these gardens and is now a mass of flowers. Its propagation is easily effected by cuttings; it is not at all partial as to soil, but a mixture of leaf-soil and loam with sand appears to suit it best.

Yucca.—Having flowered profusely this season, the old flower-stems of Yuccas should be removed, so as not to exhaust the energies of the plants.

General work.—The beds and borders are beginning to lose their summer appearance, therefore it is extremely necessary to keep all dead and decaying flowers and foliage picked off, the grass verges cut, and all weeds eradicated. The lawns should be mown frequently and the paths rolled after rain. Make preparations for the lifting of those plants that are to be housed during the winter by inserting a spade around the roots; this will sever the larger ones and fibrous roots will form nearer the stem.

PUBLIC PARKS AND GARDENS.

By W. W. PETTIGREW, Superintendent of City Parks, Cardiff.

Home-propagated versus purchased plants for park decoration.—A few months ago in the *American Florist*, a number of park superintendents in the United States carried on an interesting correspondence on the subject as to whether park authorities should propagate their own bedding plants or purchase them from the trade. I was somewhat surprised to find that any doubt could exist on this question, and that a number of park officials were found to advocate the purchase of bedding plants in preference to the establishment of a propagating department in connection with public parks. While reading this discussion, I was not at the time aware of the fact, which has since come to my knowledge, that even in our own country there are two opinions on this matter, and that in the parks of at least one well-known English town all the bedding plants used are purchased by tender from nurserymen. The responsible chief of the parks in question has, however, long since been dissatisfied with this arrangement, and has done his best to alter it, but without success, as his committee are apparently too conservative to bring themselves to alter a condition of things which has been so long in existence. While it must be admitted that municipal authorities, being generally more or less model employers—as they ought to be—cannot compete on equal terms with private trading firms, even in the matter of plant multiplication, yet the difference in cost—supposing it does exist—between home-grown plants as compared with those purchased, is so infinitesimal, and the superiority of the former over the latter so decided, that even apart from other numerous advantages accruing from home propagation, there seems to be no question as to the advisability of every park system having its own propagating department. This is especially the case where the quantity of plants required runs into hundreds of thousands every year.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, SEPTEMBER 13—
United Hort. Ben. and Prov. Soc. Com. meet.

TUESDAY, SEPTEMBER 14—
Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. Edward A. Buryard on the "Physiology of Pruning"). British Gardeners' Assoc. Ex. Council meet.

THURSDAY, SEPTEMBER 16—
Nat. Rose Soc. Autumn Exh. at Hort. Hall, Westminster.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—58.8°.

ACTUAL TEMPERATURES:—
LONDON.—Wednesday, September 8 (6 P.M.): Max. 55°; Min. 45°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, September 9 (10 A.M.): Bar. 30; Temp. 58°; Weather—Sunshine.

PROVINCES.—Wednesday, September 8: Max. 55° Cambridge; Min. 49° Yorkshire.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—
Dutch Bulbs, at 67 & 68, Cheapsea, E.C., by Protheroe & Morris, at 10.30.

MONDAY—
Twenty-fourth Annual Unreserved Sale of Pot Plants, at Dyson's Lane Nurseries, Upper Edmonton, by order of Messrs. H. B. May & Son, by Protheroe & Morris, at 11.

TUESDAY—
Great Annual Trade Sale of Winter-blooming Heaths and other Plants, at Burnt Ash Road Nurseries, Lee, S.E., by order of Messrs. B. Maller & Son, by Protheroe & Morris, at 11.

WEDNESDAY—
Great Annual Trade Sale of Winter-flowering and other Plants, at The Nurseries, South Woodford, by order of Mr. John Fraser, by Protheroe & Morris, at 11.

THURSDAY—
Twenty-eighth Annual Sale of Winter-blooming Heaths, &c., at Longlands Nursery, Sidcup, S.E., by order of Messrs. H. Evans & Sons, by Protheroe & Morris, at 11.

The Big Trees of California.

(See Supplementary Illustration.)

The groves of *Sequoia gigantea*, the "Big Trees" of California, are among the wonders of the world. They are remarkable not only for their size and beauty, but also for their splendid isolation. The blue gum (*Eucalyptus*) of Australia may rival the *Sequoia* in height—for both are said to attain to upwards of 300 feet—but in majesty the "Big Trees" are peerless. The height of the tallest specimen is estimated to be 335 feet and its lowest limbs a hundred feet above the ground. Curiously enough, the cones of *Sequoia gigantea* are small, and each cone contains from 100 to 200 parchment-like seeds not unlike those of the Parsnip. The cinnamon-coloured bark is as much as 40 inches thick and, furrowed longitudinally, gives the trunks the appearance of huge fluted columns.

The principal groves, situated on the slopes of the Sierra Nevada mountains, are the South Park grove, consisting of some 1,300 trees; Calaveras, which contains a hundred giants and many smaller specimens; the Tlumne grove, each of whose 30 trees is more than 300 feet high; the Mariposa grove of 600 trees; the Fresno grove, covering an area of two square miles; the General Grant and Tulare river groves.

The groves, within which the range of distribution of the species is confined, lie all in the same forest belt, at an altitude of about 4,000 feet, a hundred miles distant from the coast, in the centre of California.

The Big Trees stand in primeval forest associated with Sugar Pines (*Pinus Lambertiana*), Incense Cedars (*Librocedrus decurrens*), and

Firs (*Abies grandis* and *A. magnifica*), themselves marvels of vegetable growth, but which, magnificent though they be, appear, when seen from an eminence, as dwarfs in company with giants.

Though it might have been hoped that their venerable age no less than their stately beauty would save them from so mean a fate, nevertheless, the woodman's axe has been busy among the trunks of the Sequoias. Trees which grew from seeds sown before the commencement of the Christian era have proved too tempting to the greed of lumbermen. Such vandalism has now ceased. The groves contained in the national parks are patrolled by soldiers and kept cleared of undergrowth in order that forest fires may not destroy the trees. Thus, protected by Government, the Big Trees are held in trust for lovers of Nature for all time. We may be sure that in the future the trees will be spared not only from death but also from further mutilation such, for instance, as that depicted in our Supplementary Illustration.

In one of the most delightful of his essays, Asa Gray, writing of *Sequoia* and its *History*, discusses the significance of its isolation.

He asks, "were they created thus local and lonely, denizens of California only . . . ? Are they veritable Melchizedeks, without pedigree or early relationship and possibly fated to be without descent? Are they now coming upon the stage to play a part in the future? Or are they remnants, sole and scanty survivors of a race that has played a grander part in the past but is now verging to extinction? Have they had a career and can that career be ascertained or surmised, so that we may at least guess whence they came and how and when?"

The essay, which more modern writers might take as a model, and which should be read in its entirety, proceeds, in order to answer these questions, to examine into the distribution of the nearest relatives of *Sequoia gigantea*, the Red-wood *S. sempervirens* of wider distribution along the coast of California, and the much more distantly-related Bald Cypress (*Taxodium*) of the swamps of the Atlantic coast, and *Glyptostrobus*, a Chinese plant closely allied to *Taxodium*. Appealing to the geological record, Asa Gray shows that, in the tertiary period, the Bald Cypress, a *Glyptostrobus*, and more than one *Sequoia* co-existed in Europe. By following the geological evidence further he is led to the conclusion that the Sequoias now remarkable for their restricted range and numbers are of an ancient stock. Their ancestors and kindred formed a large part of the forests which once flourished throughout the Polar regions, now desolate and ice clad and which extended into the low latitudes of Europe. He concludes that "differences of climate or circumstances of migration, or both, must have determined the survival of *Sequoia* upon the Pacific and of *Taxodium* upon the Atlantic coast, and still the Redwoods will not stand in the east, nor could *Taxodium* find a congenial station in California. Both have probably had their opportunity in the olden times and failed." But man has now intervened, and the Sequoias flourish tended by his art in regions whence inexorable Nature long ago decreed their banishment.

ROYAL HORTICULTURAL SOCIETY.—The next meeting will be held at Vincent Square, Westminster, on Tuesday, September 14. At 3 o'clock a lecture on "The Physiology of Pruning" will be delivered by Mr. E. A. BUNYARD. A show of home bottled and preserved fruits and vegetables (including fruits bottled in water and in syrup, jams, &c.) will be held on December 1 to 4. Dried or bottled fruits and vegetables of any kind may be shown, subject to the conditions that they contain no chemical preservative or artificial colouring matter, that they be tasted by the judges, and that the fruit used has been grown in the British Isles.

FLOWERS IN SEASON.—Messrs. H. CANNELL & SONS, Swanley, send a bloom of *Dahlia coronata*, obtained from Mexico. This is the flower that attracted notice last season as the so-called Scented *Dahlia*. As in the flowers last year, we failed to detect this attribute in Messrs. CANNELL's specimen. It resembles a large single-flowered *Dahlia* with scarlet florets. Messrs. CANNELL also send a dwarf bedding *Dahlia* named Little Othello. The foliage is very dark and distinct. It is recommended for bedding purposes, and is said to harmonise well with silver-leaved *Pelargoniums* or with *Phlox Comtesse de Jarnac*. —Mr. SMITH, of Newry, sends several interesting specimens, including *Berberis primsa*, from Yunnan, with whitish fruits; *B. virescens*, just commencing its autumn colouring, which will last well until Christmas, and will be still beautiful by reason of its brilliantly-coloured bark; *Coriaria nepalensis*, in flower and fruit; *Carniola* (*Genista*) *mantica*, with the second crop of flowers; *Clematis integrifolia* *Durandii*, a handsome perennial variety; *Clethra acuminata*, not so sweetly scented as *C. canescens*, but earlier in blooming and very distinct; *Euonymus verrucosus*, just assuming its brilliant autumn colour; *Mallotus japonicus*; *Rosa gymnocarpa*, in fruit, and two new *Cratæguses*. *C. integra* and *C. difusa*, with exceptionally long, thick thorns. —Amongst several interesting and uncommon shrubs sent by Messrs. ROBERT VEITCH & SON, Exeter, were the following:—*Sambucus canadensis*, *Sophora flavescens*, *Desmodium tiliaefolium*, *Pentstemon cordifolius*, *Sorbus americana*, *Pavia macrostachya*, *Paliurus aculeatus*, *Eucryphia pinnatifolia*, and *Coriaria terminalis*. —A selection of remarkably fine *Pentstemons* has been received from Messrs. FORBES, LTD., Hawick, N.B. This firm's strain of these useful bedding flowers is well known as a very fine one; the flowers sent are not only large, but possess a wide range of colours.

"THE BOTANICAL MAGAZINE."—The issue for September contains notices and descriptions of the following:—

APHELANDRA TERTRAGONA, tab. 8272.—The species has been described previously under the name of *Justicia tetragona*, and it agrees also with the plant figured in 1798 as *Justicia cristata*. A two-year-old plant flowered in a warm house at Kew Gardens during September of last year, and another specimen flowered this year in May, the time of flowering depending on the age of the plant and the treatment afforded to it. It enjoys a rich loamy soil and a plentiful supply of water at the roots. The colour of the corolla is a brilliant pink.

MEGAELINIUM PURPUREORACHIS, tab. 8273.—This plant was described in the *Gardeners' Chronicle*, vol. xlv., p. 293, as *M. Bufo*, when exhibited by Sir TREVOR LAWRENCE, Bart., at the Royal Horticultural Society's meeting in April last. The specimen from which the plant in the *Botanical Magazine* was illustrated, flowered in the Royal Botanic Garden, Glasnevin, in September, 1908. The flowers are developed on a broad, flattened, slightly twisted

rachis, which is freely dotted with purple spots. The individual flowers are brown. The plant thrives best in an intermediate house, with a night temperature of 55°. It was discovered by Mr. L. GENTIL, on the Upper Lomami, a tributary of the Congo.

EXOSTEMMA SUBCORDATUM, tab. 8274.—The species differs from others of the genus in its subcordate leaves. It is very closely allied to *E. floribunda*, but has larger calyx-segments. The plant forms a small shrub about 5 feet high. Its flowers, which are pure white and very fragrant, are produced in autumn. It thrives best in a warm plant house, such as is suited for *Ixoras*.

EUPHORBIA LEDIENII, tab. 8275.—The species is nearest to *E. cærulescens*, from which it differs by its more numerous and less sinuous angles, its more distant and less marked constrictions and shorter spines. The spines are produced in pairs, and are from 2 to 4 lines long. The cymes include three involucre, each of the latter being 1½ to 2 lines long, glabrous and yellow.

PELIOSANTHES VIOLACEA VAR. **CLARKEI**, tab. 8276.—This is one of the most attractive species of *Peliosanthes* cultivated at Kew. It differs from the type form in having a dark purple perianth. The leaves are oblong-lanceolate, about 1 foot in length and 2½ inches wide. The racemes are about 6 inches long, the flowers being solitary in the axils of oblong, acuminate bracts. The flowers are about 15 lines in diameter. The plant flowers at Kew usually in April in a tropical house.

CHERRY LEAF SCORCH.—In certain districts the crop of Cherries is in some years seriously reduced owing to the prevalence of a fungus-disease which attacks and kills the leaves. The first symptoms of the disease is a dull-brown colour of the leaves on which yellow-orange spots appear. The spots increase in size and ultimately invade the whole leaf. The dead leaves remain on the trees, and on them the winter spores (asco-spores) develop. Infection of the young leaves takes place about June. Where it is possible to devote the labour to the purpose, the disease may be stamped out by gathering all the affected leaves, both those on the trees and on the ground, and burning them. This wholesale picking and destruction of diseased leaves was carried out some years ago in a district of Prussia (Altenlaude) with complete success. The disease, which had for years ruined the Cherry crop, was stamped out by systematically burning the leaves during two successive winters.

FLORA OF THE LOWER AND MIDDLE CONGO.—The first part of the third volume of the fifth series of the botanical contributions to the *Annales du Musée du Congo Belge* is a continuation of the *Flora of the Lower and Middle Congo*, by Dr. E. DE WILDEMAN, who seems to possess an inexhaustible capacity for work. This part comprises 27 plates and 147 pages of letterpress. Among the plants figured *Dorstenia yambuyaensis* is remarkable for its wide-spreading involucre with linear bracts 4 inches long. Of the polymorphic genus *Clerodendron* there seems to be no end to new species in Africa. *C. Pynaertii* has a large, open, campanulate calyx from which emerges a very slender corolla less than an inch long. *C. excavatum* has stout, hollow, prickly branches bearing dense clusters of almost sessile flowers with a closed calyx and a very slender tubular corolla 5 inches long. *Monnina congolana* (Anonaceae) bears flowers on very long, naked stalks in clusters on the old wood. *Cnestis Laurentii* (Comaraceae) has densely-woolly beaked pods, and *Trochomeeria Verdickii*, of which only the male flowers are known, is a singular cucurbitaceous plant having included stamens and long, exceedingly narrow reflexed petals.

PRESENTATION AT CAPE TOWN.—Mr. H. J. CHALWIN, on his retirement from the curatorship of the Municipal Gardens, Cape Town, was presented with a dressing-case, and an illuminated address. The Mayor (Mr. F. W. SMITH) presided, and the presentation was made by the Acting Commissioner (the Hon. D. P. DE VILLIERS GRAAFF). Mr. CHALWIN has since 1881 had the charge of the Municipal Gardens, or Staats Tuin, which are descended from Governor VAN DER STEL's famous garden of 250 years ago. In the year 1891 arrangements were made for the Government to hand over the Botanical Gardens to the City authorities, and to pay an annual subsidy towards their upkeep. Mr. CHALWIN brought together the finest collection of Orchids in South Africa.

FIG. 78.—EFFECT OF THE UNFAVOURABLE SEASON ON THE SEEDING OF SWEET PEAS OF THE SPENCER TYPE.

THE SWEET PEA SEED CROP.—It is well known that the Spencer varieties of Sweet Peas do not seed nearly as freely as those of the old type. It would not be an exaggeration to say that some of the choicest "Spencers" do not yield a tenth of what the old varieties did, and this in a favourable season. This year the proportion will be nearer that estimated by Mr. HUGH ALDERSEY, viz., one twenty-fifth or one-thirtieth. In the seed-growing districts of Essex the Sweet Pea crop is giving growers anxious concern. Seed pods on plants on the flat, which have not been sticked, are

almost a blank—in many instances the amount of seed used for stock will not be returned. Crops which have been sticked are far from satisfactory. The spring was late and cold, frosts continued into June, and right through the summer the temperature was low, especially at night-time. This condition of affairs, combined with rain almost every other day, except for a fortnight in August, has prevented the flowers setting. The photograph, reproduced in fig. 78, was sent us by a well-known firm, and represents the end of a row of Sweet Peas as it appeared after the rainstorm of August 25.

ODOURLESS ONIONS.—According to an American contemporary, WING HOP, a Chinese gardener, who owns a small truck farm, declares that he has produced an odourless Onion. For years HOP has been working on the production of an Onion which would have all the taste and other qualities of the normal vegetable but would be free from the disagreeable odour which offends so many people. Now he claims to have succeeded, and his contention is borne out by the statement of many of his white neighbours and rivals. Having regard to the close association between taste and smell, we confess to a certain measure of doubt as to whether, in divorcing the odour from the Onion, Mr. WING HOP has been able to retain the flavour.

CINERARIA AND CHRYSANTHEMUM FLY.—Leaflet No. 27 of the series issued by the New Zealand Department of Agriculture describes the methods recommended by the Department to check the ravages made by the larvæ of the flies *Phytomyza negricornis* and *P. chrysanthemi*. The larvæ tunnel through the leaves after the fashion of leaf-miners in general, and in bad seasons are very destructive. Mr. KIRK, Government Biologist, finds that the females do not lay eggs on plants which have been sprayed with tar water (½ lb. coal tar boiled in one gallon of water for 20 minutes; then diluted with 50 gallons of fresh water and stirred till well mixed). This remedy might well be tried in this country as a specific against the Celery fly, which in some seasons does so much damage to the young plants. Since the Celery plants are attacked in the very young stage, there would be little risk of the tar affecting the taste of the mature Celery. The Leaflet of the Board of Agriculture on the Celery Fly, No. 35, recommends the use of a spray consisting of a mixture of paraffin, soft soap and water (paraffin 1 quart, soft soap ½ lb., water 10 gallons).

SOCIÉTÉ FRANÇAISE D'HORTICULTURE DE LONDRES.—The annual report, balance sheet, and list of members has been issued by the London Society of French Gardeners. The continued and steady increase numerically and financially which the society enjoys is due, in a large measure, to the personal and active interest of the president, Mr. GEORGE SCHNEIDER. The society, which will soon attain its majority, has been the means of helping many a young gardener to advance himself in his profession, and this on both sides of the Channel. The issue under notice contains an excellent portrait frontispiece of Mr. HARRY VEITCH, accompanied by a biographical notice. There is also the usual matter relating to the society's rules, lists of members, library catalogue, balance-sheet, and reports of the monthly meetings. An account also appears of the annual dinner, with the text of the various speeches delivered on that occasion. The remainder of the volume is devoted to the papers read by the young members at the society's monthly meetings. Of these articles, the more interesting are those on the leading London parks, Pear culture in England, the Temple Show, Roses for forcing, the Bonvardia, and an account of Messrs. Rotherford's nursery.

CUCUMBER AND MELON CANKER.—This disease, described recently by Dr. GROSSENER as being due to a fungus *Mycosphaerella citrullina* Grossenb., has now, according to the observations of Mr. G. MASSEE, made its appearance in this country. The symptoms of the disease as it occurs in Melons are as follow:—Wilting of leaves; stem nodes, particularly those near the ground, present a water-logged appearance and may exude gum; the plant collapses and dies. At a late stage the diseased patches become ashy-grey or white in colour and the epidermis is broken up and studded with numerous perithecia belonging to the conidial stage of the fungus. Later in the ascigerous stage the resting spores are produced. Mr. MASSEE has found that the disease is, unfortunately, not confined to Melons, but also affects Tomatos, which, according to the grower's statement, were so rapidly affected as to fall over like ninepins. Cucumbers, which are said to be immune from this disease in the United States, are attacked by it in this country. It is suggested that the warm moist conditions of indoor cultivation provide those under which the fungus becomes actively parasitic; for inoculation experiments, successful in this country, are generally failures in the United States, where the plants are cultivated in the open. The spores appear to be very resistant to fungicides, and it is recommended, as a preventive measure, to spray the plants several times with Bordeaux mixture. The report in the *Bulletin* is illustrated by a plate showing the canker-like effect on the stem of the Tomato, and is accompanied by a description of the two forms of spores, conidia and ascus-spores.

THE USE OF CUT POTATOS FOR "SEED."—From experiments carried out at Frankenthal by Messrs. J. OSTERSPY & RENNER, and published in *Mitt. der Deutschen Landwirtschafts-Gesell.*, May 1, 1909, it appears that the yield obtained from Potato tubers cut lengthwise is, under suitable conditions, equal to that of mid-sized tubers of the same weight. The times at which it is best to cut the tubers depend on the nature of the soil in which they are to be planted and on the weather. In dry soils and during cold weather, it is found that the cutting of the tubers is best done shortly before planting; whereas, on wet soil and during warm, damp weather, the tubers should be cut some days (two to eight) before they are planted. When cut some days before planting, the tubers may be protected from drying by a covering of sacks.

FUMIGATION OF NURSERY STOCK.—Experiments made by W. E. BRITTON, and reported in the *Journal of Economic Entomology*, L, 1906, demonstrate that carbon-bisulphide and carbon tetrachloride are efficient substitutes for hydrocyanic acid gas for the fumigation of nursery stock. Apples infested with San José scale were used for the experiments. When carbon-bisulphide was used, it was found that 60 ounces to 100 cubic feet, allowed to act for three hours at 59°, killed all the scale and left the trees uninjured. Carbon tetrachloride, 50 ounces to 100 cubic feet, was equally fatal to the scale and innocuous to the trees.

THE EXPERIMENTAL ERROR IN FIELD TRIALS, a short paper by Mr. A. D. HALL, F.R.S., Director of the Rothamsted Experimental Station, published in the *Journal of the Board of Agriculture* (Vol. xvi., No. 5, August, 1909), should prove valuable to horticultural instructors and others who are occupied in carrying out that most difficult form of experiment known as field trials. Mr. HALL shows by striking examples that, in all such methods of experiment, there is inevitably an element of error, and that the unavoidable error may be as much as, or, indeed, exceed, 10 per cent. Hence

it is impossible to draw any conclusion of value from results which fall within this margin of error. In order to eliminate the experimental error, due to chance differences of soil, &c., it is necessary, either to repeat the experiments year after year, or to conduct them on a number of plots. It is no good to increase the size of the experimental plot and to think that the error will be eliminated if the results are estimated from samples taken from selected parts of the large plots. Increased accuracy is rather to be obtained by increasing the number of plots and decreasing their size, so that the whole produce of each plot may be measured. In the past, so many results of field trials have proved misleading or untrustworthy, owing to the neglect of these considerations, that it is to be hoped that all engaged in this form of experimentation will give heed to Mr. HALL'S advice.

TULIPOMANIA.—A very attractive paper on the introduction of the Tulip is contributed by Mr. W. S. MURRAY to the current number of the *Journal of the Royal Horticultural Society* (Vol. xxxv., Part 1, July, 1909). Mr. MURRAY gives an historical account of what is known on the subject of the introduction of the Tulip into England, beginning with the quotation from RICHARD HAKLUYT, who, in 1582, in his *Remembrances of Things to be Endeavoured at Constantinople*, records the bringing into England from Vienna of divers kinds of flowers called Tulipas, procured from Constantinople a little before by an excellent man called M. CAROLUS CLUSIUS. It is probable, however, as Mr. MURRAY proceeds to point out, that it was ANGERIUS GHIUSLENIUS BUSBEQUIUS, an ambassador of FERDINAND I. to the SULTAN, who first brought seeds from the neighbourhood of Constantinople to Western Europe. The cult of the Tulip spread fast, for even in 1590 Tulips were becoming popular in Holland. Mr. MURRAY'S paper, which is admirably illustrated, provides fascinating reading, not only with respect to the history of the Tulip and of its chief forms, but also of that astonishing period when a veritable mania for Tulips—recalling, but also far surpassing, a recent mania for a less beautiful plant—broke out in Holland and spread over Europe.

BANKRUPTCY STATISTICS RELATING TO GARDENERS, FLORISTS AND NURSERYMEN.—The 26th annual report of the Inspector-General in Bankruptcy for last year contains the following particulars: In 1904 there were 49 failures among gardeners, florists, and nurserymen, with liabilities estimated at £29,104. In 1905 there were 51 failures, with liabilities amounting to £27,065. In 1906 there were 32 failures, with a total indebtedness of £62,343. In 1907 there were 45 failures, with liabilities amounting to £35,467, and last year there were 48 failures, with liabilities amounting to £45,811, so that compared with 1907 there was last year an increase of three in the number of failures, and an increase of £8,344 in the estimated amount of the liabilities.

PUBLICATIONS RECEIVED.—*Comments of the Joint Railway and Parliamentary Committee on the Report of the Board of Trade Railway Conference* (London: Tavistock Hotel, Covent Garden, W.C.)—*Proceedings of the Agri-Horticultural Society of Madras* (January to March, 1909.)—*Bulletins Nos. 109 and 110 of the Agricultural Experiment Station of Nebraska*. (Nebraska: Lincoln.)—*U.S. Department of Agric. Bureau of Entomology*. Bulletin No. 82: Part I. The Colorado Potato Beetle in Virginia in 1908, by C. H. Poppeno. Bulletin No. 64: Part VII. New Breeding Records of the Coffee-Bean Weevil, by E. S. Tucker. (Washington: Government Printing Office.)—*Some Small Houses*. (Illustrated.) By Walter G. Ross. (London: W. G. Ross, 1, West Street, Finsbury Circus, E.C.)

A MARKET FRUIT-GROWER'S YEAR.

THE first 15 days of August were remarkable, for the most part, for intense heat, long hours of sunshine, and absolute drought. For ripening the Plum and early Apple crops this weather was splendid; but in my own district, where the rainfall of June and July had been only moderate, more good would have been done by an alternation of showers and sunshine. However, we had rain enough in the next ten days, greatly impeding the raising of the Potato crop, mainly consisting of Second Earlies, which in this southern district are quite fit to be dug up in August. My crop of British Queens proved disappointing. The haulm had been magnificent; but, partly because there had not been rain enough in June, and partly on account of disease, it died off prematurely, and thus reduced the yield of tubers from a promised 10 tons per acre to about 7 tons. Up-to-date, on the other hand, now just being lifted, seems likely to yield fully 10 tons per acre.

PLUMS AND THEIR PRICES.

That the Plum crop is a small one in the country at large is proved by the prices realised up to the time of writing. Rivers' Early Prolific appears to have been generally better cropped than any other variety. These Plums sold well for the most part, 5s. 6d. to 4s. per half-sieve of 28 lbs. having been the prevailing price, though in one week-end there was a temporary glut, which brought the price down to 2s., and even in some cases to 1s. 6d. for a small consignment. A recovery, however, quickly took place, and Czars came in at 3s. or 3s. 6d., rising later to 4s. or 4s. 6d. My own crops of both these varieties were excellent; but Czars were not generally abundant. The greatest yield with me was that of Gisborne, picked green because there was a wide gap between the ripening of Czars and the colouring of Victorias, and the demand was so good that these green Plums sold at 3s. to 3s. 6d. per half-sieve, as compared with last year's 1s. 6d. for ripe Gisbornes. The yield of Gisbornes exceeded that of either of the two earlier varieties named above, being at the rate of 6 tons 3 cwt. per acre. This Plum is much underrated. Usually it is one of the cheapest, and yet it is one of the very best varieties for tarts, puddings or jam. Fruits of the Victoria variety are reported to be generally thin on the trees, but are abundant in my plantations. I have not marketed any at the time of writing, but there is every reason to expect them to sell well. Pond's Seedling and Monarch are not abundant, and I venture to predict that they will make 5s. or 6s. per half-sieve. It is quite cheering to have remunerative prices for Plums, after two or three years of miserably low prices.

APPLES.

As in the case of Plums, the prices of Apples indicate a general shortness in the supply. For fruits of best quality, dessert varieties, 4s. to 5s. per half-sieve of 21 lbs., have been common rates, while large culinary Apples have made 3s. Unfortunately, the majority of Apples this season are small, and in the cases of some varieties they are scabby or spotted also. The aphid and the Apple sucker are accountable for the failure of many Apples to develop properly; moreover, the check to the flow of sap caused by the cold weather of June and July had an injurious influence. One great help to the sale of Apples hitherto has been the absence of strong wind to cause windfalls, which frequently causes a glut in the markets at the end of August. Some varieties have fallen freely, it is true, but in nothing like the numbers common in windy seasons. Cooking varieties that

were sold last year at 1s. 6d. to 2s. (best) and 1s. to 1s. 3d. (second quality), have been making quite half as much again this season. One of the best tests of a prolific Apple season is to be found in the observation of the very old trees to be seen in farm orchards and cottage gardens. Last year these old trees were fairly loaded with the poor fruit which is all that they ever bear; this year they are almost or entirely barren.

Blackbirds have been and are still extremely mischievous in pecking holes in dessert Apples, and even in the more attractive fruits of culinary sorts. The proportion of Apples thus rendered unmarketable is a serious item in the grower's returns. In the case of one variety, it was necessary to gather the fruit, before it was ripe, to prevent the spoiling of more than half the crop. The thrush, so far as my observation goes, does not interfere materially, if at all, with the Apple crop. If the fruit-grower's interest alone had to be considered, the extermination of blackbirds would be desirable, on account of their voracity for Strawberries, Raspberries, Cherries, Currants, Apples, Pears and ripe Plums. Thrushes are as bad amongst small fruits, but not in the case of Apples or Pears, so far as my observation enables me to judge. We have a plague of wasps this season, the worst ever known. Fruits pecked by birds are devoured by wasps, and some kinds, such as Plums and Nectarines, are attacked by them and by large blue flies.

BUDDING PLUM TREES.

The budding of Plum stocks has been extremely troublesome this season, because it has been impossible to get the wood out of the great majority of the bud scions without tearing the inner layer of the bark. Possibly the rapid ripening of young shoots by the hot and dry weather of the first half of August is accountable for this difficulty.

In the rush of fruit picking and marketing, and the digging and marketing of Potatos, much pressing work is apt to be neglected. Hoeing by horse-power or by hand can be carried on if extra labour be employed; but such delicate work as the summer pruning of Apple trees cannot be entrusted to a casual labourer. In my own case, I would rather leave it undone than give it to anyone but myself. The mere thinning of mature trees can be done by any intelligent workman with a little instruction; but it is so easy to do more harm than good by summer pruning, particularly among young trees, that great caution is necessary in the selection of the operator. Even in the case of hoeing, it is not easy everywhere to obtain extra men while the corn harvest is in full swing, and where there is not this difficulty, a grower is tempted to defer urgent work until his regular hands are available for it, in order to keep down expenses. This is seldom a good policy, as it commonly happens that weeds become rampant at this period of the season, while rainy weather in the autumn renders it impossible to destroy them thoroughly later. For this reason I have come to the conclusion that Potato growing on a fruit farm is not desirable, because it absorbs the attention of men who are wanted for hoeing during the period of raising the Potato crop. The miserably low prices of Potatos for the second year in succession have influenced me in this conclusion. The fact is that the production of Potatos in Great Britain is now overdone, not on account of any increase in the acreage of the crop, but on account of the yield having been enhanced by the choice of prolific varieties, improved cultivation and manuring, the use of sprouted seed, and spraying. My starting price for Second Earlies this season was only half what it was in the first two or three years of the present century. *A Southern Grower.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE HAMPTON COURT GRAPES.—In order to ascertain the actual weight of the fine bunches of Black Hamburgh Grapes shown at the recent R.H.S. meeting from Hampton Court, they were weighed next morning at Frogmore, and found to exceed 5 lbs. each, one weighing as much as 5 lbs. 14 ozs. In his book on *Vines and Vine Culture*, Mr. A. F. Barron refers to the berries of the Hampton Court vine as being small, but berries almost an inch long and nearly 3 inches in circumference such as were exhibited cannot be called small. When Mr. Barron saw the vine it was carrying the enormous crop of 1,700 bunches in one season, and the berries were no doubt small, and the bunches were about half a pound each. The great vine at Cumberland Lodge is held to be derived from the Hampton Court vine, but there seems to be a belief abroad that it bears more resemblance to the Hamburgh strain once known and grown in the oldinery at Chiswick many years ago as the Frankenthal. If there be some differences such as, for instance, the hammered form of the berries at Cumberland Lodge, no such marks being seen on the Hampton Court berries, that may be evidence of distinctness or of a product of diverse soil. It would be interesting could "eyes" be obtained from a dozen or so of the finest Black Hamburgh vines in the kingdom and be grown at Wisley under similar conditions. It could then be clearly determined whether all Black Hamburghs are alike or whether any of them differ. *D.*

ANTIRRHINUM SEMPERVIRENS.—Although overlooked by your correspondent Wyndham Fitzherbert (p. 166), this *Antirrhinum* is mentioned in Nicholson's *Dictionary of Gardening*. Following a description of *Antirrhinum molle*, it is stated that *Antirrhinum sempervirens* comes close to this species. Again, in such an old publication as London's *Herbarium Britannicum*, the name occurs. Its native country is there given as the Pyrenees, and the date of introduction 1821. *H.*

SWEET PEA HELEN LEWIS.—I enclose a spike of Sweet Pea Helen Lewis with seven flowers on it. We find this variety one of the best of its colour for furnishing cut blooms for decorating purposes. Several other spikes had five flowers, but this is the first I have cut with seven. *Thos. Simpson, Henham Gardens, Wangford Suffolk.* [The unusual number of flowers is due to fasciation.—*Eps.*]

ROBINIA PSEUDACACIA (FALSE ACACIA).—Probably no other tree can compare with the False Acacia for withstanding the prolonged heat and drought of our larger centres of industry, a fact that has been brought forcibly home to us by the behaviour of the tree both in France and England during unusually warm summers. When most vegetation is burnt up, the Lime and Elm look seared and sickly, and the Holly is dying out owing to the long-continued drought and heat, the Acacia stands nobly forth in all its freshness of branch and leaf, and, if anything, blooms all the more freely for the scorching heat and want of moisture to which it is subjected. Almost by the hundred may the False Acacia be seen in London and many other English towns. It is one of the most ornamental of trees, with its great wealth of pure white flowers and beautiful Pea-green foliage. As a town tree, it retains its rich verdure till well on in autumn. It grows freely in almost any soil, reproducing itself in suitable positions, and soon forms a handsome tree of almost giant proportions. The most suitable for town planting are the upright-growing and free-flowering kinds. The varieties known as *Decaisniana*, *microphylla* and *sophorifolia* are most to be desired. *A. D. Webster.*

TWO GOOD LATE STRAWBERRIES.—*W. H. V.*, p. 171, is in error regarding the variety Leader. At the latter end of last century you did me the honour to print in your columns a note in which, under a system of culture detailed, I claimed for Leader the distinction of producing the largest weight of fruit possible in any variety then in cultivation. Leader, as its name implies, is a first early Strawberry,

but is not by any means of recent introduction. Subject to these two corrections, his note is very practical. *R. G., Whitford Gardens, Altonmore, Hereford.*

SOCIETIES.

CARLISLE HORTICULTURAL.

SEPTEMBER 1, 2.—The second annual show of this society, held in the Market Hall on these dates, was a great success. The building is large, spacious, and well lighted, and very suitable for a flower show. Exhibits of Sweet Peas, of which there were upwards of 1,000 vases, formed the outstanding feature of the show. Competition in most of the classes was very keen. The Silver Cup offered for the best exhibit of 24 blooms of Cactus-flowered Dahlias was won by Mr. G. BOWNESS, Riverside Nursery, Glasgow; the 2nd prize being awarded to Mr. G. FINDLEY, East Layton Hall, Darlington. The best exhibit of 12 Cactus Dahlias was shown by Mr. W. VEITCH, The Cemetery, Carlisle. The same exhibitor was also first in the class for 12 Show or Fancy Dahlias, but he was beaten by Mr. G. BOWNESS in the class for six vases of Pompon Dahlias. Mr. BOWNESS also won the premier place in the class for four vases of Cactus-flowered Dahlias.

In the classes for Roses, Miss HELEN RHODES, Barrock Park, won the 1st prize for 12 blooms and Mr. W. S. HASLINGTON was placed 1st for six varieties, Miss RHODES taking 2nd place in this class. Mr. W. VEITCH excelled in the classes for Fancy Pansies, Show Pansies, Stocks and Gladioli. The best collection of hardy herbaceous flowers was shown by Mr. JOHN ROBERTSON, The Knells; 2nd, Mrs. RHODES, Barrock Park. Stove plants were best shown by Mr. A. KNIGHT. In a good competition, Mr. ADAM KNIGHT, Brayton Hall, carried off the premier honour for a decorated dinner table; Mr. C. ROWLAND, Mickleton, being 2nd.

VEGETABLES.—A Silver Cup was offered for a collection of vegetables. The trophy was won by Mr. C. ROWLAND, Mr. J. FORRESTER, Whitley Bay, being second. Mr. ROWLAND also excelled in the class for a collection of six varieties of vegetables. This exhibitor also showed the best Parsnips and the best Onions and Celery. Other prominent prize-winners in the vegetable classes were Messrs. J. J. GRIEVE, W. CLARKE, G. MILLICAN, Hallbankgate, J. HARCASLE, H. PRIGNEY, R. HORNE and T. TAIT.

FRUIT.—In the important class for a collection of fruit, Mr. A. HARDWOOD, Netherby, was awarded the 1st prize; 2nd, Mr. W. SCOTT, Edenhall. The best black Grapes were shown by Mr. W. SCOTT, and the best white Grapes by Mr. W. FIXTER. Mr. SCOTT also showed the best collection of hardy fruit.

The amateur and cottagers' classes were numerous, and well contested.

NON-COMPETITIVE EXHIBITS were a feature of the show, the more important being the following:—Messrs. SUTTON & SONS, Reading, exhibited a large circular group of flowering and foliage plants, for which a Gold Medal was awarded; Messrs. GEORGE FAIRBURN & SONS, Botcherby Nurseries, Carlisle, were also awarded a Gold Medal for a display of flowering and foliage plants, floral designs and Sweet Peas; a Silver-gilt Medal was awarded to Messrs. LITTLE & BALLANTYNE, Carlisle, for a stand of hardy plants in pots; Messrs. DORRIS & CO., Rothsay, received a Silver-gilt Medal for an exhibit consisting chiefly of Dahlias; a fine collection of vegetables was staged by Messrs. CLIBRAN & SON, Altrincham; it consisted of well-grown specimens, and was awarded a Silver Medal; Messrs. STORMONTH & SON, Kirkbride, Carlisle, received a Silver Medal for a very interesting example of a water garden and rockery; for a collection of Phloxes grown in pots Messrs. E. F. FAIRBURN & SONS, Edin town Nurseries, Carlisle, received a Silver Medal; the stand also included an assortment of cut herbaceous plants.

THE CUMBERLAND COUNTY COLLEGE, under Mr. W. B. LITTLE exhibited 30 varieties of Apples from the county experimental fruit plots, with a view to demonstrating the most suitable varieties for the locality.

ROYAL CALEDONIAN HORTICULTURAL. CENTENARY EXHIBITION, SEPTEMBER 8 and 9.

THE annual exhibition of the Royal Caledonian Horticultural Society this year has marked the centenary of the Society, which was established in 1809. Though this centenary exhibition was not of much greater extent than usual, it certainly well maintained a high average of merit. The leading features were the Grapes and other indoor fruits, the wonderful collections of hardy cut flowers, and the splendid vegetables. Hardy fruits and certain cut flowers would have been even finer had the season been more propitious; but development has been slow in the recent summer, and the lack of sufficient sunshine has naturally been felt even more severely in northern districts than in the English southern counties.

We fear that the Society is not so prosperous as it should be. Its present energies are mainly devoted to the holding of meetings for the discussion of horticultural subjects of interest, and to the promotion of two great competitive exhibitions each year. For some time past these competitive exhibitions have not attracted the number of people necessary to maintain the financial position at a proper degree of prosperity. This condition of affairs, reacting upon the shows themselves, has tended to impoverish the displays and weaken enthusiasm. But the centenary is likely to have a good effect in correcting these matters. It has caused the Council and others to read up the history of the Society, and thus to recognise and take pride in the valuable work that has been done through its agency. They are now reading the destiny of the Society in the light of its proud past, and it was evident during our short visit to the Scottish capital that there is a feeling of discontent at the present condition of things. This feeling could easily be detected during the proceedings at the dinner on Wednesday afternoon, at the Royal British Hotel, when Mr. J. W. McHattie (vice-president) presided, and speeches were made by Mr. W. H. Massie, Mr. R. Laird, Mr. J. Methven, J.P., Mr. J. Whytock, Mr. David W. Thomson, the Chairman, and others. Two points raised in these speeches deserve serious consideration. The first was raised by Mr. Whytock, and related to the suitability of the Waverley Market for the spring and summer shows. We think it likely that Scottish people, being more accustomed to it, fail to notice the somewhat depressing effect which this building has upon the general visitor. For ourselves, we think that Mr. Whytock's suggestion that the shows may prove more attractive to the general public if they are held in one of the city parks is a very reasonable one.

The other point was raised by the Chairman, and consisted in a plea for the two leading Scottish societies to amalgamate. The Royal Caledonian Horticultural Association and the Scottish Horticultural Society are each doing good work in the city of Edinburgh for Scottish horticulture generally, but the position would doubtless be much strengthened if, instead of separate organisations, a united executive were established for the furtherance of a definite programme.

In the following report reference is made to the leading classes, but there are so many classes for cut flowers and small numbers of specimen plants, that it has not been possible to refer to them all in detail. It may be added that the Chairman at the dinner referred in feeling terms to the loss the Society sustained on Monday last in the death of Mr. J. Forbes.

The arrangements for the present show were largely in the hands of Mr. A. D. Richardson, the secretary, Mr. McKenzie, being temporarily indisposed.

DESSERT TABLES.

This class is similar to that recently reported at the Shrewsbury Show, differing only in detail, the lesser number of dishes of fruit, &c. The tables in this case were 10 feet by 4 feet 6 inches. Not more than 16 dishes of fruit could be shown, and these had to be selected from a list of fruits published in the schedule. The 1st prize consisted of £5, and the 2nd £3 10s. Separate prizes were awarded for the decorations of plants and flowers.

There were only two exhibits in this class, one

from the Duke of PORTLAND, K.G., Welbeck, Notts. (gr. Mr. J. Gibson), and the other from the Earl of HARRINGTON, Elvaston Castle, Derby (gr. Mr. J. H. Goodacre). The 1st prize was awarded to the Earl of HARRINGTON. The pointing was as follows:—

	Possible number of points.	Number of points awarded.
Apples (1)	7	6½
Apples (2)	7	6½
Figs	7	5½
Grapes, Black (1)	9	7½
Grapes, Black (2)	9	8
Grapes, White (1)	8	6½
Grapes, White (2)	10	8½
Melon (1)	8	7
Melon (2)	8	7½
Nectarines (1)	8	6½
Nectarines (2)	8	5
Peaches (1)	8	6
Peaches (2)	8	7
Pears (1)	8	7½
Pears (2)	8	6
Plums	6	5½
Total	127	107

The Grapes shown were Madresfield Court, Muscat of Alexandria, Black Hamburg and Chasselas Napoleon, there being one bunch of each. The Peaches were Princess and Bellegarde, the Nectarines, Elruge, Victoria and Pineapple, Plums Washington, Melons The Budget and an unnamed seedling, Figs Negro Largo, Pears Marguerite Marillat and Jules Guyot, and Apples Ribston Pippin and Cox's Orange Seedling. The 2nd prize collection was little inferior to that shown by the Earl of HARRINGTON, for the number of points awarded was 103 in place of 107. There were excellent fruits in the Duke of PORTLAND's collection. The Gascovne's Scarlet Seedling Apple, Stirling Castle Peach, Gros Maroc, Muscat Hambro, Muscat of Alexandria and Madresfield Court Grapes, Allington Pippin Apples and Marguerite Marillat Pears were all good.

For the decorative arrangement the Earl of HARRINGTON also gained the 1st prize, being awarded 18 points, whilst the Duke of PORTLAND obtained 17 points. Monthretias entered largely into both arrangements, and in that from the Earl of HARRINGTON they were associated with *Francoa ramosa*.

COLLECTIONS OF FRUIT.

Collection of twelve dishes.—Not more than two dishes were allowed of each of the following kinds, namely: Grapes, Peaches, Nectarines, Apples and Pears, and one dish each of any other kind of fruit. There were two exhibits, and the 1st prize was won by the Earl of HARRINGTON. His Grapes were Muscat of Alexandria (two bunches) and Madresfield Court (two bunches). The Muscats were very large, pointed bunches, and the berries were moderately well coloured. Excellent Apples were shown in Peasgood's Nonsuch (of great size and good colour). Other dishes included Pear Marguerite Marillat, Peaches Sea Eagle and Princess, Fig Negro Largo, Nectarines Victoria and Pineapple, Plums Kirke's and Washington, and a seedling Melon. 2nd, the Earl of WEMYSS, Gosford, Longniddry (gr. Mr. W. Galloway), and 3rd, the Marquis of AILSA, Culzean Castle (gr. Mr. David Murray).

Collection of twelve dishes of fruit (grown in an orchard house).—Of three exhibits in this class, the best was shown by the Duke of PORTLAND. His Apples were Peasgood's Nonsuch and Emperor Alexander, Pears Souvenir du Congrès and Marguerite Marillat, Peaches Diamond and Stirling Castle, Nectarines Pitmaston Orange and Humboldt, Apricot, Hemskerk, Plums Jefferson's and Kirke's, and Fig Negro Largo. The Apples were the finest fruits in the exhibit. 2nd, the Earl of HARRINGTON. The Apples, Pears and Peaches were best in this collection. 3rd, the AMERICAN AMBASSADOR, Wriest Park, Bedfordshire (gr. Mr. Geo. MacKinlay).

CHALLENGE TROPHY FOR GRAPES.

This class was for eight bunches of Grapes and not more than two bunches of one variety. The 1st prize consisted of a Challenge Trophy with £3 in cash and a Gold Badge. The Challenge Trophy is presented by Mr. W. H. Massie, and has to be won three times before it becomes the property of the winner. There were four exhibits in this class, and the 1st prize was awarded to Captain STIRLING, Keir, Dunblaney (gr. Mr. Thos. Lunt). This exhibit was of the highest merit, quite sufficient to give honour to the entire show. The names of the varieties shown and the number of points awarded each were as follow:—

Number of bunch.	Possible number of points.	Number of points awarded.
1. Cooper's Black	8	7½
2. Alnwick Seedling	8	6½
3. Mrs. Pince	9	8½
4. Muscat of Alexandria	10	10
5. Muscat of Alexandria	10	9
6. Cooper's Black	8	6½
7. Madresfield Court	9	7
8. Madresfield Court	9	7½
	71	62½

It will be seen that the maximum number of points was awarded in the case of a bunch of Muscat of Alexandria. But the pointing generally was low, owing to the high standard imposed by the judges. 2nd, The Earl of HARRINGTON, who was awarded 59½ points out of a possible number of 76 points; but the comparative nearness to the quality in the 1st prize exhibit is partly explained by the fact that the Earl of HARRINGTON included more Muscat-flavoured varieties than were shown by Capt. STIRLING. The 3rd prize was awarded to Lady ARMISTEAD, Castle Huntley (gr. Mr. Jas. Beisant). This exhibitor gained 51 points out of a possible number of 71, and J. THOMSON-PATON, Esq., Norwood, Alloa (gr. Mr. A. Kirk), who obtained the 4th prize, won 46 points out of a possible 70.

OTHER GRAPE CLASSES.

Collection of four bunches.—There was an excellent array of Grapes in this class, but the best were shown by Sir JAMES SIVEWRIGHT, Tullyallan Castle (gr. Mr. George Stewart). He showed the varieties Madresfield Court, Black Hamburg, Muscat of Alexandria, and Black Alicante. Of the four bunches, that of Madresfield Court was the best, being admirable in every detail. 2nd, Sir H. E. MAXWELL, Bart., Monreith, Wigtownshire (gr. Mr. S. Gordon), who showed Alnwick Seedling, Muscat of Alexandria Black Hamburg, and Black Alicante. 3rd, Marquis of TWEEDDALE, Yester (gr. Mr. Jno. Hightgate). There were seven exhibits.

Muscat of Alexandria.—The best two bunches of Muscat of Alexandria were shown by Capt. STIRLING, and they were certainly the two best bunches of Grapes we have seen this season. They were very heavy, shapely bunches, and the berries were large and well coloured. 2nd, The Marquis of TWEEDDALE. 3rd, — HAMILTON OGLIVY, Esq., Archerfield (gr. Mr. Thos. MacPhail). There were four exhibits. Capt. STIRLING also won the 1st prize for a single bunch of this variety.

Black Hamburg.—The best in this class were shown by Sir HERBERT MAXWELL, whilst the 2nd and 3rd prizes were won by the Earl of WEMYSS and the Marquis of TWEEDDALE respectively. There were 15 exhibits. The best single bunch was shown by Sir HERBERT MAXWELL.

SINGLE BUNCH CLASSES.

The best single bunches of Black Alicante and Alnwick Seedling were shown by Sir HERBERT MAXWELL. Sir JAS. KING, Bart., Carstairs House (gr. Mr. Jno. Shiells) had the best Gros Colmar in a small bunch of extraordinarily large berries. Capt. STIRLING won the first prize for Lady Downe's Seedling, and Sir JAS SIVEWRIGHT the 1st prize for Madresfield Court. This was a magnificent bunch. The best bunch of a black Grape, any variety, was one of Gros Maroc

shown by Lady ARMISTEAD, Castle Huntley (gr. Mr. Jas. Beisant), and the best white Grape by the Dowager Lady KINROSS, North Berwick, who had Buckland Sweetwater in very fine condition. The black Grape showing finest bloom was a bunch of Cooper's Black, shown by Capt. STIRLING. All these classes were represented by numerous exhibits.

MISCELLANEOUS FRUITS.

Melons.—The best scarlet-fleshed Melon was Sotton's Superlative, shown by H. J. YOUNGER, Esq., Benmore, Kilmun (gr. Mr. Robt. Greenlaw), and the best green-fleshed Melon an unnamed seedling shown by the Earl of STAIR, Oxenford Castle, Dalkeith (gr. Mr. Ben Ness).

Peaches and Nectarines.—The best collection of six Peaches was shown by the Marquis of TWEEDDALE, the variety being Royal George. 2nd, the Duke of PORTLAND, who showed the variety Bellegarde. There were 16 exhibits. Capt. STIRLING won the 1st prize for Nectarines with the variety Pineapple; 2nd, H. J. YOUNGER, Esq. There were 17 exhibits.

Figs.—One dish of Figs was shown by F. BALFOUR, Esq., Fernie Castle (gr. Mr. Brown), who was awarded the 1st prize.

Plums.—There were seven exhibits of 12 fruits of Gage Plums, the 1st prize being awarded to an unnamed variety shown by the Earl of STAIR; 2nd, the variety Golden Gage, shown by HAMILTON OGILVY, Esq. The best yellow Plums were Jefferson, shown by Col. RICHARDSON, Ballathie, Stanley (gr. Mr. Jno. Davis). 2nd, the same variety shown by Mrs. LOUGHTON, Walkinshaw, Rentfrew (gr. Mr. G. Watson). In the class for 12 red Plums there were 15 exhibitors. The 1st prize was awarded to the variety Font-hill, shown by the AMERICAN AMBASSADOR. The best purple Plum was Kirke's, shown by Col. E. R. STEWART RICHARDSON. The 2nd and 3rd prizes were gained by the variety already mentioned. In a class for four varieties of dessert Plums the 1st prize was won by the AMERICAN AMBASSADOR, who showed the varieties Kirke's, Jefferson, Washington, and Transparent Gage. 2nd, R. G. SINCLAIR, Esq., Congalton Gardens, Drem. 3rd, the Earl of WEMYSS. There were four exhibitors.

The 1st prize in a class for four dishes of culinary Plums was also gained by the AMERICAN AMBASSADOR, his varieties being Magnum Bonum, Diamond, Fonthill, and Belgian Purple. 2nd, R. G. SINCLAIR, Esq., and 3rd, L. BREITMEYER, Esq., Cuckfield Park, Sussex (gr. Mr. Hugh MacFadyen). There were seven exhibits.

Apples.—The best collection of four dishes of pot-grown or orchard-house Apples was shown by Mr. BELL, Fergandenny (gr. Mr. David Nicoll). His varieties were Peasgood's Nonsuch, Emperor Alexander, James Grieve, and Gascoyne's Scarlet. 2nd, the Duke of PORTLAND.

The most important class for Apples was one for a collection of 12 varieties, ripe or unripe, five fruits of each variety. There were four exhibitors, the 1st prize being awarded to Mr. RICHARD M. WHITING, Credenhill, Hereford, who showed the varieties Cox's Orange Pippin, Worcester Pearmain, Queen Caroline, Baron Wolsley, Lord Suffield, Glory of the West, Queen, Stirling Castle, James Grieve, Charles Ross, Lady Sudeley and Duchess of Oldenburgh. 2nd, the AMERICAN AMBASSADOR. 3rd, Mr. JNO. LEE, Kingscroft, Cheshire.

For a similar class, limited to Scottish cultivators, the most successful exhibitor was Colonel GORDON, Castle Douglas (gr. Mr. James Duff).

The best collection of six varieties (open) was shown by the Rev. G. H. DAVENPORT, Hereford (gr. Mr. Robt. Currie).

There were also numerous classes for single dishes of specified varieties.

Pears.—The most important class called for 12 varieties, and the best collection was shown by the Duke of PORTLAND; 2nd, the AMERICAN AMBASSADOR. The fruits were generally unripe.

The local class for a similar number of varieties was won by the Earl of HOME.

In a class for four dishes of pot-grown or orchard-house Pears, the 1st prize was won by the Duke of PORTLAND; and the 2nd prize by Mr. ADAM BRYDON, Tweed Bank, Innerleithen.

GROUPS OF MISCELLANEOUS PLANTS.

The class for a miscellaneous group called for an exhibit to be arranged on a circular space 18 feet in diameter. There was nothing very remarkable in either of the exhibits. The 1st prize was given to Colonel STEWART RICHARDSON for an arrangement having a pretty effect, but composed of plants of only indifferent quality. Better plants were to be seen in the group shown by Sir WILFRID LAWSON, whose Codiaums especially were far superior to those in the 1st prize exhibit. Our Edinburgh friends, however, will be well advised if efforts are made to increase the importance of this class, for at present the groups compare most unfavourably with the best of those to be seen at provincial exhibitions in England.

SPECIMEN PLANTS.

The best collection of four stove or greenhouse plants in flower was shown by C. DICKSON, Esq., Lasswade (gr. Mr. Duncan Mackay), the varieties being *Acalypha hispida*, *Statice profusa*, *Oncidium incurvum*, *Bougainvillea Sanderiana*. 2nd, Sir D. E. HAY, Bart., King's Meadows (gr. Mr. H. E. Hughes).

There was only one exhibit of four Orchids, this being also shown by C. DICKSON, Esq.

The best single Orchid was a good specimen of *Cypripedium insigne* Sandere, shown by C. W. COWAN, Esq., Dalhousie Castle (gr. Mr. W. G. Pirie).

For a collection of six fine foliage plants the 1st prize was awarded to the Earl of HOME. He had large specimens of *Alocasia metallica*, *Phyllotanium Lindenii*, *Maranta zebra*, *Anthurium crystallinum*, *Alocasia spectabilis*, and *Dieffenbachia magnifica*. 2nd, Sir WILFRID LAWSON.

Another class was for six fine foliage plants in pots not exceeding 9 inches in diameter. The 1st prize was won by the Earl of HOME, who showed *Alocasias*, *Anthuriums*, *Codiaeums*, and a *Cordyline*. 2nd, Sir WILFRID LAWSON, who included a very pretty specimen of *Heliconia illustris*.

There were numerous exhibits in a class for six plants suitable for the decoration of a dinner table, but although the specimens themselves left but little to be desired, most of them were placed in such showy receptacles as to detract from their effect. The 1st prize was awarded to J. NELSON, Esq., Castle Douglas (gr. Mr. Jno. M. Stewart). His plants included *Pandanus Veitchii* variegata, two *Codiaeums*, two *Cordylines*, and one *Aralia Veitchii*. 2nd, Mrs. YOUNGER, Alloa (gr. Mr. Jas. Fairholm).

The best table Ferns were shown by Miss GILLESPIE, Hay Lodge, Trinity (gr. Mr. Alex. Johnstone). These included five varieties of *Gymnogramma* and one *Nephrolepis*. 2nd, Mr. JAS. JARVIE, Burn Brae House, Falkirk. The plants exhibited in both of the above classes were excellent.

BEGONIAS.

Tuberous-rooted Begonias were not numerous, but there were some good plants shown in classes for 24 specimens, three specimens, and one specimen. The 1st prize for six plants was awarded to Mr. ROBERT BROWN, Union Villa, Eskbank. 2nd, Mrs. DEWAR, Drylaw House (gr. Mr. W. T. Galloway).

CUT FLOWERS.

This section included a very important class for 35 vases of flowers cut from the open, each exhibit to occupy a space of 6 feet by 5 feet. The 1st prize consisted of a Silver "Centenary" Cup and 3 guineas, the 2nd prize was 5 guineas, and the 3rd prize 3 guineas. The 1st prize was awarded to a magnificent group of flowers shown by Mrs. FLEMING HAMILTON, Kirkcowan (gr. Mr. G. Wm. Young). We cannot enumerate all, but may remark that the *Montbretias*, *Gladioli*, *Anemones*, *Carnations*, *Lobelia cardinalis*, *Chelone obliqua*, and *Astromeria psittacina* were among the most attractive. 2nd, M. G. THORBURNE, Esq., Glenormiston, Innerleithen (gr. Mr. A. Dickson); 3rd, Mr. ADAM BRYDON, Tweedbank, Innerleithen. These exhibits together made an important feature of the show, and provided a great wealth of flowers.

Gladioli were shown uncommonly well in classes for 24 spikes, 12 spikes and six spikes, distinct varieties, respectively. The 1st prize in the class for 12 spikes was awarded to Mr.

JOSEPH C. FORDY, Warkworth, Northumberland. Some of the spikes here 12 fully-expanded flowers on each, and another 12 unopened buds. The colours were selected to afford variety. Particular mention is deserved by a variety known as Sorcerer, which had flowers of extraordinary tints of purple, red, cream and white. 2nd, Mr. ANDREW BENNETT, Tile Houses, Tweedmouth; 3rd, Mr. PETER SKILLEN, Eaglesham, Renfrewshire.

The 1st prize for 24 spikes was won by Messrs. GEO. MAIR & SON, Prestwick, and the 2nd prize by Messrs. A. E. CAMPBELL & SON, Gourock.

There were numerous classes for *Dablias*, *Hollyhocks*, *Sweet Peas*, *Chrysanthemums*, *Roses*, *Carnations*, *Violas*, *Pansies*, *Montbretias*, *Perennial Asters*, &c., and for bouquets and other floral arrangements.

The best collection of 36 Rose blooms was shown by Messrs. ADAM & CRAIGMILE, Fernielea Nurseries, Aberdeen; 2nd, Messrs. JAS. COCKER & SONS, Aberdeen; 3rd, Mr. HUGH DICKSON, Belfast. There were numerous exhibits.

The same exhibitor also won the 1st prize for 13 H.T. Roses. Messrs. D. CROLL, Dundee, had the best collection of 18 Tea Roses.

The best garden or decorative Roses were shown by Mr. W. FERGUSON, Dunfermline.

There were two good exhibits of Roses in a class for collections arranged in spaces of 15 feet by 5 feet, to be seen from one side only, shown with buds and Rose foliage only. The 1st prize was awarded to Messrs. JAS. COCKER & SONS, Aberdeen, and the 2nd prize to Mr. WILLIAM FERGUSON, Brucefield Nurseries, Dunfermline. It was surprising so many fine Roses could be exhibited so late in the season.

Sweet Peas made a fine display in the classes for nine and six dishes respectively. The 1st prize for nine dishes was won by the Hon. Mrs. BAILLIE HAMILTON, Langton, Duns (gr. Mr. G. D. Kerr). These were very remarkable for their good size and colours. 2nd, Mr. THOS. FENDER, Cultoquhey Gardens, Crieff. There were numerous exhibits.

The 1st prize for six bunches was awarded to Mr. THOS. M. KIRKWOOD, Cultoquhey, Crieff.

DECORATED DINNER TABLE.

There were six exhibits in the class for a decorated dinner table, and the 1st prize was given to Messrs. M. CAMPBELL & SONS, High Blantyre, who had a very light arrangement of a small-flowered, yellow *Oncidium* and *Franca ramosa*. This exhibit was very dainty, but we heard some criticisms of the prevailing colour, which was yellow, this being deemed by some to be little provocative of a good appetite. The 2nd prize was won by Lord ELPHINSTONE, Carberry Tower (gr. Mr. D. Kidd), who used *Montbretias*, *Gloriosa superba*, *Roses*, *Franca*, &c. Sir WILFRID LAWSON, Bart., Brayton, Carlisle (gr. Mr. A. Knight), had the 3rd prize for an arrangement of *Spiraeas* and *Carnations*, the complexion of this exhibit being pink.

COLLECTIONS OF VEGETABLES.

The 1st prize in this class and the Centenary Cup offered for the best single exhibit in the classes for vegetables were won by the Duke of PORTLAND, Nottinghamshire, with an exhibit that well deserved these high awards. The outstanding feature was the Celery, this being most remarkable and equal to any we have seen anywhere. The varieties were Solid White and Superb Pink. Other "dishes" included Prizetaker Leeks, Autumn Mammoth and Early Giant Cauliflowers, Ailsa Craig and The Globe Onions, "Black" Beet, Superlative and Satisfaction Potatoes, Princess of Wales and Perfection Tomatos, Delicacy Cucumber, Tender and True Parsnip, Centenary and Sutton's Selected Gladstone Peas, New Red Intermediate Carrots and Best of All Runner Beans. 2nd, Lord LAUDERDALE, Thirlstone Castle (gr. Mr. R. Stuart). These exhibits were "pointed," but the list of points had been removed from Mr. Gibson's stand. In the other case, however, the exhibitor was awarded 53 points out of a possible number of 76.

In the following class, which was also for 12 dishes, 12 kinds, the competition was limited to growers in Scotland. In this competition were six exhibits. The 1st prize was awarded to the Earl of WEMYSS, Gosford (gr. Mr. W. Galloway); 2nd, J. R. S. RICHARDSON, Esq., Tullibeltoun House (gr. Mr. W. Harper). The produce shown in this class was also of excellent quality.

CENTENARY CUPS.

The Centenary Cups offered to competitive exhibitors in the various sections were awarded as follows:—

For vegetables to the Duke of PORTLAND, Welbeck Abbey, Notts. (gr. Mr. J. Gibson).

For fruit to the Earl of HARRINGTON, Elvaston Castle, Derby (gr. Mr. J. H. Goodacre).

For cut flowers to Mrs. FLEMING HAMILTON, Kirkowan (gr. Mr. Wm. Young).

For plants to Col. STEWART RICHARDSON, Balhalhathie, Stanley, N.B. (gr. Mr. J. E. Davis).

HONORARY EXHIBITS.

Messrs. SUTTON & SONS, Reading, exhibited 16 Potato plants in pots. These plants represented seedlings from the stock of *S. tuberosum*, originally distributed from the Edinburgh Royal Botanic Gardens. It is said that this stock is not the typical *S. tuberosum*, but whether it has slight variations from the described species or not matters but little. The point is that Messrs. SUTTON claim that by selling this stock and by crossing it with commercial varieties of Potatoes they have succeeded in raising seedlings that remain perfectly immune from disease, although they are growing in the midst of Potatoes badly affected by the fungus *Phytophthora infestans*. They believe, further, that these plants will not lose this quality of immunity as they become older. It will be seen that should such hopes as Messrs. SUTTON entertain prove to be correct, the importance of these hybrids can hardly be over-estimated. It is only three years since the *S. tuberosum* bore seeds, therefore there has not yet been time to prove what cropping qualities the seedlings possess. It has to be seen whether any of them raised up to the present will crop sufficiently for commercial or garden purposes, but Messrs. SUTTON state that they have reason to believe that they will.

Rev. J. ATKMAN PATON, Soulseat, Castle Kennedy, showed a collection of wild types of Potato, including *S. tuberosum*, *S. etuberosum*, *S. Maglia*, *S. verrucosum*, *S. Commersonii* (both varieties), *S. tuberosum* var. *Borcale* and a number of hybrids of these, notably plants of *S. Commersonii* × *S. tuberosum* (wild). It is the first time this cross has been obtained, and the hybrids (nine in all) show the foliage and stems and fruit of *S. Commersonii*, with the flower of *S. tuberosum* in form and colour. The hybrids are remarkable as being crosses of distinct species, and yet are quite fertile. They form berries freely and the "selfed" seedlings should next year be of great interest to the Mendelian. Among other hybrids shown were one of *S. verrucosum* × *S. etuberosum*, in which the female parent's characters seem to dominate. Mr. PATON also showed some plants and tubers of a new "immune" strain obtained by crossing *S. etuberosum* with cultivated varieties. These show immense vigour, and no disease has been seen on the leaves last year or this year, although all other sorts of Potato growing alongside have been laid low. Many are first-rate croppers and of good flavour. The strain is exceedingly promising.

Messrs. R. B. LAIRD & SON, LTD., Edinburgh, exhibited a large group of plants, including *Caladiums*, *Codiaeums*, *Palms*, *Schizanthus*, *Roses*, stove and greenhouse plants, *Ferns*, *Liliums* and other good garden species.

Mr. JOHN DOWNIE, Edinburgh, put up a group of greenhouse *Ferns* and tuberous *Begonias*.

Messrs. LAING & MATHER, Kelso, exhibited a grand group of variegated *Ivies* in pots, also golden-leaved *Privets* and other shrubs.

Messrs. DICKSON & SONS, Edinburgh, had a group of shrubs, with a few specimen *Conifers* in tubs, some being 8 and 9 feet in height. This group contained some fine plants of *Hydrangea paniculata grandiflora* in full bloom.

Messrs. CUNNINGHAM, FRASER & CO., Comely Bank Nurseries, Edinburgh, showed a collection of hardy flowers in great bunches, and arranged on a low table, well within the line of sight. A fine bunch of *Scabiosa caucasica*, also bunches of *Pentstemon barbatus*, *Artemisia*, *Kuiphofas*, *Montbretias*, and many other species were of considerable merit.

Messrs. STORRIE & STORRIE, Dundee, arranged a bank of hardy flowers, which was specially noteworthy. A bunch of *Montbretia*, named *M. rosea*, was remarkable for its colour tint, uncommon in *Montbretias*.

Messrs. THOMAS METHVEN & SONS, Edinburgh, arranged an exhibit of plants on the ground floor. It consisted of three cone-like groups, surrounded by a ground covering of dwarf plants, which connected four corner groups. The plants consisted of *Palms*, *Hydrangeas*, tuberous *Begonias*, *Liliums*, *Codiaeums*, *Gloxinias*, *Chrysanthemums*, &c. In the centre of each corner group the principal plant was a good specimen of *Rouppala corcovadensis*.

Messrs. TILLIE, WHYTE & CO., Edinburgh, exhibited a collection of vegetables, in which too great prominence was given to some large Marrows of ordinary character.

The culture of Mushrooms in the Scotland Street Tunnels, Edinburgh, has been referred to more than once in these columns. On this occasion the SCOTTISH MUSHROOM CO. exhibited a miniature bed, with real Mushrooms, apparently growing upon it, although the expert could easily detect that these had been placed in position directly the model bed had been made. Fresh Mushrooms, of excellent quality, Mushroom spawn and ketchup were shown in considerable quantities.

Sweet Peas were shown in numerous instances, as these flowers are plentiful in the north long after the main display in the London district is past. In addition to a collection of flowers from Messrs. DOBBIE & CO., another and larger collection was shown by Mr. H. ECKFORD, Wem, Salop. The flowers were small, but the colours good.

Mr. THOS. W. DARLINGTON, Warton, Carnforth, Lancashire, had also an exhibit of Sweet Peas arranged in about 40 tall receptacles.

Mr. W. G. HOLMES, Tain, exhibited Sweet Peas, and some remarkable pods of new culinary Peas, the latter being unnamed seedlings.

Messrs. WELLS, Merstham, Surrey, had a large group of cut flowers composed of border *Chrysanthemums*, *Phloxes*, *Pentstemons*, &c.

Messrs. DOBBIE & CO., Rothesay, furnished a very large table space with an exhibit consisting principally of *Dahlias* in various types. The *Cactus* varieties were displayed in the form of a cone 7 or 8 feet high, in very tall, loosely-decorated pillars, and also on flat boards. The *Pompon* varieties, arranged in sprays, were exceedingly pretty, and the sparing use of *Gypsophila* merely served to relieve them without detracting from the colour effects. The new *Paeony* type was represented by a number of varieties, and attracted considerable attention from the public. In large gardens, where space is of little account, this type gives pleasure by reason of the plant's showy and exceedingly floriferous character. The show and single-flowered *Dahlias* were represented in fewer quantities. Messrs. DOBBIE'S peculiar specialities, such as *Violas* and fancy *Pansies*, were shown in sprays and upon boards; in the latter case, each bloom was provided with the old-fashioned paper collar. Poses and border *Chrysanthemums* were likewise included in this great floral group, which was the largest and best of the kind exhibited. Messrs. DOBBIE also exhibited about 40 varieties of Potatoes. The tubers, which represented choice varieties, were clean, shapely specimens, and arranged in baskets. Turnips, Beet, Parsnips and Parsley were also shown.

Mr. D. McOMISH, Nurseryman, Crieff, exhibited a collection of hardy flowers, in which prominence was given to varieties of perennial *Phlox*, *Pentstemon* and *Chrysanthemums*. A pink *Phlox* named *Gruppen Konig* was remarkable for the large size of its individual flowers. Other varieties of extra merit were *Selma*, *General Van Heute*, *Frau Von Lassberg* and *Maximilian*.

Mr. JNO PHILLIPS, Granton Road Nurseries, Edinburgh, showed a small table group for the purpose of displaying excellent plants, 1½ feet high, of *Cordylone* (*Dracaena*) *panache*, a variety having narrow, green leaves with white and cream variegation. Some of the newer varieties of *Nephrolepis* and *Rechea falcata* were also included in this exhibit.

Messrs. JNO. MASON & CO., Jameston, exhibited border *Chrysanthemums*, fancy *Pansies* and *Violas*. The *Violas* and *Pansies* were of exceedingly good quality, but the pale-colored sorts suffered in effect from their association with the "white collar."

Messrs. SPOONER & SONS, Hounslow, Middlesex, exhibited a first class collection of Apples and Pears, with a few soft fruits, including *Plums*, *Damsons*, &c.

Messrs. GUNN & SONS, Olton, near Birmingham, exhibited perennial *Phloxes* and flowers of *Viola cornata*.

Mr. H. N. ELLISON, West Bromwich, contributed a group of *Ferns*, in which some of the choicest and most decorative varieties were shown in well-grown specimens of moderate size.

Messrs. THOMAS SMITH & SONS, Stranraer, had *Roses* and herbaceous flowers, the *Roses* exhibiting first-class quality for September blooms.

Messrs. M. CAMPBELL & SONS, Blantyre, N.B., had a large collection of *Carnations*, chiefly border varieties.

Messrs. J. & A. GLASS, Edinburgh, also exhibited a large collection of Sweet Peas.

From Essex, Messrs. WALLACE & CO., Kilnfield Gardens, Colchester, exhibited a very large group of *Montbretias*, in which the varieties were numerous. Included among them were the newer, large-flowering sorts, such as *Prometheus*, *Paganet*, *Lady Hamilton*, *Germania*, *Hereward*, *E. Davison*, *King Edward*, *Lord Nelson*, and *Orion*. These flowers travel excellently, therefore they appeared as fresh and good as if exhibited in Colchester itself. A small group of *Gladioli primulinus* hybrids and other *Gladioli* shown by the same firm were interesting.

Messrs. THOS. S. WARE, LTD., Feltham, Middlesex, exhibited one of their excellent groups of tuberous-rooted *Begonias*, the collection being easily the best in quality of those shown at Edinburgh.

Messrs. STORRIE & STORRIE, Glencarse, Perthshire, exhibited a number of fruiting trees in pots suitable for orchard-house cultivation, also gathered fruits of a number of varieties of *Goscherry*. The same firm exhibited *Coleus*, *Fuchsias*, *Streptocarpus*, *Gloxinias*, *Salvias* and other plants; also plant frames with a patent method of fixing the lights at any angle, this being a convenience when the cultivator is attending to the plants, as it is not necessary for him to hold the light with either hand.

AWARDS TO HONORARY EXHIBITORS.
GOLD MEDALS.

Messrs. Dobbie & Co., Rothesay; Messrs. Thos. S. Ware, Ltd., Feltham; and Messrs. Storrie & Storrie, Glencarse.

SILVER MEDALS

Mr. D. McOmish, Crieff; Mr. John Downie, Edinburgh; Messrs. Thos. Methven & Sons, Edinburgh; Messrs. Jas. Cocker & Sons, Aberdeen; Mr. D. Nicoll, Forgandenny; Messrs. S. Spooner & Sons, Hounslow; and Messrs. R. Wallace & Co., Colchester.

BRONZE MEDALS.

Messrs. M. Campbell & Sons, Blantyre, N.B.; Messrs. Gunn & Sons, Olton, Birmingham; Messrs. W. Wells & Co., Merstham, Surrey; Messrs. Thos. Smith & Son, Stranraer, N.B.; Messrs. J. & A. Glass, 54, Prince's Street, Edinburgh; and Messrs. Cunningham, Fraser & Co., Comely Bank Nurseries, Edinburgh.

CLACKMANNANSHIRE HORTICULTURAL.

SEPTEMBER 3, 4.—The 75th annual exhibition was held in the Town Hall, Alloa, on these dates. Exclusive of the industrial section, the entries exceeded in number those of last year.

Flowering and foliage plants were well shown, whilst the exhibits of cut flowers generally were of average quality as seen at these exhibitions. The classes for floral decorations were well contested, Mr. F. G. SMALL being the most successful exhibitor.

Mr. L. McLEAN, Greenfield, Alloa, excelled in the class for a collection of fruits, last year's winner, Lord RALPHOR, Kennet (gr. Mr. J. J. Wann), being placed 2nd.

Mr. C. PALMER, Alloa, showed the best four bunches of Grapes, Mr. Wm. SIMPSON being awarded the 2nd prize.

Exhibits of fruits by amateurs were very fine, especially Apples, shown by Mr. JAS. STEWART, Junr.

Vegetables in the open classes were considerably below the average in quality compared with former years, Tomatoes being the only exception. The best vegetables in the exhibition were shown by an amateur Mr. F. CLARK.

NATIONAL DAHLIA.

SEPTEMBER 2, 3.—The National Dahlia Society, with which is incorporated the London Dahlia Union, held its first exhibition of the season at the Crystal Palace, Sydenham, on these dates. It is unfortunate to have to record that, owing to the unfavourable season, the result was somewhat disappointing. Dahlias are so backward this year, the wonder is indeed that so good an exhibition resulted. Everywhere growers complain of their plants having few or no blooms. Even the trade exhibits were not so important or so numerous as usual. The prospects for the second show in about three weeks' time are much better, although frost has already been experienced in some parts. The failure on this occasion is all the more regrettable as, with the union of the two chief organisations devoted to the interests of the Dahlia, a record display was expected. The weather on both days of the show was all that could be desired, and there appeared to be rather a better attendance on the opening day than usual.

Several novelties were submitted for award, but only four were granted the Society's Certificate of Merit, all of them being of the Cactus-flowered type.

The arrangements, under the management of the Secretaries, Messrs. H. Hawes and H. H. Thomas, were all that could be desired.

NURSERYMEN CLASSES.

Show Dahlias.—The quality of the blooms generally in this section was much below that of ordinary years. The most important class was for 48 blooms of distinct varieties, but only two growers competed. Neither of the exhibits was of a high standard, although there were many good blooms in both groups. The 1st prize was awarded to Mr. W. TRESEDER, Cardiff, who showed Richard Dean (a fine bloom), Mrs. Every, J. T. West, Champion Rollo (a fine bold flower), Purple Prince, George Hobbs, Hon. Mrs. Wyndham, Willie Garrett, Southern Queen, T. S. Ware, Dr. Keyes, George Rawlings (a beautiful, dark variety), Lord Salisbury, William Roupell (yellow; a choice bloom); Wm. Rawlings, Gracchus, Spitfire, Florence Tranter, Shirley Hibberd, Mrs. Kendall, Henry Clarke, Chieftain, David Johnson, Burgundy, Virginal, Prince Henry (a purple sport), Henry Watson, Norma, Harry Keith, John Walker, Claret Cup (an exceedingly fine bloom), Mrs. David Saunders, Prince of Denmark, Sunbeam, Mr. Chamberlain, Duchess of York, Harbinger, Joseph Ashby, Joe James, Victor, Mrs. Gladstone (soft pink tone, a very refined bloom), Mrs. John Downie, Mrs. J. Fowler, Arthur Rawlings (exquisite flower), Merlin (fine shape and of a beautiful orange scarlet colour), T. J. Saltmarsh, Excellent, and Shottesham Hero, 2nd, Mr. S. MORTIMER, Rowledge, Farnham, Surrey, with smaller flowers. Some of the best shown by this exhibitor were Gwendoline, Mrs. C. Moyes, The Reverend, Pleasance, Gleworm, Mrs. David Saunders and Eumie Walton.

The smaller class for 24 blooms of distinct varieties was contested by three growers. Mr. JOHN WALKER, 7, High Street, Thame, Oxon, was placed first, his flowers being well coloured and shapely, although rather under average exhibition size. He exhibited Colonelist, J. Hickling, Purple Prince, Henry Clarke, A. N. Burnie, Mrs. D. Saunders, Wm. Keith, R. T. Rawlings (a fine bloom of this elegant yellow variety), Mrs. Foreman (also shown well), The Reverend, Wm. Rawlings (the rich crimson purple tone being intensely developed), Rothsay, A. Rawlings, J. Walker (a fine white flower), Richard Dean, Earl of Ravensworth, Mrs. Gladstone, J. T. West, Hon. Mrs. P. Wyndham (a big bloom, but the centre florets were scarcely developed; the colour is yellow at the base, with pink tips), Kathleen, Duchess of York (the citron and purple colouring is very pleasing); Marjorie, Shirley Hibberd, and Dr. Keyes, 2nd, Mr. GEORGE HUMPHREYS, The Nurseries, Kingston Langley, Chippenham, whose best specimens were those labelled Purple Prince, Wm. Rawlings, Miss Camell, Mrs. P. McKenzie, R. T. Rawlings, Southern Queen, and Nubian, 3rd, Mrs. M. V. SEALE, Vine Nurseries, Sevenoaks, Kent.

Fancy Dahlias.—There were only two exhibitors in a class for 18 blooms of distinct varieties, and neither display was particularly good. Mr. Wm. TRESEDER carried off the 1st prize with Mrs. John Downie (reddish and yellow mark-

ings), Peacock (crimson and white), Frank Pearce (pink, with a few crimson stripes); Goldsmith (yellow with red tips), Mrs. Saunders (yellow, tipped with white, a pretty combination), Empress (mauve striped with crimson), and Dazzler (yellow and reddish markings).

Three competitors contested the class for 12 blooms of fancy Dahlias, viz.: Mr. GEORGE HUMPHREYS, Mr. MORTIMER, and Mrs. M. V. SEALE, who were placed in the order of their names. The best specimens in Mr. HUMPHREY'S collection were Hercules, Henry Clarke, Comte de La Saux, Watchman, Empress, Rev. J. B. Canum (a big yellow bloom striped with red), John Forbes, Mrs. Saunders, Mrs. J. Downie, Prince Henry, Sunset, and Lottie Eckford.

There was also a class for Show and Fancy Dahlias intermixed, the schedule requiring 12 blooms of distinct varieties. There were three competitors, the 1st prize being gained by Mr. J. R. TRANTER, 3, Hart Street, Henley-on-Thames, who showed small but bright flowers. His finest examples were Goldfinder, Rebecca (a fine crimson self), Goldsmith (a pretty shade of yellow suffused with reddish orange at the tip), R. T. Rawlings, John Standish, John Nicholson (a good mauve), Henry Keith, Blush Gem (pink on a white ground), Nubian, Dr. Keyes, and Miss Camell, 2nd, Messrs. J. CHEAL & SONS, Crawley. The examples of Willie Garrett, Crimson King, Tom Jones and Dorothy (Fancy) were all shown well in this exhibit. 3rd, Messrs. W. PEMBERTON & SON, Harden Nurseries, Bloxwich, Walsall.

Cactus Dahlias.—The most important class was that in which a Silver Challenge Cup of the value of 15 guineas was offered as the 1st prize. The schedule called for 18 bunches of distinct varieties, six blooms in each bunch. There have been two similar cups offered before in this class, and these have been won outright by Messrs. JAMES STREDWICK & SON, with an unbeaten record. Again this year they outdistanced all other competitors with a collection all of their own raising, and including several new varieties shown for the first time. One of these seedlings, a fine reddish-crimson flower, named after Mr. H. H. Thomas, received the Silver Medal offered for the finest bloom of a Cactus Dahlia in the open classes. The others were J. B. Riding, Harold Peerman, Saxon Queen (new, of a pale salmon tint), Red Admiral, Penguin (flesh coloured), Wm. Marshall, Saxonia (crimson), C. E. Wilkins, Jupiter (a fancy, yellow at the base, shaded with pink and splashed with crimson), Iolanthe, Rosette (bronze centre with rosy red tips; new); Ruby Grinstead, Aviator (punchish-mauve, new), Satisfaction, Snowdon, Rev. Jamieson, Indomitable (mauve-lilac, new).

The 2nd prize exhibit was shown by Messrs. J. BURRELL & CO., Howe House Nursery, Cambridge. This was also a creditable collection, especially considering the unfavourable season. Soreerer (bronzy red, with white tips), Nelson, C. E. Wilkins (soft pink, with a yellowish centre), Brigadier (a fine red bloom), Rev. A. Bridge (yellow, tipped with pink), and Faunis are a selection from this exhibit. 3rd, Messrs. J. CHEAL & SONS.

There was another class in which the flowers were similarly displayed, but this was for 12 varieties only. Three entries were staged, and between the 1st and 2nd prize groups there was a good competition. Mr. G. HUMPHREYS, The Nurseries, Kingston Langley, Chippenham, was awarded the premier place, Mr. JOHN WALKER being placed 2nd, and Mrs. M. V. SEALE 3rd. The winning flowers were not the largest, but they were very refined, the colours well developed. Especially good was the red coloured Dr. G. G. Gray, and others shown finely were Harold Peerman (yellow), Mrs. Macmillan (pink), Nelson (dark red), Mrs. Gaskill (deep pink with yellow centre), and Ruby Grinstead. Mr. WALKER showed Brutus, Snowstorm, W. T. Rogers, Satisfaction, Mrs. H. Shoemith, &c.

Cactus Dahlia shown on boards.—In the largest class for 48 blooms, distinct, three exhibits were staged. Messrs. KEYNES, WILLIAMS & CO., Salisbury, won the 1st prize in a good competition with Messrs. JAMES STREDWICK & SON and Messrs. J. BURRELL & CO., who were placed 2nd and 3rd respectively.

The 1st prize exhibit contained Clincher, Great Western, Glory of Wilts (yellow), Capt. Cody (reddish), Kathleen Bryant (crimson), Evening Star, Nisi Prius (reddish on an orange base),

Thos. Parkins, The Bride (a new, big white variety), Joan of Arc (fine of form, with a golden base and pink upper florets), Dr. G. G. Gray (scarlet), and Electric.

Some of Messrs. STREDWICK'S best flowers were J. B. Riding, Advance (a big scarlet or brick-red flower), Osiris, Felicity, Red Admiral, Iolanthe, Watchword, Ivernia, Clincher, Etruria, and Romaine.

Pompon Dahlias.—There were two exhibits in the class for 24 varieties, shown in bunches of 10 blooms. Exquisite little flowers were shown by both exhibitors, but Messrs. J. CHEAL & SONS, Crawley, were awarded the 1st prize. They showed Nerissa, Zerlina, Jessica, Hecla, Rosebud, Galatea, Hesperia, Girlie, Marietta, Ideal Yellow, Ganymede, Dr. Jim and San Toy.

Messrs. BURRELL & CO., won the 1st prize in the class for 12 varieties, and they were followed by Mr. JOHN WALKER and Messrs. KEYNES, WILLIAMS & CO. in this order. The struggle was keen between the 1st and 2nd prize exhibitors. Messrs. BURRELL showed Bacchus, Hecla, Midget, Darkest of All, Adelaide, Marietta, Nellie Broomhead, San Toy, Emily Hopper, Phyllis, Hesperia, Little Mary, Sylvia, Marietta, Tommy Keith and Harbinger.

Single Dahlias.—The larger of two classes provided for these pretty flowers was for 24 varieties, shown in bunches of 10 blooms. The response was poor, Messrs. J. CHEAL & SONS and Mrs. M. V. SEALE being the only exhibitors. The 1st prize was won by the former firm, who showed Leslie Seale, Miss Roberts, Columbine, Winonia, Eclipse, Polly Eccles, Eric, Hector, Mikado, Kitty, Peggy, Brilliant, &c. The 2nd prize group contained good blooms of Rosebank Scarlet, Invicta, Columbine, Cynthia and Polly Eccles.

There was only one exhibit in the class for 12 varieties; the exhibitor was Mr. JOHN WALKER, and he was awarded the 1st prize, having similar varieties to those named above.

AMATEUR CLASSES.

Show Dahlias.—The best dozen show varieties were put up by Mr. T. JONES, Ruabon, in competition with three other growers. Mr. SIDNEY COOPER, The Hamlet, Chippenham, was placed 2nd. Mr. JONES showed good blooms of Rev. J. Godwin, Mariner, Duke of Fife, John Hickling, Mrs. Gladstone, &c.

For six show varieties there were five entries, Mr. CHAS. LUCKIN, Apsley, Pulborough, winning the premier place with a good half-dozen blooms; especially fine were Mrs. W. Saunders and Diadem. 2nd, Mr. JOHN HAYCOCK, Waggoners' Inn, Gyffellin, near Wrexham.

Fancy Dahlias were best shown by Mr. SIDNEY COOPER, Chippenham, and Mr. A. P. IRONSIDE, Chippenham, in the class for twelve and six blooms respectively.

The best exhibit of Show or Fancy Dahlias intermixed was shown by Mr. SIDNEY COOPER.

Cactus Dahlias.—A Silver Challenge Cup valued at £20 was offered for six vases of distinct varieties. The result was poor. The flowers in the 1st prize exhibit hung as though top-heavy and hid themselves in the Berberis, Privet, &c., which was used for decorative relief. The exhibitor was Rev. A. BRIDGE, Worth Rectory, Three Bridges, Sussex. There were only two exhibits, the other being very dull in appearance.

The Rev. BRIDGE also excelled in the class for nine varieties in bunches of three blooms. The flowers generally were good and included Ruby Grinstead, Nelson, J. B. Riding, F. A. Havemeyer, Snowdon, Ivernia, Mrs. Marshall, Rev. T. W. Jamieson, 2nd, F. GRINSTEAD, Beaufort Park, Battle, Sussex, whose blooms of Harold Peerman (yellow) gained the Silver Medal offered for the best bunch of Cactus Dahlias in the amateurs' classes.

A Gold Badge, offered by Messrs. Dobbie & Co., for the best exhibit of six varieties shown in bunches of three blooms, was won by Mr. H. JACKSON, The Leys, Woburn Sands.

The best 24 blooms shown on boards was put up by Mr. JAMES BRYANT, Salisbury, and the best 12 blooms by Mr. MONTAGUE W. DANCE, School House, Abbot's Ain, Andover.

The best Pompon varieties were shown by Mr. H. BROWN, Dahlia Dene, Haydock Road, Luton, Beds., and the best single flowered varieties by Rev. A. BRIDGE.

The finest exhibit in the decorative classes was a shower bouquet of Cactus Dahlias with

appropriate foliage, shown by Mrs. M. V. SEALE. A small blush variety was used with Asparagus trails and variegated Nepeta glechoma

NON-COMPETITIVE EXHIBITS.

MESSRS. HOBBIES, LTD., Dereham, showed Roses, Dahlias and garden flowers. (Gold Medal.)

MESSRS. H. CANNELL & SONS, Swanley, exhibited Cactus and Peony-flowered Dahlias in variety. A large white variety of the Peony-flowered type named South Pole was of considerable merit. (Gold Medal.)

MR. J. T. WEST, Brentwood, showed rows of Cactus-flowered Dahlias in vases in front of Pompon varieties with Cactus Dahlias, Palms and Grasses at the back. (Gold Medal.)

MR. JOHN E. KNIGHT, Wolverhampton, showed Dahlias and Chrysanthemums. (Silver Medal.)

AWARDS.

Certificates were awarded to those following: *H. H. Thomas*.—A large-flowered Cactus-flowered variety, with bright-red florets.

Iolanthe.—A Cactus-flowered variety of rose-red colour with yellowish tone in the tips and centre.

Indomitable.—A Cactus-flowered variety of mauve-lilac shade.

Red Admiral.—A fine reddish-scarlet Cactus-flowered variety.

All these were shown by Messrs. JAMES STREDWICK & SON.

Obituary.

JOHN FORBES.—We regret to record the death on Monday, the 6th, of Mr. John Forbes, Royal Nurseries, Hawick, in his 68th year. He commenced business as a nurseryman in 1870, and became well known as a specialist in florists' flowers and hardy plants. He paid much attention to the improvement of such flowers as Pentstemons, Phloxes, Gaillardias, Antirrhinums, Delphiniums, Pansies and similar subjects. But his nursery firm, which was turned into a limited company last year, also engaged in general plant culture, and was the first to send out a white sport of Begonia Gloire de Lorraine, which was named "Caledonia." Mr. Forbes was a typical Highlander; a native of Aberfeldy in Perthshire. Except for serving three years on the Town Council of Hawick, all his time was devoted to his business. Two years ago he received the Royal Warrant as nurseryman to his Majesty the King, an honour which he appreciated highly, and which well befitted one of the oldest and ablest of Scottish nurserymen. The funeral took place at Wilton Cemetery on Thursday last.

ANSWERS TO CORRESPONDENTS.

BLACK HAMBURG GRAPES: *T. N. D.* There is no disease present in the Grapes; the failure to colour properly must be attributed to some cultural defect. It is generally an indication of loss of vitality in the vine, such as may result from overcropping or from sappy, immature wood. Endeavour to well ripen the canes this autumn by allowing plenty of fresh air in the vinery, and taking care not to provide too much water at the roots. If the border is formed outside, protect it from excessive autumn rain.

BOUVARDIA UNHEALTHY: *H. H.* There is no disease present in the plant, the trouble is due to some error in treatment.

CALIFORNIAN CLEMATIS: *J. J.* This is a variety of *C. ligusticifolia*, often known as *C. californica*. *C. ligusticifolia* is allied to *C. virginiana*. The flowers are white, 3 inches in diameter, and produced in terminal and axillary panicles. It is a native of North America, extending from Missouri to North Mexico and British Columbia. The var. californica has no great marked difference; the leaves are somewhat smaller and perhaps more tomentose than those of the type.

FUNGUS IN LAWNS: *F. G.* The so-called "Fairy-rings" in grass are caused by a

fungus (*Marasmius oreades*). The best plan is to dig out the affected sward, soak the soil with a solution of permanganate of potash, and replant fresh turf. If you do not wish to disturb the lawn you can get rid of the fungus by well moistening the turf to a width of 2 feet to 3 feet from the dark ring of grass with 1 lb. of sulphate of iron dissolved in two gallons of water.

GRAPES DISEASED: *G. T. B.* The berries are affected with Grape-rot, caused by *Gloeosporium ampelophagum*. The fungus is probably present on the shoots, where it forms small greyish spots. All affected canes should be removed, otherwise the disease will appear again next season. The cause of failure in the Peas is not known.

LEAVES OF LOQUAT DISFIGURED: *H. G.* The leaves are badly attacked by the fungi causing Apple and Pear scab (*Fusicladium dendriticum* and *F. pirinum*), and have probably been infected with spores from neighbouring Apple or Pear trees. Spray next spring with half-strength Bordeaux Mixture, commencing when the leaves are unfolding.

MELON: *Tunncliffe*. No disease is present; the injury is caused by a mite. Remove the affected parts, and spray the plants with an insecticide.

THE LATE JOHN FORBES.

MUSCAT OF ALEXANDRIA GRAPES: *A. H. H.* The most frequent cause of the discoloration of the berries of this variety is sulphur when used in the vinery as a fungicide. Cold draughts, hot, dry air caused through excessive fire-heat, or touching the berries during thinning operations may also be suspected.

NAMES OF FRUITS: *J. L. Land*. Plums—1. Denniston's Superb; 2. Oullin's Golden.—*E. Bennett*. Apple Irish Peach.—*W. D. S.* The seedling Apples are not fully grown. They exhibit no improvement upon varieties already in commerce.—*H. Spright*. 1. Pott's Seedling; 2. Pitmaston Duchess; 3. Lord Suffield.

NAMES OF PLANTS: *E. W.* Hibiscus syriacus.—*C. L.* Impatiens Roylei.—*W. B.* Scabiosa ochroleuca.—*H. S.* 4. Tibouchina macrantha; 5. not recognised, send when in flower; 6. Callicarpa purpurea.—*B. O.* 1. Begonia macinata; 2. B. incarnata; 3. Pellionia pulchra; 4. Gymnogramma ocreacea; 5. Adiantum lispidium.—*Leicest. r.* Eriobotrya (Photinia) japonica (Loquat).—*J. B. D.* Viburnum Opulus (Guelder Rose).—*F. H.* 1. Veronica longifolia subsessilis; 2. Erigeron philadelphicus; 3. Galega officinalis (Goat's Rue); 4. Potentilla, send when in flower; 5. Acaena millefolia; 6. A. microphylla.—*W. O. W.* 1. Onoclea sensibilis; 2. Lomaria procerca; 3. Sedum carnenum; 4. Erigeron mucronatum; 5. Campanula pulla alba; 6 and 7, next week.

PALM INJURED: *F. C. S.* The portion of leaf sent shows damage by red spider, which would suggest that the atmosphere of the house in

which the plant was grown is too warm, especially at night-time, and too dry. Such appearance is also shown on plants used for decoration in the house, and especially where gas-light is used. Another cause might be foul air in the house, arising from either the stovehole or drains.

PEACHES UNHEALTHY: *Peach Leaves and P. H., Old Southgate*. Your fruits are attacked by the Shot-hole fungus (*Cercospora circumscissa*). Spray with ammoniacal solution of copper carbonate, the first time just when the leaves are expanding, and repeat the operation at intervals.

PHLOX UNHEALTHY: *H. R.* Rhizoctonia has destroyed the roots; treat the soil with lime.

PRIZE-MONEY WITHHELD: *R. A.* Your letter is not explicit, but we understand you exhibited fruit which you did not cultivate. This is clearly an infringement of conditions at any flower show, and we are not surprised that the committee disqualified all your exhibits in consequence.

RUNNER BEANS: *H. & Co.* There is no disease present. The discoloration has been caused by cold.

SCALE ON ASH: *R. H. L.* The tree is infested with the common Ash-bark scale *Chionaspis fraxini*. The small white elongated "scales" are the male puparia; the larger grey-coloured ones the females. This insect also occurs on the Willow. Paraffin emulsion, if applied with a stiff brush, will destroy the pests. Two applications should be given, one now and the second in early spring. Spraying has little or no effect in ridding trees of this scale.

SHANKED GRAPES: *F. E. S. & Co.* The Grapes you submit are badly shanked. This may be due to a variety of causes, but the most frequent source of the trouble is an inefficient border. During the coming season overhaul the root system and ascertain if the roots are perfectly healthy. At the same time see that the provision for drainage is adequate and endeavour to obtain plenty of young fibrous roots near to the surface. Shanking may also be caused by any cultural error that gives a check to the vines, including overcropping, destruction of the foliage by red spider, stripping off a great quantity of fully-developed leaves at one time, chills or sudden changes of the temperature of the house, planting in borders composed of too rich materials, excessive dryness at the roots, &c.

SWEET PEAS: *F. E. S. & Co.* The flower-buds have been destroyed by aphides. Spray the plants with an insecticide.

TOMATOS DISCOLOURED: *E. H.* The hard, yellow patches have been attributed to a lack of potash in the soil. When preparing fresh compost for your plants incorporate with it plenty of wood-ashes. Supply the growing plants with a little potassic manure at intervals; a small quantity of nitrate of potash dissolved in water will be beneficial.

VALLOTAS, NERINES AND BELLADONNA LILIES: *Amateur*. For cultural purposes the Belladonna Lily and Nerine may be classed together when grown in pots. Success in flowering them depends on resting them in a perfectly dry condition in a garden frame, or in a sunny part of the open garden during the summer. When the foliage turns yellow it indicates that the resting season has arrived. Water should be withheld until the flowering spikes appear, or until the production of new leaves indicate that the bulbs will probably not flower, when the plants should be watered and good growth secured for flowering in the next season. Vallotas are evergreen, and do not require such vigorous drying during the resting season as the Nerines. They flower best when grown in comparatively small pots.

VIOLAS DYING: *T. W. S.* The soil has become too acid for the plants. Apply lime as a corrective.

MAKING AND PLANTING OF FRUIT TREE BORDERS.

IN former years Vine and Peach borders were usually made too wide and too deep. In some instances they were as much as 15 feet to 17 feet in width and from 2½ to 3½ feet in depth, thus containing an unnecessary amount of compost, which, at the best, only became sparsely furnished with roots. Trees growing in such large borders seldom fruited well, thus showing conclusively that the extra labour involved and expense incurred were wasted.

I have satisfied myself by many years of practical experience that a border about 10 feet wide and 2 feet 3 inches deep, immediately inside or outside the front wall, as the case may be, sloping down to a depth of 18 inches at the southern limits of the border, and enclosed by a 9-inch retaining wall,

affords ample root-space for the production of heavy crops of first-rate Grapes and Peaches. This depth provides for a 4-inch layer of brickbats or clinkers, broken somewhat fine on top, for drainage purposes. The same depth of stones with a little gravel on the top would answer the purpose equally as well. The bottom of the border supporting the drainage material should consist of a few inches of concrete or "pounded" chalk, made to slope, at the rate of half an inch for every foot, to the retaining wall. A gutter brick should be embedded in, and level with, the concrete or chalk surface, covered by another placed upside down, and connected with a drain, as a means of carrying away superfluous water from the border. The drainage material should be covered with thin turves 1 foot wide and from 2 to 3 feet long, grass-side downward, so as to prevent the fine soil from getting into the drainage.

In the initial stages of Grape and Peach-growing, the cultivator should aim at securing a network of roots in the border, and then to feed them well by giving frequent surface-dressings of artificial manure during the period the Vines and Peach trees are developing their crops. These fertilisers should be afforded immediately before applying water, so that the manurial properties may be washed down to the roots as soon as possible. The same slope to the south should be given to the surface of the border as advised for the base, so as to expose the soil to the sun's rays. The roots will push into this warm layer of soil and soon reach the mulch 3 or 4 inches deep of short manure, which should be laid on all fruit borders in the autumn to be renewed in the spring. In the case of "lean-to" and "hip-roofed" vineries, I prefer planting the vines in a strip of border formed inside the house and extending about 2 feet from the front wall, this being enclosed by a 4½-inch brick wall, 9-inch piers being built into this at intervals of 9 feet for supporting the hot-water pipes. The roots will speedily extend to the outside border between the arches supporting the front wall.

In the case of span-roofed vineries, I have in my mind's eye vineyards where there are several ranges of vineries erected side by side on the pier system—that is, where half the rafters of each successive pair of houses spring from the same pier-supported plant, and in which houses the same temperature and humidity prevail throughout. The glass-covered space in each house was dug or trenched from 18 inches to 24 inches deep, and liberal dressings of short manure were incorporated with the soil in the process. Into this, in some cases pebbly, soil the vines were planted early in March. I have never seen heavier crops of fine Grapes (including Muscat of Alexandria) than those obtained from these vines.

With such evidence as this, I hesitate to advocate an unnecessary expenditure in the making of vine borders, except in the cases where the soil is unsuitable or water is present. Heretofore many people were deterred from attempting to grow Grapes by reason of the expenditure which the formation and composition of the vine border on the lines recommended at the time would incur. Should it be found necessary to concrete the border inside a span-roofed vinery or Peach-house when the roots

are confined therein, the base of such border should slope slightly from both sides to the middle, where the gutter bricks should be placed as described above.

A base of concrete or pounded chalk not only serves to prevent the roots from pushing into the substratum, but it also confines the roots in the prepared soil. But where there is a substratum of chalk or limestone, it will only be necessary to lay thereon a few inches thick of brickbats broken finely on the top and covered with turves, the provision being made, as described above, for carrying away any superfluous water that might otherwise accumulate about the roots at an undesirable time of year.

New borders should be made in sections to begin with. In the case of a lean-to vinery, in which the vines are planted 3 feet apart in the 2 feet wide inside border, a breadth of 3 feet outside will afford ample room for the roots for the first year, and the soil may be kept in position by means of a turf wall. The border may be completed during the two following years. Thus, in forming the borders in a 20 feet wide span-roofed house, make them in sections 5 feet wide each side the first year, completing the work during the two following years in sections 2½ feet wide each. In the case of a span-roofed vinery 30 feet wide, the completion of the borders might extend over a period of four years.

As regards suitable composts for vines and Peach trees, these plants are not so particular as to soil as many people suppose. Given a deep, calcareous, loamy soil into which a liberal dressing of good manure has been dug or trenched, the Vine or Peach tree will flourish and produce heavy crops of fruit year after year under judicious management. Where the natural soil is either too light or too heavy in texture for the production of good fruit, borders of prepared soil must be made. If the time-honoured top 3 inches of pasture land is not available, any good loamy soil may be substituted, with the additions of old lime-rubble, wood-ashes, and horse-droppings at the rate of one cartload of each to five loads of loam and one barrowful of soot, the whole being thoroughly mixed.

Young vines raised in heat from "eyes" inserted in sandy soil at the beginning of the year should be planted in inside borders as soon as they have made 2 or 3 feet of growth, and before the roots become matted in the pots. They should be planted in their permanent positions about 1 inch deeper in the soil than they were in the pots and from 3 to 4 feet apart. If the latter distance be allowed between the permanent vines, super-numeraries might, with advantage, be planted between them for furnishing a crop of Grapes in the following year. The plants should be watered at the roots a few hours before being turned out of the pots. In planting, pass the hands lightly round the ball of earth and roots in order to disturb the surface, thereby enabling the roots to push more easily into the new soil. Having previously removed a spadeful or two of the compost forming the border at the intervals already mentioned, and marked off by sticks long enough to reach the first wire of the trellis, insert the individual plants into the holes thus made, pressing the soil well about the roots and afterwards watering with tepid water to settle the soil. This done, tie the young vines to the sticks and apply a surface dressing

of short manure to the thickness of 2 or 3 inches. May and June are suitable months for planting vines, of the current year's raising, in outside borders, in which case the stems are taken into the vinery through holes made in the brickwork or wall-plate. Where cut-back vines of the previous year's raising are used, they should be planted a few weeks before growth begins, say, early in March, shaking every particle of soil from the roots, disentangling and shortening them and cutting off any damaged portions. The rest should be spread regularly over the soil, giving them a downward inclination southward (assuming the house and border face that direction). Cover them with 6 inches of soil and apply a surface-dressing of half-rotted stable manure of the thickness advised above, following with sufficient water to settle the soil about the roots.

Peach and Nectarine trees, obtained from the nurseries, after they have shed their foliage, should be transplanted in the manner recommended for cut-back vines raised in the previous year. As a further argument in favour of the making of narrow and somewhat shallow fruit-borders, I may add that I have cut prize Grapes even from vines growing in a 3-foot wide border. H. W. Ward.

ACANTHUS PERRINGII.

The Acanthus, or Bear's Breech, as it is commonly called, is cultivated mainly on account of its handsome foliage, although the stout spikes of rose-coloured or white flowers are also attractive. The commonest species met with in gardens is *A. mollis*, which is found all over the south of Europe. It is a stately plant, the large, shining, green leaves on specimens, growing in deep, strong soil, forming handsome tufts 4 feet or 5 feet across. Other species in cultivation include *A. longifolius*, a very distinct plant, with leaves from 2 feet to 3 feet long, and narrow in proportion, bearing spikes of purplish-rose coloured flowers; and *A. spinosus*, distinguished by its very spiny, deeply cut leaves. This latter species seldom flowers except when planted in hot, dry situations at the foot of a wall facing south. Both species are natives of Southern Europe. Another less often seen is *A. hirsutus*, from Asia Minor, which produces a tuft of radical leaves close to the ground. The leaves and flower-stems are covered thickly with a hairy pubescence. It is to this latter species that *A. Perringii* is most closely related. Plants of *A. Perringii* were received at Kew in 1904 from Mr. W. Siehe, of Mersina, in Asia Minor, who described it in the *Gardeners' Chronicle*, 1905, vol. xxxvii., p. 2. Mr. Siehe there states that he discovered it in 1903 in the Cappadocian Antitaurus growing on cliffs composed of a chalky loam at an elevation of from 5,000 to 6,000 feet. The plant is very deep-rooting and spreads freely by means of underground rhizomes. The leaves are all radical, about 10 inches long, grey in colour, toothed and spiny, and, like the stem, covered with a fine, hairy pubescence. The inflorescence grows about 2 feet high, the flowers being rosy-red in colour. The specimen shown in fig. 80 is growing at the foot of a south wall at Kew; the extreme heat causes it to flower. Planted in the open beds it grows well and is quite hardy, but it does not bloom. This also applies to *A. hirsutus* and *A. spinosus*. *A. mollis* and *A. longifolius* will grow freely and flower well in the open on the borders of shrubberies or in open beds on lawns. *A. mollis* is grown in gardens under the names of *A. candelabrum*, *A. latifolius*, *A. lusitanicus*, and *A. Schottii*, while the plant sent out some years ago as *A. Caroli Alexandri* is only a form of *A. spinosus*. W. I.

* LOCAL GEOGRAPHICAL DISTRIBUTION OF PLANTS.

THE two books, of which the titles are given below, treat of the geographical distribution of the plants of given districts from totally different standpoints. Mr. Hamilton Davey has produced a county flora on the conventional model of drainage areas, with numerous localities for the plants under each area and the authorities for the same. Some idea of the plan and scope of the work may be gathered from the headings of the "Introduction," namely: Topography, climate, geology, history of botanical research, botanical districts, list of books, herbaria, &c., quoted, summary, and plan of the flora. This part occupies 88 pages, as against 570 pages of enumeration of the species represented in Corn-

of the author's eight districts, and nearly three-quarters of a page is taken up with localities. *Anemone nemorosa* occupies a whole page in the same manner, and there are scores of other instances. This calls to mind a remark by the late Dr. Reichenbach that we should soon have all the native plants labelled! No one surely would contend that any useful purpose is served by giving such details of the occurrence of these common plants. Of much more interest is their general distribution in and beyond the United Kingdom. On the contrary, it seems inexpedient to give exact localities of the rarer plants. An ideal county flora should include all that Hooker's *Students' Flora of the British Islands* contains concerning the plants of the county, and in addition local conditions and other facts of interest, such as associations of

[Photograph by W. Irving.]

FIG. 80.—ACANTHUS PERRINGII: COLOUR OF FLOWERS, ROSY-RED.

wall and bald records of localities, the results of many years' trappings by the compiler and numerous coadjutors. The work compares favourably with other county "Floras" on the same plan; but who will have the courage to depart from this plan and give less space to localities and more space to biological facts, local conditions and traditions, the derivation of the botanical names and the general distribution of the genera, and species under consideration? Taking *Clematis vitalba*, the first plant in the list, as an example. This is recorded from all

plants and the position they fill in the composition of the vegetation.

Judging Mr. Davey's book by what it does comprise, it is only fair to repeat that it compares favourably with similar compilations, and that it will be indispensable to all who wish to become acquainted with what is known of the flora of the county; much information may be easily gathered from the introduction. It will come as a surprise to persons unfamiliar with the distribution of plants how few are peculiar to Cornwall so far as the United Kingdom is concerned, and how near the total is the same in each of the southernmost counties eastward to Kent. Of flowering plants and Ferns the author enumerates 953 native species, whilst "denizens," "colonists," "aliens," and "casuals" bring the total up to 1,180. Out of this total only a score have not been recorded from any other British county, and several of these are certainly introduced plants. As might

* *Flora of Cornwall*. Being an account of the Flowering Plants and Ferns found in the county of Cornwall, including the Scilly Islands. By F. H. Davey, F.L.S., &c. Octavo, pp. lxxxviii + 570, with six portraits and a map. (Penryn: F. Chegwidan, 1909. Price 21s. net.)

Les Aspects de la Végétation en Belgique, par Charles Bommer et Jean Massart. *Essai de Géographie Botanique des Districts Littoraux et Alluviaux de la Belgique*, par Jean Massart. One vol. large folio, 86 plates. One vol. octavo, numerous tables and maps and 82 small photographs. (Brussels: Jardin Botanique de l'Etat, 1908.)

be expected, some of the rarer plants have not been observed growing by the author, among them, apparently, *Adiantum Capillus-Veneris*, which is becoming very rare, though we have heard lately of a locality where it is fairly plentiful, but which is not to be divulged even to the author of a county flora. Interesting as the native flora of Cornwall is, it is poor in comparison with that of New Zealand, or of Chili, for example, whose members find such congenial conditions in the Duchy and constitute the chief delights of the gardens.

Including coves and bays, Cornwall has a coast line of about 500 miles, the vegetation of the various parts of which is not specially described by Mr. Davey. This by way of comparison.

—The second work before us deals in great detail with the vegetation of the much smaller coast line of Belgium, both of the coast and the alluvial districts behind, and of both wild and cultivated elements in the vegetation. It is the first part of a comprehensive and elaborate pictorial and descriptive account of the vegetation of the whole of Belgium, illustrated by 400 folio plates and numerous small views. As

the conservators, and an unusually severe wind-storm will often undo the work of years and alter the whole face of certain strips of land. Fortunately the very heaviest wind-storms have a narrow course.

The long series of photographic views of the natural and artificial vegetation are admirably reproduced, all the leading elements being easily recognised, and the various plant-associations under different conditions brought to view. Gregarious vegetation and mixed vegetation of two or three or few or numerous elements appear. In the more composite associations it is surprising to see such plants as *Hemimium monorchis*, *Epipactis palustris*, and *Parnassia palustris* sufficiently abundant to be conspicuous in some views. The native plants, as we need not tell botanists, are the same as those inhabiting the coast of Britain. Prominent among them is the Mat Grass or Marram, *Ammophila arundinacea* (*Puccinellia arenaria*), which is apparently the only kind of herb that is actually planted for sand binding. Previous to planting, the naked sand dunes are prepared by deeply inserted rows of branches of thorn bushes.

rici-Augusti, all red-flowering species with crusted foliage. The most attractive of the three is *S. Grisebachii*, which is a native of Macedonia. It has silvery leaves, which are produced in handsome rosettes. The flower-stalks attain to a height of 9 inches or more when fully developed, bearing at the top the nodding inflorescence of purplish-crimson flowers. The plant on the left is *S. Stribrnyi*, a recent introduction to gardens. Seedlings of it appeared in a batch of young plants of *S. Grisebachii* raised from collected seed. The rosettes of leaves in both species are similar, but the inflorescence of *S. Stribrnyi* is more branched. The stem, branches, and flowers of this species are covered with glandular hairs, more or less tinged with red. *S. intermedia*, as may be noticed from the figure, is intermediate between the other two species, the red flowers being borne on longer pedicels. This also came up amongst seedlings of *S. Grisebachii*. A full account of the red-flowering *Saxifragas* with crusted foliage will be found in the *Gardeners' Chronicle*, April 24, 1909, p. 258. W. I.

FIG. 81.—THREE RED-FLOWERING SAXIFRAGAS.
[*S. STRIBRNYI*, *S. INTERMEDIA*, AND *S. GRISEBACHII*.]

planned, there will be five parts: (1) Districts Littoraux et Alluviaux; (2) Districts Flandrien et Campinien; (3) Districts Argilo-sablonneux et Cretacé; (4) Districts Calcaire et Jurassique; (5) District Ardennais. This will be the final consolidation and elaboration of numerous contributions to the subject, many of which have appeared in the forty-third and succeeding volumes of the *Bulletin de la Société Royale de Botanique de Belgique*. The first part is specially interesting, inasmuch as it treats of the composition of the vegetation concerned in the preservation of the land reclaimed from the sea and precariously held by extensive breakwaters, dams and stockades. Beginning with the seaweeds on the outer face of the breakwaters, we are taken over the areas covered by every tide, over those covered by ordinary spring tides, and over others inundated by exceptionally high tides and sea-storms, on to the cultivated alluvial plains dotted with homesteads. Within the protective works of timber, stone and brick are enormous stretches of more or less moving sands, the binding of which is the great task of

Common Pines and Poplars are the first trees planted for sheltering the crops and homesteads of the reclaimed land.

The *Aspects de la Végétation en Belgique* are interesting and valuable, alike to the botanist and the practical man, and our only objection to the work from a practical standpoint is its size. For educational purposes it is unwieldy; but we are glad to learn that there is to be an issue of the plates about one-quarter the size of the present edition.

It may be added that some of the maps and photographs illustrate the conditions of 60 or 70 years ago as compared with those of the present time. W. B. H.

THREE RED-FLOWERING SAXIFRAGAS.

THE three red-flowering *Saxifragas* illustrated in fig. 81 are all natives of Macedonia and Bulgaria. They belong to a section of the genus which includes the Pyrenean *S. media*, the Italian *S. porphylla*, and the Grecian *S. Frede-*

ORCHID NOTES AND GLEANINGS.

SPIRANTHES ROMANZOVIANA.

IT may be of interest to record that this rare little Orchidaceous plant (the Irish *Spiranth*) was found a fortnight ago in the extreme North of Ireland. Hitherto its only recorded stations in Europe were in the South (at Bantry Bay) and West of Ireland.

HABENARIA VIRIDIS.

I HAVE never seen this *Habenaria* so plentiful as on some of the waste heaps of the limestone quarries in County Tyrone. *Orchis pyramidalis*, *O. conopsea* and *Epipactis latifolia* were also abundant. A. D. Webster.

DENDROBIUM SANGUINOLENTUM ALBUM.

FLOWERS of what may be regarded as an albino form of *Dendrobium sanguinolentum* have been forwarded by Mr. James Geddes, The Lodge, Red House, Ascot, who states that the flowers, on opening, are yellowish, but change to white when mature. The typical form has the segments tipped with claret purple, but in Mr. Geddes' variety no colouring is present. The flowers are developed on short racemes of from four to eight blooms. The type plant received from Ceylon flowered at Syon House in 1842, but the species is widely distributed along the Malay Peninsula, and varies considerably in different localities both in size and colour of flower. Mr. H. N. Ridley, in his *Materials for a Flora of the Malayan Peninsula*, describes the plant as having white sepals tinted with rose, and white petals, and an albino of such a section of the species might be expected more readily than from the original heavily coloured form, which, however, is the one more commonly seen in gardens. The same author also enumerates as *D. sanguinolentum* var. *cerina*, the *Dendrobium cerinum* of Rehb. f. in *Gardeners' Chronicle*, 1879, ii., p. 554. "Flowers yellowish ochre, occurs with the other"—the *D. sanguinolentum*. It is a desirable warm-house species flowering at different seasons, but generally in summer and autumn, and lasting in bloom for a long time.

CYPRIPEDIUM STONEI.

A PHOTOGRAPH of a fine specimen of this handsome old Bornean species is sent us by C. E. Franck, Esq., Hill Court, Yatton, Somerset, in whose garden the plant flowered. The photograph shows the plant bearing four spikes of two flowers each. The species was introduced by Messrs. Low & Co. in 1860. It is an attractive species having white dorsal sepals with two or three blackish lines, narrow, decurved petals and elongated rose-tinted lip. The plant requires a warm, moist atmosphere.

TREES AND SHRUBS.

SPARTIUM JUNCEUM.

By the middle of July or thereabouts, at which time the earliest blossoms of the Spanish Broom expand, most of the yellow-flowered Leguminosae of a shrubby character are past. The fact that this *Spartium* continues to bloom from July till the end of August is a great point in its favour, as at that time comparatively few hardy shrubs are in flower. It is too well known to need any detailed description, therefore it will suffice to say that it can be readily distinguished from the other Brooms by the long, green, Rush-like shoots which are very sparingly furnished with small narrow leaves. The flowers are comparatively large and borne in great profusion. This *Spartium* is of a rather naked habit of growth, for which reason it should be associated with other shrubs and allowed to overtop them. In this way the slender shoots dispose themselves in a very graceful manner, and have a very pretty effect when laden with their golden blossoms. The plant is more satisfactory in a rather poor than in a rich soil; indeed, it will thrive on dry sandy banks, but under these conditions it does not attain the same dimensions as when more liberally treated. In any selection of late summer-flowering shrubs the Spanish Broom should be given a place. The plant may be raised readily from seeds, but it does not transplant readily, for which reason it is usually grown in pots till planted permanently. When raised in considerable quantities from seed, there is a slight amount of individual variation, but the only recognised variety is the double-flowered form, which is, however, scarce in cultivation and of no great merit as a garden plant. H.

THE SYCAMORE FUNGUS.

EVERYONE interested in trees must be familiar with the conspicuous black, pitch-like spots which so mar the appearance of Sycamore leaves at this season of the year. These are due to *Rhytisma acerinum*, a fungus which, appearing as small yellowish spots on the under sides of the leaves towards the end of June, gradually increase in size and intensity of colour until they attain to fully half-an-inch in diameter and are inky-black, with a margin of dirty yellow. The attacked portion of the leaf becomes wrinkled and much thickened in texture, while all the affected foliage drops prematurely. After lying on the ground during the winter the thread-like spores are produced in large quantities at the time when the foliage of the Sycamore is appearing in May and June. The Sycamore is not the only tree affected by this fungus, for the Norway Maple and our native *Acer comprestre* are equally liable to attack, and have in some instances suffered very severely from this cause. The fungus is becoming more plentiful, and it disfigures the Maple and Sycamore leaves to a wide extent. Another fungus which infests the leaves of these trees is *Rhytisma punctata*, which may at once be distinguished from the above species by the many small black spots studded thickly together, which combine to form the large conspicuous blotches for which affected trees are remarkable. Both species are sometimes found on the same leaf. As the attacks of this fungus continue from year to year, and it causes almost every leaf to drop prematurely, the health of the trees is greatly impaired, and they become easy preys to the still more destructive coral spot fungus, *Nectria cinnabarina*. By burning the leaves affected with *Rhytisma* before the spores are liberated in spring the spread of the fungus is prevented in a simple and effective manner. The Sycamore fungus is very plentiful on trees around London. A. D. Webster.

ELMWOOD.

ELMWOOD, Lord Northcliffe's pretty country estate in the Isle of Thanet (see figs. 82, 85, and 84) has many interesting garden features. These include an old-fashioned lean-to vinery against the older part of the house, the ancient Fig trees, with massive trunks, and many other objects which tell of the gardener's art in a bygone age, and in a not less degree the improvements wrought during the eight years in which Mr. Henry Charman has been head gardener at Elmwood. Being situated close to the sea, between Margate and Broadstairs, the necessity for protection from the winds evidently prompted the original owner to provide a fine plantation of trees on one side. The trees are now dense and tall, and form a very fine feature. Large patches of hardy Ferns are planted as an undergrowth, and spring-flowering bulbs. At the end of the shady walk leading from the wood is an extensive fishpond, containing Water Lilies. Both with a view to shelter, and to display different effects in the garden, separate enclosures are arranged, each worked out on a different plan.

the house has a fine old Fig tree in the centre, the borders being planted with fragrant flowers, among which *Heliotrope* was prominent. Beside it is a Rosary arranged on the usual plan, but rendered homely-looking by the old flint wall on one side and the rustic trellis covered with Rambler Roses on the other. There are two Iris gardens, with large masses of varieties of *Iris germanica*, which must have looked very pretty when in bloom; and Carnation borders, the plants having produced an immense quantity of flowers this season. Some 2,000 plants of border Carnations are cultivated, the favourites being Trojan, Mrs. F. W. Flight, Raby Castle, Uriah Pike, Miss Audrey Campbell, Mrs. Eric Hambro, Helmsman, Mary Morris and Duchess of Fife.

Tennis courts are bordered by grass that is not mown. In these margins, quantities of Daffodils, Crocuses, Snowdrops, and other spring-flowering plants have been planted. Some long borders of annuals are very effective with Stocks, Larkspurs, Dianthus, and other showy flowers. Sweet Peas, also, are grown in great quantity and variety.

The houses are chiefly on the modern plan,

FIG. 82.—ELMWOOD, KENT, A RESIDENCE OF LORD NORTHCLIFFE.

In one of these spaces, with its smooth lawn in the centre, is a pretty bungalow, which Lord Northcliffe uses as a study, and which is well stocked with works of reference, as well as a very interesting collection of trophies and curiosities from many parts of the world, including rugs formed of the skins of gigantic Polar bears captured during the Jackson Harmsworth expedition to the Polar regions. Another interesting relic is the boat "Mary Harmsworth," which formed part of the equipment of the expedition. Blue flowers and fragrant plants are favourites with Lady Northcliffe, and they appear in great variety in the open garden and also in the glasshouses. Around the bungalow is a border of Rosemary and Lavender, and on one side of the lawn is a broad, herbaceous border, densely set with bright flowers, the patches of *Montbretias* being specially effective. At the end is a border with large specimens of *Fuchsia Riccartonii*, with tall plants of *Eulalia japonica variegata* between them, and in front a row of the double-flowering salmon-pink *Pelargonium* Mrs. Chas. Lawrence, a variety which Mr. Charman considers one of the best both for borders and for pot culture. One pretty little nook near

and are well furnished with decorative plants. They include a warm tank-house, containing on the stages *Coleus* in variety and Ferns, with *Asparagus Sprengeri* and other plants suspended overhead. In the tank are several large alligators, which were obtained when very small from Florida, and which are now fully grown.

In the first division of the main block *Caladiums* are in fine condition, and with beautifully-coloured leaves. The plants of a large batch of *Calanthe Veitchii* have very strong growths, promising well for winter flowering. There are also *Codiaeums* (*Crotons*), *Cordylines* (*Dracenas*), and other decorative plants, and on the roof the red and yellow Climbing Lily (*Gloriosa superba*) has a profusion of its showy flowers. Here *Gymnogramme schizophylla* shows well as a basket plant, and the end wall is clad with Ferns and large-leaved *Begonias*—probably the original *B. Rex*, which is still one of the most beautiful. The next house has a fine collection of *Nagelias* of the *N. cinnabarina* class, with fine, velvety, green leaves marked with purple, and pyramidal heads of white, yellow and scarlet flowers; a batch of well grown plants of *Browallia speciosa*, covered

with bright blue flowers, ornamental-leaved *Acalyphas*, profusely-flowered *Bougainvillea glabra*, and sky-blue *Plumbago capensis* overhead.

In the greenhouse the delicate, pale blue *Ipomœa cœrulea*, which partly covers the roof, is a very beautiful object. Although the individual blooms do not last long, they are produced in succession over a long period, and few plants rival this species for the delicacy of its tints. Among the plants in bloom I noticed a pure white variety, which, however, cannot compare with the typical form in point of attractiveness. On the stages were tuberous-rooted *Begonias* of the fringed or crimped strain, with large, white, pink, yellow and scarlet flowers, all displaying the characters which constitute the section, and which have become fixed. *Streptocarpus* are well grown at Elmwood, where they bloom finely.

Souvenir de la Malmaison Carnations are favourites, and have flowered well this year. Plants of *Cyclamen persicum* are raised annually in large numbers from seeds, and young plants are found to be the most reliable for blooming. The elegant, pale blue *Trachelium cœruleum* is grown in quantity, and is now making a good show. *Chrysanthemums* are largely and well

France for cool and palatable salads. If we only had summers in England like those experienced in France, there would be no risk in starting "French" gardens all over the country!

Orleans is the centre of a great industry in trees, shrubs, Roses, Conifers, fruit-tree stocks, &c., and one of the most remarkable establishments is that of MM. Barbier et Cie. This firm has three large and quite distinct establishments. One of these, about 16 miles outside Orleans, I had the pleasure of visiting with a few friends, under the guidance of MM. L. and R. Barbier. The establishment at La Ferté St. Aubin comprises about 400 acres of rather heavy loam, devoted principally to the raising of young stocks of all kinds of trees, shrubs, Roses, and Conifers. In this nursery experiments were being carried out with certain kinds of Australian and Chilian Apple-stocks, with a view to securing one that will best withstand the ravages of the woolly aphid or American blight. One Chilian variety called "Hindobro" gave excellent results. Shoots of this variety were grafted on Apple trees smothered in American blight. They made fine growth in due course, but have remained quite immune from the blight itself. Apple "Northern Spy," which

roots of the herbaceous kinds (*P. chinensis*). The roots are cut into pieces about 6 inches long, a triangular piece is taken out of the side, and the shoot of the tree *Pæony*, cut to fit, is inserted, tied, and waxed with a dexterity only secured by long practice. Other men dibble these grafts into narrow, sandy beds, over which lights and frames are placed and kept heavily shaded. In 12 months the plants are established and ready for sale.

In all the nurseries visited, bell-glasses or cloches are extensively used for propagating purposes. Trees and shrubs of all kinds are put under them either as cuttings or grafts, two rows of cloches being generally placed upon the narrow, sandy beds. The cuttings or grafts put in during the autumn are sufficiently established by the following spring or early summer; the cloches are then available for placing over other batches of cuttings to be rooted during the summer months. Sand is used freely, and is mostly obtained from the rivers—the Loire and its tributary, the Loiret.

It should be mentioned that at each of the towns visited a cordial reception was given to the English visitors, and the same would, no doubt, be accorded to any British nurseryman or gardener wishing to visit the different establishments. The *entente cordiale* is very much in evidence in commercial gardening, and there is a great deal to be learned by paying a visit to France. *John W. Cathers.*

cultivated. The vines and Peach and Nectarine trees are said to have given satisfactory crops this season, and there are excellent Grapes still hanging. The kitchen gardens also are in good order. *B.*

NURSERIES AND GARDENS IN NORMANDY.

(Concluded from page 178.)

ORLEANS.

LEAVING Angers on August 15, about 2 p.m., Orleans was reached about three hours later. Several nurserymen of the district met the party, and visits to some nurseries close at hand were made in the cool of the evening. The country between Angers and Orleans is very flat, but not a square yard of ground seems to be wasted. On both sides of the railway are to be seen hundreds of acres of vineyards, Wheat fields, Beet, Maize, Buckwheat, Hemp, &c., and here and there great stretches of *marais* or gardens devoted to intensive cultivation. As at Mondéville, near Caen, these "French" gardens looked particularly green and refreshing in the scorching sun, and it was by no means difficult to realise from the intense heat why there is such a demand in

is reputed in England to be a great check to the American blight, has also been tried, but the results have not been altogether satisfactory.

It would be impossible to enumerate all the interesting things seen at this nursery. Attention, however, may be called to a charming little shrub—*Ligustrum Buota variegata*—with small oval leaves variegated with creamy-yellow and green. It is very compact in habit, and should make a good substitute for the Golden Privet.

In this nursery also it was pleasant to find quite a large lake devoted to the culture of hybrid Water Lilies, and also to great masses of the Indian Sacred Bean—*Nelumbium speciosum*. This latter plant—which one sees only in hot-houses in England—looked handsome in the open air with its huge Nasturtium-like leaves. Unfortunately the plants were not in blossom, but, judging by the number of buds upon them, they promised to provide a fine sight later.

In the town nurseries of MM. Barbier there are numerous glasshouses, and all kinds of plants are propagated here with marvellous rapidity. It was quite an interesting sight, for instance, to see several gardeners busily engaged in grafting tree *Pæonies* (*P. Moutan*) upon the tuberous

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Repotting Odontoglossums.—The present is the most suitable time for overhauling the cool *Odontoglossums*, as at this season there is little difficulty in maintaining an equable moist temperature, such as is favourable to the plants getting re-established before winter sets in. This is especially important in cases of unhealthy specimens, and there are few collections that have none. These should be turned out of their pots, and, after the decayed compost, dead roots, and useless back pseudo-bulbs are removed, potted in receptacles just large enough to accommodate them for one season. Such weak plants must, for a few weeks after being repotted, be kept at that end of the house where the least quantity of fresh air is admitted. Keep the atmosphere about them as moist as possible, afford very little water to the roots, and shade them whenever necessary. Plants which flowered early in the year are now making their new growths, and roots will soon be pushing freely in all directions. No time should be lost in affording fresh rooting material to those that need it. Plants that have not yet started into growth should not be disturbed at this season, but the repotting should be deferred till new growths appear and the roots are active. Previous to repotting the plants they should be carefully examined for small yellow thrips, which are apt to escape notice till the leaves are disfigured. If only one or two are visible in the interior of the growths, the house should be vaporised on two consecutive evenings. Vaporise after sunset, first taking the precaution to well moisten the paths and beneath the stages. For an hour or two previous to the operation, maintain a moderate degree of warmth, which will entice the insects out of their haunts on to the leaves, where the vapour will soon kill them. When repotting cool-growing *Odontoglossums*, the beginner should guard against using pots that are out of proportion to the size of the plants, over-potting generally ending in failure, especially if the watering can gets into inexperienced hands. The pots should vary according to the sizes of the plants, and if room enough is left for one or two seasons' growth, that will be sufficient. That the plants may be put into pots of a suitable size, it is advisable to cut off the old pseudo-bulbs that are of no further use to the plant, leaving about two behind each leading growth. If these back pseudo-bulbs belong to special varieties or rare hybrids,

they should be carefully labelled, and if laid upon damp cocoanut fibre or Sphagnum-moss, and managed much in the same way as imported plants, some of them in time will break into growth. If potted carefully into the smallest pots that will hold them they will grow into healthy plants. When repotting established plants, the back part of each should be placed as near to the edge of the pot as possible, and the base of the plant just on a level with the rim. The fresh, clean pots should contain crocks to about one-half of their depth, and, above this, a thin layer of rough Sphagnum-moss. A suitable compost for these *Odontoglossums* consists of *Osmunda* fibre, *Polypodium* fibre and Sphagnum-moss in equal proportions. Cut up the fibres moderately fine, so that the materials will pass through a half-inch sieve; if the moss is also cut up and sifted through a quarter-inch sieve it will mix better with the other materials than if used in a coarser state. Previous to using the Sphagnum-moss it should be cleaned of all rubbish and be closely examined for small slugs and snails. If it is very damp it should be squeezed and then spread in the sun to dry. Add plenty of small crocks to the compost. We pass the crocks through a quarter-inch sieve, and the dust is removed by using a sieve with a very fine mesh. Mix the materials well together, and pot each plant with moderate firmness, but not so hard that water cannot pass freely away. The critical period with *Odontoglossums*, as with many other species of Orchids, is just after potting, and any excess of moisture at the root then will cause the roots to decay and many leaves drop off. It is advisable to afford only as much water as will keep the surface of the compost moist, and this especially around the edges of the pot, which will induce the new roots to push their way rapidly through the soil to the extra moisture. In some cases after root disturbance the pseudo-bulbs will shrivel, but no extra waterings should be given with the idea of causing them to plump up quickly. Under proper treatment they will return to their normal condition, when new roots become active and plentiful.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart.,
Leonardslee, Sussex.

Bedding plants.—It is time all cuttings of bedding plants were inserted. Any plants which will be lifted later should be prepared for this by cutting the soil around them with a spade. Very choice subjects should soon be brought under cover, but the general housing of outdoor plants may be left until the first week in October, unless severe frosts occur before that date. The winds and rains of autumn are liable to break many of the shoots unless the plants are properly staked. Cuttings of bedding plants should be allowed to remain in the open for as long as possible; but if the weather turns cold and wet, place them in cold frames. During fine days the lights may be left off.

Hardy plant border.—Liliums, Dahlias, *Perennial Phloxes*, *Asters*, and other autumn-flowering plants have grown tall this season, and, in consequence, they will need extra care in staking. Now that the plants are fully grown, it is a good time to plan any rearrangement in this border that may be deemed advisable. Although this is not the best time to renovate herbaceous borders, because many of the plants are now in flower, nevertheless new ones can be formed. *Lobelia cardinalis* var. *Queen Victoria* is particularly effective in our borders just now, and the various *Statice*s and *Pentstemons* are most decorative. Cuttings of *Pentstemons* should be inserted now. They will require the protection of a cool frame during the winter. Other plants that are at their best just now include *Chelone barbata*, *C. glabra*, *Hydrangeas* of sorts, *Salvias*, *Monardias*, and *Nandina domestica*. The leaves of the *Nandina* colour a beautiful red in autumn; the flowers are white, being borne in large panicles. The blooms are succeeded by red berries.

Boy and aquatic plants.—Many of these plants grow very rapidly at this season, and the stronger-growing kinds are liable to smother the weaker ones. Any necessary thinning should be done, so that the specimens may be kept to their allotted spaces. Flowering plants, such as *Liliums*, *Richardias* and *Spireas*,

should have their old flower-spikes removed. It is a good time to plant these subjects, for the roots soon take hold of the soil, which is much warmer now than it is in spring-time.

Alpine garden.—Weeds have been very troublesome this season, and much labour has been required to keep them in check. Propagation should be continued. Seeds should be sown and cuttings inserted. If alterations are to be effected, preparations should at once be made to obtain the requisite soil and stones, and to place these in position. By doing this now, everything will be ready and the soil well settled before planting time arrives.

Roses.—The autumn crop of *Roses* is a very good one. The ground about the plants must be kept stirred with the hoe, not only to prevent weeds, but that the land may become properly aerated. Make secure any long shoots, and, in the case of strong-growing *Tea*, *Hybrid Tea* and *Rambler* varieties, cut out all the old wood.

Lawns.—These should be mown frequently when the grass is dry, and if the weather continues showery, they will require frequent rollings. The paths and the verges must be made tidy, and if the former are weedy, a weed-killer should be used. The grass edging should be protected from this corrosive substance by means of a long plank, which can be shifted as the work proceeds.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICAR GIBBS,
Aldenham House, Elstree, Hertfordshire.

Brussels Sprouts.—This has been an ideal season for this popular vegetable. The plants are strong, and give every promise of a fine crop. It is a good plan at this season to examine the bed and remove all decaying leaves and superfluous growths. It frequently happens, when *Brussels Sprouts* are planted on rich ground, that large, loose growths are formed at the base. These should be taken away, as they impede the light and air which are necessary to ripen the stems. In exposed places, and where winds from the west are prevalent, it is advisable to support the plants in some way. This is easily accomplished by driving stakes in the ground at intervals, and securing to these stout cords by which to fasten the plants.

Cucumbers.—Strong plants should now be planted on well-prepared beds in the *Cucumber house*. A bed of leaves and long litter, which should have been previously well mixed and turned, should be built up at the bottom, and on this a mixture of good light loam and leaf-soil, in equal proportions. *Cucumbers* do much better during the winter months when growing in a light rather than a heavy soil. The plants should be neatly staked until the trellis is reached, and every encouragement should be given them to grow freely. Close the ventilators early in the day, and damp the foliage with tepid water, both in the morning and early afternoon. Do not hurry the plants into bearing, and, even when they commence to bear, great care should be taken not to overtax them. Plants in full bearing need careful attention as the days shorten. Thin out the old and regulate the young growth as much as possible; give frequent top-dressings of fresh compost, and, immediately the plants appear to be losing their vigour, afford plenty of stimulants in frequent but weak doses. Never allow the fruits to remain on the plants a day longer than is necessary. If they are not wanted for immediate use, place the ends in a little water, by which plan they will keep fresh and good for several days. Plants in heated pits will require much the same kind of treatment. Portable frames on hot-beds employed for *Cucumber* culture will need to be lined frequently with fresh manure: all the sun-heat possible should be conserved, and the lights opened only during the hottest part of the day. Cover the glass at night-time with mats or similar materials. If careful attention be paid to these details, and the plants are kept free from insect pests, they will continue to fruit in favourable seasons until the middle or end of October. Where plenty of glass is available, and fresh *Cucumbers* are required all through the year, another sowing should be made. Place the seed singly in small pots, and let them germinate in strong heat. Prolific, short-fruited varieties should be selected

for this sowing. Such are *Lockie's Perfection* and the old *Syon House*.

Endive.—Continue to blanch *Endive* in the open, tying the leaves when they are quite dry. Or the plants may be lifted and placed, not too thickly, in a dark building to blanch.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Pot fruit trees.—The cultivation of fruit trees in pots is rapidly extending. They are not only valuable for furnishing high-class dessert fruits, but they are also useful for decorative purposes. The fruits may not be equal in size to those grown on permanent trees, but their flavour and colour are all that could be desired. Where the means for growing *Peaches* and *Nectarines* in borders is limited, a few dozen trees in pots are extremely valuable, and especially for early forcing. A number of pot trees of *Cardinal Nectarine*, which we have forced very early for the past eight years, show no signs of deterioration and give even better results each year. All the yellow varieties of *Nectarines* do well in pots, but *Pineapple* and *Humboldt* are the two best. Of *Peaches*, *Hale's Early*, *Royal George*, *Stirling Castle*, *Bellegarde* and *Dymond* are all suited for this system of culture. Plum trees are extremely adaptable for fruiting in pots. The varieties *Early Transparent Gage*, *Denniston's Superb*, *Jefferson*, *Greengage*, *Kirk's* and *Coe's Golden Drop* will furnish a supply of fruits over a long period. Of *Apples* the following are excellent for this purpose: *Cox's Orange Pippin*, *Ribston Pippin*, *James Grieve*, *The Houblon*, *Peasgood's Nonesuch*, *Emperor Alexander* and *Gascoyne's Seedling*. *Pears* may be represented by *Triomphe de Vienne*, *Souvenir du Congrès* and *Doyenné du Comice*. If a stock of pot trees is to be obtained, no time should be lost in purchasing the trees, as they will need repotting.

Repotting fruit trees.—Preparations should be made for repotting the main batch of these trees. Prepare a sufficient quantity of soil and place it under cover so that it will be in a good condition for use. It is preferable to have the compost a little too dry rather than too wet. Some cultivators do not advise repotting the trees every year, but unless they are growing in very large pots which they have not filled with roots the best results are obtained by repotting annually. For *Peaches*, *Nectarines* and *Plums* the compost advised in a previous Calendar will be suitable, but for *Apples* and *Pears* a more substantial compost should be used, and less lime rubble included. Young, well-rooted trees should be afforded a slightly larger pot, but over-potting must not be practised. Pot firmly and be careful to fill up the whole of the space between the ball and side of the pot, using a thin rammer for this purpose. Apply water carefully till the roots are again active.
